## Stereo 3.1 W Class D Amplifier

#### Abstract

\section*{General Description}

The MAX98303 stereo 3.1W Class D amplifier provides Class AB audio performance with Class D efficiency This device offers five selectable gain settings (6dB, $9 \mathrm{~dB}, 12 \mathrm{~dB}, 15 \mathrm{~dB}$, and 18 dB ) set by a single gain-select input (GAIN).

Active emissions limiting, edge-rate, and overshoot control circuitry greatly reduces EMI. A filterless spreadspectrum modulation scheme eliminates the need for output filtering found in traditional Class D devices. These features reduce application component count. The IC's 2.0 mA at $3.7 \mathrm{~V}, 2.7 \mathrm{~mA}$ at 5 V , quiescent current extends battery life in portable applications.

The IC is available in a 16 -bump WLP $(1.68 \mathrm{~mm} \times 1.68 \mathrm{~mm}$ $\times 0.64 \mathrm{~mm}$ ) package specified over the extended $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ temperature range.

\section*{Applications}

Notebook and Netbook Computers

Tablets Cellular Phones

MP3 Players Portable Audio Players VoIP Phones

Features

- Low Quiescent Current: 2.0mA at 3.7V, 2.7 mA at 5 V
- Spread Spectrum and Active Emissions Limiting
- Five Pin-Selectable Gains
- Click-and-Pop Suppression
- Thermal and Overcurrent Protection
- Low-Current Shutdown Mode
- Space-Saving, $1.68 \mathrm{~mm} \times 1.68 \mathrm{~mm} \times 0.64 \mathrm{~mm}$, 16-Bump WLP ( 0.4 mm Pitch)

Note 1: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a fourlayer board. For detailed information on package thermal considerations, refer to www.maxim-ic.com/thermal-tutorial.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## Stereo 3.1W Class D Amplifier

## Detailed Description

The MAX98303 features low quiescent current, a lowpower shutdown mode, comprehensive click-and-pop suppression, and excellent RF immunity.
The IC offers Class AB audio performance with Class D efficiency in a minimal board-space solution.
The Class D amplifier features spread-spectrum modulation, edge-rate, and overshoot control circuitry that offers significant improvements to switch-mode amplifier radiated emissions.
The amplifier features click-and-pop suppression that reduces audible transients on startup and shutdown. The amplifier includes thermal-overload and short-circuit protection.

## Class D Speaker Amplifier

The filterless Class D amplifier offers much higher efficiency than Class $A B$ amplifiers. The high efficiency of a Class D amplifier is due to the switching operation of the output stage transistors. Any power loss associated with the Class D output stage is mostly due to the $I^{2} R$ loss of the MOSFET on-resistance and quiescent current overhead.

## Ultra-Low-EMI Filterless Output Stage

Traditional Class D amplifiers require the use of external LC filters, or shielding, to meet EN55022B electromagnet-ic-interference (EMI) regulation standards. Maxim's active emissions limiting edge-rate control circuitry and spreadspectrum modulation reduce EMI emissions, while maintaining up to $93 \%$ efficiency.
Maxim's spread-spectrum modulation mode flattens wideband spectral components, while proprietary techniques ensure that the cycle-to-cycle variation of the switching period does not degrade audio reproduction or efficiency. The IC's spread-spectrum modulator randomly varies the switching frequency by $\pm 15 \mathrm{kHz}$ around the center frequency $(300 \mathrm{kHz})$. Above 10 MHz , the wideband spectrum looks like noise for EMI purposes (Figure 1).

## Speaker Current Limit

If the output current of the speaker amplifier exceeds the current limit (2A typ), the IC disables the outputs for approximately $100 \mu \mathrm{~s}$. At the end of $100 \mu \mathrm{~s}$, the outputs are reenabled. If the fault condition still exists, the IC continues to disable and reenable the outputs until the fault condition is removed.

Selectable Gain
The IC offers five programmable gains selected using the GAIN input.

Table 1. Gain Control Configuration

| GAIN PIN | MAXIMUM GAIN (dB) |
| :--- | :---: |
| Connect to PGND | 18 |
| Connect to PGND through <br> $100 \mathrm{k} \Omega$ <br> $5 \%$ resistor | 15 |
| Connect to PVDD | 12 |
| Connect to PVDD through <br> $100 k \Omega \pm 5 \%$ resistor | 9 |
| Unconnected | 6 |

Figure 1. EMI with 30 cm of Speaker Cable and No Output Filter

Shutdown
The IC features a low-power shutdown mode, drawing $\leq 0.1 \mu \mathrm{~A}$ (typ) of supply current. Drive SHDN low to place the MAX98303 into shutdown.

## Click-and-Pop Suppression

The IC speaker amplifier features Maxim's comprehensive click-and-pop suppression. During startup, the click-and-pop suppression circuitry reduces any audible transient sources internal to the device. When entering shutdown, the differential speaker outputs ramp down to PGND quickly and simultaneously.

## Stereo 3.1W Class D Amplifier

## Applications Information

## Filterless Class D Operation

Traditional Class D amplifiers require an output filter. The filter adds cost and size and decreases THD performance. The IC's filterless modulation scheme does not require an output filter.
Because the switching frequency of the IC is well beyond the bandwidth of most speakers, voice coil movement due to the switching frequency is very small. Use a speaker with a series inductance > 10رH. Typical $8 \Omega$ speakers exhibit series inductances in the $20 \mu \mathrm{H}$ to $100 \mu \mathrm{H}$ range.

## Component Selection <br> Power-Supply Input (PVDD)

PVDD powers the speaker amplifier. PVDD ranges from 2.6 V to 5.5 V . Bypass PVDD with $0.1 \mu \mathrm{~F}$ and $10 \mu \mathrm{~F}$ capacitors to PGND. Apply additional bulk capacitance at the device if long input traces between PVDD and the power source are used.

## Input Filtering

The input-coupling capacitor (CIN), in conjunction with the amplifier's internal input resistance (RIN), forms a highpass filter that removes the DC bias from the incoming signal. These capacitors allow the amplifier to bias the signal to an optimum DC level.
Assuming zero source impedance with a gain setting of $12 \mathrm{~dB}, 15 \mathrm{~dB}$, or $18 \mathrm{~dB}, \mathrm{CIN}$ is:

$$
\mathrm{C}_{\mathrm{IN}}=\frac{8}{f_{-3 \mathrm{~dB}}}[\mu \mathrm{~F}]
$$

with a gain setting of $9 \mathrm{~dB}, \mathrm{CIN}$ is:

$$
\mathrm{C}_{\mathrm{IN}}=\frac{5.7}{\mathrm{f}_{-3 \mathrm{~dB}}}[\mu \mathrm{~F}]
$$

with a gain setting of $6 \mathrm{~dB}, \mathrm{CIN}$ is:

$$
\mathrm{C}_{I N}=\frac{4}{f_{-3 \mathrm{~dB}}}[\mu F]
$$

where $\mathrm{f}-3 \mathrm{~dB}$ is the -3 dB corner frequency. Use capacitors with adequately low-voltage coefficients for best low-frequency THD performance.

## Layout and Grounding

Proper layout and grounding are essential for optimum performance. Good grounding improves audio performance and prevents switching noise from coupling into the audio signal.
Use wide, low-resistance output traces. As the load impedance decreases, the current drawn from the device increases. At higher current, the resistance of the output traces decrease the power delivered to the load. For example, if 2 W is delivered from the device output to a $4 \Omega$ load through $100 \mathrm{~m} \Omega$ of total speaker trace, 1.904 W is delivered to the speaker. If power is delivered through $10 \mathrm{~m} \Omega$ of total speaker trace, 1.99 W is delivered to the speaker. Wide output, supply, and ground traces also improve the power dissipation of the device.
The IC is inherently designed for excellent RF immunity. For best performance, add ground fills around all signal traces on top or bottom PCB planes.

## WLP Applications Information

For the latest application details on WLP construction, dimensions, tape carrier information, PCB techniques, bump-pad layout, and recommended reflow temperature profile, as well as the latest information on reliability testing results, refer to Application Note 1891: Wafer level packaging (WLP) and its applications. Figure 2 shows the dimensions of the WLP balls used on the IC.
