Evaluates: MAX9979

General Description

The MAX9979 evaluation kit (EV kit) is a fully assembled and tested PCB that evaluates the MAX9979 dualchannel pin electronic driver, comparator, load, and PMU with integrated level-setting DACs. It includes SMA connections for the high-speed digital I/Os and the MAX9979 pin driver outputs. It is connected to the computer through the universal serial bus (USB) port. It also includes Windows[®] 10-compatible software that provides a simple graphical user interface (GUI) for exercising the features of the MAX9979.

Component List

DESIGNATION	QTY	DESCRIPTION
C1–C7, C9–C14, C16, C17, C18	16	10nF ±10%, 25V X7R ceramic capacitors (0402) Murata GRM155R71E103K
C19	1	10μF ±10%, 25V X5R ceramic capacitor (1206) Murata GRM31CR61E106K
C20, C23, C24, C27, C28, C30, C31	7	0.1µF ±10%, 25V X7R ceramic capacitors (0603) Murata GRM188R71E104K
C21, C22, C25, C26, C29	5	1µF ±10%, 25V X7R ceramic capacitors (0805) Murata GRM21BR71E105K
C43, C54, C56	3	10μF ±20%, 16V X5R ceramic capacitors (1206) Murata GRM31CR61C106M

Features

- High Speed: 1.1Gbps at 1V_{P-P}
- Extremely Low Power Dissipation: 1.2W/Channel (Active Load Disabled)
- Wide Voltage Range: -1.5V to +6.5V and Up to 13V VHH
- Low-Leak Mode: 10nA (max)
- Integrated 16-Bit, Level-Setting DACs
- Programmable Cable-Droop Compensation
- Programmable Driver Output Impedance
- Programmable Slew-Rate Control for Driver Output
- Integrated Voltage Clamps
- Integrated 20mA Active Load
- Integrated Per-Pin PMU
- Heatsink Included for Safe Operation
- Windows 10 Compatible
- USB-PC Connection (Cable Included)
- Lead (Pb)-Free and RoHS Compliant
- Proven PCB Layout
- Fully Assembled and Tested

Quick Start

Required Equipment

Before beginning, the following equipment is needed:

- MAX9979 EV kit (USB cable included)
- A user-supplied Windows 10 compatible PC with a spare USB port
- +17.5V/0.5A DC power supply (VHH)
- -4.75V/0.5A DC power supply (VEE)
- Differential output pulse generator
- High-speed oscilloscope
- Digital multimeter

Note: In the following sections, software-related items are identified by bolding. Text in **bold** refers to items directly from the EV kit software.

Procedure

The MAX9979 EV kit is fully assembled and tested. Follow the steps below to verify board operation. **Caution: Do not turn on the power supplies until all connections are completed.**

- Visit <u>www.maximintegrated.com/evkitsoftware</u> to download the latest version of the EV kit software, MAX9979EVKIT Software. Save the EV kit software to a temporary folder.
- 2) Connect the EV kit to computer using USB cable.
- Install the EV kit software on your computer by running the MAX9979 EVKit Setup.exe program inside the temporary folder. The program files are copied and icons are created in the Windows.
- 4) Make sure the shunts of all jumpers are in the default positions, as shown in Table 2 and Table 3.
- 5) Verify that the heatsink is installed and flush on the top of the MAX9979 IC.
- 6) Verify the correct polarity, voltage, and current limit of all power supplies. Ensure all power supplies are disabled.
- Set the differential pulse generator to output ±100mV centered at +1.2V common-mode voltage. Ensure that the outputs are disabled (high impedance). Set the pulse frequency to 20MHz, 50% duty cycle.

- Connect the power supplies to the banana jacks of the MAX9979 EV kit. Connect all power-supply grounds to a single ground terminal.
- Connect the digital multimeter positive input to TP10, and the negative input to ground. Ensure that the multimeter is in DC-voltage measurement mode, either on auto range or a fixed range greater than 5V.
- Connect the differential pulse generator to the DATA0 and NDATA0 SMA connectors on the MAX9979 EV kit with SMA cables of equal length.
- Set the RCV0/NRCV0 to a differential logic-low (i.e., V_{RCV0} < V_{NRCV0}) to disable the high-impedance output mode.
- 12) Connect the DUT0 SMA connector of the MAX9979 EV kit with a short SMA cable to the high-speed oscilloscope. Set the scope input impedance to 50Ω.
- 13) Turn on the power supplies in the following order: VHH, VEE.
- 14) Enable the differential pulse generator.
- 15) Connect the USB cable from the PC to the EV kit board.
- 16) Start the MAX9979 EV kit software by double clicking the icon on the desktop. The EV kit software main window appears, as shown in Figure 1.
- 17) Put the EV kit into drive mode by clicking the Quick Start on the menu bar of the GUI, as shown in <u>Figure 2</u>. This is a quick start option and places both channel 0 and channel 1 into the drive-high mode. In this mode, VDH is set to 3V and VDL to 0V for both channels.
- 18) TP10 monitors the MAX9979 junction temperature. Verify that the multimeter does not read higher than +4.2V (T_J < +150°C).
- 19) Set the oscilloscope to 50Ω input-impedance mode.
- 20) Set the oscilloscope to trigger on the DUT0 channel, with the trigger level set to 0.5V. Set the time base to 20ns per division. A 0 to 3V square wave of 20MHz should appear on the oscilloscope.

Detailed Description of Software

User-Interface Panel

The GUI is organized into five-tab sheets for all level, register, and control signal settings, plus the **File** menu to save and load all these settings. There are identical DCL and PMU tab sheets for channels 0 and 1, respectively. **Registers** tab consists of all the user registers in the MAX9979.

Driver/Comparator/Load (DCL) Settings

Ch0 DCL and **Ch1 DCL** tab sheets (Figure 1 and Figure 3) are identical and are for channels 0 and 1, respectively. These tab sheets contain **Level Setting**, **Driver**, and **Control** group boxes. Click on **Write All** button to load the data into the MAX9979 through SPI interface.

Level Setting DACs

The **Level Setting** group box contains registers for signal level for **VDH**, **VDL**, **VDT**, **VCH**, **VCL**, **VCPH**, **VCPL**, **VCOM**, **VLDH**, and **VLDL** level settings. Each voltage level can be set by entering value either in Voltage box or hexadecimal box. Finer adjustment can be made by clicking on the +/- sign of the **Voltage** box, which has 65,536 steps corresponding to 16 bits. The value can also be typed into the edit boxes inside the **Voltage** group box. Click on **Write All** to load the data into the MAX9979. For all DACs, the calibration window is available in the **Options** menu. Select **Change Calibration (Advance Users)**. The offset code is an integer value between 0 and 255, and the gain code is an integer value between 0 and 63, as shown in <u>Figure 6</u>.

Driver and Control Settings

Driver and Control group boxes are combination of Driver, Slew Rate Control, Cable Droop Compensation, Comparator Hysteresis, Adjustable Output Impedance and Load Control Settings. Driver output is chosen either automatically or manually by the slide bar in the **Driver** group box. In automatic mode, Driver output is selected from the **Output** drop-down box. In manual mode, Driver output is selected based on the control group box settings. Adjustable Driver Output Resistance is controlled by the **Driver RO Control** drop-down box. Driver output slew rate and CDRP is controlled by the **Slew Rate** and the **Cable Droop Compensation** drop-down boxes respectively.

Figure 7. MAX9979 EV Kit Software Main Window (Registers Tab)

Registers Tab

There are two methods for configuring the MAX9979 device. The first method is through the graphical user interface as shown in <u>Figure 2</u>. The second method is through the **Registers** tab as shown in <u>Figure 7</u>. The **Registers** tab allows execution of serial commands manually. It can also be used as a debug tool because it is capable of writing to every register of the MAX9979.

Driver/Comparator/Load (DCL) Settings

Tab sheets (<u>Figure 1</u> and <u>Figure 3</u>) are identical and are for channels 0 and 1, respectively. These tab sheets contain group boxes. The value can also be typed into the edit boxes inside the **Voltage** group box.

Detailed Description of Hardware

The MAX9979 evaluation kit (EV kit) is a fully assembled and tested PCB that evaluates the MAX9979 dual-channel pin electronic driver, comparator, load, and PMU with integrated level-setting DACs. It includes SMA connections for the high-speed digital I/Os and the MAX9979 pin driver outputs. It is connected to the computer through the universal serial bus (USB) port.

Power Supplies

Connect the power supplies using the high-current banana jacks, J22 (-4.75V), and J23 (17.5V). Common for all the power supplies should be the GND banana jack on the MAX9979 EV kit. All power supplies should be within the range specified in the MAX9979 IC data sheet. The MAX9979 needs only two supplies to be attached to the board; all other supplies are generated through regulators on the EV kit board.

High-Speed Digital I/Os

The top edge and the bottom edge of the PCB are populated with end-launch SMA connectors, and are the high-speed digital I/Os of the MAX9979. The inputs are terminated internally to the MAX9979 IC. The outputs require termination (nominally 50Ω) at the end of the attached cable.

The board power supply (VTRM) is the voltage used to terminate the comparator outputs on the MAX9979 IC. Setting VTRM to +1.2V makes the high-speed digital I/Os compatible with LVDS levels.

The high-speed digital inputs (DATA0/NDATA0, RCV0/ NRCV0, DATA1/NDATA1, and RCV1/NRCV1) are intended for use with a high-speed differential signal source such as LVDS, LVPECL, ECL, etc. If only a single-ended stimulus source is available, a converter consisting of a 1:1 ratio transformer (balun) can be used to produce a differential pair of inputs for DATA0/NDATA0 or DATA1/NDATA1. A three-resistor network can be used to

Table 1. Test Points and Their Functions

produce a differential logic level for RCV0/NRCV0 or RCV1/NRCV1 inputs.

The high-speed digital outputs (CL0/NCL0, CH0/NCH0, CL1/NCL1, and CH1/NCH1) are intended for use with a high-speed differential logic analyzer. These outputs are internally pulled up to the VTRM voltage through internal 50Ω resistors. These outputs can be double terminated at the measurement source by external 50Ω resistors.

Pin Driver Outputs

The dual-pin driver outputs or DCLP IO pins (DUT0 and DUT1) are through end-launch SMA connectors on the right edge of the PCB. The outputs have a typical output impedance of 50Ω , which can be adjusted by software.

Test Points

There are 23 test points on the EV kit to facilitate performance analysis and circuit modification. The test points are listed in Table 1.

TEST POINT	SIGNAL	FUNCTION	
TP1	MEAS0	PMU analog output for channel 0	
TP2	DUTHI0	PMU comparator high output for channel 0	
TP3	DUTLO0	PMU comparator low output for channel 0

TP23	RST	Serial reset	

Device Ground Sense

The MAX9979 IC has the ability to sense the ground potential at the device under test (DUT). The MAX9979 EV kit is preconfigured to have the device ground sense pin (DGS) connected to the ground plane through a 0 Ω resistor (R9). If remote sensing is desired, remove R9 and connect TP5 to the remote DUT ground.

Temperature Sensing

The MAX9979 EV kit provides the means to determine the MAX9979 IC's die temperature through TP10. During operation, TP10 should be continuously monitored to ensure that the junction temperature does not exceed +150°C, which corresponds with +4.2V. During normal operation, a voltage of 3V to 3.6V is typical.

Jumper Settings

Table 2 and Table 3 provide a list for jumper settings.

Table 2. Digital Interface Jumper Settings (JU1–JU12)

JUMPER	SHUNT POSITION	DESCRIPTION		
JU1	1-2*	Connects the DOUT pin of the MAX9979 to the on-board MAXQ2000 microcontroller through a level translator		
	2-3	Connects the external DOUT signal to the J21-1 pin of the J21 connector		
JU2	1-2*	Connects the DIN pin of the MAX9979 to the on-board MAXQ2000 microcontroller through a level translator		
	2-3	Connects the external DIN signal to the J21-3 pin of the J21 connector		
JU3	1-2*	Connects the SCLK pin of the MAX9979 to the on-board MAXQ2000 microcontroller through a level translator		
	2-3	Connects the external SCLK signal to the J21-5 pin of the J21 connector		
JU4	1-2*	Connects the $\overline{\text{CS}}$ pin of the MAX9979 to the on-board MAXQ2000 microcontroller through a level translator		
	2-3	Connects the external $\overline{\text{CS}}$ signal to the J21-7 pin of the J21 connector		
JU5	1-2*	Connects the LOAD pin of the MAX9979 to the on-board MAXQ2000 microcontroller through a level translator		
	2-3	Connects the external LOAD signal to the J21-9 pin of the J21 connector		
JU6	1-2*	Connects the VHHEN0 pin of the MAX9979 to the on-board MAXQ2000 microcontroller through a level translator		
	2-3	Connects the external VHHEN0 signal to the J21-11 pin of the J21 connector		
JU7	1-2*	Connects the VHHEN1 pin of the MAX9979 to the on-board MAXQ2000 microcontroller through a leve translator		
	2-3	Connects the external VHHEN1 signal to the J21-13 pin of the J21 connector		
JU8	1-2*	Connects the LLEAKP0 pin of the MAX9979 to the on-board MAXQ2000 microcontroller through a level translator		
	2-3	Connects the external LEAKPO signal to the J21-15 pin of the J21 connector		

JUMPER	SHUNT POSITION	DESCRIPTION		
JU9	1-2*	Connects the LLEAKP1 pin of the MAX9979 to the on-board MAXQ2000 microcontroller through a level translator		
	2-3	Connects the external LLEAKP1 signal to the J21-17 pin of the J21 connector		
JU10	1-2*	Connects the HIZMEASP0 pin of the MAX9979 to the on-board MAXQ2000 microcontroller through a level translator		
	2-3	Connects the external HIZMEASP0 signal to the J21-19 pin of the J21 connector		
JU11	1-2*	Connects the HIZMEASP1 pin of the MAX9979 to the on-board MAXQ2000 microcontroller through a level translator		
	2-3	Connects the external HIZMEASP1 signal to the J21-21 pin of the J21 connector		
JU12	1-2*	Connects the RST pin of the MAX9979 to the on-board MAXQ2000 microcontroller through a level translator		
	2-3	Connects the external RST signal to the J21-23 pin of the J21 connector		

Table 2. Digital Interface Jumper Settings (JU1–JU12) (continued)

*Default position.

Table 3. Power Supplies Jumper Settings (JU14–JU22)

JUMPER	SHUNT POSITION	DESCRIPTION	
JU14	1-2*	Connects the ADJ pin of the regulator (U16) to ground	
	Open	Disconnects the ADJ pin of the regulator from ground	
JU15	1-2	Connects the ADJ pin of the regulator (U16) to ground through a 147 Ω resistor (R25)	
	Open*	Disconnects the ADJ pin of the regulator from R25	
JU16	1-2	Connects the ADJ pin of the regulator (U16) to ground through a 301Ω resistor (R26)	
	Open*	Disconnects the ADJ pin of the regulator from R26	
JU17	1-2*	Jumper shorted by trace and connects the ADJ pin of the regulator (U16) to ground through a 475Ω resistor	
	Open	Jumper shorted by trace and connects the ADJ pin of the regulator (U16) to ground through a 475Ω resistor	
JU18	1-2*	Connects VHH to the positive power-supply input jack	
	Open	Disconnect VHH from the positive input power supply	
JU19	1-2*	Connects VCC to the on-board regulator (U14)	
	Open	Disconnects VCC from the on-board regulator (U14)	
JU20	1-2*	Connects VDD to the on-board regulator (U15)	
	Open	Disconnects VDD from the on-board regulator (U15)	
JU21	1-2*	Connects VTRM to the on-board regulator (U16)	
	Open	Disconnects VTRM from the on-board regulator (U16)	
JU22	1-2*	Connects VEE to the negative power-supply input jack	
	Open	Disconnect VEE from the negative input power supply	

*Default position.

Revision History

REVISION NUMBER	REVISION DATE	DESCRIPTION	PAGES CHANGED
0	12/08	Initial release	—
1	1/20	Updated <i>General Description</i> and <i>Features</i> section, removed <i>Component Suppliers</i> table and <i>MAX9979 EV Kit files</i> table, updated <i>Required Equipment</i> under <i>Quick Start</i> section, added a new number list and updated <i>Procedure</i> section, replaced figures 1 through 6, updated <i>Detailed Description of Software</i> section	1–9
2	10/20	Updated Component List	2
