

SP506

5V Single Chip WAN Multi-Mode Serial Transceiver

- +5V Only Operation
- Seven (7) Drivers and Seven (7) Receivers
- Driver and Receiver Tri-state Control
- Internal Transceiver Termination Resistors for V.11 and V.35 Protocols
- Loopback Self-Test Mode
- Software Selectable Protocol
- Interface Modes Supported:
 - RS-232 (V.28) • X.21/RS-422 (V.11)
 - EIA-530 (V.10 & V.11) • EIA-530A (V.10 & V.11)
 - RS-449 (V.10 & V.11) • V.35 (V.35 & V.28)
 - V.36 (V.10 & V.11) • RS-485 (un-terminated V.11)
- Improved ESD Tolerance for Analog I/Os
- Highest Differential Transmission Rates at over 20Mbps
- Compliant to NET1/2 and TBR2 Physical Layer Requirements
- Used in WAN Serial Ports in Routers, Switches, DSU/CSU's and other Access Devices

DESCRIPTION

The SP506 is a monolithic IC that supports eight (8) popular serial interface standards for DTE to DCE connectivity. The SP506 is pin-to-pin compatible to our SP505 multi-protocol transceiver but with faster throughput. The seven (7) drivers and seven (7) receivers can transmit and receive signals at 20Mbps. As with SP505, the SP506 requires no additional external components for compliant operation for all of the eight (8) modes of operation. All necessary termination is integrated within the SP506 and is switchable when V.35 drivers, V.35 receivers, and V.11 receivers are used. The SP506 can operate as either a DTE or DCE.

Additional features with the SP506 include internal loopback that can be initiated in either single-ended or differential modes. While in loopback mode, driver outputs are internally connected to receiver inputs creating an internal signal path convenient for diagnostic testing. This eliminates the need for an external loopback plug. The SP506 also includes a latch enable pin with the driver and receiver address decoder. Tri-state ability for the driver and receiver outputs is controlled by supplying a 4-bit word into the address decoder. Seven (7) drivers and one (1) receiver in the SP506 include separate enable pins for added convenience.

ABSOLUTE MAXIMUM RATINGS

These are stress ratings only and functional operation of the device at these ratings or any other above those indicated in the operation sections of the specifications below is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

V _{CC}	+7V
Input Voltages:	
Logic.....	-0.3V to (V _{CC} +0.5V)
Drivers.....	-0.3V to (V _{CC} +0.5V)
Receivers.....	±15.5V
Output Voltages:	
Logic.....	-0.3V to (V _{CC} +0.5V)
Drivers.....	±15V
Receivers.....	-0.3V to (V _{CC} +0.5V)
Storage Temperature.....	-65°C to +150°C
Power Dissipation per package - 80-pin QFP (derate 18.3mW°C above +70°C).....	1500mW

STORAGE CONSIDERATIONS

Due to the relatively large package size of the 80-pin quad flat-pack, storage in a low humidity environment is preferred. Large high density plastic packages are moisture sensitive and should be stored in Dry Vapor Barrier Bags. Prior to usage, the parts should remain bagged and stored below 40°C and 60%RH. If the parts are removed from the bag, they should be used within 48 hours or stored in an environment at or below 20%RH. If the above conditions cannot be followed, the parts should be baked for four hours at 125°C in order to remove moisture prior to soldering. Exar ships the 80-pin QFP in Dry Vapor Barrier Bags with a humidity indicator card and desiccant pack. The humidity indicator should be below 30%RH.

ELECTRICAL CHARACTERISTICS

T_A = +25°C and V_{CC} = +4.75V to +5.25V unless otherwise noted.

PARAMETER	MIN	TYP	MAX	UNITS	CONDITIONS
LOGIC INPUTS					
V _{IL}			0.8	Volts	
V _{IH}	2.0			Volts	
LOGIC OUTPUTS					
V _{OL}			0.4	Volts	I _{OUT} = -3.2mA
V _{OH}	2.4			Volts	I _{OUT} = 1.0mA
V.28 DRIVER OUTPUT DC PARAMETERS					
Open Circuit Voltage			+/-15	Volts	Per Figure 1
Loaded Voltage	+/-5.0		+/-15	Volts	Per Figure 2
Short-Circuit Current			+/-100	mA	Per Figure 4
Power-Off Impedance	300			Ω	Per Figure 5
V.28 DRIVER OUTPUT AC PARAMETERS (V_{CC} = +5V for AC Parameters)					
Transition Time			1.5	μs	Per Figure 6; +3V to -3V
Instantaneous Slew Rate			30	V/ μs	Per Figure 3
Propagation Delay t _{PHL}	0.5	1	5	μs	
Propagation Delay t _{PLH}	0.5	1	5	μs	
Max. Transmission Rate	120	230		kbps	
V.28 RECEIVER INPUT DC PARAMETERS					
Input impedance	3		7	kΩ	Per Figure 7
Open-Circuit Bias			+2.0	Volts	Per Figure 8
HIGH Threshold		1.7	3.0	Volts	
LOW Threshold	0.8	1.2		Volts	

ELECTRICAL CHARACTERISTICS

$T_A = +25^\circ\text{C}$ and $V_{CC} = +4.75\text{V}$ to $+5.25\text{V}$ unless otherwise noted.

PARAMETER	MIN.	TYP.	MAX.	UNITS	CONDITIONS
V.28 RECEIVER AC PARAMETERS ($V_{CC} = +5\text{V}$ for AC Parameters)					
Propagation Delay t_{PHL}	50	100	500	ns	
Propagation Delay t_{PLH}	50	100	500	ns	
Max Transmission Rate	120	230		kbps	
V.10 DRIVER OUTPUT DC PARAMETERS					
Open Circuit Voltage	+/-4.0		+/-6.0	Volts	Per Figure 9
Test Terminated Voltage	0.9V _{CC}			Volts	Per Figure 10
Short-Circuit Current			+/-150	mA	Per Figure 11
Power-Off Current			+/-100	mA	Per Figure 12
V.10 DRIVER AC PARAMETERS ($V_{CC} = +5\text{V}$ for AC Parameters)					
Transition Time			200	ns	Per Figure 13; 10% to 90%
Propagation Delay t_{PHL}	50	100	500	ns	
Propagation Delay t_{PLH}	50	100	500	ns	
Max Transmission Rate	120	230		kbps	
V.10 RECEIVER INPUT DC PARAMETERS					
Input Current	-3.25		+3.25	mA	Per Figures 14 and 15
Input Impedance	4			k Ω	
Sensitivity			+/-0.3	Volts	
V.10 RECEIVER AC PARAMETERS ($V_{CC} = +5\text{V}$ for AC Parameters)					
Propagation Delay t_{PHL}	50	120	250	ns	
Propagation Delay t_{PLH}	50	120	250	ns	
Max Transmission Rate	120			kbps	
V.11 DRIVER OUTPUT DC PARAMETERS					
Open Circuit Voltage			+/-5.0	Volts	Per Figure 16
Test Terminated Voltage	+/-2.0			Volts	Per Figure 17
	0.5V _{OC}		0.67V _{OC}	Volts	Per Figure 17
Balance			+/-0.4	Volts	Per Figure 17
Offset			+3.0	Volts	Per Figure 17
Short-Circuit Current			+/-150	mA	Per Figure 18
Power-Off Current			+/-100	μA	Per Figure 19
V.11 DRIVER OUTPUT AC PARAMETERS ($V_{CC} = +5\text{V}$ for AC Parameters)					
Transition Time			20	ns	Per Figures 21 and 36; 10% to 90%
Propagation Delay t_{PHL}	50	65	85	ns	Per Figures 33 and 36; $C_L = 50\text{pF}$
Propagation Delay t_{PLH}	50	65	85	ns	Per Figures 33 and 36; $C_L = 50\text{pF}$
Differential Skew		10	20	ns	Per Figures 33 and 36; $C_L = 50\text{pF}$
Max. Transmission Rate	20			Mbps	Per Figure 33; $C_L = 50\text{pF}$, $f_{IN} = 10\text{MHz}$

ELECTRICAL CHARACTERISTICS

$T_A = +25^\circ\text{C}$ and $V_{CC} = +4.75\text{V}$ to $+5.25\text{V}$ unless otherwise noted.

PARAMETER	MIN	TYP	MAX	UNITS	CONDITIONS
V.11 RECEIVER INPUT DC PARAMETERS					
Common Mode Range	-7		+7	Volts	
Sensitivity			+/-0.3	Volts	
Input Current	-3.25		+3.25	mA	Per Figures 20 and 22
Current w/ 100Ω Termination			+/-60.75	mA	Per Figures 23 and 24
Input Impedance	4			kΩ	
V.11 RECEIVER INPUT AC PARAMETERS (V_{CC} = +5V for AC Parameters)					
Propagation Delay t_{PHL}	30	65	85	ns	Per Figures 33 and 38; $C_L = 50\text{pF}$
Propagation Delay t_{PLH}	30	65	85	ns	Per Figures 33 and 38; $C_L = 50\text{pF}$
Differential Skew		10		ns	Per Figures 33; $C_L = 50\text{pF}$
Max. Transmission Rate	20			Mbps	Per Figure 33; $C_L = 50\text{pF}$, $f_{IN} = 10\text{MHz}$
V.35 DRIVER OUTPUT DC PARAMETERS					
Open Circuit Voltage			+/-1.20	Volts	Per Figure 16
Test Terminated Voltage	+/-0.44		+/-0.66	Volts	Per Figure 25
Offset			+/-0.6	Volts	Per Figure 25
Source Impedance	50		150	Ω	Per Figure 27; $Z_S = V_2/V_1 \times 50 \Omega$
Short Circuit Impedance	135		165	Ω	Per Figure 28
V.35 DRIVER OUTPUT AC PARAMETERS (V_{CC} = +5V for AC Parameters)					
Transition Time		30	40	ns	Per Figure 29; 10% to 90%
Propagation Delay t_{PHL}	50	70	90	ns	Per Figures 33 and 36; $C_L = 20\text{pF}$
Propagation Delay t_{PLH}	50	70	90	ns	Per Figures 33 and 36; $C_L = 20\text{pF}$
Differential Skew		7	10	ns	Per Figure 33 and 36; $C_L = 20\text{pF}$
Max. Transmission Rate	20			Mbps	Per Figure 33; $C_L = 20\text{pF}$, $f_{IN} = 10\text{MHz}$
V.35 RECEIVER INPUT DC PARAMETERS					
Sensitivity		+/-80		mV	
Source Impedance	90		110	Ω	Per Figure 30; $Z_S = V_2/V_1 \times 50 \Omega$
Short Circuit Impedance	135		165	Ω	Per Figure 31
V.35 RECEIVER INPUT AC PARAMETERS (V_{CC} = +5V for AC Parameters)					
Propagation Delay t_{PHL}	30	75	90	ns	Per Figures 33 and 38; $C_L = 20\text{pF}$
Propagation Delay t_{PLH}	30	75	90	ns	Per Figures 33 and 38; $C_L = 20\text{pF}$
Differential Skew		10		ns	Per Figures 33; $C_L = 20\text{pF}$
Max. Transmission Rate	20			Mbps	Per Figure 33; $C_L = 20\text{pF}$, $f_{IN} = 10\text{MHz}$

PINOUT...

PIN ASSIGNMENTS...

CLOCK AND DATA GROUP

Pin 1 — RxD — Receive Data; TTL output, sourced from RD(a) and RD(b) inputs.

Pin 14 — TxD — TTL input ; transmit data source for SD(a) and SD(b) outputs.

Pin 15 — TxCl — Transmit Clock; TTL input for TT driver outputs.

Pin 20 — RxC — Receive Clock; TTL output sourced from RT(a) and RT(b) inputs.

Pin 22 — ST — Send Timing; TTL input; source for ST(a) and ST(b) outputs.

Pin 37 — RT(a) — Receive Timing; analog input, inverted; source for RxC.

Pin 38 — RT(b) — Receive Timing; analog input, non-inverted; source for RxC.

Pin 42 — ST(a) — Send Timing; analog output, inverted; sourced from ST.

Pin 44 — ST(b) — Send Timing; analog output, non-inverted; sourced from ST.

Pin 59 — SD(b) — Analog Out — Send data, non-inverted; sourced from TxD.

Pin 61 — SD(a) — Analog Out — Send data, inverted; sourced from TxD.

Pin 63 — TT(a) — Analog Out — Terminal Timing, inverted; sourced from TxCl

Pin 65 — TT(b) — Analog Out — Terminal Timing, non-inverted; sourced from TxCl

Pin 70 — RD(a) — Receive Data, analog input; inverted; source for RxD.

Pin 71 — RD(b) — Receive Data; analog input; non-inverted; source for RxD.

Pin 76 — SCT(a) — Serial Clock Transmit; analog input, inverted; source for SCT.

Pin 77 — SCT(b) — Serial Clock Transmit; analog input, non-inverted; source for SCT

Pin 79 — SCT — Serial Clock Transmit; TTL output; sources from SCT(a) and SCT(b) inputs.

CONTROL LINE GROUP

Pin 13 — DTR — Data Terminal Ready; TTL input; source for TR(a) and TR(b) outputs.

Pin 16 — RTS — Ready To Send; TTL input; source for RS(a) and RS(b) outputs.

Pin 17 — RL — Remote Loopback; TTL input; source for RL(a) and RL(b) outputs.

Pin 19 — DCD — Data Carrier Detect; TTL output; sourced from RR(a) and RR(b) inputs.

Pin 21 — RI — Ring In; TTL output; sourced from IC(a) and IC(b) inputs.

Pin 24 — LL — Local Loopback; TTL input; source for LL(a) and LL(b) outputs.

Pin 35 — RR(a) — Receiver Ready; analog input, inverted; source for DCD.

Pin 36 — RR(b) — Receiver Ready; analog input, non-inverted; source for DCD.

Pin 39 — IC(a) — Incoming Call; analog input, inverted; source for RI.

Pin 40 — IC(b) — Incoming Call; analog input, non-inverted; source for RI.

Pin 45 — $\overline{\text{RL}}(\text{b})$ — Remote Loopback; analog output, non-inverted; sourced from RL.

Pin 47 — $\overline{\text{RL}}(\text{a})$ — Remote Loopback; analog output inverted; sourced from RL.

Pin 49 — $\overline{\text{LL}}(\text{b})$ — Local Loopback; analog output, non-inverted; sourced from LL.

Pin 51 — $\overline{\text{LL}}(\text{a})$ — Local Loopback; analog output, inverted; sourced from LL.

Pin 52 — $\overline{\text{RS}}(\text{b})$ — Ready To Send; analog output, non-inverted; sourced from RTS.

Pin 54 — $\overline{\text{RS}}(\text{a})$ — Ready To Send; analog output, inverted; sourced from RTS.

Pin 56 — $\overline{\text{TR}}(\text{b})$ — Terminal Ready; analog output, non-inverted; sourced from DTR.

Pin 58 — $\overline{\text{TR}}(\text{a})$ — Terminal Ready; analog output, inverted; sourced from DTR.

Pin 66 — $\overline{\text{CS}}(\text{a})$ — Clear To Send; analog input, inverted; source for CTS.

Pin 67 — $\overline{\text{CS}}(\text{b})$ — Clear To Send; analog input, non-inverted; source for CTS.

Pin 68 — $\overline{\text{DM}}(\text{a})$ — Data Mode; analog input, inverted; source for DSR.

Pin 69 — $\overline{\text{DM}}(\text{b})$ — Data Mode; analog input, non-inverted; source for DSR

Pin 78 — $\overline{\text{DSR}}$ — Data Set Ready; TTL output; sourced from $\overline{\text{DM}}(\text{a})$, $\overline{\text{DM}}(\text{b})$ inputs.

Pin 80 — $\overline{\text{CTS}}$ — Clear To Send; TTL output; sourced from $\overline{\text{CS}}(\text{a})$ and $\overline{\text{CS}}(\text{b})$ inputs.

CONTROL REGISTERS

Pins 2 — $\overline{\text{SDEN}}$ — Enables TxD driver, active low; TTL input.

Pins 3 — $\overline{\text{TREN}}$ — Enables DTR driver, active low; TTL input.

Pins 4 — $\overline{\text{RSEN}}$ — Enables RTS driver, active low; TTL input.

Pins 5 — $\overline{\text{LLEN}}$ — Enables LL driver, active low; TTL input.

Pin 6 — $\overline{\text{TTEN}}$ — Enables TT driver, active low; TTL input.

Pin 7 — $\overline{\text{SCTEN}}$ — Enables SCT receiver; active high; TTL input.

Pin 8 — $\overline{\text{LATCH}}$ — Latch control for decoder bits (pins 9-12), active low. Logic high input will make decoder transparent.

Pins 12–9 — $\overline{\text{DEC}}_0$ – $\overline{\text{DEC}}_3$ — Transmitter and receiver decode register; configures transmitter and receiver modes; TTL inputs.

Pin 18 — $\overline{\text{RLEN}}$ — Enables RL driver; active low; TTL input.

Pin 23 — $\overline{\text{STEN}}$ — Enables ST driver; active low; TTL input.

POWER SUPPLIES

Pins 25, 33, 41, 48, 55, 62, 73, 74 — V_{CC} — +5V input.

Pins 29, 34, 43, 46, 50, 53, 57, 60, 64, 72, 75 — GND — Ground.

Pin 27 — V_{DD} +10V Charge Pump Capacitor — Connects from V_{DD} to V_{CC} . Suggested capacitor size is 22 μF , 16V.

Pin 32 — V_{SS} -10V Charge Pump Capacitor — Connects from ground to V_{SS} . Suggested capacitor size is 22 μF , 16V.

Pins 26 and 30 — C_1^+ and C_1^- — Charge Pump Capacitor — Connects from C_1^+ to C_1^- . Suggested capacitor size is 22 μF , 16V.

Pins 28 and 31 — C_2^+ and C_2^- — Charge Pump Capacitor — Connects from C_2^+ to C_2^- . Suggested capacitor size is 22 μF , 16V.

FEATURES...

The SP506 is a highly integrated serial transceiver that allows software control of its interface modes. Similar to the SP504, the SP506 offers the same hardware interface modes for RS-232 (V.28), RS-422A (V.11), RS-449, RS-485, V.35, EIA-530 and includes V.36 and EIA-530A. The interface mode selection is done via a 4-bit switch for the drivers and receivers. The SP506 is fabricated using low-power BiCMOS process technology, and incorporates a Exar-patented (5,306,954) charge pump allowing +5V only operation. Each device is packaged in an 80-pin JEDEC Quad FlatPack package.

The SP506 is ideally suited for wide area network connectivity based on the interface modes offered and the driver and receiver configurations. The SP506 has seven (7) independent drivers and seven (7) independent receivers. In V.35 mode, the SP506 includes the necessary components and termination resistors internal within the device for compliant V.35 operation.

THEORY OF OPERATION

The SP506 is made up of five separate circuit blocks — the charge pump, drivers, receivers, decoder and switching array. Each of these circuit blocks is described in more detail below.

Charge-Pump

The SP506 charge pump is based on the SP504 design where Exar's patented charge pump design (5,306,954) uses a four-phase voltage shifting technique to attain symmetrical 10V power supplies. The charge pump still requires external capacitors to store the charge. In addition the SP506 charge pump supplies $\pm 10V$ or $\pm 5V$ on V_{SS} and V_{DD} depending on the mode of operation. There is a free-running oscillator that controls the four phases of the voltage shifting. A description of each phase follows.

The SP506 charge pump is used for RS-232 where the output voltage swing is typically $\pm 10V$ and also used for RS-423. However, RS-423 requires the voltage swing on the driver output be between

$+4V$ to $+6V$ during an open-circuit (no load). The charge pump would need to be regulated down from $\pm 10V$ to $\pm 5V$. A typical $\pm 10V$ charge pump would require external clamping such as 5V zener diodes on V_{DD} and V_{SS} to ground. The $\pm 5V$ output has symmetrical levels as in the $\pm 10V$ output. The $\pm 5V$ is used in the following modes where RS-423 (V.10) are used: RS-449, EIA-530, EIA-530A and V.36.

Phase 1 ($\pm 10V$)

— V_{SS} charge storage — During this phase of the clock cycle, the positive side of capacitors C_1 and C_2 are initially charged to +5V. C_1^+ is then switched to ground and the charge on C_1^- is transferred to C_2^- . Since C_2^+ is connected to +5V, the voltage potential across capacitor C_2 is now 10V.

Phase 1 ($\pm 5V$)

— V_{SS} & V_{DD} charge storage and transfer — With the C_1 and C_2 capacitors initially charged to +5V, C_1^+ is then switched to ground and the charge on C_1^- is transferred to the V_{SS} storage capacitor. Simultaneously the C_2^- is switched to ground and 5V charge on C_2^+ is transferred to the V_{DD} storage capacitor.

Figure 45. Charge Pump Phase 1 for $\pm 10V$.

Figure 46. Charge Pump Phase 1 for $\pm 5V$.

Phase 2 ($\pm 10V$)

— V_{SS} transfer — Phase two of the clock connects the negative terminal of C_2 to the V_{SS} storage capacitor, and the positive terminal of C_2 to ground, and transfers the generated $-10V$ or the generated $-5V$ to C_3 . Simultaneously, the positive side of capacitor C_1 is switched to $+5V$ and the negative side is connected to ground.

Phase 2 ($\pm 5V$)

— V_{SS} & V_{DD} charge storage — C_1^+ is reconnected to V_{CC} to recharge the C_1 capacitor. C_2^+ is switched to ground and C_2^- is connected to C_3 . The $5V$ charge from Phase 1 is now transferred to the V_{SS} storage capacitor. V_{SS} receives a continuous charge from either C_1 or C_2 . With the C_1 capacitor charged to $5V$, the cycle begins again.

Phase 3

— V_{DD} charge storage — The third phase of the clock is identical to the first phase — the charge transferred in C_1 produces $-5V$ in the negative terminal of C_1 , which is applied to the negative side of capacitor C_2 . Since C_2^+ is at $+5V$, the voltage potential across C_2 is $10V$. For the $5V$ output, C_2^+ is connected to ground so that the potential on C_2 is only $+5V$.

Phase 4

— V_{DD} transfer — The fourth phase of the clock connects the negative terminal of C_2 to ground and transfers the generated $10V$ or the generated $5V$ across C_2 to C_4 , the V_{DD} storage capacitor. Again, simultaneously with this, the positive side of capacitor C_1 is switched to $+5V$ and the negative side is connected to ground, and the cycle begins again.

Since both V_{DD} and V_{SS} are separately generated from V_{CC} in a no-load condition, V_{DD} and V_{SS} will be symmetrical. Older charge pump approaches that generate V^- from V^+ will show a decrease in the magnitude of V^- compared to V^+ due to the inherent inefficiencies in the design.

The clock rate for the charge pump typically operates at $15kHz$. The external capacitors must be a minimum of $22\mu F$ with a $16V$ breakdown rating.

External Power Supplies

For applications that do not require $+5V$ only, external supplies can be applied at the V^+ and V^- pins. The value of the external supply voltages must be no greater than $\pm 10.5V$. The tolerance should be $\pm 5\%$ from $\pm 10V$. The current drain for the supplies is used for RS-232 and RS-423 drivers. For the RS-232 driver, the current requirement will be $3.5mA$ per driver. The RS-423 driver worst case current drain will be $11mA$ per driver. Power sequencing is required for the SP506. The supplies must be sequenced accordingly: $+10V$, $+5V$ and $-10V$. It is important to prevent V_{SS} from starting up before V_{CC} or V_{DD} .

Figure 49. Charge Pump Phase 3.

Figure 50. Charge Pump Phase 4.

Drivers

The SP506 has seven (7) enhanced independent drivers. Control for the mode selection is done via a four-bit control word. The drivers are prearranged such that for each mode of operation, the relative position and functionality of the drivers are set up to accommodate the selected interface mode. As the mode of the drivers is changed, the electrical characteristics will change to support the requirements of clock, data, and control line signal levels. Table 1 shows the mode of each driver in the different interface modes that can be selected.

There are four basic types of driver circuits — V.28, V.11, V.10 and V.35.

V.28 Drivers

The V.28 drivers output single-ended signals with a minimum of $\pm 5V$ (with $3k\Omega$ & $2500pF$ loading), and can operate to at least $120kbps$ under full load. Since the SP506 uses a charge pump to generate the RS-232 output rails, the driver outputs will never exceed $\pm 10V$. The V.28 drivers are used in RS-232 mode for all signals, and also in V.35 mode where four (4) drivers are used as the control line signals (DTR, RTS, LL, and RL).

V.10 Drivers

The V.10 (RS-423) drivers are also single-ended signals which produce open circuit V_{OL} and V_{OH} measurements of $\pm 4.0V$ to $\pm 6.0V$. When terminated with a 450Ω load to ground, the driver output will not deviate more than 10% of the open circuit value. This is in compliance of the ITU V.10 specification. The V.10 drivers are used in RS-449, EIA-530, EIA-530A and V.36 modes as Category II signals from each of their corresponding specifications.

V.11 Drivers

The third type of driver is a V.11 (RS-422) type differential driver. Due to the nature of differential signaling, the drivers are more immune to noise as opposed to single-ended transmission methods. The advantage is evident over high speeds and long transmission lines. The strength of the driver outputs can produce differential signals that can maintain typically $\pm 2.2V$ differential output levels with

a load of 100Ω . The signal levels and drive capability of these drivers allow the drivers to also support RS-485 requirements of $\pm 1.5V$ minimum differential output levels with a 54Ω load. The driver is designed to operate over a common mode range of $+12V$ to $-7V$, which follows the RS-485 specification. This also covers the $+7V$ to $-7V$ common mode range for V.11 (RS-422) requirements. The V.11 drivers are used in RS-449, EIA-530, EIA-530A and V.36 modes as Category I signals which are used for clock and data signals.

V.35 Drivers

The fourth type of driver is the V.35 driver. These drivers were specifically designed to comply with the requirements of V.35. Unique to the industry, the Exar V.35 driver architecture used in the SP506 does not need external termination resistors to operate and comply with V.35. This simplifies existing V.35 implementations that use external termination schemes. The V.35 drivers can produce $\pm 0.55V$ driver output signals with minimum deviation (maximum 20%) given an equivalent load of 100Ω . With the help of internal resistor networks, the drivers achieve the 50Ω to 150Ω source impedance and the 135Ω to 165Ω short-circuit impedance for V.35. The V.35 driver is disabled and transparent when the decoder is in all other modes. All of the differential drivers; V.11 (RS-422) and V.35, can operate over $20Mbps$.

Driver Enable and Input

All the drivers in the SP506 contain individual enable lines which can tri-state the driver outputs when a logic "1" is applied. This simplifies half-duplex configurations for some applications and also provides simpler DTE/DCE flexibility with one integrated circuit.

The driver inputs are both TTL or CMOS compatible. Each driver input should have a pull-down or pull-up resistor so that the output will be at a defined state. Unused driver inputs should not be left floating.

Receivers

The SP506 has seven (7) independent receivers which can be programmed for the different interface modes. Control for the

mode selection is done via a 4-bit control word, which is the same as the driver's 4-bit control word.

Like the drivers, the receivers are prearranged for the specific requirements of the synchronous serial interface. As the operating mode of the receivers is changed, the electrical characteristics will change to support the requirements of clock, data, and control line receivers. Table 2 shows the mode of each receiver in the different interface modes that can be selected.

There are three basic types of receiver circuits — V.28, V.10, and V.11.

V.28 Receivers

The V.28 receiver is single-ended and accepts V.28 signals from the V.28 driver. The V.28 receiver has an operating voltage range of $\pm 15V$ and can receive signals down to $\pm 3V$. The input sensitivity complies with RS-232 and V.28 specifications at $\pm 3V$. The input impedance is $3k\Omega$ to $7k\Omega$ in accordance to RS-232 and V.28 over a $\pm 15V$ input range. The receiver output produces a TTL/CMOS signal with a $+2.4V$ minimum for a logic "1" and a $+0.8V$ maximum for a logic "0". V.28 receivers are used in RS-232 mode for all data, clock and control signals. They are also used in V.35 mode for control line signals: CTS, DSR, LL, and RL. The V.28 receivers can operate to at least 120kbps.

V.10 Receivers

The V.10 receivers are also single-ended as with the V.28 receivers but have an input threshold as low as $\pm 200mV$. The input impedance is guaranteed to be greater than $4K\Omega$, with an operating voltage range of $\pm 7V$. The V.10 receivers can operate to at least 120kbps. V.10 receivers are used in RS-449, EIA-530, EIA-530A and V.36 modes as Category II signals as indicated by their corresponding specifications.

V.11 Receivers

The third type of receiver is a differential which supports V.11 and RS-485 signals. This receiver has a typical input impedance of $10k\Omega$ and a typical differential threshold of $\pm 200mV$, which complies with the V.11 specification. Since the characteristics of the

V.11 receivers are actually subsets of RS-485, the V.11 receivers can accept RS-485 signals. However, these receivers cannot support 32-transceivers on the signal bus due to the lower input impedance as specified in the RS-485 specification. Three receivers (RxD, RxC, and SCT) include a typical 120Ω cable termination resistor across the A and B inputs. The resistor for the three receivers is switched on when the SP506 is configured in a mode which uses V.11 receivers. The V.11 cable termination resistor is switched off when the receiver is disabled or in another operating mode not using V.11 receivers. The V.11 receivers are used in X.21, RS-449, EIA-530, EIA-530A and V.36 as Category I signals for receiving clock, data, and some control line signals not covered by Category II V.10 circuits. The differential receivers can receive signals over 20Mbps.

V.35 Receiver

The V.11 receivers are also used for the V.35 mode. Unlike the older implementations of differential receivers used for V.35, the SP506 contains an internal resistor termination network that ensures a V.35 input impedance of 100Ω ($\pm 10\Omega$) and a short-circuit impedance of 150Ω ($\pm 15\Omega$). The traditional V.35 implementations required external termination resistors to achieve the proper V.35 impedances. The internal network is connected via low on-resistance FET switches when the decoder is changed to V.35 mode. These FET switches can accept input signals of up to $\pm 15V$ without any forward biasing and other parasitic affects. The V.35 termination resistor network is switched off when the receiver is disabled either by the decoder or receiver enable pin. The termination network is transparent when all other modes are selected. The V.35 receivers can operate over 20Mbps.

Figure 51. Simplified R_{IN} Termination Circuit

Receiver Enable and Output

Only one receiver includes an enable line. The SCTEN input for the SCT receiver can enable or tri-state the output of the receiver. When the pin is at a logic "0", the receiver output is high impedance and any input termination internal connected is switched off. The inputs will be at approximately 10k Ω during tri-state.

All receivers include a fail-safe feature that outputs a logic "1" when the receiver inputs are open. The differential receivers allocated for data and clock signals (RxD, RxC, and SCT) have advanced fail-safe that outputs a logic "1" when the inputs are either open, shorted, or terminated. Other discrete or integrated implementations require external pull-up and pull-down resistors to define the receiver output state. For single-ended V.28 receivers, there are internal 5k Ω pull-down resistors on the inputs which produces a logic high ("1") at the receiver outputs. The single-ended V.10 receivers produce a logic LOW ("0") on the output when the inputs are open. This is due to an internal pull-up device connected to the input. The differential receivers have the same internal pull-up device on the non-inverting input which produces a logic HIGH ("1") at the receiver output, representing an "OFF" state to the HDLC controller. The three differential receivers when configured in V.35 mode (RxD, RxC & SCT) will also include fail-safe even when the internal termination resistor network is connected and the inputs are either shorted or floating.

Decoder

The SP506 has the ability to change the interface mode of the drivers or receivers via a 4-bit switch. The decoder for the drivers and receivers can be latched through a control pin.

The control word can be latched either high or low to write the appropriate code into the SP506. The codes shown in Tables 1 and 2 are the only specified, valid modes for the SP506. Undefined codes may represent other interface modes not specified (consult the factory for more information). The drivers and receivers are controlled with the data bits labeled DEC₃–DEC₀. All of the drivers

outputs and receiver outputs can be put into tri-state mode by writing 0000 to the driver decode switch. All internal termination networks are switched off during this mode. Individual tri-state capability is possible for all drivers through each driver's own enable control input. The SCT receiver also contains an individual enable input. When this control pin is disabled (logic "0"), the V.11 and V.35 input termination is deactivated. The 0000 decoder word will override the enable control line for the one receiver (SCT).

The SP506 contains internal loopback capabilities for self-diagnostic tests. Loopback is enabled through the decoder. To initiate single-ended mode loopback, the decoder word is 1010. To initiate differential mode loopback, the decoder word is 1011. The minimum transmission rates into the SP506 under loopback conditions are 120kbps for single-ended mode and 5Mbps for differential mode. The driver outputs are tri-stated and the receiver inputs are disabled during loopback. The receiver input impedance during loopback is approximately 10k Ω .

The SP506 is equipped with a latch control for the four (4) decoder bits. The latch control pin is pin 8 of the SP506. The latch control is active low, a logic low on pin 8 will latch the decoder signals. A logic "1" on pin 8 will force the latch to be transparent to the user. A pulse width of at least 30ns is required to latch the decoder for the next mode. The resultant output is typically 600ns after the latch control pin is toggled assuming that the decoder word is set.

NET1/2 & TBR2 European Compliancy

As with all of Exar's previous multi-protocol serial transceiver ICs, the drivers and receivers have been designed to meet all the requirements to NET1/2. The SP506 is internally tested to all the NET1/2 physical layer testing parameters and the ITU Series V specifications.

With the emergence of ETSI TBR2 (Technical Basis for Regulation) document now in place as an alternative for European compliancy, Exar has tested the SP506 to TBR2 specifications to ensure "CE" approval for either testing method.

The SP506 was externally tested by TUV Telecom Services, Division of TUV Rheinland, and passed both NET1/2 and TBR2 requirements. Test reports (NET2/052101/98 for NET1/2 and CTR2/05101/98 for TBR2) can be furnished upon request.

Please note that although the SP506 adheres to NET1/2 testing; any complex or unusual configuration should be double-checked to ensure NET compliance. Consult factory for details.

LOOPBACK MODE

The SP506 is equipped with two loopback modes. Single-ended loopback internally connects V.28 driver outputs to V.28 receiver inputs. The signal path is non-inverting and will support data rates up to 120kbps. The propagation delay times are as specified in the electrical specifications. To initiate a single-ended loopback, the code "1010" should be written to the driver decoder. Differential loopback is implemented by applying "1011" to the driver decoder. This

internally connects V.11 driver outputs to V.11 receiver inputs. The signal path again is non-inverting; the differential loopback data rate can be at least 5Mbps.

Under loopback conditions the receiver decoder is disabled. While the SP506 is in either single-ended or differential loopback mode, the driver outputs are tri-stated and the receiver inputs are disabled.

Mode	Driver Output		Receiver Input		Driver Input	Receiver Output
	non-inverting	inverting	non-inverting	inverting		
Loopback DEC = 1010	tri-state	tri-state	>10KΩ to GND	>10KΩ to GND	active	active
DEC = 1011	tri-state	tri-state	>10KΩ to GND	>10KΩ to GND	active	active
Power down $V_{CC}=V_{DD}=V_{SS}=0V$	tri-state	tri-state	>10KΩ to GND	>10KΩ to GND	inactive	clamped at $\pm 0.6V$
Tri-state DEC = 0000	tri-state	tri-state	>10KΩ to GND	>10KΩ to GND	inactive	tri-state

REVISION HISTORY

Date	REVISION	DESCRIPTION
1-27-04	A	Legacy Sipex Data Sheet
8-12-08	1.0.0	SP506 is no longer available in MQFP package per PCN 07-1102-06a. Device is now only available in a Pb-Free, RoHS compliant package. MQFP package drawing has been replaced with the LQFP package drawing. Ordering information has been updated. Changed to Exar datasheet format and revision to 1.0.0.
8/17/10	1.0.1	Added missing verbiage about description and theory of operation including LOOPBACK feature.

Notice

EXAR Corporation reserves the right to make changes to any products contained in this publication in order to improve design, performance or reliability. EXAR Corporation assumes no representation that the circuits are free of patent infringement. Charts and schedules contained herein are only for illustration purposes and may vary depending upon a user's specific application. While the information in this publication has been carefully checked; no responsibility, however, is assumed for inaccuracies.

EXAR Corporation does not recommend the use of any of its products in life support applications where the failure or malfunction of the product can reasonably be expected to cause failure of the life support system or to significantly affect its safety or effectiveness. Products are not authorized for use in such applications unless EXAR Corporation receives, in writing, assurances to its satisfaction that: (a) the risk of injury or damage has been minimized; (b) the user assumes all such risks; (c) potential liability of EXAR Corporation is adequately protected under the circumstances.
