## Features

- Dual RF input for antenna space and frequency diversity, LNA cascading or differential feeding
- Fully integrated PLL-based synthesizer
- $2^{\text {nd }}$ mixer with image rejection
- Reception of ASK or FSK modulated signals
- Wide operating voltage and temperature ranges
- Very low standby current consumption
- Low operating current consumption
- External IF filter for 455 kHz or 10.7 MHz
- Internal FSK demodulator
- Average or peak detection data slicer mode
- RSSI output with high dynamic range for RF level indication
- Output noise cancellation filter
- MCU clock output
- High over-all frequency accuracy
- 32-pin Quad Flat No-Lead Package (QFN)

## Application Examples

- Tire pressure monitoring systems (TPMS)
- Remote keyless entry (RKE)
- Remote controls
- Home and building automation
- Alarm and security systems
- Low power telemetry systems
- Garage and gate controls
- General-purpose RF receivers at 300 to 930 MHz

## General Description

The MLX71120 is a highly-integrated single-channel/dual-band RF receiver based on a doubleconversion super-heterodyne architecture. It can receive FSK and ASK modulated signals. The IC is designed for gen-eral purpose applications for example in the European bands at 433 MHz and 868 MHz or for similar applica-tions in North America or Asia, e.g. at 315 MHz or 915 MHz . It is also well-suited for narrow-band applications according to the ARIB STD-T67 standard in the frequency range 426 MHz to 470 MHz . The receiver's extended temperature and supply voltage ranges make the device a perfect fit for automotive or similar applications where harsh environmental conditions can occur.

## 1. Theory of Operation

### 1.1. General

The MLX71120 receiver architecture is based on a double-conversion super-heterodyne approach. The two LO signals are derived from an on-chip integer-N PLL frequency synthesizer. The PLL reference frequency is derived from a crystal (XTAL). As the first intermediate frequency (IF1) is very high, a reasonably high degree of image rejection is provided even without using an RF front-end filter. At applications asking for very high image rejections, cost-efficient RF frontend filtering can be realized by using a SAW filter in front of the LNA. The second mixer MIX2 is an image-reject mixer.

The receiver signal chain is setup by one (or two) low noise amplifier(s) (LNA1, LNA2), two down-conversion mixers (MIX1, MIX2) and an external IF filter with an on-chip amplifier (IFA). By choosing the required modulation via an FSK/ASK switch (at pin MODSEL), either the on-chip FSK demodulator (FSK DEMOD) or the RSSI-based ASK detector is selected. A second order data filter (OA1) and a data slicer (OA2) follow the demodulator. The data slicer threshold can be generated from the mean-value of the data stream or by means of the positive and negative peak detectors (PKDET+/-). A digital post-processing of the sliced data signal can be performed by a noise cancellation filter (NCF) building block.

The dual LNA configuration can be used for antenna space diversity or antenna frequency diversity or to setup an LNA cascade (to further improve the input sensitivity). The two LNAs can also be setup to feed the RF signal differentially.

A sequencer circuit (SEQ) controls the timing during start-up. This is to reduce start-up time and to minimize power dissipation.

A clock output, which is a divide-by-8 version of the crystal oscillator signal, can be used to drive a microcontroller. The clock output is open drain and gets activated through a load connected to positive supply.

### 1.2. Technical Data Overview

- Input frequency ranges: 300 to 470 MHz 610 to 930 MHz
- Power supply range: 2.1 to 5.5 V
- Temperature range: -40 to $+125^{\circ} \mathrm{C}$
- Shutdown current: 50 nA
- Operating current: 6.5 to 8.1 mA
- FSK input sensitivity:
$-108 \mathrm{dBm} *$ (WB, 433 MHz )
$-112 \mathrm{dBm} *$ (NB, 433 MHz )
- ASK input sensitivity:
-113 dBm * (WB, 433 MHz )
- Selectable IF2 frequency: 10.7 MHz or 455 kHz
- FSK deviation range:
$\pm 10 \mathrm{kHz}$ to $\pm 100 \mathrm{kHz}$ (WB)
$\pm 2 \mathrm{kHz}$ to $\pm 10 \mathrm{kHz}$ (NB)
- Image rejection:
$65 \mathrm{~dB} 1^{\text {st }}$ IF (with external RF frontend filter)
$25 \mathrm{~dB} 2^{\text {nd }}$ IF (internal image rejection)
- Maximum data rate:

50kps RZ (bi-phase) code, 100kps NRZ

- Spurious emission: <-54dBm
- Linear RSSI range: > 70dB
- Crystal reference frequency: 16 to 27 MHz
- MCU clock frequency: 2.0 to 3.4 MHz

[^0]
### 1.3. Block Diagram

Fig. 1: MLX71120 block diagram

The MLX71120 receiver IC consists of the following building blocks:

- PLL synthesizer (PLL SYNTH) to generate the first and second local oscillator signals LO1 and LO2.
The PLL SYNTH consists of a fully integrated voltage-controlled oscillator (VCO), a distributed feedback divider chain (N1,N2), a phase-frequency detector (PFD) a charge pump (CP), a loop filter (LF) and a crystal-based reference oscillator (RO).
- Two low-noise amplifiers (LNA1, LNA2) for high-sensitivity RF signal reception
- First mixer (MIX1) for down-conversion of the RF signal to the first IF (intermediate frequency)
- Second mixer (MIX2) with image rejection for down-conversion from the first to the second IF
- IF amplifier (IFA) to provide a high voltage gain and an RSSI signal output
- FSK demodulator (FSK DEMOD)
- Operational amplifiers OA1 and OA2 for low-pass filtering and data slicing, respectively
- Positive (PKDET+) and negative (PKDET-) peak detectors
- Switches SW1 to select between FSK and ASK as well as SW2 to chose between averaging or peak detection mode.
- Noise cancellation filter (NCF)
- Sequencer circuit (SEQ) and biasing (BIAS) circuit
- Clock output (DIV8)

### 1.4. Operating Modes

The receiver offers two operating modes selectable by setting the corresponding logic level at pin ENRX.

| ENRX | Description |
| :---: | :---: |
| 0 | Shutdown mode |
| 1 | Receive mode |

Note: ENRX is pulled down internally.

The receiver's start-up procedure is controlled by a sequencer circuit. It performs the sequential activation of the different building blocks. It also initiates the pre-charging of the data filter and data slicer capacitors in order to reduce the overall start-up time and current consumption during the start-up phase.
At ENRX $=0$, the receiver is in shutdown mode and draws only a few nA . The bias system and the reference oscillator are activated after enabling the receiver by a positive edge at pin ENRX. The crystal oscillator (RO) is turned on first. Then the crystal oscillation amplitude builds up from noise. After reaching a certain amplitude level at pin ROI, the whole IC is activated and draws the full receive mode current consumption $I_{c c}$. This event is used to start the precharging of the external data path capacitors. Pre-charging is finished after 5504 clock cycles. After that time the data output pin DTAO output is activated.

Fig. 2: Timing diagram of start-up and shutdown behavior

### 1.5. LNA Selection

The receiver features two identical LNAs. Each LNA is a cascode amplifier with a voltage gain of approximately 18 dB . The actual gain depends on the antenna matching network at the inputs and the LC tank network between the LNA outputs and mixer input. LNA operation can be controlled by the LNASEL pin.

| LNASEL | Description |
| :---: | :---: |
| 0 | LNA1 active, LNA2 shutdown |
| $\mathrm{Hi}-Z$ | LNA1 and LNA2 active |
| 1 | LNA1 shutdown, LNA2 active |

Pin LNASEL is internally pulled to VCC/ $\mathbf{2}$ during receive mode. Therefore both LNAs are active if LNASEL is left floating (Hi-Z state).

### 1.6. Mixer Section

The mixer section consists of two mixers. Both are double-balanced mixers. The second mixer is built as an image rejection mixer. The first mixer's inputs (MIXP and MIXN) are functionally the same. For single-ended drive, the unused input has to be tied to ground via a capacitor. A soft band-pass filter is placed between the mixers.

| RFSEL | Description |
| :---: | :---: |
| 0 | Input frequency range 300 to 470 MHz |
| 1 | Input frequency range 610 to 930 MHz |

Pin RFSEL is used to select the required RF band. The LO frequencies and the proper sidebands for image suppression will be set accordingly. The mixer output (MIXO) is to drive an external IF filter. This output is set up by a source follower that can be biased to create a driving impedance of either 1500 Ohms or 330 Ohms, depending on the logic level at pin IFSEL.

| IFSEL | Description |
| :---: | :---: |
| 0 | IF2 $=455 \mathrm{kHz}$ |
| 1 | IF2 $=10.7 \mathrm{MHz}$ |

This feature allows to use standard ceramic filters for 455 kHz and 10.7 MHz . They can be connected directly without additional matching elements. The overall voltage conversion gain of the mixer section is approximately 25 dB .

### 1.7. IF Amplifier

After having passed the IF filter, the signal is amplified by a high-gain limiting amplifier. It consists of several ACcoupled gain stages with a bandwidth of 400 kHz to 11 MHz . The overall small-signal pass-band gain is about 80 dB . A received-signal-strength indicator (RSSI) signal is generated within the IF amplifier and is available at pin RSSI.

### 1.8. PLL Synthesizer

The PLL synthesizer consists of a fully integrated voltage-controlled oscillator running at 400 MHz to 640 MHz , a distributed feedback divider chain, an edge-triggered phase-frequency detector, a charge pump, a loop filter and a crystal-based reference oscillator. The PLL is used for generating the LO signals. The LO1 is directly taken from the VCO output, and the LO2 is derived from the LO1 signal passing the N1 counter. Another counter N2 follows N1. The overall feedback divider ratio $\mathrm{N}_{\text {tot }}$ is fixed to 24 . The values of N 1 and N 2 are depending on the selected RF band that can be chosen via pin RFSEL.

| RFSEL | $\mathrm{f}_{\text {LOImin }}$ [MHz] | $\mathrm{flormax}^{\text {[MHz] }}$ | $\mathrm{f}_{\text {LO2 } \min }[\mathrm{MHz}]$ | $\mathrm{flormax}_{\text {[MHz] }}$ | $\mathrm{N}_{1}$ | $\mathrm{N}_{2}$ | $\mathrm{N}_{\text {tot }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 400 | 640 | 100 | 160 | 4 | 6 | 24 |
| 1 | 400 | 640 | 200 | 320 | 2 | 12 | 24 |

### 1.9. Reference Oscillator

A Colpitts crystal oscillator with integrated functional capacitors is used as the reference oscillator (RO) of the PLL synthesizer. The equivalent input capacitance CRO offered to the crystal at pin ROI is about 18pF. The crystal oscillator features an amplitude control loop. This is to assure a very stable frequency over the specified supply voltage and temperature range together with a short start-up time. A buffer amplifier with hysteresis is between RO and PFD. Also a clock divider follows the buffer.

### 1.10. Clock Output

The clock output pin CKOUT is an open-drain output. For power saving reasons, the circuit is only active if an external pull-up resistor RCL is applied to the pin. Furthermore, RCL can be used to adjust the clock waveform. It forms an RC low-pass together with the capacitive load at the pin, the parasitics of the PCB and the input capacitance of the external circuitry (e.g. a microcontroller).
The clock output feature is disabled if pin CKOUT is connected to ground or left open.

Fig. 3: Clock output implementation

### 1.11. FSK Demodulator

The integrated FSK demodulator is based on a phase-coincidence demodulator principle. An injection-locked oscillator (ILO) is used as a frequency-dependent phase shifter. This topology features a good linearity of the frequency-phase relationship over the entire locking range. The type of demodulator has no built-in constraints regarding the modulation index. It also offers a wide carrier acceptance range.
In addition, the demodulator provides an AFC loop for correcting the remaining free-running frequency error and drift effects, and also to remove possible frequency offsets between transmitter and receiver frequencies. The AFC loop features a dead band which means that the AFC loop is only closed if the demodulator output voltage leaves the linear region of the demodulator. Most of the time, the control loop is open. This leads to several advantages. The AFC loop bandwidth can be high and therefore the reaction time is short. Furthermore the demodulator itself has no low-end cut-off frequency.
The FSK demodulator has a negative control slope, this means the output voltage decreases by increasing the IF2 frequency. This guarantees an overall positive slope because the mixer section converts the receive frequency to IF2 either with high-low or low-high side injection.
The FSK demodulator is turned off during ASK demodulation.

### 1.12. Baseband Data Path

The baseband data path can be divided into a data filter section and a data slicer section.

Fig. 4: Block diagram of the data path

The data filter input is either connected to the ASK or to the FSK demodulation output. Pin MODSEL can be used to set the internal switch SW1 accordingly.

| MODSEL | Description |
| :---: | :---: |
| 0 | ASK demodulation |
| 1 | FSK demodulation |

For ASK demodulation, the RSSI signal of the IFA is used. During FSK demodulation, SW1 is connected to the FSK demodulator output.
The SLCSEL pin is used to control the internal switches depending on operating and slicer mode.

Pins DF1, DF2, DFO, SLC and DTAO are left floating during shutdown mode. So they are in a high-Z state.

### 1.13. Data Filter

The data filter is formed by the operational amplifier OA1, two internal $100 \mathrm{k} \Omega$ resistors and two external capacitors. It is implemented as a $2^{\text {nd }}$ order Sallen-Key filter. The low pass filter characteristic rejects noise at higher frequencies and therefore leads to an increased sensitivity.

Fig. 5: Data filter

The filter's pole locations can be set by the external capacitors CF1 and CF2. The cut-off frequency $f_{c}$ has to be adjusted according to the transmission data rate R. It should be set to approximately 1.5 times the fastest expected data rate. For a Butterworth filter characteristic, the data filter capacitors can be calculated as follows.

$$
\mathrm{CF} 1=\frac{1}{\sqrt{2} \cdot \pi \cdot 100 \mathrm{k} \cdot \mathrm{f}_{\mathrm{c}}} \quad \mathrm{CF} 2=\frac{\mathrm{CF} 1}{2}
$$

| $\mathrm{R}_{\text {Rz }}$ [kbit/s] | $\mathrm{R}_{\text {NRZ }}$ [kbit/s] | fc [kHz] | CF1 [pF] | CF2 [pF] |
| :---: | :---: | :---: | :---: | :---: |
| 0.6 | 1.2 | 0.9 | 2200 | 1000 |
| 1.2 | 2.4 | 1.8 | 1200 | 680 |
| 1.6 | 3.2 | 2.4 | 1000 | 470 |
| 2.4 | 4.8 | 3.6 | 680 | 330 |
| 3.3 | 6.6 | 5 | 470 | 220 |
| 4.8 | 9.6 | 7.2 | 330 | 150 |
| 6.0 | 12 | 9 | 220 | 100 |

### 1.14. Data Slicer

The purpose of the data slicer is to convert the filtered data signal into a digital output. It can therefore be considered as an analog-to-digital converter. This is done by using the operational amplifier OA2 as a comparator that compares the data filter output with a threshold voltage. The threshold voltage can be derived in two different ways from the data signal.

| SLCSEL | Description |
| :---: | :---: |
| 0 | Averaging detection mode |
| 1 | Peak detection mode |

### 1.14.1. Averaging Detection Mode

The simplest configuration is the averaging or RC integration method. An on-chip 100k $\Omega$ resistor together with an external slicer capacitor (CSL) set up an RC low-pass filter. This way the threshold voltage automatically adjusts to the mean or average value of the analog input voltage.
To create a stable threshold voltage, the cut-off frequency of the low pass has to be lower than the lowest signal frequency.
$\mathrm{CSL} \geq \frac{\tau_{\mathrm{AVG}}}{100 \mathrm{k}} \quad \tau_{\mathrm{AVG}}=\frac{1.5}{\mathrm{R}_{\mathrm{RZ}}}$
A long string of zeros or ones, like in NRZ codes, can cause a drift of the threshold. That's why a Manchester or other DCfree coding scheme works best.
The peak detectors are disabled during averaging detection mode, and the output pins PDP and PDN are pulled to ground (S4, S6 are closed).

### 1.14.2. Peak Detection Mode

Peak detection mode has a general advantage over averaging detection mode because of the part attack and slow release times. Peak detection should be used for all non DC-free codes like NRZ. In this configuration the threshold is generated by using the positive and negative peak detectors. The slicer comparator threshold is set to the midpoint between the high output and the low output of the data filter by an on-chip resistance divider. Two external capacitors (CP1, CP2) determine the release times for the positive and negative envelope. The two on-chip resistors provide a path for the capacitors to discharge. This allows the peak detectors to dynamically follow peak changes of the data filter output voltage. The attack times are very short due to the high peak detector load currents of about 500uA. The decay time constant mainly depends on the longest time period without bit polarity change. This corresponds to the maximum number of consecutive bits with the same polarity ( $\mathrm{N}_{\mathrm{MAX}}$ ).

$$
\mathrm{CP} 1 / 2 \geq \frac{\tau_{\mathrm{DECAY}}}{100 \mathrm{k}} \quad \tau_{\mathrm{DECAY}}=\frac{\mathrm{N}_{\mathrm{MAX}}}{\mathrm{R}_{\mathrm{NRZ}}}
$$

Fig. 6: Data path in averaging detection mode

Fig. 7: Data path in peak detection mode

If the receiver is in shutdown mode and peak detection mode is selected then the peak detectors are disabled and the output of the positive peak detector (PDP) is connected to VEE (S4 is closed) and the output of the negative peak detector (PDN) is connected to VCC (S5 is closed). This guarantees the correct biasing of CP1 and CP2 during start-up

### 1.15. Data Output and Noise Cancellation Filter

The data output pin DTAO delivers the demodulated data signal which can be further processed by a noise cancellation filter (NCF). The NCF can be disabled if pin CINT is connected to ground. In this case the multiplexer (MUX) connects the receiver output DTAO directly to the data slicer output.

Fig. 8: Data output and noise filter

The noise cancellation filter can suppress random pulses in the data output which are shorter than $\mathrm{t}_{\text {min }}$.

$$
\mathrm{CF} 3=15 \cdot 10^{-6} \cdot t_{\min }=\frac{15 \cdot 10^{-6}}{R_{N R Z}}=\frac{7.5 \cdot 10^{-6}}{R_{R Z}}
$$

The NCF can also operate as a muting circuit. So if the RF input signal is below sensitivity level (or if no RF signal is applied) then the data output will go to a constant DC level (either HIGH or LOW). This can be achieved by setting the bandwidth of the preceding data filter (sec 1.13) about 10 times higher than the bandwidth of the NCF. Further the data filter cutoff frequency must be higher than the data rate, so the noise pulses are shorter than the shortest data pulse. Otherwise, the NCF will not be able to distinguish between noise and data pulses.

Having the NCF activated is a good means for reducing the computing power of the microcontroller that follows the receiver IC for further data processing.

In contrast to conventional muting (or squelch) circuits, this topology does not need the RSSI signal for level indication. The filtering process is done by means of an analogue integrator. The cut-off frequency of the NCF is set by the external capacitor connected to pin CINT. This capacitor CF3 should be set according to the maximum data rate. Below table provides some recommendations..

During receiver start-up a sequencer checks if pin CINT is connected to a capacitor or to ground. The maximum value of $C_{F 3}$ should not exceed 12 nF . This defines the lowest data rate that can be processed if the noise cancellation filter is activated.

| $R_{R Z}[k b i t / s]$ | $R_{N R Z}[k b i t / s]$ | $C_{F 3}[\mathrm{nF}]$ |
| :---: | :---: | :---: |
| 0.6 | 1.2 | 12 |
| 1.2 | 2.4 | 6.8 |
| 1.6 | 3.2 | 4.7 |
| 2.4 | 4.8 | 3.3 |
| 3.3 | 6.6 | 2.2 |
| 4.8 | 9.6 | 1.5 |
| 6.0 | 12 | 1.2 |

[^1]
## 2. Frequency Planning

Because of the double conversion architecture that employs two mixers and two IF signals, there are four different combinations for injecting the LO1 and LO2 signals:

- LO1 high side and LO2 high side: receiving at $f_{\text {RF }}$ (high-high)
- LO1 high side and LO2 low side: receiving at frf (high-low)
- LO1 low side and LO2 high side: receiving at frF (low-high)
- LO1 low side and LO2 low side: receiving at $f_{\text {RF }}$ (low-low)

As a result, four different radio frequencies (RFs) could yield one and the same second IF (IF2). Fig. 9 shows this for the case of receiving at $f_{R F}$ (high-high). In the example of Fig. 9, the image signals at $f_{R F}$ (low-high) and $f_{R F}$ (low-low) are suppressed by the bandpass characteristic provided by the RF front-end. The bandpass shape can be achieved either with a SAW filter (featuring just a couple of MHz bandwidth), or by the tank circuits at the LNA input and output (this typically yields 30 to 60 MHz bandwidth). In any case, the high value of the first IF (IF1) helps to suppress the image signals at $f_{R F}$ (low-high) and $f_{R F}$ (low-low).

The two remaining signals at IF1 resulting from $f_{\text {RF }}$ (high-high) and $f_{\text {RF }}$ (high-low) are entering the second mixer MIX2. This mixer features image rejection with so-called single-sideband (SSB) selection. This means either the upper or lower sideband of IF1 can be selected. In the example of Fig. 9, LO2 high-side injection has been chosen to select the IF2 signal resulting from $f_{\text {RF }}$ (high-high).

Fig. 9: The four receiving frequencies in a double conversion superhet receiver

It can be seen from the block diagram of Fig. 1 that there is a fixed relationship between the LO signal frequencies ( $\mathrm{f}_{\text {LO1 }}$ ,$f_{\text {LO2 }}$ ) and the reference oscillator frequency $f_{R O}$.

$$
\mathrm{f}_{\mathrm{LO} 1}=\mathrm{N}_{1} \cdot \mathrm{f}_{\mathrm{LO} 2} \quad \mathrm{f}_{\mathrm{LO} 2}=\mathrm{N}_{2} \cdot \mathrm{f}_{\mathrm{RO}}
$$

The IF2 frequency can be selected to 455 kHz or 10.7 MHz via the logic level at the IFSEL control pin. At the same time the output impedance of the $2^{\text {nd }}$ mixer at pin MIXO is set according to the IF2 (please refer to pin description for details). Of course, also the operating frequency of the FSK demodulator (FSK DEMOD) is set accordingly.

### 2.1. Calculation of Frequency Settings

The receiver has two predefined receive frequency plans which can be selected by the RFSEL control pin. Depending on the logic level of RFSEL pin the sideband selection of the second mixer and the counter settings for N1 and N2 are changed accordingly.

| RFSEL | Injection | $f_{\text {RFmin }}[M H z]$ | $f_{\text {RFmax }}[M H z]$ | $N_{1}$ | $N_{2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | high-low | 300 | 470 | 4 | 6 |
| 1 | low-high | 610 | 930 | 2 | 12 |

The following table shows the relationships of several internal receiver frequencies for the two input frequency ranges.

| $\mathrm{f}_{\mathrm{RF}}[\mathrm{MHz}]$ | $\mathrm{f}_{1 \times 1}$ | $\mathrm{f}_{601}$ | $\mathrm{f}_{102}$ | $\mathrm{f}_{\mathrm{RO}}$ |
| :---: | :---: | :---: | :---: | :---: |
| 300 to 470 | $\frac{\mathrm{f}_{\mathrm{RF}}+\mathrm{N}_{1} \mathrm{f}_{\mathrm{IF} 2}}{\mathrm{~N}_{1}-1}$ | $\frac{\mathrm{N}_{1}\left(\mathrm{f}_{\mathrm{RF}}+\mathrm{f}_{\mathrm{IF} 2}\right)}{\mathrm{N}_{1}-1}$ | $\frac{\mathrm{f}_{\mathrm{RF}}+\mathrm{f}_{\mathrm{IF} 2}}{\mathrm{~N}_{1}-1}$ | $\frac{\mathrm{f}_{\mathrm{RF}}+\mathrm{f}_{\mathrm{IF} 2}}{\mathrm{~N}_{2}\left(\mathrm{~N}_{1}-1\right)}$ |
| 610 to 930 | $\frac{\mathrm{f}_{\mathrm{RF}}-\mathrm{N}_{1} \mathrm{f}_{\mathrm{IF} 2}}{\mathrm{~N}_{1}+1}$ | $\frac{\mathrm{N}_{1}\left(\mathrm{f}_{\mathrm{RF}}+\mathrm{f}_{\mathrm{IF} 2}\right)}{\mathrm{N}_{1}+1}$ | $\frac{\mathrm{f}_{\mathrm{RF}}+\mathrm{f}_{\mathrm{IF} 2}}{\mathrm{~N}_{1}+1}$ | $\frac{\mathrm{f}_{\mathrm{RF}}+\mathrm{f}_{\mathrm{IF} 2}}{\mathrm{~N}_{2}\left(\mathrm{~N}_{1}+1\right)}$ |

Given IF2 is selectable at either 455 kHz or 10.7 MHz and the corresponding $\mathrm{N}_{1}, \mathrm{~N}_{2}$ counter settings, above equations can be transferred into the following table.

IF2=455kHz

| $\mathrm{f}_{\text {RF }}[\mathrm{MHz}]$ | $\mathrm{f}_{1 / 1}$ | $\mathrm{f}_{61}$ | $\mathrm{f}_{102}$ | $\mathrm{f}_{\mathrm{RO}}$ |
| :---: | :---: | :---: | :---: | :---: |
| 300 to 470 | $\frac{\mathrm{f}_{\text {RF }}+1.82 \mathrm{MHz}}{3}$ | $\frac{4\left(\mathrm{f}_{\mathrm{RF}}+0.455 \mathrm{MHz}\right)}{3}$ | $\underline{\mathrm{f}_{\text {RF }}+0.455 \mathrm{MHz}}$ | $\frac{\mathrm{f}_{\text {RF }}+0.455 \mathrm{MHz}}{18}$ |
| 610 to 930 | $\frac{\mathrm{f}_{\mathrm{RF}}-0.91 \mathrm{MHz}}{3}$ | $\frac{2\left(\mathrm{f}_{\mathrm{RF}}+0.455 \mathrm{MHz}\right)}{3}$ | 3 | $\frac{\mathrm{f}_{\mathrm{RF}}+0.455 \mathrm{MHz}}{36}$ |

IF2=10.7MHz

### 2.3. 433/868MHz Frequency Diversity

The receiver's multi-band functionality can be used to operate at two different frequency bands just by changing the logic level at pin RFSEL and without changing the crystal. This feature is applicable for common use of the 433 and 868 MHz bands. Below table shows the corresponding frequency plans.
$\mathrm{IF} 2=455 \mathrm{kHz}$

| RFSEL | $f_{\text {RF }}[M H z]$ | $f_{\text {IF1 }}[M H z]$ | $f_{\text {LO1 }}[M H z]$ | $f_{\text {LO2 }}[M H z]$ | $f_{\text {RO }}[M H z]$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 433.9225 | 145.2483 | 579.17 | 144.7925 | 24.132083 |
| 1 | 868.3 | 289.1300 | 579.17 | 289.5850 |  |

## 3. Pin Definitions and Descriptions

| Pin No. | Name | //O Type | Functional Schematic | Description |

| 32 | LNASEL | CMOS <br> input |  | LNA select input |

## 4. Technical Data

### 4.1. Absolute Maximum Ratings

Operation beyond absolute maximum ratings may cause permanent damage of the device.

| Parameter | Symbol | Condition | Min | Max | Unit |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Supply voltage | $\mathrm{V}_{\mathrm{CC}}$ |  | 0 | 7 | V |
| Input voltage | $\mathrm{V}_{\text {IN }}$ |  | -0.3 | $\mathrm{~V}_{\mathrm{CC}}+0.3$ | V |
| Storage temperature | $\mathrm{T}_{\text {STG }}$ |  | -55 | 150 | ${ }^{\circ} \mathrm{C}$ |
| Junction temperature | $\mathrm{T}_{\mathrm{J}}$ |  |  | 150 | ${ }^{\circ} \mathrm{C}$ |
| Thermal Resistance | $\mathrm{R}_{\text {thJA }}$ |  |  | 22 | $\mathrm{~K} / \mathrm{W}$ |
| Power dissipation | $\mathrm{P}_{\text {diss }}$ |  |  | 0.12 | W |
| Electrostatic discharge | $\mathrm{V}_{\text {ESD }}$ | HBM according to MIL STD <br> 833 D, method 3015.7 | $\pm 1$ |  | kV |

### 4.2. Normal Operating Conditions

| Parameter | Symbol | Condition | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Supply voltage | $\mathrm{V}_{\text {cc }}$ |  | 2.1 | 5.5 | V |
| Operating temperature | $\mathrm{T}_{\mathrm{A}}$ |  | -40 | 125 | ${ }^{\circ} \mathrm{C}$ |
| Input low voltage (CMOS) | $\mathrm{V}_{\text {IL }}$ | ENRX, SEL pins |  | $0.3 * V_{\text {cc }}$ | V |
| Input high voltage (CMOS) | $\mathrm{V}_{\text {IH }}$ | ENRX, SEL pins | $0.7 * \mathrm{~V}_{\mathrm{cc}}$ |  | V |
| Input frequency range | $\mathrm{f}_{\mathrm{RF}}$ | RFSEL=0 | 300 | 470 | MHz |
|  |  | RFSEL=1 | 610 | 930 |  |
| First IF range | $\mathrm{f}_{\text {IF } 1}$ | RFSEL=0 | 100 | 170 | MHz |
|  |  | RFSEL=1 | 200 | 310 |  |
| Second IF range | $\mathrm{f}_{\text {FF2 }}$ |  | 0.4 | 11 | MHz |
| LO1 range (VCO frequency) | $\mathrm{f}_{\text {LO1 }}$ | $\mathrm{f}_{\text {LO1 }}=24 * \mathrm{f}_{\text {REF }}$ | 400 | 640 | MHz |
| LO2 range | $\mathrm{f}_{\mathrm{LO} 2}$ | RFSEL=0, $\mathrm{f}_{\mathrm{LO} 2}=\mathrm{f}_{\mathrm{LO} 1} / 4$ | 100 | 160 | MHz |
|  |  | RFSEL=1, $\mathrm{f}_{\mathrm{LO} 2}=\mathrm{f}_{\mathrm{LO} 1} / 2$ | 200 | 320 |  |
| XOSC frequency | $\mathrm{f}_{\text {REF }}$ | set by the crystal | 16 | 27 | MHz |
| CLKO frequency | $\mathrm{f}_{\text {CLK }}$ | $\mathrm{f}_{\text {CLK }}=\mathrm{f}_{\text {REF }} / 8$ | 2.0 | 3.375 | MHz |
| FSK deviation | $\Delta f$ | IFSEL=0 | $\pm 2$ | $\pm 10$ | kHz |
|  |  | IFSEL=1 | $\pm 10$ | $\pm 100$ |  |
| Data rate ASK | $\mathrm{R}_{\text {ASK }}$ | bi-phase code |  | 50 | kbps |
|  |  | NRZ |  | 100 |  |
| Data rate FSK | $\mathrm{R}_{\text {FSK }}$ | bi-phase code, IFSEL=0 |  | 5 | kbps |
|  |  | NRZ, IFSEL=0 |  | 10 |  |
|  |  | bi-phase code, IFSEL=1 |  | 50 |  |
|  |  | NRZ, IFSEL=1 |  | 100 |  |

### 4.3. DC Characteristics

all parameters under normal operating conditions, unless otherwise stated;
typical values at $T_{A}=23^{\circ} \mathrm{C}$ and $\mathrm{V}_{\mathrm{CC}}=3 \mathrm{~V}$, all parameters based on test circuits as shown Fig. 10

| Parameter | Symbol | Condition | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## 6. Package Description

- The device MLX71120 is RoHS compliant.

### 6.1. Soldering Information

- The device MLX71120 is qualified for MSL3 with soldering peak temperature 260 deg C according to JEDEC J-STD-20.

## 7. Standard information regarding manufacturability of Melexis with different soldering processes

Our products are classified and qualified regarding soldering technology, solderability and moisture sensitivity level according to following test methods:

## Reflow Soldering SMD's (Surface Mount Devices)

- IPC/JEDEC J-STD-020

Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices (classification reflow profiles according to table 5-2)

- EIA/JEDEC JESD22-A113 Preconditioning of Nonhermetic Surface Mount Devices Prior to Reliability Testing (reflow profiles according to table 2)

## Wave Soldering SMD's (Surface Mount Devices) and THD's (Through Hole Devices)

- EN60749-20

Resistance of plastic- encapsulated SMD's to combined effect of moisture and soldering heat

- EIA/JEDEC JESD22-B106 and EN60749-15

Resistance to soldering temperature for through-hole mounted devices

## Iron Soldering THD's (Through Hole Devices)

- EN60749-15

Resistance to soldering temperature for through-hole mounted devices
Solderability SMD's (Surface Mount Devices) and THD's (Through Hole Devices)

- EIA/JEDEC JESD22-B102 and EN60749-21

Solderability

For all soldering technologies deviating from above mentioned standard conditions (regarding peak temperature, temperature gradient, temperature profile etc) additional classification and qualification tests have to be agreed upon with Melexis.

The application of Wave Soldering for SMD's is allowed only after consulting Melexis regarding assurance of adhesive strength between device and board.

Melexis is contributing to global environmental conservation by promoting lead free solutions. For more information on qualifications of RoHS compliant products (RoHS = European directive on the Restriction Of the use of certain Hazardous Substances) please visit the quality page on our website: http://www.melexis.com/quality.aspx

## 8. ESD Precautions

Electronic semiconductor products are sensitive to Electro Static Discharge (ESD).
Always observe Electro Static Discharge control procedures whenever handling semiconductor products.

## 10. Disclaimer

The information furnished by Melexis herein ("Information") is believed to be correct and accurate. Melexis disclaims (i) any and all liability in connection with or arising out of the furnishing, performance or use of the technical data or use of the product(s) as described herein ("Product") (ii) any and all liability, including without limitation, special, consequential or incidental damages, and (iii) any and all warranties, express, statutory, implied, or by description, including warranties of fitness for particular purpose, noninfringement and merchantability. No obligation or liability shall arise or flow out of Melexis' rendering of technical or other services.
The Information is provided "as is" and Melexis reserves the right to change the Information at any time and without notice. Therefore, before placing orders and/or prior to designing the Product into a system, users or any third party should obtain the latest version of the relevant information to verify that the information being relied upon is current. Users or any third party must further determine the suitability of the Product for its application, including the level of reliability required and determine whether it is fit for a particular purpose.
The Information is proprietary and/or confidential information of Melexis and the use thereof or anything described by the Information does not grant, explicitly or implicitly, to any party any patent rights, licenses, or any other intellectual property rights.
This document as well as the Product(s) may be subject to export control regulations. Please be aware that export might require a prior authorization from competent authorities. The Product(s) are intended for use in normal commercial applications. Unless otherwise agreed upon in writing, the Product(s) are not designed, authorized or warranted to be suitable in applications requiring extended temperature range and/or unusual environmental requirements. High reliability applications, such as medical life-support or lifesustaining equipment are specifically not recommended by Melexis.
The Product(s) may not be used for the following applications subject to export control regulations: the development, production, processing, operation, maintenance, storage, recognition or proliferation of 1) chemical, biological or nuclear weapons, or for the development, production, maintenance or storage of missiles for such weapons: 2) civil firearms, including spare parts or ammunition for such arms; 3) defense related products, or other material for military use or for law enforcement; 4) any applications that, alone or in combination with other goods, substances or organisms could cause serious harm to persons or goods and that can be used as a means of violence in an armed conflict or any similar violent situation.
The Products sold by Melexis are subject to the terms and conditions as specified in the Terms of Sale, which can be found at https://www.melexis.com/en/legal/terms-andconditions.

This document supersedes and replaces all prior information regarding the Product(s) and/or previous versions of this document.
