

Gigabit Ethernet Transceiver with GMII/MII Support

Highlights

- Single-chip 10/100/1000Mbps IEEE 802.3 compliant Ethernet Transceiver
- · GMII/MII standard compliant interface
- Auto-negotiation to automatically select the highest link up speed (10/100/100Mbps) and duplex (half/full)
- On-chip termination resistors for the differential pairs
- On-chip LDO controller to support single 3.3V supply operation – requires only external FET to generate 1.2V for the core
- · Jumbo frame support up to 16KB
- 125MHz Reference Clock Output
- Programmable LED outputs for link, activity and speed
- Baseline Wander Correction
- LinkMD[®] TDR-based cable diagnostics for identification of faulty copper cabling
- Parametric NAND Tree support for fault detection between chip I/Os and board.
- · Loopback modes for diagnostics
- Automatic MDI/MDI-X crossover for detection and correction of pair swap at all speeds of operation
- Automatic detection and correction of pair swaps, pair skew and pair polarity
- MDC/MDIO Management Interface for PHY register configuration
- · Interrupt pin option
- Power down and power saving modes
- · Operating Voltages
 - Core: 1.2V (external FET or regulator)
 - I/O: 3.3V or 2.5V
 - Transceiver: 3.3V
- Available in 128-pin PQFP (14mm x 20mm) package

Applications

- Laser/Network Printer
- Network Attached Storage (NAS)
- Network Server
- Gigabit LAN on Motherboard (GLOM)
- Broadband Gateway
- · Gigabit SOHO/SMB Router
- IPTV
- IP Set-top Box
- Game Console
- · Triple-play (data, voice, video) Media Center
- Media Converter

TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at docerrors@microchip.com. We welcome your feedback.

Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

http://www.microchip.com

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS3000000A is version A of document DS30000000).

Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; http://www.microchip.com
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include -literature number) you are using.

1.0 INTRODUCTION

1.1 General Description

The KSZ9021GQ is a completely integrated triple speed (10Base-T/100Base-TX/1000Base-T) Ethernet Physical Layer Transceiver for transmission and reception of data on standard CAT-5 unshielded twisted pair (UTP) cable.

The KSZ9021GQ provides the industry standard GMII/MII (Gigabit Media Independent Interface / Media Independent Interface) for direct connection to GMII/MII MACs in Gigabit Ethernet Processors and Switches for data transfer at 1000 Mbps or 10/100Mbps speed.

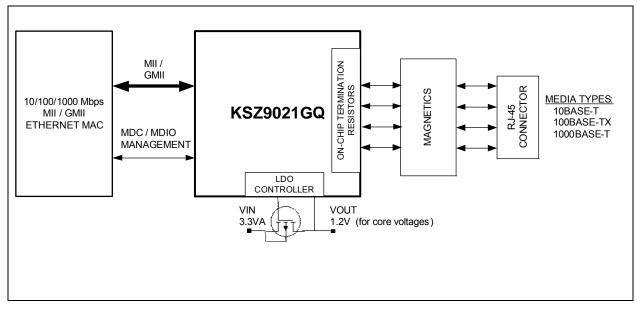

The KSZ9021GQ reduces board cost and simplifies board layout by using on-chip termination resistors for the four differential pairs and by integrating a LDO controller to drive a low cost MOSFET to supply the 1.2V core.

The KSZ9021GQ provides diagnostic features to facilitate system bring-up and debugging in production testing and in product deployment. Parametric NAND tree support enables fault detection between KSZ9021 I/Os and board. Micro-chip LinkMD[®] TDR-based cable diagnostics permit identification of faulty copper cabling. Remote and local loopback functions provide verification of analog and digital data paths.

The KSZ9021GQ is available in a 128-pin, RoHS Compliant PQFP package (See Product Identification System on page 60).

I/O = Bi-directional.

Ipu = Input with internal pull-up.

lpu/O = Input with internal pull-up / Output.

2.3 Strapping Options

Pin Number	Pin Name	Type (Note 1)	Pin Fu	nction	
42 43 44 45 48 78 83	PHYAD4 PHYAD3 PHYAD2 PHYAD1 PHYAD0 MODE3 MODE2	I/O I/O I/O I/O I/O I/O	The PHY Address, PHYAD[4:0], is latched at power-up / reset and is con- figurable to any value from 1 to 31. Each PHY address bit is configured as follows: Pull-up = 1 Pull-down = 0 The MODE[3:0] strap-in pins are latched at power-up / reset and are defined as follows:		
88 89	MODE1 MODE0	I/O I/O			
00	MODEO	1/0	MODE[3:0]	Mode	
			0000	Reserved - not used	
			0001	GMII / MII Mode	
			0010	Reserved - not used	
			0011	Reserved - not used	
			0100	NAND Tree Mode	
			0101	Reserved - not used	
			0110	Reserved - not used	
			0111	Chip Power Down Mode	
			1000	Reserved - not used	
			1001	Reserved - not used	
			1010	Reserved - not used	
			1011	Reserved - not used	
			1100	Reserved - not used	
			1101	Reserved - not used	
			1110	Reserved - not used	
			1111	Reserved - not used	
90	CLK125_EN	I/O	CLK125_EN is latched at power-up /	reset and is defined as follows:	
			Pull-up = Enable 125MHz Clock	Output	
			Pull-down = Disable 125MHz Clo	ock Output	
			Pin 107 (CLK125_NDO) provides the option for use by the MAC.	·	

Note 1:

I/O = Bi-directional.

Pin strap-ins are latched during power-up or reset. In some systems, the MAC receive input pins may be driven during power-up or reset, and consequently cause the PHY strap-in pins on the GMII/MII signals to be latched to the incorrect configuration. In this case, it is recommended to add external pull-ups/pull-downs on the PHY strap-in pins to ensure the PHY is configured to the correct pin strap-in mode.

3.0 FUNCTIONAL OVERVIEW

The KSZ9021GQ is a completely integrated triple speed (10Base-T/100Base-TX/1000Base-T) Ethernet Physical Layer Transceiver solution for transmission and reception of data over a standard CAT-5 unshielded twisted pair (UTP) cable. Its on-chip proprietary 1000Base-T transceiver and Manchester/MLT-3 signaling-based 10Base-T/100Base-TX transceivers are all IEEE 802.3 compliant.

The KSZ9021GQ reduces board cost and simplifies board layout by using on-chip termination resistors for the four differential pairs and by integrating a LDO controller to drive a low cost MOSFET to supply the 1.2V core.

On the copper media interface, the KSZ9021GQ can automatically detect and correct for differential pair misplacements and polarity reversals, and correct propagation delays and re-sync timing between the four differential pairs, as specified in the IEEE 802.3 standard for 1000Base-T operation.

The KSZ9021GQ provides the GMII/MII interface for a direct and seamless connection to GMACs in Gigabit Ethernet Processors and Switches for data transfer at 10/100/1000 Mbps speed.

The following figure shows a high-level block diagram of the KSZ9021GQ.

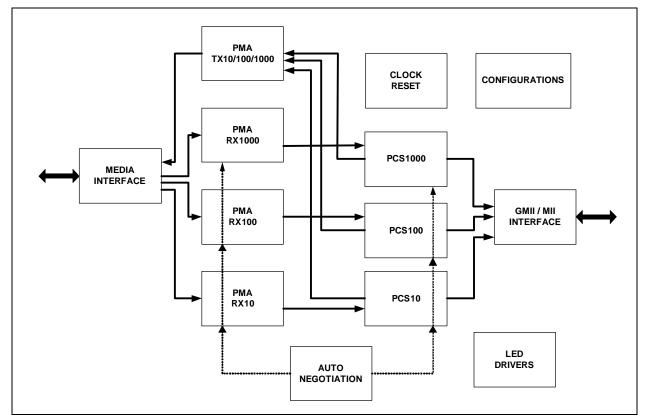

FIGURE 3-1: KSZ9021GQ BLOCK DIAGRAM

3.1 Functional Description: 10Base-T/100Base-TX Transceiver

3.1.1 100BASE-TX TRANSMIT

The 100Base-TX transmit function performs parallel to serial conversion, 4B/5B coding, scrambling, NRZ-to-NRZI conversion, and MLT-3 encoding and transmission.

The circuitry starts with a parallel-to-serial conversion, which converts the MII data from the MAC into a 125MHz serial bit stream. The data and control stream is then converted into 4B/5B coding, followed by a scrambler. The serialized data is further converted from NRZ-to-NRZI format, and then transmitted in MLT-3 current output. The output current is set by an external 4.99K Ω 1% resistor for the 1:1 transformer ratio.

The output signal has a typical rise/fall time of 4ns and complies with the ANSI TP-PMD standard regarding amplitude balance, overshoot, and timing jitter. The wave-shaped 10Base-T output is also incorporated into the 100Base-TX transmitter.

3.1.2 100BASE-TX RECEIVE

The 100BASE-TX receiver function performs adaptive equalization, DC restoration, MLT-3-to-NRZI conversion, data and clock recovery, NRZI-to-NRZ conversion, de-scrambling, 4B/5B decoding, and serial-to-parallel conversion.

The receiving side starts with the equalization filter to compensate for inter-symbol interference (ISI) over the twisted pair cable. Since the amplitude loss and phase distortion is a function of the cable length, the equalizer must adjust its characteristics to optimize performance. In this design, the variable equalizer makes an initial estimation based on comparisons of incoming signal strength against some known cable characteristics, and then tunes itself for optimization. This is an ongoing process and self-adjusts against environmental changes such as temperature variations.

Next, the equalized signal goes through a DC restoration and data conversion block. The DC restoration circuit is used to compensate for the effect of baseline wander and to improve the dynamic range. The differential data conversion circuit converts the MLT-3 format back to NRZI. The slicing threshold is also adaptive.

The clock recovery circuit extracts the 125MHz clock from the edges of the NRZI signal. This recovered clock is then used to convert the NRZI signal into the NRZ format. This signal is sent through the de-scrambler followed by the 4B/ 5B decoder. Finally, the NRZ serial data is converted to the GMII/MII format and provided as the input data to the MAC.

3.1.3 SCRAMBLER/DE-SCRAMBLER (100BASE-TX ONLY)

The purpose of the scrambler is to spread the power spectrum of the signal to reduce electromagnetic interference (EMI) and baseline wander. Transmitted data is scrambled through the use of an 11-bit wide linear feedback shift register (LFSR). The scrambler generates a 2047-bit non-repetitive sequence, and the receiver then de-scrambles the incoming data stream using the same sequence as at the transmitter.

3.1.4 10BASE-T TRANSMIT

The output 10Base-T driver is incorporated into the 100Base-TX driver to allow transmission with the same magnetic. They are internally wave-shaped and pre-emphasized into typical outputs of 2.5V amplitude. The harmonic contents are at least 31 dB below the fundamental when driven by an all-ones Manchester-encoded signal.

3.1.5 10BASE-T RECEIVE

On the receive side, input buffer and level detecting squelch circuits are employed. A differential input receiver circuit and a phase-locked loop (PLL) perform the decoding function. The Manchester-encoded data stream is separated into clock signal and NRZ data. A squelch circuit rejects signals with levels less than 300 mV or with short pulse widths in order to prevent noises at the receive inputs from falsely triggering the decoder. When the input exceeds the squelch limit, the PLL locks onto the incoming signal and the KSZ9021GQ decodes a data frame. The receiver clock is maintained active during idle periods in between receiving data frames.

3.2 Functional Description: 1000Base-T Transceiver

The 1000Base-T transceiver is based-on a mixed-signal / digital signal processing (DSP) architecture, which includes the analog front-end, digital channel equalizers, trellis encoders/decoders, echo cancellers, cross-talk cancellers, precision clock recovery scheme, and power efficient line drivers.

The following figure shows a high-level block diagram of a single channel of the 1000Base-T transceiver for one of the four differential pairs.

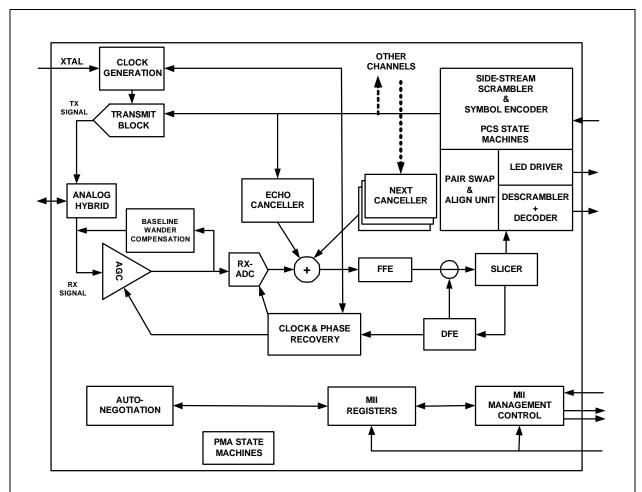

FIGURE 3-2: KSZ9021GQ 1000BASE-T BLOCK DIAGRAM - SINGLE CHANNEL

3.2.1 ANALOG ECHO CANCELLATION CIRCUIT

In 1000Base-T mode, the analog echo cancellation circuit helps to reduce the near-end echo. This analog hybrid circuit relieves the burden of the ADC and the adaptive equalizer.

This circuit is disabled in 10Base-T/100Base-TX mode.

3.2.2 AUTOMATIC GAIN CONTROL (AGC)

In 1000Base-T mode, the automatic gain control (AGC) circuit provides initial gain adjustment to boost up the signal level. This pre-conditioning circuit is used to improve the signal-to-noise ratio of the receive signal.

3.2.3 ANALOG-TO-DIGITAL CONVERTER (ADC)

In 1000Base-T mode, the analog-to-digital converter (ADC) digitizes the incoming signal. ADC performance is essential to the overall performance of the transceiver.

This circuit is disabled in 10Base-T/100Base-TX mode.

3.2.4 TIMING RECOVERY CIRCUIT

In 1000Base-T mode, the mixed-signal clock recovery circuit together with the digital phase locked loop is used to recover and track the incoming timing information from the received data. The digital phase locked loop has very low long-term jitter to maximize the signal-to-noise ratio of the receive signal.

The 1000Base-T slave PHY is required to transmit the exact receive clock frequency recovered from the received data back to the 1000Base-T master PHY. Otherwise, the master and slave will not be synchronized after long transmission. Additionally, this helps to facilitate echo cancellation and NEXT removal.

3.2.5 ADAPTIVE EQUALIZER

In 1000Base-T mode, the adaptive equalizer provides the following functions:

- Detection for partial response signaling
- Removal of NEXT and ECHO noise
- Channel equalization

Signal quality is degraded by residual echo that is not removed by the analog hybrid and echo due to impedance mismatch. The KSZ9021GQ employs a digital echo canceller to further reduce echo components on the receive signal.

In 1000Base-T mode, data transmission and reception occurs simultaneously on all four pairs of wires (four channels). This results in high frequency cross-talk coming from adjacent wires. The KSZ9021GQ employs three NEXT cancellers on each receive channel to minimize the cross-talk induced by the other three channels.

In 10Base-T/100Base-TX mode, the adaptive equalizer needs only to remove the inter-symbol interference and recover the channel loss from the incoming data.

3.2.6 TRELLIS ENCODER AND DECODER

In 1000Base-T mode, the transmitted 8-bit data is scrambled into 9-bit symbols and further encoded into 4D-PAM5 symbols. The initial scrambler seed is determined by the specific PHY address to reduce EMI when more than one KSZ9021GQ are used on the same board. On the receiving side, the idle stream is examined first. The scrambler seed, pair skew, pair order and polarity have to be resolved through the logic. The incoming 4D-PAM5 data is then converted into 9-bit symbols and then de-scrambled into 8-bit data.

3.3 Functional Description: Additional 10/100/1000 PHY Features

3.3.1 AUTO MDI/MDI-X

The Automatic MDI/MDI-X feature eliminates the need to determine whether to use a straight cable or a crossover cable between the KSZ9021GQ and its link partner. This auto-sense function detects the MDI/MDI-X pair mapping from the link partner, and then assigns the MDI/MDI-X pair mapping of the KSZ9021GQ accordingly.

The following table shows the KSZ9021GQ 10/100/1000 pin-out assignments for MDI/MDI-X pin mapping.

Pin (P 45 noir)	MDI			MDI-X		
Pin (RJ-45 pair)	1000Base-T	100Base-TX	10Base-T	1000Base-T	100Base-TX	10Base-T
TXRXP/M_A (1,2)	A+/-	TX+/-	TX+/-	B+/-	RX+/-	RX+/-
TXRXP/M_B (3,6)	B+/-	RX+/-	RX+/-	A+/-	TX+/-	TX+/-
TXRXP/M_C (4,5)	C+/-	Not used	Not used	D+/-	Not used	Not used
TXRXP/M_D (7,8)	D+/-	Not used	Not used	C+/-	Not used	Not used

TABLE 3-1: MDI / MDI-X PIN MAPPING

Auto MDI/MDI-X is enabled by default. It is disabled by writing a one to register 28 (1Ch) bit 6. MDI and MDI-X mode is set by register 28 (1Ch) bit 7 if auto MDI/MDI-X is disabled.

An isolation transformer with symmetrical transmit and receive data paths is recommended to support auto MDI/MDI-X.

3.3.2 PAIR- SWAP, ALIGNMENT, AND POLARITY CHECK

In 1000Base-T mode, the KSZ9021GQ

- detects incorrect channel order and automatically restore the pair order for the A, B, C, D pairs (four channels)
- supports 50±/-10ns difference in propagation delay between pairs of channels in accordance with the IEEE 802.3 standard, and automatically corrects the data skew so the corrected four pairs of data symbols are synchronized

Incorrect pair polarities of the differential signals are automatically corrected for all speeds.

3.3.3 WAVE SHAPING, SLEW RATE CONTROL AND PARTIAL RESPONSE

In communication systems, signal transmission encoding methods are used to provide the noise-shaping feature and to minimize distortion and error in the transmission channel.

- For 1000Base-T, a special partial response signaling method is used to provide the band-limiting feature for the transmission path.
- · For 100Base-TX, a simple slew rate control method is used to minimize EMI.
- For 10Base-T, pre-emphasis is used to extend the signal quality through the cable.

3.3.4 PLL CLOCK SYNTHESIZER

The KSZ9021GQ generates 125MHz, 25MHz and 10MHz clocks for system timing. Internal clocks are generated from the external 25 MHz crystal or reference clock.

3.4 Auto-Negotiation

The KSZ9021GQ conforms to the auto-negotiation protocol, defined in Clause 28 of the IEEE 802.3 Specification.

Auto-negotiation allows UTP (Unshielded Twisted Pair) link partners to select the highest common mode of operation.

During auto-negotiation, link partners advertise capabilities across the UTP link to each other, and then compare their own capabilities with those they received from their link partners. The highest speed and duplex setting that is common to the two link partners is selected as the mode of operation.

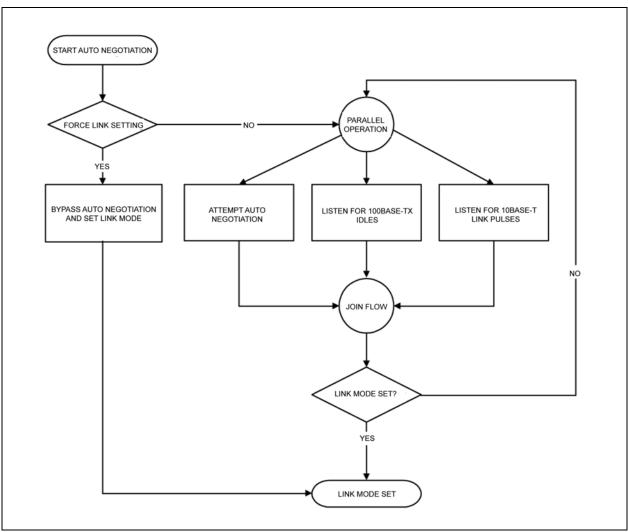

The following list shows the speed and duplex operation mode from highest to lowest.

- Priority 1: 1000Base-T, full-duplex
- · Priority 2: 1000Base-T, half-duplex
- Priority 3: 100Base-TX, full-duplex
- · Priority 4: 100Base-TX, half-duplex
- Priority 5: 10Base-T, full-duplex
- Priority 6: 10Base-T, half-duplex

If auto-negotiation is not supported or the KSZ9021GQ link partner is forced to bypass auto-negotiation for 10Base-T and 100Base-TX modes, then the KSZ9021GQ sets its operating mode by observing the input signal at its receiver. This is known as parallel detection, and allows the KSZ9021GQ to establish link by listening for a fixed signal protocol in the absence of auto-negotiation advertisement protocol.

The auto-negotiation link up process is shown in the following flow chart.

For 1000Base-T mode, auto-negotiation is required and always used to establish a link. During 1000Base-T auto-negotiation, the Master and Slave configuration is first resolved between link partners, and then the link is established with the highest common capabilities between link partners.

Auto-negotiation is enabled by default at power-up or after hardware reset. Afterwards, auto-negotiation can be enabled or disabled through register 0 bit 12. If auto-negotiation is disabled, the speed is set by register 0 bits 6 and 13, and the duplex is set by register 0 bit 8.

If the speed is changed on the fly, the link goes down and either auto-negotiation or parallel detection will initiate until a common speed between KSZ9021GQ and its link partner is re-established for a link.

If link is already established and there is no change of speed on the fly, then the changes will not take effect unless either auto-negotiation is restarted through register 0 bit 9, or a link down to link up transition occurs (i.e., disconnecting and reconnecting the cable).

After auto-negotiation is completed, the link status is updated in register 1 and the link partner capabilities are updated in registers 5, 6, and 10.

The auto-negotiation finite state machines employ interval timers to manage the auto-negotiation process. The duration of these timers under normal operating conditions are summarized in the following table.

TABLE 3-2: AUTO-NEGOTIATION TIMERS

Auto-Negotiation Interval Timers	Time Duration
Transmit Burst interval	16 ms
Transmit Pulse interval	68 us
FLP detect minimum time	17.2 us
FLP detect maximum time	185 us
Receive minimum Burst interval	6.8 ms
Receive maximum Burst interval	112 ms
Data detect minimum interval	35.4 us
Data detect maximum interval	95 us
NLP test minimum interval	4.5 ms
NLP test maximum interval	30 ms
Link Loss time	52 ms
Break Link time	1480 ms
Parallel Detection wait time	830 ms
Link Enable wait time	1000 ms

3.5 GMII Interface

The Gigabit Media Independent Interface (GMII) is compliant to the IEEE 802.3 Specification. It provides a common interface between GMII PHYs and MACs, and has the following key characteristics:

- Pin count is 24 pins (11 pins for data transmission, 11 pins for data reception, and 2 pins for carrier and collision indication).
- 1000Mbps is supported at both half and full duplex.
- Data transmission and reception are independent and belong to separate signal groups.
- Transmit data and receive data are each 8-bit wide, a byte.

In GMII operation, the GMII pins function as follow:

- The MAC sources the transmit reference clock, GTX_CLK, at 125MHz for 1000Mbps.
- The PHY recovers and sources the receive reference clock, RX_CLK, at 125MHz for 1000Mbps.
- TX_EN, TXD[7:0] and TX_ER are sampled by the KSZ9021GQ on the rising edge of GTX_CLK.
- RX_DV, RXD[7:0], and RX_ER are sampled by the MAC on the rising edge of RX_CLK.
- CRS and COL are driven by the KSZ9021GQ and are not required to transition synchronously with respect to either GTX_CLK or RX_CLK.

The KSZ9021GQ combines GMII mode with MII mode to form GMII/MII mode to support data transfer at 10/100/1000 Mbps speed. After power-up or reset, the KSZ9021GQ is configured to GMII/MII mode if the MODE[3:0] strap-in pins are set to 0001. See Strapping Options section.

The KSZ9021GQ has the option to output a low jitter 125MHz reference clock on CLK125_NDO (pin 107). This clock provides a lower cost reference clock alternative for GMII/MII MACs that require a 125MHz crystal or oscillator. The 125MHz clock output is enabled after power-up or reset if the CLK125_EN strap-in pin is pulled high.

The KSZ9021GQ provides a dedicated transmit clock input pin for GMII mode, defined as follows:

GTX_CLK (input, pin 65): Sourced by MAC in GMII mode for 1000Mbps speed.

3.5.1 GMII SIGNAL DEFINITION

The following table describes the GMII signals. Refer to Clause 35 of the IEEE 802.3 Specification for more detailed information.

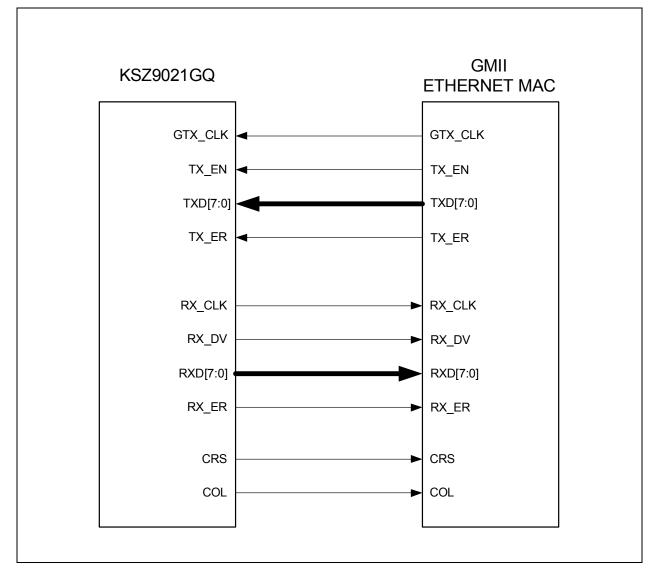

GMII Signal Name (per spec)	GMII Signal Name (per KSZ9021GQ)	Pin Type (with respect to PHY)	Pin Type (with respect to MAC)	Description
GTX_CLK	GTX_CLK	Input	Output	Transmit Reference Clock (125MHz for 1000Mbps)
TX_EN	TX_EN	Input	Output	Transmit Enable
TXD[7:0]	TXD[7:0]	Input	Output	Transmit Data [7:0]
TX_ER	TX_ER	Input	Output	Transmit Error
RX_CLK	RX_CLK	Output	Input	Receive Reference Clock (125MHz for 1000Mbps)
RX_DV	RX_DV	Output	Input	Receive Data Valid
RXD[7:0]	RXD[7:0]	Output	Input	Receive Data [7:0]
RX_ER	RX_ER	Output	Input	Receive Error
CRS	CRS	Output	Input	Carrier Sense
COL	COL	Output	Input	Collision Detected

TABLE 3-3: GMII SIGNAL DEFINITION

3.5.2 GMII SIGNAL DIAGRAM

The KSZ9021GQ GMII pin connections to the MAC are shown in the following figure.

3.6 MII Interface

The Media Independent Interface (MII) is compliant with the IEEE 802.3 Specification. It provides a common interface between MII PHYs and MACs, and has the following key characteristics:

- Pin count is 16 pins (7 pins for data transmission, 7 pins for data reception, and 2 pins for carrier and collision indication).
- 10Mbps and 100Mbps are supported at both half and full duplex.
- · Data transmission and reception are independent and belong to separate signal groups.
- Transmit data and receive data are each 4-bit wide, a nibble.

In MII operation, the MII pins function as follow:

- The PHY sources the transmit reference clock, TX_CLK, at 25MHz for 100Mbps and 2.5MHz for 10Mbps.
- The PHY recovers and sources the receive reference clock, RX_CLK, at 25MHz for 100Mbps and 2.5MHz for 10Mbps.

- TX_EN, TXD[3:0] and TX_ER are driven by the MAC and shall transition synchronously with respect to TX_CLK.
- RX_DV, RXD[3:0], and RX_ER are driven by the KSZ9021GQ and shall transition synchronously with respect to RX_CLK.
- CRS and COL are driven by the KSZ9021GQ and are not required to transition synchronously with respect to either TX_CLK or RX_CLK.

The KSZ9021GQ combines GMII mode with MII mode to form GMII/MII mode to support data transfer at 10/100/1000 Mbps speeds. After the power-up or reset, the KSZ9021GQ is then configured to GMII/MII mode if the MODE[3:0] strapin pins are set to 0001. See Strapping Options section.

The KSZ9021GQ has the option to output a low jitter 125MHz reference clock on CLK125_NDO (pin 107). This clock provides a lower cost reference clock alternative for GMII/MII MACs that require a 125MHz crystal or oscillator. The 125MHz clock output is enabled after power-up or reset if the CLK125_EN strap-in pin is pulled high.

The KSZ9021GQ provides a dedicated transmit clock output pin for MII mode, defined as follow:

• TX_CLK (output, pin 115) : Sourced by KSZ9021GQ in MII mode for 10/100Mbps speed

3.6.1 MII SIGNAL DEFINITION

The following table describes the MII signals. Refer to Clause 22 of the IEEE 802.3 Specification for detailed information.

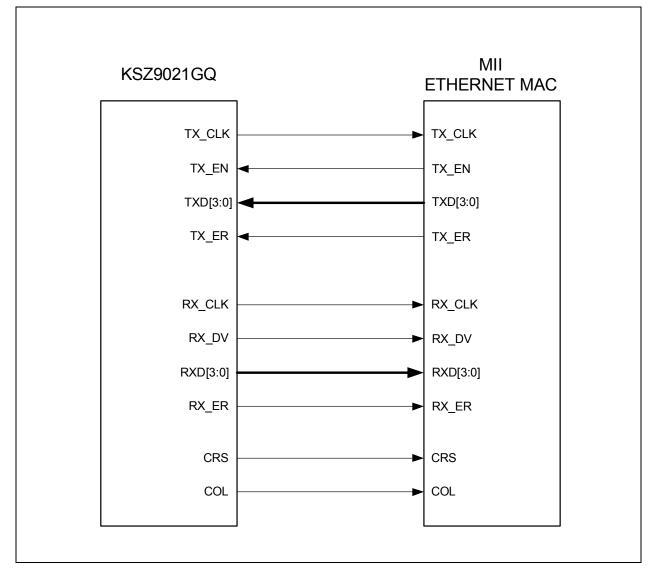

MII Signal Name (per spec)	MII Signal Name (per KSZ9021GQ)	Pin Type (with respect to PHY)	Pin Type (with respect to MAC)	Description
TX_CLK	TX_CLK	Output	Input	Transmit Reference Clock (25MHz for 100Mbps, 2.5MHz for 10Mbps)
TX_EN	TX_EN	Input	Output	Transmit Enable
TXD[3:0]	TXD[3:0]	Input	Output	Transmit Data [3:0]
TX_ER	TX_ER	Input	Output	Transmit Error
RX_CLK	RX_CLK	Output	Input	Receive Reference Clock (25MHz for 100Mbps, 2.5MHz for 10Mbps)
RX_DV	RX_DV	Output	Input	Receive Data Valid
RXD[3:0]	RXD[3:0]	Output	Input	Receive Data [3:0]
RX_ER	RX_ER	Output	Input	Receive Error
CRS	CRS	Output	Input	Carrier Sense
COL	COL	Output	Input	Collision Detected

TABLE 3-4: MII SIGNAL DEFINITION

3.6.2 MII SIGNAL DIAGRAM

The KSZ9021GQ MII pin connections to the MAC are shown in the following figure.

3.7 MII Management (MIIM) Interface

The KSZ9021GQ supports the IEEE 802.3 MII Management Interface, also known as the Management Data Input/Output (MDIO) Interface. This interface allows upper-layer devices to monitor and control the state of the KSZ9021GQ. An external device with MIIM capability is used to read the PHY status and/or configure the PHY settings. Further detail on the MIIM interface can be found in Clause 22.2.4.5 of the IEEE 802.3 Specification.

The MIIM interface consists of the following:

- A physical connection that incorporates the clock line (MDC) and the data line (MDIO).
- A specific protocol that operates across the aforementioned physical connection that allows an external controller to communicate with one or more KSZ9021GQ device. Each KSZ9021GQ device is assigned a PHY address between 1 and 31 by the PHYAD[4:0] strapping pins.

• A 32 register address space to access the KSZ9021GQ IEEE Defined Registers, Vendor Specific Registers and Extended Registers. See Register Map section.

The following table shows the MII Management frame format for the KSZ9021GQ.

	Preamble	Start of Frame	Read/Write OP Code	PHY Address Bits [4:0]	REG Address Bits [4:0]	ТА	Data Bits [15:0]	ldle
Read	32 1's	01	10	AAAAA	RRRRR	Z0	DDDDDDDD_DDDDDDDD	Z
Write	32 1's	01	01	AAAAA	RRRRR	10	DDDDDDDD_DDDDDDD	Z

 TABLE 3-5:
 MII MANAGEMENT FRAME FORMAT – FOR KSZ9021GQ

3.8 Interrupt (INT_N)

INT_N (pin 101) is an optional interrupt signal that is used to inform the external controller that there has been a status update in the KSZ9021GQ PHY register. Bits [15:8] of register 27 (1Bh) are the interrupt control bits to enable and disable the conditions for asserting the INT_N signal. Bits [7:0] of register 27 (1Bh) are the interrupt status bits to indicate which interrupt conditions have occurred. The interrupt status bits are cleared after reading register 27 (1Bh).

Bit 14 of register 31 (1Fh) sets the interrupt level to active high or active low. The default is active low.

The MII management bus option gives the MAC processor complete access to the KSZ9021GQ control and status registers. Additionally, an interrupt pin eliminates the need for the processor to poll the PHY for status change.

3.9 LED Mode

The KSZ9021GQ provides six programmable LED output pins (LED1 thru LED6) that are configurable to support three LED modes. Bits [7:6] of register 17 (11h) are the LED Mode Select [1:0] bits, and are defined as follows:

- 00 = Reserved not used
- 10 = 4-LED Configuration
- 01 = 5-LED Configuration
- 11 = 6-LED Configuration (default setting after power-up / reset)

3.9.1 4-LED CONFIGURATION

In this LED mode, the link and activity are combined into one LED for each speed. The unused pins LED2 and LED1 are internally pulled high.

LED pin	Pin State	LED Definition	Description
LED6	н	OFF	10Base-T, Link off
	L	ON	10Base-T, Link on
	Toggle	Blinking	10Base-T, Activity
LED5	Н	OFF	100Base-TX, Link off
	L	ON	100Base-TX, Link on
	Toggle	Blinking	100Base-TX, Activity
LED4	Н	OFF	1000Base-T, Link off
	L	ON	1000Base-T, Link on
	Toggle	Blinking	1000Base-T, Activity
LED3	Н	OFF	Half-duplex
	L	ON	Full-duplex
	Toggle	Blinking	Collision

TABLE 3-6: 4-LED CONFIGURATION – PIN DEFINITION

3.9.2 5-LED CONFIGURATION

In this LED mode, the transmit and receive activities are combined into pin LED1. The unused pin LED2 is internally pulled high.

LED pin	Pin State	LED Definition	Description
LED6	Н	OFF	10Base-T, Link off
	L	ON	10Base-T, Link on
LED5	Н	OFF	100Base-TX, Link off
	L	ON	100Base-TX, Link on
LED4	Н	OFF	1000Base-T, Link off
	L	ON	1000Base-T, Link on
LED3	Н	OFF	Half-duplex
	L	ON	Full-duplex
	Toggle	Blinking	Collision
LED1	Н	OFF	No Activity
	L	ON	Transmit or Receive Activity
	Toggle	Blinking	

TABLE 3-7: 5-LED CONFIGURATION – PIN DEFINITION

3.9.3 6-LED CONFIGURATION

In this LED mode, all six LED pins are used. Pins LED2 and LED1 are dedicated for receive activity and transmit activity, respectively, for all speeds.

TABLE 3-8:6-LED CONFIGURATION – PIN DEFINITION

LED pin	Pin State	LED Definition	Description
LED6	Н	OFF	10Base-T, Link off
	L	ON	10Base-T, Link on
LED5	Н	OFF	100Base-TX, Link off
	L	ON	100Base-TX, Link on
LED4	Н	OFF	1000Base-T, Link off
	L	ON	1000Base-T, Link on
LED3	Н	OFF	Half-duplex
	L	ON	Full-duplex
	Toggle	Blinking	Collision
LED2	Н	OFF	No Receive Activity
	L	ON	Receive Activity
	Toggle	Blinking	
LED1	Н	OFF	No Transmit Activity
	L	ON	Transmit Activity
	Toggle	Blinking	

Each LED output pin can directly drive a LED with a series resistor (typically 220Ω to 470Ω).

For activity indication, the LED output toggles at approximately 12.5Hz (80ms) to ensure visibility to the human eye.

3.10 NAND Tree Support

The KSZ9021GQ provides parametric NAND tree support for fault detection between chip I/Os and board. The NAND tree mode is enabled at power-up / reset with the MODE[3:0] strap-in pins set to 0100.

The following table lists the NAND tree pin order.

Pin	Description
LED6	Input
LED5	Input
LED4	Input
LED3	Input
LED2	Input
LED1	Input
TXD0	Input
TXD1	Input
TXD2	Input
TXD3	Input
TXD4	Input
TXD5	Input
TXD6	Input
TXD7	Input
TX_ER	Input
GTX_CLK	Input
TX_EN	Input
RXD7	Input
RXD6	Input
RXD5	Input
RXD4	Input
RX_DV	Input
RX_ER	Input
RX_CLK	Input
CRS	Input
COL	Input

MDC	Input
A1	Input
MDIO	Input
CLK125_NDO	Output

TABLE 3-9: NAND TREE TEST PIN ORDER – FOR KSZ9021GQ

3.11 Power Management

The KSZ9021GQ offers the following power management modes:

3.11.1 POWER SAVING MODE

This mode is a KSZ9021GQ green feature to reduce power consumption when the cable is unplugged. It is in effect when auto-negotiation mode is enabled and the cable is disconnected (no link).

3.11.2 SOFTWARE POWER-DOWN MODE

This mode is used to power down the KSZ9021GQ device when it is not in use after power-up. Power-down mode is enabled by writing a one to register 0h bit 11. In the power-down state, the KSZ9021GQ disables all internal functions, except for the MII management interface. The KSZ9021GQ exits power-down mode after writing a zero to register 0h bit 11.

3.11.3 CHIP POWER-DOWN MODE

This mode provides the lowest power state for the KSZ9021GQ when it is not in use and is mounted on the board. Chip power-down mode is enabled at power-up / reset with the MODE[3:0] strap-in pins set to 0111. The KSZ9021GQ exits chip power down mode when a hardware reset is applied to RESET_N (pin 110) with the MODE[3:0] strap-in pins set to an operating mode other than chip power-down mode.

4.0 **REGISTER MAP**

The IEEE 802.3 Specification provides a 32 register address space for the PHY. Registers 0 thru 15 are standard PHY registers, defined per the specification. Registers 16 thru 31 are vendor specific registers.

The KSZ9021GQ uses the IEEE provided register space for IEEE Defined Registers and Vendor Specific Registers, and uses the following registers to access Extended Registers:

- · Register 11 (Bh) for Extended Register Control
- · Register 12 (Ch) for Extended Register Data Write
- · Register 13 (Dh) for Extended Register Data Read

Examples:

2.

- Extended Register Read // Read from Operation Mode Strap Status Register
- 1. Write register 11 (Bh) with 0103h

// Set register 259 (103h) for read // Read register value

· Extended Register Write

Read register 13 (Dh)

// Write to Operation Mode Strap Override Register

- 1. Write register 11 (Bh) with 8102h
- Write register 12 (Ch) with 0010h 2.

// Set register 258 (102h) for write

- // Write 0010h value to register to set NAND Tree mode

Note 1: Exceeding the absolute maximum rating may damage the device. Stresses greater than the absolute maximum rating may cause permanent damage to the device. Operation of the device at these or any other conditions above those specified in the operating sections of this specification is not implied. Maximum conditions for extended periods may affect reliability.

2: The device is not guaranteed to function outside its operating rating.

3: $T_A = 25^{\circ}C$. Specification is for packaged product only.

t _{hi}	RX_CLK high pulse width	14		26	ns
t _{lo}	RX_CLK low pulse width	14		26	ns

6.5 Auto-Negotiation Timing

Timing Parameter	Description	Min	Тур	Max	Units
t _{втв}	FLP Burst to FLP Burst	8	16	24	ms
t _{FLPW}	FLP Burst width		2		ms
t _{PW}	Clock/Data Pulse width		100		ns
t _{CTD}	Clock Pulse to Data Pulse	55.5	64	69.5	μS
t _{CTC}	Clock Pulse to Clock Pulse	111	128	139	μS
	Number of Clock/Data Pulse per FLP Burst	17		33	

6.6 MDC/MDIO Timing

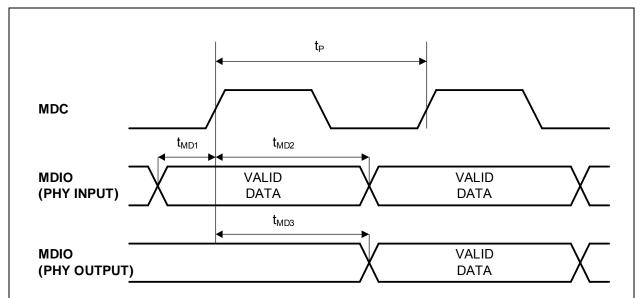

TABLE 6-6: MDC/MDIO TIMING PARAMETERS

Timing Parameter	Description	Min	Тур	Max	Unit
t _P	MDC period		400		ns
t _{1MD1}	MDIO (PHY input) setup to rising edge of MDC	10			ns
t _{MD2}	MDIO (PHY input) hold from rising edge of MDC	10			ns
t _{MD3}	MDIO (PHY output) delay from rising edge of MDC	0			ns

6.7 Reset Timing

The recommended KSZ9021GQ power-p reset timing is summarized in the following figure and table.

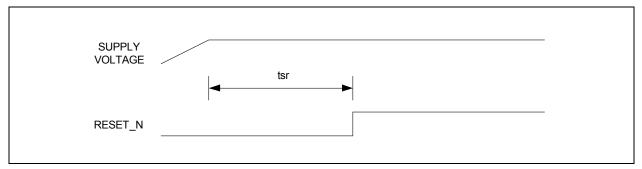

TABLE 6-7: RESET TIMING PARAMETERS

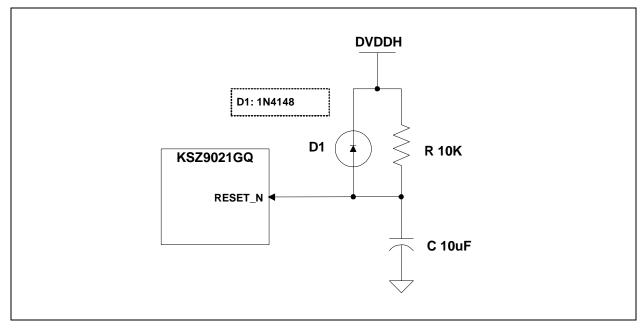

Parameter	Description	Min	Max	Units
t _{sr}	Stable supply voltage to reset high	10		ms

After the de-assertion of reset, it is recommended to wait a minimum of 100µs before starting programming on the MIIM (MDC/MDIO) Interface.

6.8 Reset Circuit

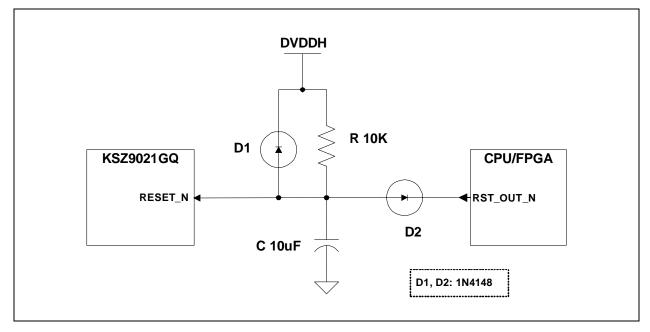

The following reset circuit is recommended for powering up the KSZ9021GQ if reset is triggered by the power supply.

The following reset circuit is recommended for applications where reset is driven by another device (e.g., CPU or FPGA). At power-on-reset, R, C and D1 provide the necessary ramp rise time to reset the KSZ9021GQ device. The RST_OUT_N from CPU/FPGA provides the warm reset after power up.

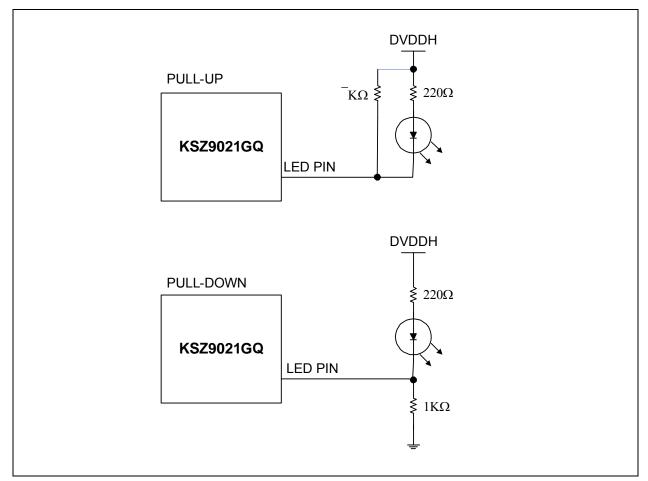

6.9 Reference Circuits – LED Strap-in Pins

The pull-up and pull-down reference circuits for the LED5/PHYAD4, LED4/PHYAD3, LED3/PHYAD2, LED2/PHYAD1 and LED1/PHYAD0 strapping pins are shown in the following figure.

FIGURE 6-10: REFERENCE CIRCUITS FOR LED STRAPPING PINS

6.10 Reference Clock – Connection and Selection

A crystal or external clock source, such as an oscillator, is used to provide the reference clock for the KSZ9021GQ. The reference clock is 25 MHz for all operating modes of the KSZ9021GQ.

The following figure and table shows the reference clock connection to XI (pin 124) and XO (pin 123) of the KSZ9021GQ, and the reference clock selection criteria.

FIGURE 6-11: 25MHZ CRYSTAL / OSCILLATOR REFERENCE CLOCK CONNECTION

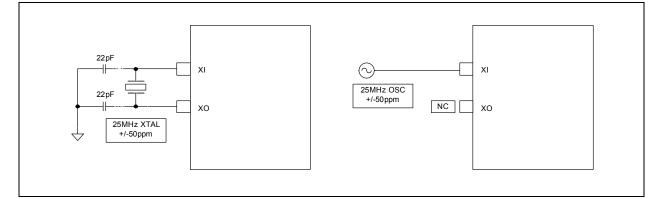

TABLE 6-8: REFERENCE CRYSTAL/CLOCK SELECTION CRITERIA

Characteristics	Value	Units
Frequency	25	MHz
Frequency tolerance (max)	±50	ppm

6.11 Magnetics Specification

A 1:1 isolation transformer is required at the line interface. An isolation transformer with integrated common-mode chokes is recommended for exceeding FCC requirements.

The following tables provide recommended magnetic characteristics and a list of qualified magnetics for the KSZ9021GQ.

TABLE 6-9:	MAGNETICS SELECTION CRITERIA

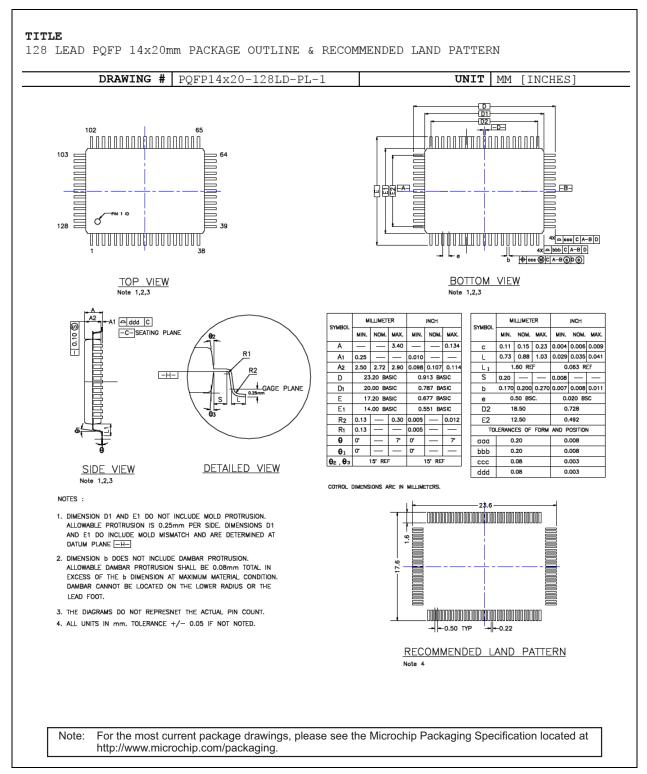

Parameter	Value	Test Condition
Turns ratio	1 CT : 1 CT	
Open-circuit inductance (min.)	350μΗ	100mV, 100kHz, 8mA
Insertion loss (max.)	1.0dB	0MHz – 100MHz
HIPOT (min.)	1500Vrms	

	TABLE 6-10:	QUALIFIED SINGLE PORT 10/100/1000 MAGNETICS
--	-------------	---

Magnetic Manufacturer	Part Number	Auto MDI-X	Number of Port	
Pulse	H5007NL	Yes	1	
ТDК	TLA-7T101LF	Yes	1	

7.0 PACKAGE INFORMATION

FIGURE 7-1: 128-PIN (14MM X 20MM) PQFP PACKAGE OUTLINE AND RECOMMENDED LAND PATTERN

APPENDIX A: DATA SHEET REVISION HISTORY

TABLE A-1: REVISION HISTORY

Revision	Section/Figure/Entry	Correction	
DS00003115A (07-18-19)	Replaces previous Micrel version M9999-091010-1.2		
1.2 (09-10-10)	All	Added support for 2.5V VDD I/O. Added LED drive current. Updated KSZ9021GQ pin outs throughout data sheet to reflect pin out changes for silicon revision A3. Updated boilerplate.	
1.1 (10-13-09)	All	Updated current consumption in Electrical Charac- teristics section. Corrected data sheet omission of register 1 bit 8 for 1000Base-T Extended Status information. Added the following register bits to provide further power saving during software power down: Tri- state all digital I/Os (reg. 258.7), LDO disable (reg. 263.15), Low frequency oscillator mode (reg. 263.8). Corrected tsu minimum for 1000Base-T in GMII Receive Timing Parameters table.	
1.0 (01-16-09)	Data Sheet created	I	

THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- Business of Microchip Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: http://www.microchip.com/support

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

PART NO.	<u>[X]</u> - <u>XXX</u> Temperature Package Range	- [X] ⁽¹⁾ T Tape and Reel Option	Exa a)	mples: KSZ9021GQ Commercial Temperature, GMII/MII
Device: Temperature:	KSZ9021GQ Blank = 0°C to +70°C (Commercial) Industrial)	b)	128-pin PQFP, RoHS Compliant package, Tray KSZ9021GQI Industrial Temperature, GMII/MII 128-pin PQFP, RoHS Compliant package, Tray
Package: Tape and Reel Option:	GQ = 128-pin PQFP Blank = Standard packaging (TR = Tape and Reel ⁽¹⁾	tray)	Note	e 1: Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option.

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

Trademarks
