## DESCRIPTION

The SY100S351 offers six D-type, edge-triggered, master/ slave flip-flops with differential outputs, and is designed for use in high-performance ECL systems. The flip-flops are controlled by the signal from the logical OR operation on a pair of common clock signals (CPa, CPb). Data enters the master when both CPa and CPb are LOW and transfers to the slave when either CPa or CPb (or both) go to a logic HIGH. The Master Reset (MR) input overrides all other inputs and takes the $Q$ outputs to a logic LOW. The inputs on this device have $75 \mathrm{k} \Omega$ pull-down resistors.
