

### 16K Microwire Compatible Serial EEPROM

### **Device Selection Table**

| Part Number | Vcc Range | ORG Pin | PE Pin | Word Size   | Temp Ranges | Packages          |
|-------------|-----------|---------|--------|-------------|-------------|-------------------|
| 93AA86A     | 1.8-5.5   | No      | No     | 8-bit       | I           | OT                |
| 93AA86B     | 1.8-5-5   | No      | No     | 16-bit      | I           | ОТ                |
| 93LC86A     | 2.5-5.5   | No      | No     | 8-bit       | I, E        | OT                |
| 93LC86B     | 2.5-5.5   | No      | No     | 16-bit      | I, E        | OT                |
| 93C86A      | 4.5-5.5   | No      | No     | 8-bit       | I, E        | OT                |
| 93C86B      | 4.5-5.5   | No      | No     | 16-bit      | I, E        | OT                |
| 93AA86C     | 1.8-5.5   | Yes     | Yes    | 8 or 16-bit | I           | P, SN, ST, MS, MC |
| 93LC86C     | 2.5-5.5   | Yes     | Yes    | 8 or 16-bit | I, E        | P, SN, ST, MS, MC |
| 93C86C      | 4.5-5.5   | Yes     | Yes    | 8 or 16-bit | I, E        | P, SN, ST, MS, MC |

#### Features:

- · Low-power CMOS technology
- ORG pin to select word size for '86C' version
- 2048 x 8-bit organization 'A' devices (no ORG)
- 1024 x 16-bit organization 'B' devices (no ORG)
- Program Enable pin to write-protect the entire array ('86C' version only)
- Self-timed erase/write cycles (including auto-erase)
- Automatic ERAL before WRAL
- Power-on/off data protection circuitry
- Industry standard 3-wire serial I/O
- Device Status signal (Ready/Busy)
- · Sequential read function
- 1,000,000 E/W cycles
- Data retention > 200 years
- Temperature ranges supported:
  - Industrial (I) -40°C to +85°C
  - Automotive (E) -40°C to +125°C

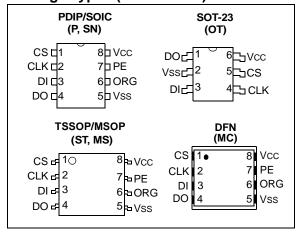

### **Pin Function Table**

| Name | Function             |  |  |  |  |  |  |  |
|------|----------------------|--|--|--|--|--|--|--|
| CS   | Chip Select          |  |  |  |  |  |  |  |
| CLK  | Serial Data Clock    |  |  |  |  |  |  |  |
| DI   | Serial Data Input    |  |  |  |  |  |  |  |
| DO   | Serial Data Output   |  |  |  |  |  |  |  |
| Vss  | Ground               |  |  |  |  |  |  |  |
| PE   | Program Enable       |  |  |  |  |  |  |  |
| ORG  | Memory Configuration |  |  |  |  |  |  |  |
| Vcc  | Power Supply         |  |  |  |  |  |  |  |

### **Description:**

The Microchip Technology Inc. 93XX86A/B/C devices are 16K bit low-voltage serial Electrically Erasable PROMs (EEPROM). Word-selectable devices such as the 93XX86C are dependent upon external logic levels driving the ORG pin to set word size. In the SOT-23 package, the 93XX86A devices provide dedicated 8-bit memory organization, while the 93XX86B devices provide dedicated 16-bit memory organization. A Program Enable (PE) pin allows the user to write-protect the entire memory array. Advanced CMOS technology makes these devices ideal for low-power, nonvolatile memory applications. The entire 93XX Series is available in standard packages including 8-lead PDIP and SOIC, and advanced packaging including 8-lead MSOP, 6-lead SOT-23, 8-lead 2x3 DFN and 8-lead TSSOP. Pb-free (Pure Matte Sn) finish is available.

### Package Types (not to scale)

### 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings (†)

| Vcc                                    | 7.0\              |
|--|-------------------|
| All inputs and outputs w.r.t. Vss      | 0.6V to Vcc +1.0\ |
| Storage temperature                    | 65°C to +150°C    |
| Ambient temperature with power applied | 40°C to +125°C    |
| ESD protection on all pins             | ≥4 k\             |

† NOTICE: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

TABLE 1-1: DC CHARACTERISTICS

### 2.0 FUNCTIONAL DESCRIPTION

When the ORG pin (93XX86C) is connected to Vcc, the (x16) organization is selected. When it is connected to ground, the (x8) organization is selected. Instructions, addresses and write data are clocked into the DI pin on the rising edge of the clock (CLK). The DO pin is normally held in a High-Z state except when reading data from the device, or when checking the Ready/Busy status during a programming operation. The Ready/Busy status can be verified during an Erase/Write operation by polling the DO pin; DO low indicates that programming is still in progress, while DO high indicates the device is ready. DO will enter the High-Z state on the falling edge of CS.

### 2.1 Start Condition

The Start bit is detected by the device if CS and DI are both high with respect to the positive edge of CLK for the first time.

Before a Start condition is detected, CS, CLK and DI may change in any combination (except to that of a Start condition), without resulting in any device operation (Read, Write, Erase, EWEN, EWDS, ERAL or WRAL). As soon as CS is high, the device is no longer in Standby mode.

An instruction following a Start condition will only be executed if the required opcode, address and data bits for any particular instruction are clocked in.

**Note:** When preparing to transmit an instruction, either the CLK or DI signal levels must be

at a logic low as CS is toggled active high.

### 2.2 Data In/Data Out (DI/DO)

It is possible to connect the Data In and Data Out pins together. However, with this configuration it is possible for a "bus conflict" to occur during the "dummy zero" that precedes the read operation, if A0 is a logic high level. Under such a condition the voltage level seen at Data Out is undefined and will depend upon the relative impedances of Data Out and the signal source driving A0. The higher the current sourcing capability of the driver, the higher the voltage at the Data Out pin. In order to limit this current, a resistor should be connected between DI and DO.

### 2.3 Data Protection

All modes of operation are inhibited when VCC is below a typical voltage of 1.5V for '93AA' and '93LC' devices or 3.8V for '93C' devices.

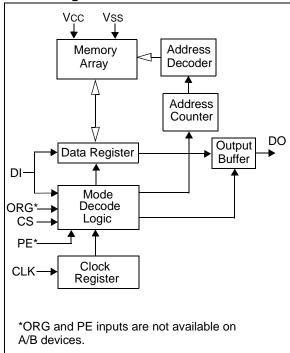

The EWEN and EWDS commands give additional protection against accidentally programming during normal operation.

Note: For added protection, an EWDS command should be performed after every write operation and an external 10  $k\Omega$  pull-down protection resistor should be added to the CS pin.

After power-up the device is automatically in the EWDS mode. Therefore, an EWEN instruction must be performed before the initial ERASE or WRITE instruction can be executed.

Note: To prevent accidental writes to the array in the 93XX86C devices, set the PE pin to a logic low.

### **Block Diagram**

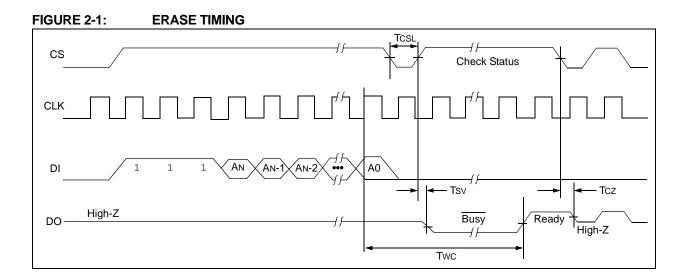

### 2.4 Erase

The ERASE instruction forces all data bits of the specified address to the logical '1' state. The rising edge of CLK before the last address bit initiates the write cycle.

The DO pin indicates the Ready/Busy status of the device if CS is brought high after a minimum of 250 ns low (TcsL). DO at logical '0' indicates that programming is still in progress. DO at logical '1' indicates that the register at the specified address has been erased and the device is ready for another instruction.

Note: After the Erase cycle is complete, issuing a Start bit and then taking CS low will clear the Ready/Busy status from DO.

### 2.5 Erase All (ERAL)

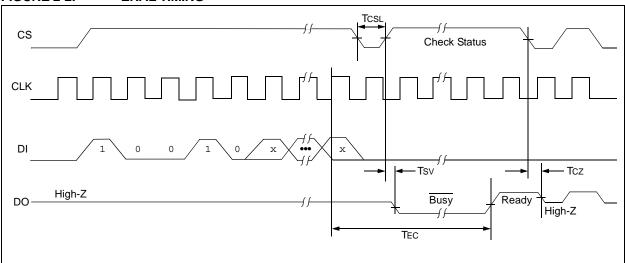

The Erase All (ERAL) instruction will erase the entire memory array to the logical '1' state. The ERAL cycle is identical to the erase cycle, except for the different opcode. The ERAL cycle is completely self-timed. The rising edge of CLK before the last data bit initiates the write cycle. Clocking of the CLK pin is not necessary after the device has entered the ERAL cycle.

The DO pin indicates the Ready/Busy status of the device, if CS is brought high after a minimum of 250 ns low (TCSL).

**Note:** After the ERAL command is complete, issuing a Start bit and then taking CS low will clear the Ready/Busy status from DO.

Vcc must be  $\geq$  4.5V for proper operation of ERAL.

### FIGURE 2-2: ERAL TIMING

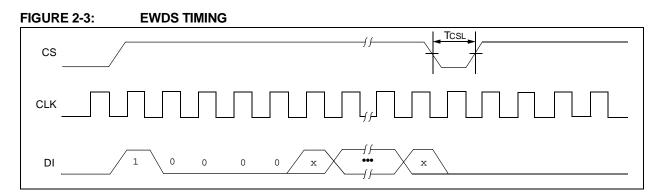

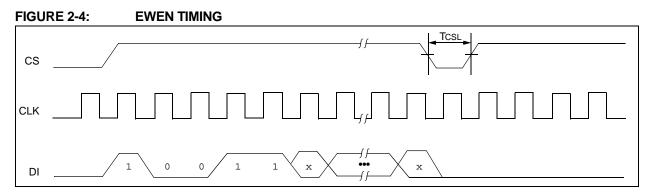

## 2.6 Erase/Write Disable and Enable (EWDS/EWEN)

The 93XX86A/B/C powers up in the Erase/Write Disable (EWDS) state. All programming modes must be preceded by an Erase/Write Enable (EWEN) instruction.

Once the EWEN instruction is executed, programming remains enabled until an EWDS instruction is executed or Vcc is removed from the device.

To protect against accidental data disturbance, the EWDS instruction can be used to disable all Erase/Write functions and should follow all programming operations. Execution of a READ instruction is independent of both the EWEN and EWDS instructions.

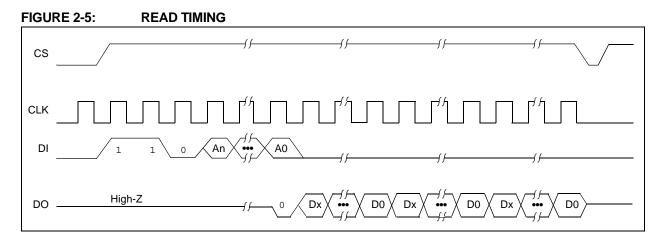

### 2.7 Read

The READ instruction outputs the serial data of the addressed memory location on the DO pin. A dummy zero bit precedes the 8-bit (If ORG pin is low or A-Version devices) or 16-bit (If ORG pin is high or B-version devices) output string.

The output data bits will toggle on the rising edge of the CLK and are stable after the specified time delay (TPD). Sequential read is possible when CS is held high. The memory data will automatically cycle to the next register and output sequentially.

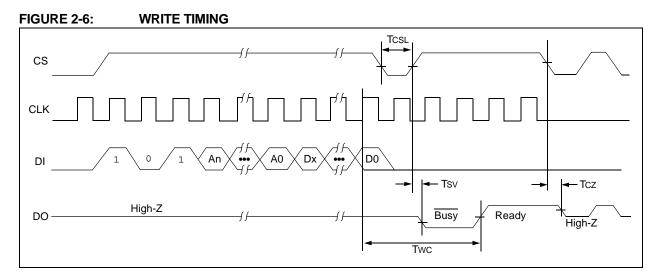

### 2.8 Write

The WRITE instruction is followed by 8 bits (If ORG is low or A-version devices) or 16 bits (If ORG pin is high or B-version devices) of data which are written into the specified address. The self-timed auto-erase and programming cycle is initiated by the rising edge of CLK on the last data bit.

The DO pin indicates the Ready/Busy status of the device, if CS is brought high after a minimum of 250 ns low (Tcsl.). DO at logical '0' indicates that programming is still in progress. DO at logical '1' indicates that the register at the specified address has been written with the data specified and the device is ready for another instruction.

**Note:** The write sequence requires a logic high signal on the PE pin prior to the rising edge of the last data bit.

Note: After the Write cycle is complete, issuing a Start bit and then taking CS low will clear the Ready/Busy status from DO

### 2.9 Write All (WRAL)

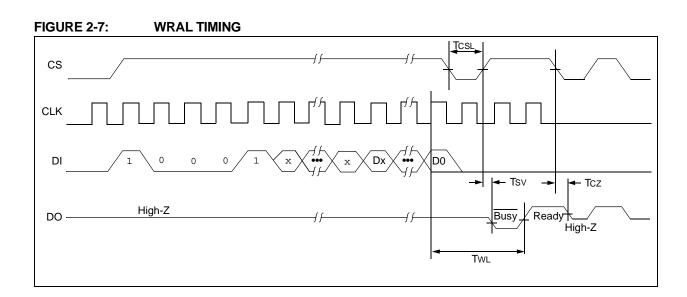

The Write All (WRAL) instruction will write the entire memory array with the data specified in the command. The self-timed auto-erase and programming cycle is initiated by the rising edge of CLK on the last data bit. Clocking of the CLK pin is not necessary after the device has entered the WRAL cycle. The WRAL command does include an automatic ERAL cycle for the device. Therefore, the WRAL instruction does not require an ERAL instruction, but the chip must be in the EWEN status.

The DO pin indicates the Ready/Busy status of the device if CS is brought high after a minimum of 250 ns low (TCSL).

**Note:** The write sequence requires a logic high signal on the PE pin prior to the rising edge of the last data bit.

Note: After the Write All cycle is complete, issuing a Start bit and then taking CS low will clear the Ready/Busy status from DO.

VCC must be  $\geq$  4.5V for proper operation of WRAL.

### 3.0 PIN DESCRIPTIONS

TABLE 3-1: PIN DESCRIPTIONS

| Name | SOIC/PDIP/<br>MSOP/TSSOP/<br>DFN | SOT-23 | Function               |
|------|----------------------------------|--------|------------------------|
| CS   | 1                                | 5      | Chip Select            |
| CLK  | 2                                | 4      | Serial Clock           |
| DI   | 3                                | 3      | Data In                |
| DO   | 4                                | 1      | Data Out               |
| Vss  | 5                                | 2      | Ground                 |
| ORG  | 6                                |        | Organization / 93XX86C |
| PE   | 7                                |        | Program Enable         |
| Vcc  | 8                                | 6      | Power Supply           |

### 3.1 Chip Select (CS)

A high level selects the device; a low level deselects the device and forces it into Standby mode. However, a programming cycle which is already in progress will be completed, regardless of the Chip Select (CS) input signal. If CS is brought low during a program cycle, the device will go into Standby mode as soon as the programming cycle is completed.

CS must be low for 250 ns minimum (TCSL) between consecutive instructions. If CS is low, the internal control logic is held in a Reset status.

### 3.2 Serial Clock (CLK)

The Serial Clock is used to synchronize the communication between a master device and the 93XX series device. Opcodes, address and data bits are clocked in on the positive edge of CLK. Data bits are also clocked out on the positive edge of CLK.

CLK can be stopped anywhere in the transmission sequence (at high or low level) and can be continued anytime with respect to clock high time (TCKH) and clock low time (TCKL). This gives the controlling master freedom in preparing opcode, address and data.

CLK is a "don't care" if CS is low (device deselected). If CS is high, but the Start condition has not been detected (DI = 0), any number of clock cycles can be received by the device without changing its status (i.e., waiting for a Start condition).

CLK cycles are not required during the self-timed write (i.e., auto erase/write) cycle.

After detection of a Start condition the specified number of clock cycles (respectively low-to-high transitions of CLK) must be provided. These clock cycles are required to clock in all required opcode, address and data bits before an instruction is executed. CLK and DI then become "don't care" inputs waiting for a new Start condition to be detected.

### 3.3 Data In (DI)

Data In (DI) is used to clock in a Start bit, opcode, address and data, synchronously with the CLK input.

### 3.4 Data Out (DO)

Data Out (DO) is used in the Read mode to output data synchronously with the CLK input (TPD after the positive edge of CLK).

This pin also provides Ready/Busy status information during erase and write cycles. Ready/Busy status information is available on the DO pin if CS is brought high after being low for minimum Chip Select low time (TCsL), and an erase or write operation has been initiated.

The Status signal is not available on DO if CS is held low during the entire erase or write cycle. In this case, DO is in the High-Z mode. If status is checked after the erase/write cycle, the data line will be high to indicate the device is ready.

**Note:** After a programming cycle is complete, issuing a Start bit and then taking CS low will clear the Ready/Busy status from DO.

### 3.5 Organization (ORG)

When the ORG pin is connected to Vcc or Logic HI, the (x16) memory organization is selected. When the ORG pin is tied to Vss or Logic LO, the (x8) memory organization is selected. For proper operation, ORG must be tied to a valid logic level.

93XX86A devices are always x8 organization and 93XX86B devices are always x16 organization.

### 3.6 Program Enable (PE)

This pin allows the user to enable or disable the ability to write data to the memory array. If the PE pin is tied to Vcc, the device can be programmed. If the PE pin is tied to Vss, programming will be inhibited. This pin cannot be floated, it must be tied to Vcc or Vss. PE is not available on 93XX86A or 93XX86B. On those devices, programming is always enabled.

#### 4.0 PACKAGING INFORMATION

### APPENDIX A: REVISION HISTORY

### **Revision C**

Corrections to Section 1.0, Electrical Characteristics. Section 4.1, 6-Lead SOT-23 package to OT.

### **Revision D**

Corrections to Device Selection Table, Table 1-1, Table 1-2, Section 2.4, Section 2.5, Section 2.8 and Section 2.9. Added note to Figure 2-7.

### Revision E

Added DFN package.

### **Revision F**

Added notes throughout.

### **Revision G**

Revised note in Sections 2.8 and 2.9. Replaced DFN package drawing.

### THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- Product Support Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- General Technical Support Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- Business of Microchip Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

## CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com, click on Customer Change Notification and follow the registration instructions.

#### CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- · Distributor or Representative
- · Local Sales Office
- Field Application Engineer (FAE)
- Technical Support
- Development Systems Information Line

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: http://support.microchip.com

### **READER RESPONSE**

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this document.

#### Examples:

- a) 93AA86C-I/MS: 16K, 2048x8 or 1024x16
   Serial EEPROM, MSOP package, 1.8V
- b) 93AA86AT-I/OT: 16K, 2048x8 Serial EEPROM, SOT-23 package, tape and reel, 1.8V
- 93AA86CT-I/MS: 16K, 2048x8 or 1024x16 Serial EEPROM, MSOP package, tape and reel, 1.8V
- a) 93LC86C-I/MS: 16K, 2048x8, 1024x16 Serial EEPROM, MSOP package, 2.5V
- b) 93LC86BT-I/OT: 16K, 1024x16 Serial EEPROM, SOT-23 package, tape and reel, 2.5V
- 93C86C-I/MS: 16K, 2048x8 or 1024x16 Serial EEPROM, MSOP package, 5.0V
- 93C86AT-I/OT: 16K, 2048x8 Serial EEPROM, SOT-23 package, tape and reel, 5.0V

Note 1: Most products manufactured after January 2005 will have a Matte Tin (Pb-free) finish. Most products manufactured before January 2005 will have a finish of approximately 63% Sn and 37% Pb (Sn/Pb).

Please visit www.microchip.com for the latest information on Pb-free conversion, including conversion date codes.

#### Thease visit www.microcrip.com for the latest information of the lotter conversion, including conversion date codes.

### Sales and Support

### **Data Sheets**

Products supported by a preliminary Data Sheet may have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

- 1. Your local Microchip sales office
- 2. The Microchip Corporate Literature Center U.S. FAX: (480) 792-7277
- 3. The Microchip Worldwide Site (www.microchip.com)

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

### **New Customer Notification System**

Register on our web site (www.microchip.com/cn) to receive the most current information on our products.

NOTES:

### Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the
  intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WAR-RANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION. QUALITY. PERFORMANCE. MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip's products as critical components in life support systems is not authorized except with express written approval by Microchip. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

#### **Trademarks**

The Microchip name and logo, the Microchip logo, Accuron, dsPIC, KEELOQ, microID, MPLAB, PIC, PICmicro, PICSTART, PRO MATE, PowerSmart, rfPIC, and SmartShunt are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

AmpLab, FilterLab, Migratable Memory, MXDEV, MXLAB, PICMASTER, SEEVAL, SmartSensor and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Analog-for-the-Digital Age, Application Maestro, dsPICDEM, dsPICDEM.net, dsPICworks, ECAN, ECONOMONITOR, FanSense, FlexROM, fuzzyLAB, In-Circuit Serial Programming, ICSP, ICEPIC, Linear Active Thermistor, MPASM, MPLIB, MPLINK, MPSIM, PICkit, PICDEM, PICDEM.net, PICLAB, PICtail, PowerCal, PowerInfo, PowerMate, PowerTool, Real ICE, rfLAB, rfPICDEM, Select Mode, Smart Serial, SmartTel, Total Endurance, UNI/O, WiperLock and Zena are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

QUALITY MANAGEMENT SYSTEM

CERTIFIED BY DNV

ISO/TS 16949:2002

Microchip received ISO/TS-16949:2002 quality system certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona and Mountain View, California in October 2003. The Company's quality system processes and procedures are for its PICmicro® 8-bit MCUs, KEELoo® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
