AT24C01C and AT24C02C

Atmel

I²C-Compatible (2-wire) Serial EEPROM 1-Kbit (128 x 8), 2-Kbit (256 x 8)

DATASHEET

Features

- Low-voltage Operation
 - V_{CC} = 1.7V to 5.5V
- Internally Organized as 128 x 8 (1K) or 256 x 8 (2K)
- I²C Compatible (2-wire) Serial Interface
- Schmitt Trigger, Filtered Inputs for Noise Suppression
- Bidirectional Data Transfer Protocol
- 400kHz (1.7V) and 1MHz (2.5V, 2.7V, 5.0V) Compatibility
- Write Protect Pin for Hardware Data Protection
- 8-byte Page Write Mode
 - Partial Page Writes Allowed
- Self-timed Write Cycle (5ms max)
- High-reliability
 - Endurance: 1,000,000 Write Cycles
 - Data Retention: 100 Years
- Green Package Options (Pb/Halide-free/RoHS-compliant)
 - 8-lead PDIP, 8-lead JEDEC SOIC, 8-lead TSSOP, 8-pad UDFN, 5-lead SOT23, and 8-ball VFBGA
- Die Sale Options: Wafer Form and Tape and Reel Available

Description

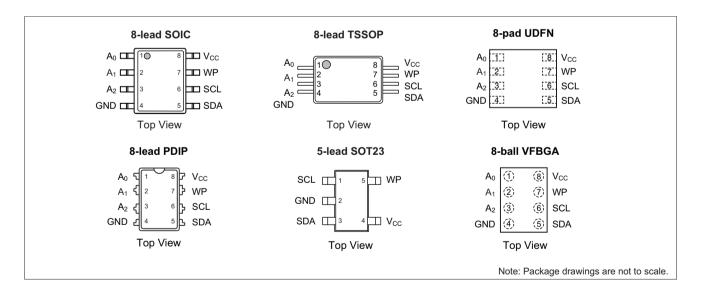

The Atmel[®] AT24C01C/02C provides 1024/2048-bits of Serial Electrically Erasable and Programmable Read-Only Memory (EEPROM) organized as 128/256 words of eight bits each. Both devices include a cascading feature that allows up to eight devices to share a common 2-wire bus. These devices are optimized for use in many industrial and commercial applications where low power and low voltage operation are essential. The AT24C01C/02C are available in space saving 8-lead PDIP, 8-lead JEDEC SOIC, 8-lead TSSOP, 8-lead UDFN, 5-lead SOT23, and 8-ball VFBGA packages. In addition, the entire family operates from 1.7V to 5.5V V_{CC}.

1. Pin Configurations and Pinouts

Pin Number	Pin Symbol	Pin Name and Functional Description	Asserted State	Pin Type
1, 2, 3	$A_0 - A_2$	Address Inputs: The A_2 , A_1 , and A_0 pins are device address inputs that are hard wired. As many as eight 1-Kbit or 2-Kbit devices may be addressed on a single bus system.		Input
4	GND	Ground: The ground reference for the power supply. GND should be connected to the system ground.	—	Power
5	SDA	Serial Data: The SDA pin is bidirectional for serial data transfer. This pin is open drain driven and may be wire-ORed with any number of other open drain or open collector devices.		Input/ Output
6	SCL	Serial Clock Input: The SCL input is used to positive edge clock data into each EEPROM device and negative edge clock data out of each device.	_	Input
7	WP	Write Protect: Provides hardware data protection. The Write Protect pin allows normal read/write operations when connected to Ground (GND). When the Write Protect pin is connected to V_{CC} , the write protection feature is enabled and operates as shown in Table 5-1.		Input
8	V _{CC}	Device Power Supply: The V _{CC} pin is used to supply the source voltage to the device. Operations at invalid V _{CC} voltages may produce spurious results and should not be attempted.	_	Power

Table 1-1. Pin Descriptions

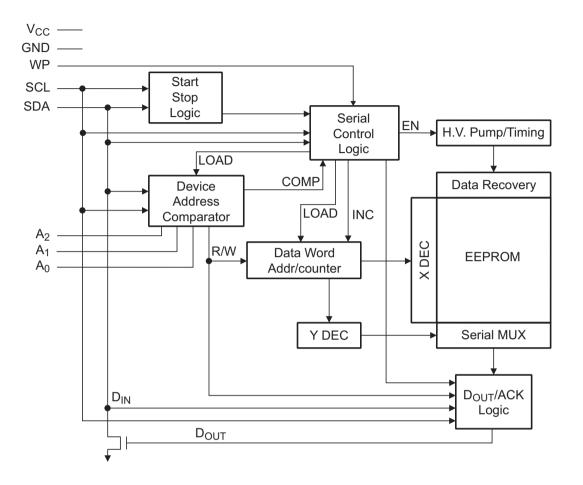

Note: 1. For use of 5-lead SOT23, the software A2, A1, and A0 bits in the device address word must be set to zero to properly communicate.

2. Block Diagram

3. Absolute Maximum Ratings

Operating Temperature55°C to +125°C
Storage Temperature65°C to +150°C
Voltage on any pin with respect to ground1.0V to +7.0V
Maximum Operating Voltage 6.25V
DC Output Current

*Notice: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

4. Memory Organization

AT24C01C, 1K Serial EEPROM: Internally organized with 16 pages of eight bytes each, the 1K requires a 7-bit data word address for random word addressing.

AT24C02C, 2K Serial EEPROM: Internally organized with 32 pages of eight bytes each, the 2K requires an 8-bit data word address for random word addressing.

4.1 Pin Capacitance

Table 4-1.Pin Capacitance⁽¹⁾

Applicable over recommended operating range from $T_A = 25^{\circ}$ C, f = 1.0MHz, $V_{CC} = 1.7$ V to 5.5V.

Symbol	Test Condition	Мах	Units	Conditions
C _{I/O}	Input/Output Capacitance (SDA)	8	pF	V _{I/O} = 0V
C _{IN}	Input Capacitance (A ₀ , A ₁ , A ₂ , SCL)	6	pF	$V_{IN} = 0V$

Note: 1. This parameter is characterized and is not 100% tested.

4.2 DC Characteristics

Table 4-2. DC Characteristics

Applicable over recommended operating range from: $T_{AI} = -40^{\circ}C$ to $+85^{\circ}C$, $V_{CC} = 1.7V$ to 5.5V (unless otherwise noted).

Symbol	Parameter	Test Condition	Min	Тур	Мах	Units
V _{CC1}	Supply Voltage		1.7		5.5	V
V _{CC2}	Supply Voltage		2.5		5.5	V
V _{CC3}	Supply Voltage		4.5		5.5	V
I _{CC1}	Supply Current V_{CC} = 5.0V	Read at 400kHz		0.4	1.0	mA
I _{CC2}	Supply Current V_{CC} = 5.0V	Write at 400kHz		2.0	3.0	mA
I _{SB1}	Standby Current V_{CC} = 1.7V	V_{IN} = V_{CC} or V_{SS}			1.0	μA
I _{SB2}	Standby Current V _{CC} = $2.5V$	V_{IN} = V_{CC} or V_{SS}			2.0	μA
I _{SB3}	Standby Current V_{CC} = 5.5V	V_{IN} = V_{CC} or V_{SS}			6.0	μA
ILI	Input Leakage Current	V_{IN} = V_{CC} or V_{SS}		0.10	3.0	μA
I _{LO}	Output Leakage Current	V_{OUT} = V_{CC} or V_{SS}		0.05	3.0	μA
V _{IL}	Input Low Level ⁽¹⁾		-0.6		V _{CC} x 0.3	V
V _{IH}	Input High Level ⁽¹⁾		V _{CC} x 0.7		V _{CC} + 0.5	V
V _{OL1}	Output Low Level V _{CC} = 1.7V	I _{OL} = 0.15mA			0.2	V
V _{OL2}	Output Low Level V_{CC} = 3.0V	I _{OL} = 2.1mA			0.4	V

Note: 1. V_{IL} min and V_{IH} max are reference only and are not tested.

4.3 AC Characteristics

Table 4-3. AC Characteristics

Applicable over recommended operating range from $T_{AI} = -40^{\circ}$ C to +85°C, $V_{CC} = 1.7$ V to 5.5V, CL = 1TTL Gate and 100pF (unless otherwise noted). Test conditions are listed in Note 2.

		1.7V		2.5V, 5.0V			
Symbol	Parameter	Min	Max	Min	Max	Units	
f _{SCL}	Clock Frequency, SCL		400		1000	kHz	
t _{LOW}	Clock Pulse Width Low	1.2		0.4		μs	
t _{HIGH}	Clock Pulse Width High	0.6		0.4		μs	
t _i	Noise Suppression Time		100		50	ns	
t _{AA}	Clock Low to Data Out Valid	0.1	0.9	0.05	0.55	μs	
t _{BUF}	Time the bus must be free before a new transmission can start.	1.2		0.5		μs	
t _{HD.STA}	Start Hold Time	0.6		0.25		μs	
t _{SU.STA}	Start Setup Time	0.6		0.25		μs	
t _{HD.DAT}	Data In Hold Time	0		0		μs	
t _{SU.DAT}	Data In Setup Time	100		100		ns	
t _R	Inputs Rise Time ⁽¹⁾		0.3		0.3	μs	
t _F	Inputs Fall Time ⁽¹⁾		300		100	ns	
t _{SU.STO}	Stop Setup Time	0.6		.25		μs	
t _{DH}	Data Out Hold Time	50		50		ns	
t _{wR}	Write Cycle Time		5		5	ms	
Endurance ⁽¹⁾ 3.3V, +25°C, Page Mode			1,00	0,000		Write Cycles	

Note: 1. This parameter is ensured by characterization only.

- 2. AC measurement conditions:
 - R_L (connects to V_{CC}): 1.3 kΩ (2.5V, 5V), 10 kΩ (1.7V)
 - Input pulse voltages: 0.3 V_{CC} to 0.7 V_{CC}
 - Input rise and fall times: \leq 50ns
 - Input and output timing reference voltages: 0.5 V_{CC}

5. Write Protection

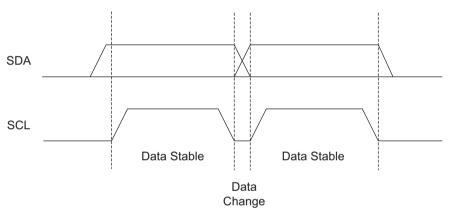

The AT24C01C/02C utilizes a hardware data protection scheme that allows the user to write protect the entire memory contents when the WP pin is at V_{CC} (or a valid V_{IH}). No write protection will be set if the WP pin is at GND or left floating.

WP Pin Status	Part of the Array Protected
At V _{CC}	Full (2K) Array
At GND	Normal Read/Write Operations

6. Device Operation

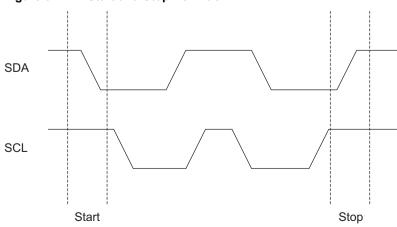

Clock and Data Transitions: The SDA pin is normally pulled high with an external device. Data on the SDA pin may change only during SCL low time periods. Data changes during SCL high periods will indicate a Start or Stop condition as defined below.

Start Condition: A high-to-low transition of SDA with SCL high is a Start condition which must precede any other command.

Stop Condition: A low-to-high transition of SDA with SCL high is a Stop condition. After a read sequence, the Stop condition will place the EEPROM in a standby power mode.

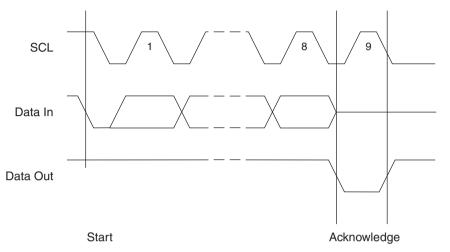

Acknowledge: All addresses and data words are serially transmitted to and from the EEPROM in 8-bit words. The EEPROM sends a zero to acknowledge that it has received each word. This happens during the ninth clock cycle.

Standby Mode: The AT24C01C/02C features a low-power standby mode which is enabled:

- Upon power-up.
- After the receipt of the Stop condition and the completion of any internal operations.

2-wire Software Reset: After an interruption in protocol, power-loss, or system reset, any 2-wire part can be reset by following these steps:

- 1. Create a Start condition (if possible).
- 2. Clock nine cycles.
- 3. Create another Start condition followed by Stop condition as shown in Figure 6-4.

The device will be ready for the next communication after above steps have been completed. The device should be ready for the next communication after above steps have been completed. In the event that the device is still non-responsive or remains active on the SDA bus, a power cycle must be used to reset the device.

Figure 6-4. Software Reset

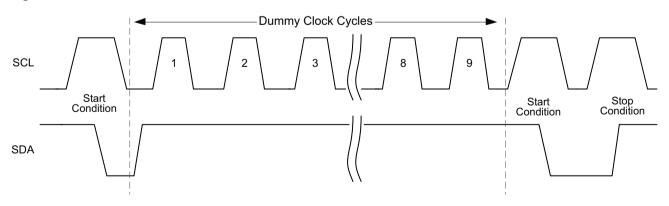

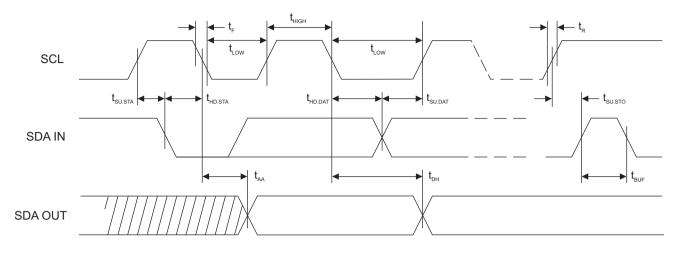

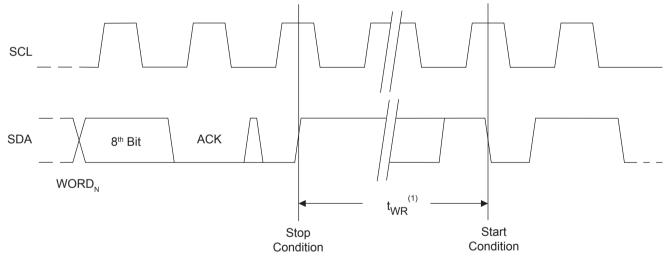

Figure 6-5. Bus Timing

SCL: Serial Clock, SDA: Serial Data I/O

Figure 6-6. Write Cycle Timing

SCL: Serial Clock, SDA: Serial Data I/O

Note: 1. The write cycle time t_{WR} is the time from a valid Stop condition of a write sequence to the end of the internal clear/write cycle.

Atmel

7. Device Addressing

The 1-Kbit and 2-Kbit EEPROM device requires an 8-bit device address word following a Start condition to enable the device for a Read or Write operation.

The device address word consists of a mandatory `1010' (0xA) sequence for the first four most significant bits as shown in Figure 7-1. This is common to all Serial EEPROM devices.

The next three bits are the A2, A1, and A0 device address bits for the 1K and 2K EEPROM. These three bits must compare to their corresponding hard-wired input pins A_2 , A_1 , and A_0 in order for the part to acknowledge.

The eighth bit of the device address is the Read/Write operation select bit. A Read operation is initiated if this bit is high and a Write operation is initiated if this bit is low.

Upon a valid compare of the device address with hard-wired input pins A_2 , A_1 , and A_0 , the EEPROM will output a zero. If a compare is not successfully made, the chip will return to a standby state.

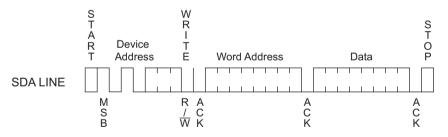

8. Write Operations

Byte Write: A Byte Write operation requires an 8-bit data word address following the device address word and acknowledgment. Upon receipt of this address, the EEPROM will again respond with a zero and then clock in the first 8-bit data word. Following receipt of the 8-bit data word, the EEPROM will output a zero and the addressing device, such as a microcontroller, must terminate the write sequence with a Stop condition. At this time, the EEPROM enters an internally timed write cycle, t_{WR} , to the nonvolatile memory. All inputs are disabled during this write cycle and the EEPROM will not respond until the write is complete.

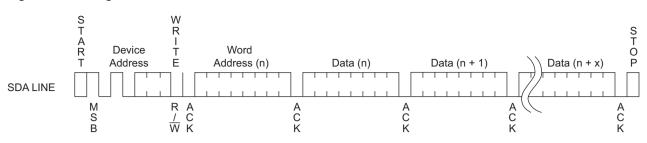

Page Write: The 1-Kbit and 2-Kbit EEPROM are capable of an 8-byte Page Write.

A Page Write is initiated the same as a Byte Write, but the microcontroller does not send a Stop condition after the first data word is clocked in. Instead, after the EEPROM acknowledges receipt of the first data word, the microcontroller can transmit up to seven data words. The EEPROM will respond with a zero after each data word received. The microcontroller must terminate the page write sequence with a Stop condition.

The data word address lower three bits are internally incremented following the receipt of each data word. The higher data word address bits are not incremented, retaining the memory page row location. When the word address, internally generated, reaches the page boundary, the following byte is placed at the beginning of the same page. If more than eight data words are transmitted to the EEPROM, the data word address will "roll over" and previous data will be overwritten.

Atmel

Acknowledge Polling: Once the internally timed write cycle has started and the EEPROM inputs are disabled, acknowledge polling can be initiated. This involves sending a Start condition followed by the device address word. The read/write bit is representative of the operation desired. Only if the internal write cycle has completed will the EEPROM respond with a zero allowing the read or write sequence to continue.

Data Security: The AT24C01C/02C has a hardware data protection scheme that allows the user to write protect the entire memory when the WP pin is at V_{CC} .

9. Read Operations

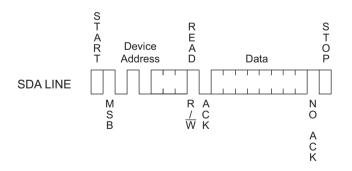

Read operations are initiated the same way as write operations with the exception that the read/write select bit in the device address word is set to one. There are three read operations:

- Current Address Read
- Random Address Read
- Sequential Read.

Current Address Read: The internal data word address counter maintains the last address accessed during the last read or write operation, incremented by one. This address stays valid between operations as long as the chip power is maintained. The address roll-over during read is from the last byte of the last memory page to the first byte of the first page. The address roll-over during write is from the last byte of the current page to the first byte of the same page.

Once the device address with the read/write select bit set to one is clocked in and acknowledged by the EEPROM, the current address data word is serially clocked out. The microcontroller does not respond with an zero but does generate a following Stop condition

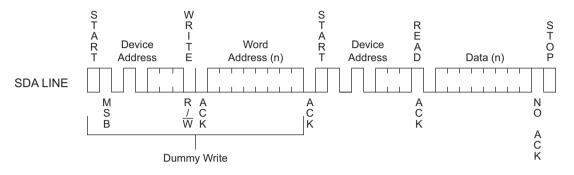

Figure 9-1. Current Address Read

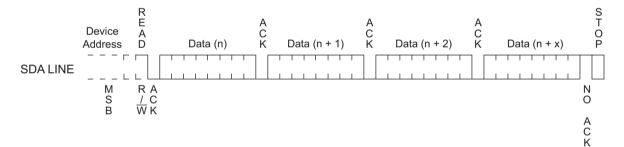

Random Read: A Random Read requires a dummy byte write sequence to load in the data word address. Once the device address word and data word address are clocked in and acknowledged by the EEPROM, the microcontroller must generate another start condition. The microcontroller now initiates a Current Address Read by sending a device address with the read/write select bit high. The EEPROM acknowledges the device address and serially clocks out the data word. The microcontroller does not respond with a zero but does generate a following stop condition.

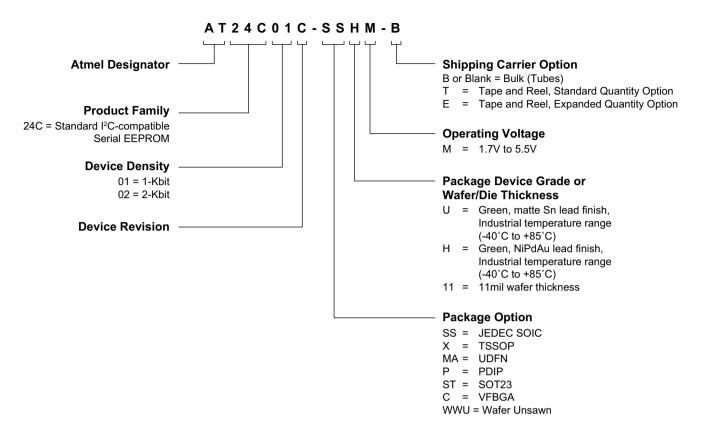

Sequential Read: Sequential Reads are initiated by either a Current Address Read or a Random Address Read. After the microcontroller receives a data word, it responds with an acknowledge. As long as the EEPROM receives an acknowledge, it will continue to increment the data word address and serially clock out sequential data words. When the memory address limit is reached, the data word address will roll-over and the Sequential Read will continue. The Sequential Read operation is terminated when the microcontroller does not respond with a zero but does generate a following stop condition.

14. Revision History

Doc. Rev.	Date	Comments
8700H	12/2016	Part marking SOT23: - Moved backside mark (YMXX) to front side line2. - Added @ = Country of Assembly.
8700G	01/2015	Add the UDFN extended quantity option. Update part markings, package drawings, ordering information, template, and reorganize.
8700F	06/2012	Correct ordering codes: - AT24C01C-WWU11, Die Sale to AT24C01C-WWU11M, Wafer Sale. - AT24C02C-WWU11, Die Sale to AT24C02C-WWU11M, Wafer Sale. Remove WDT from ordering code detail. Update Atmel logos and disclaimer page.
8700E	05/2012	Update datasheet template. Add AT24C01C to document. Electrical performance improvements: - Reduce all ISB from legacy values - Increase 1MHz frequency range to include 2.5V operation. Update package drawings to latest versions (where applicable) and selected waveforms.
8700D	08/2010	Change AT24C02C-XHM Part Marking from C02CM@ to 02CM @.
8700C	07/2010	Ordering Information: - Change Atmel AT24C02C-TSUM-T to Atmel AT24C02C-STUM-T. - Change Atmel AT24C02CY6-MAHM-T to Atmel AT24C02C-MAHM-T. - Change Atmel AT24C02CU3-CUM-T to Atmel AT24C02C-CUM-T. Catalog numbering scheme, change TS = SOT23 to ST = SOT23. Part marking SOT23: - Change 2CMWU to 2CMBU. - Change W = Write Protection Feature to B = Write Protection. Part marking PDIP and SOIC: Added @ = Country of Assembly. Part marking TSSOP: Replaced and removed bottom mark. Part marking UDFN: Added HM@. Remove preliminary status. Change t _I Max 40 to 50 in Table AC Characteristics.
8700B	02/2010	Correct catalog numbering scheme and ordering information.
8700A	12/2009	Initial document release.

Atmel Enabling Unlimited Possibilities[®]

DISCLAIMER: The information in this document is provided in connection with Atmel products. No license, express or implied, by estoppel or otherwise, to any intellectual property right is granted by this document or in connection with the sale of Atmel products. EXCEPT AS SET FORTH IN THE ATMEL TERMS AND CONDITIONS OF SALES LOCATED ON THE ATMEL WEBSITE, ATMEL ASSUMES NO LIABILITY WHATSOEVER AND DISCLAIMS ANY EXPRESS, IMPLIED OR STATUTORY WARRANTY RELATING TO ITS PRODUCTS INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL ATMEL BE LIABLE FOR ANY DIRECT, INDIRECT, CONSEQUENTIAL, PUNITIVE, SPECIAL OR INCIDENTAL DAMAGES (INCLUDING, WITHOUT LIMITATION, DAMAGES FOR SAND PROFITS, BUSINESS INTERRUPTION, OR LOSS OF INFORMATION) ARISING OUT OF THE USE OR INABILITY TO USE THIS DOCUMENT, EVEN IF ATMEL HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. Atmel makes no representations or warranties with respect to the accuracy or completeness of the contents of this document and reserves the right to make changes to specifications and products descriptions at any time without notice. Atmel does not make any commitment to update the information authorized, or warranted for use as components in applications intended to support or sustain life.

SAFETY-CRITICAL, MILITARY, AND AUTOMOTIVE APPLICATIONS DISCLAIMER: Atmel products are not designed for and will not be used in connection with any applications where the failure of such products would reasonably be expected to result in significant personal injury or death ("Safety-Critical Applications") without an Atmel officer's specific written consent. Safety-Critical Applications include, without limitation, life support devices and systems, equipment or systems for the operation of nuclear facilities and weapons systems. Atmel products are not designed nor intended for use in military or aerospace applications or environments unless specifically designated by Atmel as military-grade. Atmel products are not designed nor intended for use in automotive applications unless specifically designated by Atmel as automotive-grade.
