## Overview

The ATtiny $11 / 12$ is a low-power CMOS 8-bit microcontroller based on the AVR RISC architecture. By executing powerful instructions in a single clock cycle, the ATtiny11/12 achieves throughputs approaching 1 MIPS per MHz, allowing the system designer to optimize power consumption versus processing speed.
The AVR core combines a rich instruction set with 32 general-purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

Table 1. Parts Description

| Device | Flash | EEPROM | Register | Voltage Range | Frequency |
| :--- | :--- | :--- | :--- | :--- | :--- |
| ATtiny11L | 1 K | - | 32 | $2.7-5.5 \mathrm{~V}$ | $0-2 \mathrm{MHz}$ |
| ATtiny11 | 1 K | - | 32 | $4.0-5.5 \mathrm{~V}$ | $0-6 \mathrm{MHz}$ |
| ATtiny12V | 1 K | 64 B | 32 | $1.8-5.5 \mathrm{~V}$ | $0-1.2 \mathrm{MHz}$ |
| ATtiny12L | 1 K | 64 B | 32 | $2.7-5.5 \mathrm{~V}$ | $0-4 \mathrm{MHz}$ |
| ATtiny12 | 1 K | 64 B | 32 | $4.0-5.5 \mathrm{~V}$ | $0-8 \mathrm{MHz}$ |

The ATtiny11/12 AVR is supported with a full suite of program and system development tools including: macro assemblers, program debugger/simulators, in-circuit emulators, and evaluation kits.

## ATtiny11 Block Diagram

See Figure 1 on page 3. The ATtiny11 provides the following features: 1K bytes of Flash, up to five general-purpose I/O lines, one input line, 32 general-purpose working registers, an 8-bit timer/counter, internal and external interrupts, programmable Watchdog Timer with internal oscillator, and two software-selectable power-saving modes. The Idle Mode stops the CPU while allowing the timer/counters and interrupt system to continue functioning. The Power-down Mode saves the register contents but freezes the oscillator, disabling all other chip functions until the next interrupt or hardware reset. The wake-up or interrupt on pin change features enable the ATtiny11 to be highly responsive to external events, still featuring the lowest power consumption while in the power-down modes.

The device is manufactured using Atmel's high-density nonvolatile memory technology. By combining an RISC 8-bit CPU with Flash on a monolithic chip, the Atmel ATtiny11 is a powerful microcontroller that provides a highly-flexible and cost-effective solution to many embedded control applications.

The ATtiny 12 provides the following features: 1 K bytes of Flash, 64 bytes EEPROM, up to six general-purpose I/O lines, 32 general-purpose working registers, an 8-bit timer/counter, internal and external interrupts, programmable Watchdog Timer with internal oscillator, and two software-selectable power-saving modes. ## Pin Descriptions

vcc
GND
Port B (PB5..PB0)

XTAL1
XTAL2
RESET

Supply voltage pin.
Ground pin.
Port B is a 6-bit I/O port. PB4..0 are I/O pins that can provide internal pull-ups (selected for each bit). On ATtiny11, PB5 is input only. On ATtiny12, PB5 is input or open-drain output. The port pins are tri-stated when a reset condition becomes active, even if the clock is not running. The use of pins PB5.. 3 as input or I/O pins is limited, depending on reset and clock settings, as shown below.

Table 2. PB5..PB3 Functionality vs. Device Clocking Options

| Device Clocking Option | PB5 | PB4 | PB3 |
| :--- | :---: | :---: | :---: |
| External Reset Enabled | Used $^{(1)}$ | $-(2)$ | - |
| External Reset Disabled | Input $^{(3)} / / / O^{(4)}$ | - | - |
| External Crystal | - | Used | Used |
| External Low-frequency Crystal | - | Used | Used |
| External Ceramic Resonator | - | Used | Used |
| External RC Oscillator | - | I/O ${ }^{(5)}$ | Used |
| External Clock | - | I/O | Used |
| Internal RC Oscillator | - | I/O | I/O |

Notes: 1. "Used" means the pin is used for reset or clock purposes.
2. "-" means the pin function is unaffected by the option.
3. Input means the pin is a port input pin.
4. On ATtiny11, PB5 is input only. On ATtiny12, PB5 is input or open-drain output.
5. $\mathrm{I} / \mathrm{O}$ means the pin is a port input/output pin.

Input to the inverting oscillator amplifier and input to the internal clock operating circuit.
Output from the inverting oscillator amplifier.
Reset input. An external reset is generated by a low level on the RESET pin. Reset pulses longer than 50 ns will generate a reset, even if the clock is not running. Shorter pulses are not guaranteed to generate a reset.

Notes: 1. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.
2. Some of the status flags are cleared by writing a logical one to them. Note that the CBI and SBI instructions will operate on all bits in the I/O register, writing a one back into any flag read as set, thus clearing the flag. The CBI and SBI instructions work with registers $\$ 00$ to $\$ 1 F$ only.
