
16-Bit Microcontrollers and Digital Signal Controllers with High-Speed PWM, USB and Advanced Analog

Operating Conditions

- 3.0V to 3.6V, -40°C to +125°C, DC to 60 MIPS
- 3.0V to 3.6V, -40°C to +85°C, DC to 70 MIPS

Core: 16-Bit dsPIC33E/PIC24E CPU

- Code-Efficient (C and Assembly) architecture
- Two 40-Bit Wide Accumulators
- Single-Cycle (MAC/MPY) with Dual Data Fetch
- Single-Cycle Mixed-Sign MUL Plus Hardware Divide
- 32-Bit Multiply Support

Clock Management

- 2% Internal Oscillator
- Programmable PLLs and Oscillator Clock Sources
- Fail-Safe Clock Monitor (FSCM)
- Independent Watchdog Timer
- Fast Wake-up and Start-up

Power Management

- Low-Power Management modes (Sleep, Idle, Doze)
- Integrated Power-on Reset and Brown-out Reset
- 1.0 mA/MHz Dynamic Current (typical)
- 60 μ A IPD Current (typical)

High-Speed PWM

- Up to Seven PWM Pairs with Independent Timing
- Dead Time for Rising and Falling Edges
- 8.32 ns PWM Resolution
- PWM Support for:
 - DC/DC, AC/DC, Inverters, PFC, Lighting
 - BLDC, PMSM, ACIM, SRM
- Programmable Fault Inputs
- Flexible Trigger Configurations for ADC Conversions

Advanced Analog Features

- Two Independent ADC modules:
 - One ADC configurable as 10-bit, 1.1 Msps with four S&H or 12-bit, 500 ksps with one S&H
 - One 10-bit ADC, 1.1 Msps with four S&H
 - Eight S&H using both ADC 10-bit modules
 - 24 analog channels (64-pin devices) up to 32 analog channels (100/121/144-pin devices)
- Flexible and Independent ADC Trigger Sources
- Comparators:
 - Up to three Analog Comparator modules
 - Programmable references with 32 voltage points

Timers/Output Compare/Input Capture

- 27 General Purpose Timers:
 - Nine 16-bit and up to four 32-bit Timers/Counters
 - 16 OC modules configurable as Timers/Counters
 - Two 32-bit Quadrature Encoder Interface (QEI) modules configurable as Timers/Counters
- 16 IC modules
- Peripheral Pin Select (PPS) to allow Function Remap
- Real-Time Clock and Calendar (RTCC) module

Communication Interfaces

- USB 2.0 OTG-Compliant Full-Speed Interface
- Four UART modules (15 Mbps)
 - Supports LIN/J2602 protocols and IrDA®
- Four 4-Wire SPI modules (15 Mbps)
- Two ECAN™ modules (1 Mbaud) CAN 2.0B Support
- Two I²C modules (up to 1 Mbaud) with SMBus Support
- Data Converter Interface (DCI) module with Support for I²S and Audio Codecs
- PPS to allow Function Remap
- Parallel Master Port (PMP)
- Programmable Cyclic Redundancy Check (CRC)

Direct Memory Access (DMA)

- 15-Channel DMA with User-Selectable Priority Arbitration
- UART, USB, SPI, ADC, ECAN™, IC, OC, Timers, DCI/I²S, PMP

Input/Output

- Sink/Source 10 mA on All Pins
- 5V Tolerant Pins
- Selectable Open-Drain, Pull-ups and Pull-Downs
- Up to 5 mA Overvoltage Clamp Current
- External Interrupts on All I/O pins

Qualification and Class B Support

- AEC-Q100 REVG (Grade 1 -40°C to +125°C) Planned
- AEC-Q100 REVG (Grade 0 -40°C to +150°C) Planned
- Class B Safety Library, IEC 60730

Debugger Development Support

- In-Circuit and In-Application Programming
- Five Program and Three Complex Data Breakpoints
- IEEE 1149.2 Compatible (JTAG) Boundary Scan
- Trace and Run-Time Watch

dsPIC33EPXXX(GP/MC/MU)806/810/814
and PIC24EPXXX(GP/GU)810/814
PRODUCT FAMILIES

The device names, pin counts, memory sizes and peripheral availability of each device are listed in Table 1. Their pinout diagrams appear on the following pages.

TABLE 1: dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814

- Note 1:** Flash size is inclusive of 24 Kbytes of auxiliary Flash. Auxiliary Flash supports simultaneous code execution and self-erase/programming. Refer to Section 5. “Flash Programming” (DS70609) in the “dsPIC33E/PIC24E Family Reference Manual”.
- 2:** RAM size is inclusive of 4 Kbytes of DMA RAM (DPSRAM) for all devices.
- 3:** Up to eight of these timers can be combined into four 32-bit timers.
- 4:** Eight out of nine timers are remappable.
- 5:** PWM Faults and Sync signals are remappable.
- 6:** Four out of five interrupts are remappable.
- 7:** Comparator output is remappable.
- 8:** The ADC2 module supports 10-bit mode only.

Pin Diagrams

- Note 1:** The RPN/RPIn pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select”](#) for available peripherals and for information on limitations.
- 2:** Every I/O port pin (RAX-RGX) can be used as change notification (CNAX-CNGX). See [Section 11.0 “I/O Ports”](#) for more information.
- 3:** The availability of I²C™ interfaces varies by device. Selection (SDAx/SCLx or ASDAx/ASCLx) is made using the device Configuration bits, ALTI2C1 and ALTI2C2 (FPOR<5:4>). See [Section 29.0 “Special Features”](#) for more information.

Pin Diagrams

- Note 1:** The RPN/RPIN pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select”](#) for available peripherals and for information on limitations.
- 2:** Every I/O port pin (RAX-RGX) can be used as change notification (CNAX-CNGX). See [Section 11.0 “I/O Ports”](#) for more information.
- 3:** The availability of I²C™ interfaces varies by device. Selection (SDAx/SCLx or ASDAx/ASCLx) is made using the device Configuration bits, ALTI2C1 and ALTI2C2 (FPOR<5:4>). See [Section 29.0 “Special Features”](#) for more information.

Pin Diagrams

- Note 1:** The RPN/RPI pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select”](#) for available peripherals and for information on limitations.
- 2:** Every I/O port pin (RAX-RGX) can be used as change notification (CNAX-CNGX). See [Section 11.0 “I/O Ports”](#) for more information.
- 3:** The availability of I²C™ interfaces varies by device. Selection (SDAx/SCLx or ASDAx/ASCLx) is made using the device Configuration bits, ALTI2C1 and ALTI2C2 (FPOR<5:4>). See [Section 29.0 “Special Features”](#) for more information.

Pin Diagrams (Continued)

- Note 1:** The RPN/RPIn pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select”](#) for available peripherals and for information on limitations.
- 2:** Every I/O port pin (RAX-RGx) can be used as change notification (CNAX-CNGx). See [Section 11.0 “I/O Ports”](#) for more information.
- 3:** The availability of I²C™ interfaces varies by device. Selection (SDAx/SCLx or ASDAx/ASCLx) is made using the device Configuration bits, ALTI2C1 and ALTI2C2 (FPOR<5:4>). See [Section 29.0 “Special Features”](#) for more information.

Pin Diagrams (Continued)

- Note 1:** The RPN/RPI pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select”](#) for available peripherals and for information on limitations.
- 2:** Every I/O port pin (RAX-RGx) can be used as change notification (CNAX-CNGx). See [Section 11.0 “I/O Ports”](#) for more information.
- 3:** The availability of I²C™ interfaces varies by device. Selection (SDAx/SCLx or ASDAx/ASCLx) is made using the device Configuration bits, ALT12C1 and ALT12C2 (FPOR<5:4>). See [Section 29.0 “Special Features”](#) for more information.

Pin Diagrams (Continued)

- Note 1:** The RPN/RPIn pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select”](#) for available peripherals and for information on limitations.
- 2:** Every I/O port pin (RAX-RGx) can be used as change notification (CNAX-CNGx). See [Section 11.0 “I/O Ports”](#) for more information.
- 3:** The availability of I²C™ interfaces varies by device. Selection (SDAx/SCLx or ASDAx/ASCLx) is made using the device Configuration bits, ALTI2C1 and ALTI2C2 (FPOR<5:4>). See [Section 29.0 “Special Features”](#) for more information.

D11	ASCL1 ⁽³⁾ /PMCS2/RPI74/RD10	J7	AN12/PMA11/RPI44/RB12

- Note 1:** The RPN/RPI pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select”](#) for available peripherals and for information on limitations.
- Note 2:** Every I/O port pin (RAx-RGx) can be used as change notification (CNAX-CNGx). See [Section 11.0 “I/O Ports”](#) for more information.
- Note 3:** The availability of I²C™ interfaces varies by device. Selection (SDAx/SCLx or ASDAx/ASCLx) is made using the device Configuration bits, ALTI2C1 and ALTI2C2 (FPOR<5:4>). See [Section 29.0 “Special Features”](#) for more information.
- Note 4:** The pin name is SCL1/RG2 for the dsPIC33EP512(GP/MC)806 and PIC24EP512GP806 devices.
- Note 5:** The pin name is SDA1/RG3 for the dsPIC33EP512(GP/MC)806 and PIC24EP512GP806 devices.

TABLE 3: PIN NAMES: PIC24EP256GU810 AND PIC24EP512GU810 DEVICES^(1,2) (CONTINUED)

Pin Number	Full Pin Name
E1	AN19/RPI52/RC4
E2	AN18/RPI51/RC3
E3	C1IN3-/SCK2/PMA5/RP118/RG6
E4	AN17/RPI50/RC2
E5	No Connect
E6	RP113/RG1
E7	No Connect
K4	AN8/PMA6/RPI40/RB8
K5	No Connect
K6	RP108/RF12
K7	AN14/PMA1/RPI46/RB14
K8	VDD
K9	RP79/RD15
K10	USBID/RP99/RF3
K11	RP98/RF2
L1	PGEC1/AN6/RPI38/RB6
L2	VREF-/RA9

Pin Number	Full Pin Name
J8	No Connect
J9	No Connect
J10	RP104/RF8
J11	D-/RG3 ⁽⁵⁾
K1	PGEC3/AN1/RPI33/RB1
K2	PGED3/AN0/RPI32/RB0
K3	VREF+/RA10
L3	AVSS
L4	AN9/PMA7/RPI41/RB9
L5	AN10/CVREF/PMA13/RPI42/RB10
L6	RP109/RF13
L7	AN13/PMA10/RPI45/RB13
L8	AN15/PMA0/RPI47/RB15
L9	RPI78/RD14
L10	SDA2 ⁽³⁾ /PMA9/RP100/RF4
L11	SCL2 ⁽³⁾ /PMA8/RP101/RF5

- Note** 1: The RPN/RPIN pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select”](#) for available peripherals and for information on limitations.
- 2: Every I/O port pin (RAX-RGX) can be used as change notification (CNAX-CNGX). See [Section 11.0 “I/O Ports”](#) for more information.
- 3: The availability of I²C™ interfaces varies by device. Selection (SDAX/SCLX or ASDAX/ASCLX) is made using the device Configuration bits, ALTI2C1 and ALTI2C2 (FPOR<5:4>). See [Section 29.0 “Special Features”](#) for more information.
- 4: The pin name is SCL1/RG2 for the dsPIC33EP512(GP/MC)806 and PIC24EP512GP806 devices.
- 5: The pin name is SDA1/RG3 for the dsPIC33EP512(GP/MC)806 and PIC24EP512GP806 devices.

TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at docerrors@microchip.com or fax the **Reader Response Form** in the back of this data sheet to (480) 792-4150. We welcome your feedback.

Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

<http://www.microchip.com>

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000A is version A of document DS30000).

Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; <http://www.microchip.com>
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

Customer Notification System

Register on our web site at www.microchip.com to receive the most current information on all of our products.

Referenced Sources

This device data sheet is based on the following individual chapters of the “*dsPIC33E/PIC24E Family Reference Manual*”. These documents should be considered as the general reference for the operation of a particular module or device feature.

Note: To access the documents listed below, browse to the documentation section of the [dsPIC33EP512MU814](http://www.microchip.com) product page on the Microchip web site (www.microchip.com).

In the event you are not able to access the product page using the link above, enter this URL in your browser:

NOTES:

1.0 DEVICE OVERVIEW

- Note 1:** This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive resource. To complement the information in this data sheet, refer to the related section of the “*dsPIC33E/PIC24E Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com)
- 2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

This document contains device-specific information for the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 Digital Signal Controller (DSC) and Microcontroller (MCU) devices. The dsPIC33EPXXX(GP/MC/MU)806/810/814 devices contain extensive Digital Signal Processor (DSP) functionality with a high-performance 16-bit MCU architecture.

Figure 1-1 illustrates a general block diagram of the core and peripheral modules in the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices.

Table 1-1 lists the functions of the various pins shown in the pinout diagrams.

FIGURE 1-1: dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 BLOCK DIAGRAM

TABLE 1-1: PINOUT I/O DESCRIPTIONS

Pin Name	Pin Type	Buffer Type	PPS	Description
AN0-AN31	I	Analog	No	Analog input channels.
CLKI	I	ST/ CMOS	No	External clock source input. Always associated with OSC1 pin function. Oscillator crystal output. Connects to crystal or resonator in Crystal Oscillator mode. Optionally functions as CLKO in RC and EC modes.
CLKO	O	—	No	Always associated with OSC2 pin function.
OSC1	I	ST/ CMOS	No	Oscillator crystal input. ST buffer when configured in RC mode; CMOS otherwise.
OSC2	I/O	—	No	Oscillator crystal output. Connects to crystal or resonator in Crystal Oscillator mode. Optionally functions as CLKO in RC and EC modes.
SOSCI	I	ST/ CMOS	No	32.768 kHz low-power oscillator crystal input; CMOS otherwise.
SOSCO	O	—	No	32.768 kHz low-power oscillator crystal output.
IC1-IC16	I	ST	Yes	Capture Inputs 1 through 16.
OCFA	I	ST	Yes	Compare Fault A input (for Compare channels).
OCFB	I	ST	Yes	Compare Fault B input (for Compare channels).
OCFC	I	ST	Yes	Compare Fault C input (for Compare channels).
OC1-OC16	O	—	Yes	Compare Outputs 1 through 16.
INT0	I	ST	No	External Interrupt 0.
INT1	I	ST	Yes	External Interrupt 1.
INT2	I	ST	Yes	External Interrupt 2.
INT3	I	ST	Yes	External Interrupt 3.
INT4	I	ST	Yes	External Interrupt 4.
RA0-RA7, RA9, RA10, RA14, RA15	I/O	ST	No	PORTA is a bidirectional I/O port.
RB0-RB15	I/O	ST	No	PORTB is a bidirectional I/O port.
RC1-RC4, RC12-RC15	I/O	ST	No	PORTC is a bidirectional I/O port.
RD0-RD15	I/O	ST	No	PORTD is a bidirectional I/O port.
RE0-RE9	I/O	ST	No	PORTE is a bidirectional I/O port.
RF0-RF6, RF8 RF12, RF13	I/O	ST	No	PORTF is a bidirectional I/O port.
RG0, RG1	I/O	ST	No	PORTG is a bidirectional I/O port.
RG2, RG3 ⁽³⁾	I/O	ST	No	PORTG is a bidirectional I/O port.
RG6-RG9, RG12-RG15	I/O	ST	No	PORTG is a bidirectional I/O port.
RH0-RH15	I/O	ST	No	PORTH is a bidirectional I/O port.
RJ0-RJ15	I/O	ST	No	PORTJ is a bidirectional I/O port.
RK0-RK1, RK11-RK15	I/O	ST	No	PORTK is a bidirectional I/O port.

Legend: CMOS = CMOS compatible input or output Analog = Analog input P = Power
 ST = Schmitt Trigger input with CMOS levels O = Output I = Input
 PPS = Peripheral Pin Select TTL = TTL input buffer

- Note 1:** This pin is available on dsPIC33EPXXX(MC/MU)806/810/814 devices only.
- 2:** AVDD must be connected at all times.
- 3:** These pins are input only on dsPIC33EPXXXMU8XX and PIC24EPXXXGU8XX devices.
- 4:** These pins are only available on dsPIC33EPXXXMU8XX and PIC24EPXXXGU8XX devices.
- 5:** The availability of I²C™ interfaces varies by device. Refer to the “Pin Diagrams” section for availability. Selection (SDAx/SCLx or ASDAx/ASCLx) is made using the device Configuration bits, ALTI2C1 and ALTI2C2 (FPOR<5:4>). See [Section 29.0 “Special Features”](#) for more information.
- 6:** Analog functionality is activated by enabling the USB module and is not controlled by the ANSEL register.

TABLE 1-1: PINOUT I/O DESCRIPTIONS (CONTINUED)

Pin Name	Pin Type	Buffer Type	PPS	Description
T1CK	I	ST	No	Timer1 external clock input.
T2CK	I	ST	Yes	Timer2 external clock input.
T3CK	I	ST	Yes	Timer3 external clock input.
T4CK	I	ST	Yes	Timer4 external clock input.
T5CK	I	ST	Yes	Timer5 external clock input.
T6CK	I	ST	Yes	Timer6 external clock input.
T7CK	I	ST	Yes	Timer7 external clock input.
T8CK	I	ST	Yes	Timer8 external clock input.
T9CK	I	ST	Yes	Timer9 external clock input.
U1CTS	I	ST	Yes	UART1 Clear-to-Send.
U1RTS	O	—	Yes	UART1 Ready-to-Send.
U1RX	I	ST	Yes	UART1 receive.
U1TX	O	—	Yes	UART1 transmit.
U2CTS	I	ST	Yes	UART2 Clear-to-Send.
U2RTS	O	—	Yes	UART2 Ready-to-Send.
U2RX	I	ST	Yes	UART2 receive.
U2TX	O	—	Yes	UART2 transmit.
U3CTS	I	ST	Yes	UART3 Clear-to-Send.
U3RTS	O	—	Yes	UART3 Ready-to-Send.
U3RX	I	ST	Yes	UART3 receive.
U3TX	O	—	Yes	UART3 transmit.
U4CTS	I	ST	Yes	UART4 Clear-to-Send.
U4RTS	O	—	Yes	UART4 Ready-to-Send.
U4RX	I	ST	Yes	UART4 receive.
U4TX	O	—	Yes	UART4 transmit.
SCK1	I/O	ST	Yes	Synchronous serial clock input/output for SPI1.
SDI1	I	ST	Yes	SPI1 data in.
SDO1	O	—	Yes	SPI1 data out.
SS1	I/O	ST	Yes	SPI1 slave synchronization or frame pulse I/O.
SCK2	I/O	ST	No	Synchronous serial clock input/output for SPI2.
SDI2	I	ST	No	SPI2 data in.
SDO2	O	—	No	SPI2 data out.
SS2	I/O	ST	Yes	SPI2 slave synchronization or frame pulse I/O.
SCK3	I/O	ST	Yes	Synchronous serial clock input/output for SPI3.
SDI3	I	ST	Yes	SPI3 data in.
SDO3	O	—	Yes	SPI3 data out.
SS3	I/O	ST	Yes	SPI3 slave synchronization or frame pulse I/O.
SCK4	I/O	ST	Yes	Synchronous serial clock input/output for SPI4.
SDI4	I	ST	Yes	SPI4 data in.
SDO4	O	—	Yes	SPI4 data out.
SS4	I/O	ST	Yes	SPI4 slave synchronization or frame pulse I/O.

Legend: CMOS = CMOS compatible input or output Analog = Analog input P = Power
 ST = Schmitt Trigger input with CMOS levels O = Output I = Input
 PPS = Peripheral Pin Select TTL = TTL input buffer

- Note 1:** This pin is available on dsPIC33EPXXX(MC/MU)806/810/814 devices only.
- 2:** AVDD must be connected at all times.
- 3:** These pins are input only on dsPIC33EPXXXMU8XX and PIC24EPXXXGU8XX devices.
- 4:** These pins are only available on dsPIC33EPXXXMU8XX and PIC24EPXXXGU8XX devices.
- 5:** The availability of I²C™ interfaces varies by device. Refer to the “Pin Diagrams” section for availability. Selection (SDAx/SCLx or ASDAx/ASCLx) is made using the device Configuration bits, ALT12C1 and ALT12C2 (FPOR<5:4>). See **Section 29.0 “Special Features”** for more information.
- 6:** Analog functionality is activated by enabling the USB module and is not controlled by the ANSEL register.

TABLE 1-1: PINOUT I/O DESCRIPTIONS (CONTINUED)

Pin Name	Pin Type	Buffer Type	PPS	Description
SCL1 ⁽⁵⁾	I/O	ST	No	Synchronous serial clock input/output for I2C1.
SDA1 ⁽⁵⁾	I/O	ST	No	Synchronous serial data input/output for I2C1.
ASCL1 ⁽⁵⁾	I/O	ST	No	Alternate synchronous serial clock input/output for I2C1.
ASDA1 ⁽⁵⁾	I/O	ST	No	Alternate synchronous serial data input/output for I2C1.
SCL2 ⁽⁵⁾	I/O	ST	No	Synchronous serial clock input/output for I2C2.
SDA2 ⁽⁵⁾	I/O	ST	No	Synchronous serial data input/output for I2C2.
ASCL2 ⁽⁵⁾	I/O	ST	No	Alternate synchronous serial clock input/output for I2C2.
ASDA2 ⁽⁵⁾	I/O	ST	No	Alternate synchronous serial data input/output for I2C2.
TMS	I	ST	No	JTAG Test mode select pin.
TCK	I	ST	No	JTAG test clock input pin.
TDI	I	ST	No	JTAG test data input pin.
TDO	O	—	No	JTAG test data output pin.
INDX1 ⁽¹⁾	I	ST	Yes	Quadrature Encoder Index1 pulse input.
HOME1 ⁽¹⁾	I	ST	Yes	Quadrature Encoder Home1 pulse input.
QEA1 ⁽¹⁾	I	ST	Yes	Quadrature Encoder Phase A input in QE11 mode. Auxiliary timer external clock input in Timer mode.
QEB1 ⁽¹⁾	I	ST	Yes	Quadrature Encoder Phase A input in QE11 mode. Auxiliary timer external gate input in Timer mode.
CNTCMP1 ⁽¹⁾	O	—	Yes	Quadrature Encoder Compare Output 1.
INDX2 ⁽¹⁾	I	ST	Yes	Quadrature Encoder Index2 pulse input.
HOME2 ⁽¹⁾	I	ST	Yes	Quadrature Encoder Home2 pulse input.
QEA2 ⁽¹⁾	I	ST	Yes	Quadrature Encoder Phase A input in QE12 mode. Auxiliary timer external clock input in Timer mode.
QEB2 ⁽¹⁾	I	ST	Yes	Quadrature Encoder Phase B input in QE12 mode. Auxiliary timer external gate input in Timer mode.
CNTCMP2 ⁽¹⁾	O	—	Yes	Quadrature Encoder Compare Output 2.
COFS	I/O	ST	Yes	Data Converter Interface frame synchronization pin.
CCLK	I/O	ST	Yes	Data Converter Interface serial clock input/output pin.
CSDI	I	ST	Yes	Data Converter Interface serial data input pin.
CSDO	O	—	Yes	Data Converter Interface serial data output pin.
C1RX	I	ST	Yes	ECAN1 bus receive pin.
C1TX	O	—	Yes	ECAN1 bus transmit pin.
C2RX	I	ST	Yes	ECAN2 bus receive pin.
C2TX	O	—	Yes	ECAN2 bus transmit pin.
RTCC	O	—	No	Real-Time Clock alarm output.
CVREF	O	Analog	No	Comparator voltage reference output.
C1IN1+, C1IN2-, C1IN1-, C1IN3-	I	Analog	No	Comparator 1 inputs
C1OUT	O	—	Yes	Comparator 1 output.

Legend: CMOS = CMOS compatible input or output Analog = Analog input P = Power
 ST = Schmitt Trigger input with CMOS levels O = Output I = Input
 PPS = Peripheral Pin Select TTL = TTL input buffer

- Note 1:** This pin is available on dsPIC33EPXXX(MC/MU)806/810/814 devices only.
- 2:** AVDD must be connected at all times.
- 3:** These pins are input only on dsPIC33EPXXXMU8XX and PIC24EPXXXGU8XX devices.
- 4:** These pins are only available on dsPIC33EPXXXMU8XX and PIC24EPXXXGU8XX devices.
- 5:** The availability of I²C™ interfaces varies by device. Refer to the “**Pin Diagrams**” section for availability. Selection (SDAx/SCLx or ASDAx/ASCLx) is made using the device Configuration bits, ALTI2C1 and ALTI2C2 (FPOR<5:4>). See **Section 29.0 “Special Features”** for more information.
- 6:** Analog functionality is activated by enabling the USB module and is not controlled by the ANSEL register.

TABLE 1-1: PINOUT I/O DESCRIPTIONS (CONTINUED)

Pin Name	Pin Type	Buffer Type	PPS	Description
C2IN1+, C2IN2-, C2IN1-, C2IN3- C2OUT	I O	Analog —	No Yes	Comparator 2 inputs. Comparator 2 output.
C3IN1+, C3IN2-, C2IN1-, C3IN3- C3OUT	I O	Analog —	No Yes	Comparator 3 inputs. Comparator 3 output.
PMA0	I/O	TTL/ST	No	Parallel Master Port Address Bit 0 input (Buffered Slave modes) and output (Master modes).
PMA1	I/O	TTL/ST	No	Parallel Master Port Address Bit 1 input (Buffered Slave modes) and output (Master modes).
PMA2 -PMA13	O	—	No	Parallel Master Port Address Bits 2-13 (Demultiplexed Master modes).
PMBE	O	—	No	Parallel Master Port byte enable strobe.
PMCS1, PMCS2	O	—	No	Parallel Master Port Chip Select 1 and 2 strobe.
PMD0-PMD7	I/O	TTL/ST	No	Parallel Master Port data (Demultiplexed Master mode) or address/data (Multiplexed Master modes).
PMRD	O	—	No	Parallel Master Port read strobe.
PMWR	O	—	No	Parallel Master Port write strobe.
FLT1-FLT7 ⁽¹⁾	I	ST	Yes	PWM Fault Input 1 through 7.
DTCMP1-DTCMP7 ⁽¹⁾	I	ST	Yes	PWM dead-time compensation input.
PWM1L-PWM7L ⁽¹⁾	O	—	No	PWM Low Output 1 through 7.
PWM1H-PWM7H ⁽¹⁾	O	—	No	PWM High Output 1 through 7.
SYNCI1, SYNCI2 ⁽¹⁾	I	ST	Yes	PWM Synchronization Inputs 1 and 2.
SYNCO1, SYNCO2 ⁽¹⁾	O	—	Yes	PWM Synchronization Outputs 1 and 2.

Legend: CMOS = CMOS compatible input or output Analog = Analog input P = Power
 ST = Schmitt Trigger input with CMOS levels O = Output I = Input
 PPS = Peripheral Pin Select TTL = TTL input buffer

- Note 1:** This pin is available on dsPIC33EPXXX(MC/MU)806/810/814 devices only.
- 2:** AVDD must be connected at all times.
- 3:** These pins are input only on dsPIC33EPXXXMU8XX and PIC24EPXXXGU8XX devices.
- 4:** These pins are only available on dsPIC33EPXXXMU8XX and PIC24EPXXXGU8XX devices.
- 5:** The availability of I²C™ interfaces varies by device. Refer to the “Pin Diagrams” section for availability. Selection (SDAx/SCLx or ASDAx/ASCLx) is made using the device Configuration bits, ALT12C1 and ALT12C2 (FPOR<5:4>). See Section 29.0 “Special Features” for more information.
- 6:** Analog functionality is activated by enabling the USB module and is not controlled by the ANSEL register.

TABLE 1-1: PINOUT I/O DESCRIPTIONS (CONTINUED)

Pin Name	Pin Type	Buffer Type	PPS	Description
VBUS ^(4,6)	I	Analog	No	USB bus power monitor.
VUSB3V3 ⁽⁴⁾	P	—	No	USB internal transceiver supply. If the USB module is not being used, this pin must be connected to VDD.
VBUSON ⁽⁴⁾	O	—	No	USB host and On-The-Go (OTG) bus power control output.
D+ ^(4,6)	I/O	Analog	No	D+ pin of internal USB transceiver.
D- ^(4,6)	I/O	Analog	No	D- pin of internal USB transceiver.
USBID ⁽⁴⁾	I	ST	No	USB OTG ID detect.
USBOEN ⁽⁴⁾	O	—	No	USB output enabled control (for external transceiver).
VBUSST ⁽⁴⁾	I	ST	No	USB boost controller overcurrent detection.
VCPCON ⁽⁴⁾	O	—	No	USB boost controller PWM signal.
VCOMPST1 ⁽⁴⁾	I	ST	No	USB External Comparator 1 input.
VCOMPST2 ⁽⁴⁾	I	ST	No	USB External Comparator 2 input.
VCOMPST3 ⁽⁴⁾	I	ST	No	USB External Comparator 3 input.
VMIO ⁽⁴⁾	I/O	ST	No	USB differential minus input/output (external transceiver).
VPIO ⁽⁴⁾	I/O	ST	No	USB differential plus input/output (external transceiver).
DMH ⁽⁴⁾	O	—	No	D- external pull-up control output.
DPH ⁽⁴⁾	O	—	No	D+ external pull-up control output.
DMLN ⁽⁴⁾	O	—	No	D- external pull-down control output.
DPLN ⁽⁴⁾	O	—	No	D+ External Pull-down Control Output.
RCV ⁽⁴⁾	I	ST	No	USB receive input (from external transceiver).
PGED1	I/O	ST	No	Data I/O pin for Programming/Debugging Communication Channel 1.
PGEC1	I	ST	No	Clock input pin for Programming/Debugging Communication Channel 1.
PGED2	I/O	ST	No	Data I/O pin for Programming/Debugging Communication Channel 2.
PGEC2	I	ST	No	Clock input pin for Programming/Debugging Communication Channel 2.
PGED3	I/O	ST	No	Data I/O pin for Programming/Debugging Communication Channel 3.
PGEC3	I	ST	No	Clock input pin for Programming/Debugging Communication Channel 3.
MCLR	I/P	ST	No	Master Clear (Reset) input. This pin is an active-low Reset to the device.
AVDD ⁽²⁾	P	P	No	Positive supply for analog modules. This pin must be connected at all times.
AVSS	P	P	No	Ground reference for analog modules.
VDD	P	—	No	Positive supply for peripheral logic and I/O pins.
VCAP	P	—	No	CPU logic filter capacitor connection.
VSS	P	—	No	Ground reference for logic and I/O pins.
VREF+	I	Analog	No	Analog voltage reference (high) input.
VREF-	I	Analog	No	Analog voltage reference (low) input.

Legend: CMOS = CMOS compatible input or output Analog = Analog input P = Power
 ST = Schmitt Trigger input with CMOS levels O = Output I = Input
 PPS = Peripheral Pin Select TTL = TTL input buffer

- Note 1:** This pin is available on dsPIC33EPXXX(MC/MU)806/810/814 devices only.
- 2:** AVDD must be connected at all times.
- 3:** These pins are input only on dsPIC33EPXXXMU8XX and PIC24EPXXXGU8XX devices.
- 4:** These pins are only available on dsPIC33EPXXXMU8XX and PIC24EPXXXGU8XX devices.
- 5:** The availability of I²C™ interfaces varies by device. Refer to the “Pin Diagrams” section for availability. Selection (SDAx/SCLx or ASDAx/ASCLx) is made using the device Configuration bits, ALTI2C1 and ALTI2C2 (FPOR<5:4>). See [Section 29.0 “Special Features”](#) for more information.
- 6:** Analog functionality is activated by enabling the USB module and is not controlled by the ANSEL register.

NOTES:

2.0 GUIDELINES FOR GETTING STARTED WITH 16-BIT DIGITAL SIGNAL CONTROLLERS AND MICROCONTROLLERS

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the related section of the “dsPIC33E/PIC24E Family Reference Manual”, which is available from the Microchip web site (www.microchip.com)

2: Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

2.1 Basic Connection Requirements

Getting started with the 16-bit DSCs and microcontrollers requires attention to a minimal set of device pin connections before proceeding with development. The following is a list of pin names, which must always be connected:

- All VDD and VSS pins (see [Section 2.2 “Decoupling Capacitors”](#))
- All AVDD and AVSS pins (regardless if ADC module is not used) (see [Section 2.2 “Decoupling Capacitors”](#))
- VCAP (see [Section 2.3 “CPU Logic Filter Capacitor Connection \(VCAP\)”](#))
- MCLR pin (see [Section 2.4 “Master Clear \(MCLR\) Pin”](#))
- PGECx/PGEDx pins used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes (see [Section 2.5 “ICSP Pins”](#))
- OSC1 and OSC2 pins when external oscillator source is used (see [Section 2.6 “External Oscillator Pins”](#))

Additionally, the following pins may be required:

- VUSB3V3 pin is used when utilizing the USB module. If the USB module is not used, VUSB3V3 must be connected to VDD.
- VREF+/VREF- pin is used when external voltage reference for ADC module is implemented

Note: The AVDD and AVSS pins must be connected independent of the ADC voltage reference source. The voltage difference between AVDD and VDD cannot exceed 300 mV at any time during operation or start-up.

2.2 Decoupling Capacitors

The use of decoupling capacitors on every pair of power supply pins, such as VDD, VSS, VUSB3V3, AVDD and AVSS is required.

Consider the following criteria when using decoupling capacitors:

- **Value and type of capacitor:** Recommendation of 0.1 μ F (100 nF), 10-20V. This capacitor should be a low-ESR and have resonance frequency in the range of 20 MHz and higher. It is recommended to use ceramic capacitors.
- **Placement on the printed circuit board:** The decoupling capacitors should be placed as close to the pins as possible. It is recommended to place the capacitors on the same side of the board as the device. If space is constricted, the capacitor can be placed on another layer on the PCB using a via; however, ensure that the trace length from the pin to the capacitor is within one-quarter inch (6 mm) in length.
- **Handling high frequency noise:** If the board is experiencing high frequency noise, above tens of MHz, add a second ceramic-type capacitor in parallel to the above described decoupling capacitor. The value of the second capacitor can be in the range of 0.01 μ F to 0.001 μ F. Place this second capacitor next to the primary decoupling capacitor. In high-speed circuit designs, consider implementing a decade pair of capacitances as close to the power and ground pins as possible. For example, 0.1 μ F in parallel with 0.001 μ F.
- **Maximizing performance:** On the board layout from the power supply circuit, run the power and return traces to the decoupling capacitors first, and then to the device pins. This ensures that the decoupling capacitors are first in the power chain. Equally important is to keep the trace length between the capacitor and the power pins to a minimum, thereby reducing PCB track inductance.

FIGURE 2-1: RECOMMENDED MINIMUM CONNECTION

2.2.1 TANK CAPACITORS

On boards with power traces running longer than six inches in length, it is suggested to use a tank capacitor for integrated circuits including DSCs to supply a local power source. The value of the tank capacitor should be determined based on the trace resistance that connects the power supply source to the device and the maximum current drawn by the device in the application. In other words, select the tank capacitor so that it meets the acceptable voltage sag at the device. Typical values range from 4.7 µF to 47 µF.

2.3 CPU Logic Filter Capacitor Connection (VCAP)

A low-ESR (< 1 Ohms) capacitor is required on the VCAP pin, which is used to stabilize the voltage regulator output voltage. The VCAP pin must not be connected to VDD and must have a capacitor greater than 4.7 µF (10 µF is recommended), 16V connected

to ground. The type can be ceramic or tantalum. See [Section 32.0 “Electrical Characteristics”](#) for additional information.

The placement of this capacitor should be close to the VCAP. It is recommended that the trace length not exceeds one-quarter inch (6 mm). See [Section 29.2 “On-Chip Voltage Regulator”](#) for details.

2.4 Master Clear (MCLR) Pin

The MCLR pin provides two specific device functions:

- Device Reset
- Device Programming and Debugging

During device programming and debugging, the resistance and capacitance that can be added to the pin must be considered. Device programmers and debuggers drive the MCLR pin. Consequently, specific voltage levels (VIH and VIL) and fast signal transitions must not be adversely affected. Therefore, specific values of R and C will need to be adjusted based on the application and PCB requirements.

For example, as shown in [Figure 2-2](#), it is recommended that the capacitor C, be isolated from the MCLR pin during programming and debugging operations.

Place the components as shown in [Figure 2-2](#) within one-quarter inch (6 mm) from the MCLR pin.

FIGURE 2-2: EXAMPLE OF MCLR PIN CONNECTIONS

2.5 ICSP Pins

The PGECx and PGEDx pins are used for ICSP and debugging purposes. It is recommended to keep the trace length between the ICSP connector and the ICSP pins on the device as short as possible. If the ICSP connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of Ohms, not to exceed 100 Ohms.

Pull-up resistors, series diodes and capacitors on the PGECx and PGEDx pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin input voltage high (V_{IH}) and input low (V_{IL}) requirements.

Ensure that the “Communication Channel Select” (i.e., PGECx/PGEDx pins) programmed into the device matches the physical connections for the ICSP to MPLAB® PICKit™ 3, MPLAB ICD 3, or MPLAB REAL ICE™.

For more information on MPLAB ICD 3 and MPLAB REAL ICE connection requirements, refer to the following documents that are available on the Microchip web site.

- “Using MPLAB® ICD 3” (poster) DS51765
- “MPLAB® ICD 3 Design Advisory” DS51764
- “MPLAB® REAL ICE™ In-Circuit Emulator User’s Guide” DS51616
- “Using MPLAB® REAL ICE™ In-Circuit Emulator” (poster) DS51749

2.6 External Oscillator Pins

Many DSCs have options for at least two oscillators: a high-frequency primary oscillator and a low-frequency secondary oscillator. For details, see [Section 9.0 “Oscillator Configuration”](#) for details.

The oscillator circuit should be placed on the same side of the board as the device. Also, place the oscillator circuit close to the respective oscillator pins, not exceeding one-half inch (12 mm) distance between them. The load capacitors should be placed next to the oscillator itself, on the same side of the board. Use a grounded copper pour around the oscillator circuit to isolate them from surrounding circuits. The grounded copper pour should be routed directly to the MCU ground. Do not run any signal traces or power traces inside the ground pour. Also, if using a two-sided board, avoid any traces on the other side of the board where the crystal is placed. A suggested layout is shown in [Figure 2-3](#).

FIGURE 2-3: SUGGESTED PLACEMENT OF THE OSCILLATOR CIRCUIT

2.7 Oscillator Value Conditions on Device Start-up

If the PLL of the target device is enabled and configured for the device start-up oscillator, the maximum oscillator source frequency must be limited to $3 \text{ MHz} < F_{IN} < 5.5 \text{ MHz}$ to comply with device PLL start-up conditions. This means that if the external oscillator frequency is outside this range, the application must start-up in the FRC mode first. The default PLL settings after a POR with an oscillator frequency outside this range will violate the device operating speed.

Once the device powers up, the application firmware can initialize the PLL SFRs, CLKDIV and PLLDBF to a suitable value, and then perform a clock switch to the Oscillator + PLL clock source. Note that clock switching must be enabled in the device Configuration Word.

2.8 Unused I/Os

Unused I/O pins should be configured as outputs and driven to a logic-low state.

Alternatively, connect a 1k to 10k resistor between V_{SS} and unused pins and drive the output to logic low.

2.9 Application Examples

- Induction heating
- Uninterruptable Power Supplies (UPS)
- DC/AC inverters
- Compressor motor control
- Washing machine 3-phase motor control
- BLDC motor control
- Automotive HVAC, cooling fans, fuel pumps
- Stepper motor control
- Audio and fluid sensor monitoring
- Camera lens focus and stability control

- Speech (playback, hands-free kits, answering machines, VoIP)
- Consumer audio
- Industrial and building control (security systems and access control)
- Barcode reading
- Networking: LAN switches, gateways
- Data storage device management
- Smart cards and smart card readers

Examples of typical application connections are shown in [Figure 2-4](#) through [Figure 2-8](#).

3.0 CPU

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 2. “CPU”** (DS70359) in the “*dsPIC33E/PIC24E Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The CPU has a 16-bit (data) modified Harvard architecture with an enhanced instruction set, including significant support for digital signal processing. The CPU has a 24-bit instruction word, with a variable length opcode field. The Program Counter (PC) is 24 bits wide and addresses up to 4M x 24 bits of user program memory space.

An instruction prefetch mechanism helps maintain throughput and provides predictable execution. Most instructions execute in a single-cycle effective execution rate, with the exception of instructions that change the program flow, the double-word move (`MOV.D`) instruction, PSV accesses and the table instructions. Overhead free program loop constructs are supported using the `DO` and `REPEAT` instructions, both of which are interruptible at any point.

3.1 Registers

Devices have sixteen 16-bit working registers in the programmer's model. Each of the working registers can act as a Data, Address or Address Offset register. The 16th working register (W15) operates as a Software Stack Pointer for interrupts and calls. The working registers, W0 through W3, and selected bits from the STATUS register, have shadow registers for fast context saves and restores using a single `POP.S` or `PUSH.S` instruction.

3.2 Instruction Set

The dsPIC33EPXXXMU806/810/814 instruction set has two classes of instructions: the MCU class of instructions and the DSP class of instructions. The PIC24EPXXX(GP/GU)810/814 instruction set has the MCU class of instructions and does not support DSP instructions. These two instruction classes are seamlessly integrated into the architecture and execute from a single execution unit. The instruction set includes many addressing modes and was designed for optimum C compiler efficiency.

3.3 Data Space Addressing

The Base Data Space can be addressed as 32K words or 64 Kbytes and is split into two blocks, referred to as X and Y data memory. Each memory block has its own independent Address Generation Unit (AGU). The MCU class of instructions operate solely through the X memory AGU, which accesses the entire memory map as one linear data space. On dsPIC33EPXXX(GP/MC/MU)806/810/814 devices, certain DSP instructions operate through the X and Y AGUs to support dual operand reads, which splits the data address space into two parts. The X and Y data space boundary is device-specific.

The upper 32 Kbytes of the data space memory map can optionally be mapped into Program Space at any 16K program word boundary. The program-to-data space mapping feature, known as Program Space Visibility (PSV), lets any instruction access Program Space as if it were data space. Moreover, the Base Data Space address is used in conjunction with a read or write page register (DSRPAG or DSWPAG) to form an Extended Data Space (EDS) address. The EDS can be addressed as 8M words or 16 Mbytes. Refer to **Section 3. “Data Memory”** (DS70595) and **Section 4. “Program Memory”** (DS70613) in the “*dsPIC33E/PIC24E Family Reference Manual*” for more details on EDS, PSV and table accesses.

On dsPIC33EPXXX(GP/MC/MU)806/810/814 devices, overhead-free circular buffers (Modulo Addressing) are supported in both X and Y address spaces. The Modulo Addressing removes the software boundary checking overhead for DSP algorithms. The X AGU circular addressing can be used with any of the MCU class of instructions. The X AGU also supports Bit-Reversed Addressing to greatly simplify input or output data reordering for radix-2 FFT algorithms. PIC24EPXXX(GP/GU)810/814 devices do not support Modulo and Bit-Reversed Addressing.

3.4 Addressing Modes

The CPU supports these addressing modes:

- Inherent (no operand)
- Relative
- Literal
- Memory Direct
- Register Direct
- Register Indirect

Each instruction is associated with a predefined addressing mode group, depending upon its functional requirements. As many as six addressing modes are supported for each instruction.

3.5 Programmer's Model

The programmer's model is shown in [Figure 3-2](#). All registers in the programmer's model are memory mapped and can be manipulated directly by instructions. [Table 3-1](#) lists a description of each register.

In addition to the registers contained in the programmer's model, all devices in this family contain control registers for interrupts, while the dsPIC33EPXXX(GP/MC/MU)806/810/814 devices contain control registers for Modulo and Bit-reversed Addressing. These registers are described in subsequent sections of this document.

All registers associated with the programmer's model are memory mapped, as shown in [Table 4-1](#).

TABLE 3-1: PROGRAMMER'S MODEL REGISTER DESCRIPTIONS

Register(s) Name	Description
W0 through W15	Working Register Array
ACCA, ACCB	40-Bit DSP Accumulators
PC	23-Bit Program Counter
SR	ALU and DSP Engine Status register
SPLIM	Stack Pointer Limit Value register
TBLPAG	Table Memory Page Address register
DSRPAG	Extended Data Space (EDS) Read Page register
DSWPAG	Extended Data Space (EDS) Write Page register
RCOUNT	REPEAT Loop Count register
DCOUNT ⁽¹⁾	DO Loop Count register
DOSTARTH ^(1,2) , DOSTARTL ^(1,2)	DO Loop Start Address register (High and Low)
DOENDH ⁽¹⁾ , DOENDL ⁽¹⁾	DO Loop End Address register (High and Low)
CORCON	Contains DSP Engine, DO Loop Control and Trap Status bits

Note 1: This register is available on dsPIC33EPXXX(GP/MC/MU)806/810/814 devices only.

2: The DOSTARTH and DOSTARTL registers are read-only.

- bit 3 **IPL3:** CPU Interrupt Priority Level Status bit 3⁽³⁾
 1 = CPU Interrupt Priority Level is greater than 7
 0 = CPU Interrupt Priority Level is 7 or less

Note 1: This bit is available on dsPIC33EPXXX(GP/MC/MU)806/810/814 devices only.
Note 2: This bit is always read as '0'.
Note 3: The IPL3 bit is concatenated with the IPL<2:0> bits (SR<7:5>) to form the CPU Interrupt Priority Level.

REGISTER 3-2: CORCON: CORE CONTROL REGISTER (CONTINUED)

- bit 2 **SFA:** Stack Frame Active Status bit
1 = Stack frame is active; W14 and W15 address 0x0000 to 0xFFFF, regardless of DSRPAG and DSWPAG values
0 = Stack frame is not active; W14 and W15 address of EDS or Base Data Space
- bit 1 **RND:** Rounding Mode Select bit⁽¹⁾
1 = Biased (conventional) rounding is enabled
0 = Unbiased (convergent) rounding is enabled
- bit 0 **IF:** Integer or Fractional Multiplier Mode Select bit⁽¹⁾
1 = Integer mode is enabled for DSP multiply
0 = Fractional mode is enabled for DSP multiply

- Note 1:** This bit is available on dsPIC33EPXXX(GP/MC/MU)806/810/814 devices only.
2: This bit is always read as '0'.
3: The IPL3 bit is concatenated with the IPL<2:0> bits (SR<7:5>) to form the CPU Interrupt Priority Level.

3.8 Arithmetic Logic Unit (ALU)

The ALU is 16 bits wide and is capable of addition, subtraction, bit shifts and logic operations. Unless otherwise mentioned, arithmetic operations are two's complement in nature. Depending on the operation, the ALU can affect the values of the Carry (C), Zero (Z), Negative (N), Overflow (OV) and Digit Carry (DC) Status bits in the SR register. The C and DC Status bits operate as Borrow and Digit Borrow bits, respectively, for subtraction operations.

The ALU can perform 8-bit or 16-bit operations, depending on the mode of the instruction that is used. Data for the ALU operation can come from the W register array or data memory, depending on the addressing mode of the instruction. Likewise, output data from the ALU can be written to the W register array or a data memory location.

Refer to the “16-bit MCU and DSC Programmer’s Reference Manual” (DS70157) for information on the SR bits affected by each instruction.

The core CPU incorporates hardware support for both multiplication and division. This includes a dedicated hardware multiplier and support hardware for 16-bit divisor division.

3.8.1 MULTIPLIER

Using the high-speed 17-bit x 17-bit multiplier, the ALU supports unsigned, signed, or mixed-sign operation in several MCU multiplication modes:

- 16-bit x 16-bit signed
- 16-bit x 16-bit unsigned
- 16-bit signed x 5-bit (literal) unsigned
- 16-bit signed x 16-bit unsigned
- 16-bit unsigned x 5-bit (literal) unsigned
- 16-bit unsigned x 16-bit signed
- 8-bit unsigned x 8-bit unsigned

3.8.2 DIVIDER

The divide block supports 32-bit/16-bit and 16-bit/16-bit signed and unsigned integer divide operations with the following data sizes:

1. 32-bit signed/16-bit signed divide
2. 32-bit unsigned/16-bit unsigned divide
3. 16-bit signed/16-bit signed divide
4. 16-bit unsigned/16-bit unsigned divide

The quotient for all divide instructions ends up in W0 and the remainder in W1. The 16-bit signed and unsigned DIV instructions can specify any W register for both the 16-bit divisor (Wn) and any W register (aligned) pair (W(m + 1):Wm) for the 32-bit dividend. The divide algorithm takes one cycle per bit of divisor, so both 32-bit/16-bit and 16-bit/16-bit instructions take the same number of cycles to execute.

3.9 DSP Engine (dsPIC33EPXXX(GP/MC/MU)806/810/814 Devices Only)

The DSP engine consists of a high-speed 17-bit x 17-bit multiplier, a 40-bit barrel shifter and a 40-bit adder/subtractor (with two target accumulators, round and saturation logic).

The DSP engine can also perform inherent accumulator-to-accumulator operations that require no additional data. These instructions are: ADD, SUB and NEG.

The DSP engine has options selected through bits in the CPU Core Control register (CORCON), as listed below:

- Fractional or integer DSP multiply (IF)
- Signed, unsigned or mixed-sign DSP multiply (US)
- Conventional or convergent rounding (RND)
- Automatic saturation on/off for ACCA (SATA)
- Automatic saturation on/off for ACCB (SATB)
- Automatic saturation on/off for writes to data memory (SATDW)
- Accumulator Saturation mode selection (ACCSAT)

TABLE 3-2: DSP INSTRUCTIONS SUMMARY

Instruction	Algebraic Operation	ACC Write Back
CLR	$A = 0$	Yes
ED	$A = (x - y)^2$	No
EDAC	$A = A + (x - y)^2$	No
MAC	$A = A + (x \cdot y)$	Yes
MAC	$A = A + x^2$	No
MOVSAC	No change in A	Yes
MPY	$A = x \cdot y$	No
MPY	$A = x^2$	No
MPY.N	$A = -x \cdot y$	No
MSC	$A = A - x \cdot y$	Yes

4.0 MEMORY ORGANIZATION

Note: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 4. “Program Memory”** (DS70613) of the “*dsPIC33E/PIC24E Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

The device architecture features separate program and data memory spaces and buses. This architecture also allows the direct access of program memory from the data space during code execution.

4.1 Program Address Space

The device program address memory space is 4M instructions. The space is addressable by a 24-bit value derived either from the 23-bit PC during program execution, or from table operation or data space remapping as described in **Section 4.8 “Interfacing Program and Data Memory Spaces”**.

User application access to the program memory space is restricted to the lower half of the address range (0x000000 to 0x7FFFFFFF). The exception is the use of TBLRD/TBLWT operations, which use TBLPAG<7> to permit access to the Configuration bits and Device ID sections of the configuration memory space.

The device program memory map is shown in **Figure 4-1**.

FIGURE 4-1: PROGRAM MEMORY MAP FOR dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 DEVICES⁽¹⁾

4.1.1 PROGRAM MEMORY ORGANIZATION

The program memory space is organized in word-addressable blocks. Although it is treated as 24 bits wide, it is more appropriate to think of each address of the program memory as a lower and upper word, with the upper byte of the upper word being unimplemented. The lower word always has an even address, while the upper word has an odd address (Figure 4-2).

Program memory addresses are always word-aligned on the lower word and addresses are incremented or decremented by two during code execution. This arrangement provides compatibility with data memory space addressing and makes data in the program memory space accessible.

4.1.2 INTERRUPT AND TRAP VECTORS

All devices reserve the addresses between 0x00000 and 0x000200 for hard-coded program execution vectors. A hardware Reset vector is provided to redirect code execution from the default value of the PC on device Reset to the actual start of code. A GOTO instruction is programmed by the user application at address 0x000000 of the primary Flash memory or at address 0x7FFFFC of the auxiliary Flash memory, with the actual address for the start of code at address 0x000002 of the primary Flash memory or at address 0x7FFFFE of the auxiliary Flash memory. Reset Target Vector Select bit (RSTPRI) in the FPOR Configuration register controls whether primary or auxiliary Flash Reset location is used.

A more detailed discussion of the interrupt vector tables is provided in Section 7.1 “Interrupt Vector Table”.

FIGURE 4-2: PROGRAM MEMORY ORGANIZATION

4.2 Data Address Space

The CPU has a separate 16-bit wide data memory space. The data space is accessed using separate Address Generation Units (AGUs) for read and write operations. The data memory maps are shown in [Figure 4-3](#), [Figure 4-4](#), [Figure 4-5](#) and [Figure 4-6](#).

All Effective Addresses (EAs) in the data memory space are 16 bits wide and point to bytes within the data space. This arrangement gives a Base Data Space address range of 64 Kbytes or 32K words.

The Base Data Space address is used in conjunction with a Read or Write Page register (DSRPAG or DSWPAG) to form an Extended Data Space, which has a total address range of 16 MBytes.

dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices implement up to 56 Kbytes of data memory. If an EA point to a location outside of this area, an all-zero word or byte is returned.

4.2.1 DATA SPACE WIDTH

The data memory space is organized in byte-addressable, 16-bit wide blocks. Data is aligned in data memory and registers as 16-bit words, but all data space EAs resolve to bytes. The Least Significant Bytes (LSBs) of each word have even addresses, while the Most Significant Bytes (MSBs) have odd addresses.

4.2.2 DATA MEMORY ORGANIZATION AND ALIGNMENT

To maintain backward compatibility with PIC® MCU devices and improve data space memory usage efficiency, the device instruction set supports both word and byte operations. As a consequence of byte accessibility, all Effective Address calculations are internally scaled to step through word-aligned memory. For example, the core recognizes that Post-Modified Register Indirect Addressing mode [Ws++] results in a value of Ws + 1 for byte operations and Ws + 2 for word operations.

A data byte read, reads the complete word that contains the byte, using the LSb of any EA to determine which byte to select. The selected byte is placed onto the LSB of the data path. That is, data memory and registers are organized as two parallel byte-wide entities with shared (word) address decode but separate write lines. Data byte writes only write to the corresponding side of the array or register that matches the byte address.

All word accesses must be aligned to an even address. Misaligned word data fetches are not supported, so care must be taken when mixing byte and word operations, or translating from 8-bit MCU code. If a misaligned read or write is attempted, an address error trap is generated. If the error occurred on a read, the instruction underway is completed. If the error occurred on a write, the instruction is executed but the write does not occur. In either case, a trap is then executed, allowing the system and/or user application to examine the machine state prior to execution of the address Fault.

All byte loads into any W register are loaded into the LSB. The MSB is not modified.

A Sign-Extend instruction (SE) is provided to allow user applications to translate 8-bit signed data to 16-bit signed values. Alternatively, for 16-bit unsigned data, user applications can clear the MSB of any W register by executing a Zero-Extend (ZE) instruction on the appropriate address.

4.2.3 SFR SPACE

The first 4 Kbytes of the Near Data Space, from 0x0000 to 0x0FFF, is primarily occupied by Special Function Registers (SFRs). These are used by the core and peripheral modules for controlling the operation of the device.

SFRs are distributed among the modules that they control and are generally grouped together by module. Much of the SFR space contains unused addresses; these are read as '0'.

Note: The actual set of peripheral features and interrupts varies by the device. Refer to the corresponding device tables and pinout diagrams for device-specific information.

4.2.4 NEAR DATA SPACE

The 8-Kbyte area between 0x0000 and 0x1FFF is referred to as the Near Data Space. Locations in this space are directly addressable through a 13-bit absolute address field within all memory direct instructions. Additionally, the whole data space is addressable using MOV instructions, which support Memory Direct Addressing mode with a 16-bit address field, or by using Indirect Addressing mode using a working register as an Address Pointer.

FIGURE 4-6: DATA MEMORY MAP FOR PIC24EP256GU810/814 DEVICES WITH 28-KBYTE RAM

4.2.5 X AND Y DATA SPACES

The dsPIC33EPXXX(GP/MC/MU)806/810/814 core has two data spaces, X and Y. These data spaces can be considered either separate (for some DSP instructions), or as one unified linear address range (for MCU instructions). The data spaces are accessed using two Address Generation Units (AGUs) and separate data paths. This feature allows certain instructions to concurrently fetch two words from RAM, thereby enabling efficient execution of DSP algorithms such as Finite Impulse Response (FIR) filtering and Fast Fourier Transform (FFT).

The PIC24EPXXX(GP/GU)806/810/814 devices do not have a Y data space and a Y AGU. For these devices, the entire data space is treated as X data space.

The X data space is used by all instructions and supports all addressing modes. X data space has separate read and write data buses. The X read data bus is the read data path for all instructions that view data space as combined X and Y address space. It is also the X data prefetch path for the dual operand DSP instructions (MAC class).

The Y data space is used in concert with the X data space by the MAC class of instructions (CLR, ED, EDAC, MAC, MOVSAC, MPY, MPY.N and MSC) to provide two concurrent data read paths.

Both the X and Y data spaces support Modulo Addressing mode for all instructions, subject to addressing mode restrictions. Bit-Reversed Addressing mode is only supported for writes to X data space. Modulo Addressing and Bit-Reversed Addressing are not present in PIC24EPXXX(GP/GU)806/810/814 devices.

All data memory writes, including in DSP instructions, view data space as combined X and Y address space. The boundary between the X and Y data spaces is device-dependent and is not user-programmable.

4.2.6 DMA RAM

Each dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 device contains 4 Kbytes of dual ported DMA RAM located at the end of Y data RAM and is part of Y data space. Memory locations in the DMA RAM space are accessible simultaneously by the CPU and the DMA Controller module. DMA RAM is utilized by the DMA controller to store data to be transferred to various peripherals using DMA, as well as data transferred from various peripherals using DMA. The DMA RAM can be accessed by the DMA controller without having to steal cycles from the CPU.

When the CPU and the DMA controller attempt to concurrently write to the same DMA RAM location, the hardware ensures that the CPU is given precedence in accessing the DMA RAM location. Therefore, the DMA RAM provides a reliable means of transferring DMA data without ever having to stall the CPU.

Note 1: DMA RAM can be used for general purpose data storage if the DMA function is not required in an application.

2: On PIC24EPXXX(GP/GU)806/810/814 devices, DMA RAM is located at the end of X data RAM and is part of X data space.

4.3 Program Memory Resources

Many useful resources related to the Program Memory are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:

4.4.1 PAGED MEMORY SCHEME

The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 architecture extends the available data space through a paging scheme, which allows the available data space to be accessed using MOV instructions in a linear fashion for pre- and post-modified Effective Addresses (EA). The upper half of Base Data Space address is used in conjunction with the Data Space Page registers, the 10-Bit Read Page register (DSRPAG) or the 9-Bit Write Page register (DSWPAG), to form an Extended Data Space (EDS) address or Program Space Visibility (PSV) address. The Data Space Page registers are located in the SFR space.

Construction of the EDS address is shown in Figure 4-1. When DSRPAG<9> = 0 and the base address bit, EA<15> = 1, DSRPAG<8:0> is concatenated onto EA<14:0> to form the 24-bit EDS read address. Similarly, when the base address bit, EA<15> = 1, DSWPAG<8:0> is concatenated onto EA<14:0> to form the 24-bit EDS write address.

EXAMPLE 4-1: EXTENDED DATA SPACE (EDS) READ ADDRESS GENERATION

EXAMPLE 4-2: EXTENDED DATA SPACE (EDS) WRITE ADDRESS GENERATION

The paged memory scheme provides access to multiple 32-Kbyte windows in the EDS and PSV memory. The Data Space Page registers DSxPAG, in combination with the upper half of data space address can provide up to 16 Mbytes of additional address space in the EDS and 12 Mbytes (DSRPAG only) of PSV address space. The paged data memory space is shown in [Example 4-3](#).

The Program Space (PS) can be accessed with DSRPAG of 0x200 or greater. Only reads from PS are supported using the DSRPAG. Writes to PS are not supported, so DSWPAG is dedicated to DS, including EDS, only. The data space and EDS can be read from and written to using DSRPAG and DSWPAG, respectively.

EXAMPLE 4-3: PAGED DATA MEMORY SPACE

Allocating different Page registers for read and write access allows the architecture to support data movement between different pages in data memory. This is accomplished by setting the DSRPAG register value to the page from which you want to read and configuring the DSWPAG register to the page to which it needs to be written. Data can also be moved from different PSV to EDS pages, by configuring the DSRPAG and DSWPAG registers to address PSV and EDS space, respectively. The data can be moved between pages by a single instruction.

When an EDS or PSV page overflow or underflow occurs, EA<15> is cleared as a result of the register indirect EA calculation. An overflow or underflow of the EA in the EDS or PSV pages can occur at the page boundaries when:

- The initial address, prior to modification, addresses an EDS or PSV page.
- The EA calculation uses Pre- or Post-Modified Register Indirect Addressing. However, this does not include Register Offset Addressing.

In general, when an overflow is detected, the DSxPAG register is incremented and the EA<15> bit is set to keep the base address within the EDS or PSV window. When an underflow is detected, the DSxPAG register is decremented and the EA<15> bit is set to keep the base address within the EDS or PSV window. This creates a linear EDS and PSV address space, but only when using Register Indirect Addressing modes.

Exceptions to the operation described above arise when entering and exiting the boundaries of Page 0, EDS and PSV spaces. Table 4-73 lists the effects of overflow and underflow scenarios at different boundaries.

In the following cases, when overflow or underflow occurs, the EA<15> bit is set and the DSxPAG is not modified; therefore, the EA will wrap to the beginning of the current page:

- Register Indirect with Register Offset Addressing
- Modulo Addressing
- Bit-Reversed Addressing

TABLE 4-73: OVERFLOW AND UNDERFLOW SCENARIOS AT PAGE 0, EDS and PSV SPACE BOUNDARIES^(2,3,4)

O/U, R/W	Operation	Before			After		
		DSxPAG	DS EA<15>	Page Description	DSxPAG	DS EA<15>	Page Description
O, Read	[++Wn] or [Wn++]	DSRPAG = 0x1FF	1	EDS: Last page	DSRPAG = 0x1FF	0	See Note 1
O, Read		DSRPAG = 0x2FF	1	PSV: Last lsw page	DSRPAG = 0x300	1	PSV: First MSB page
O, Read		DSRPAG = 0x3FF	1	PSV: Last MSB page	DSRPAG = 0x3FF	0	See Note 1
O, Write		DSWPAG = 0x1FF	1	EDS: Last page	DSWPAG = 0x1FF	0	See Note 1
U, Read	[--Wn] or [Wn--]	DSRPAG = 0x001	1	EDS page	DSRPAG = 0x001	0	See Note 1
U, Read		DSRPAG = 0x200	1	PSV: First lsw page	DSRPAG = 0x200	0	See Note 1
U, Read		DSRPAG = 0x300	1	PSV: First MSB page	DSRPAG = 0x2FF	1	PSV: Last lsw page

Legend: O = Overflow, U = Underflow, R = Read, W = Write

- Note 1:** Register Indirect Addressing now addresses a location in the Base Data Space (0x0000-0x8000).
2: An EDS access with DSxPAG = 0x000 will generate an address error trap.
3: Only reads from PS are supported using DSRPAG. An attempt to write to PS using DSWPAG will generate an address error trap.
4: Pseudo-Linear Addressing is not supported for large offsets.

4.4.2 EXTENDED X DATA SPACE

The lower half of the base address space range, between 0x0000 and 0x7FFF, is always accessible regardless of the contents of the Data Space Page registers. It is indirectly addressable through the register indirect instructions. It can be regarded as being located in the default EDS Page 0 (i.e., EDS address range of 0x000000 to 0x007FFF with the base address bit, EA<15> = 0, for this address range). However, Page 0 cannot be accessed through the upper 32 Kbytes (0x8000 to 0xFFFF) of Base Data Space, in combination with DSRPAG = 0x00 or DSWPAG = 0x00. Consequently, DSRPAG and DSWPAG are initialized to 0x001 at Reset.

Note 1: DSxPAG should not be used to access Page 0. An EDS access with DSxPAG set to 0x000 will generate an address error trap.

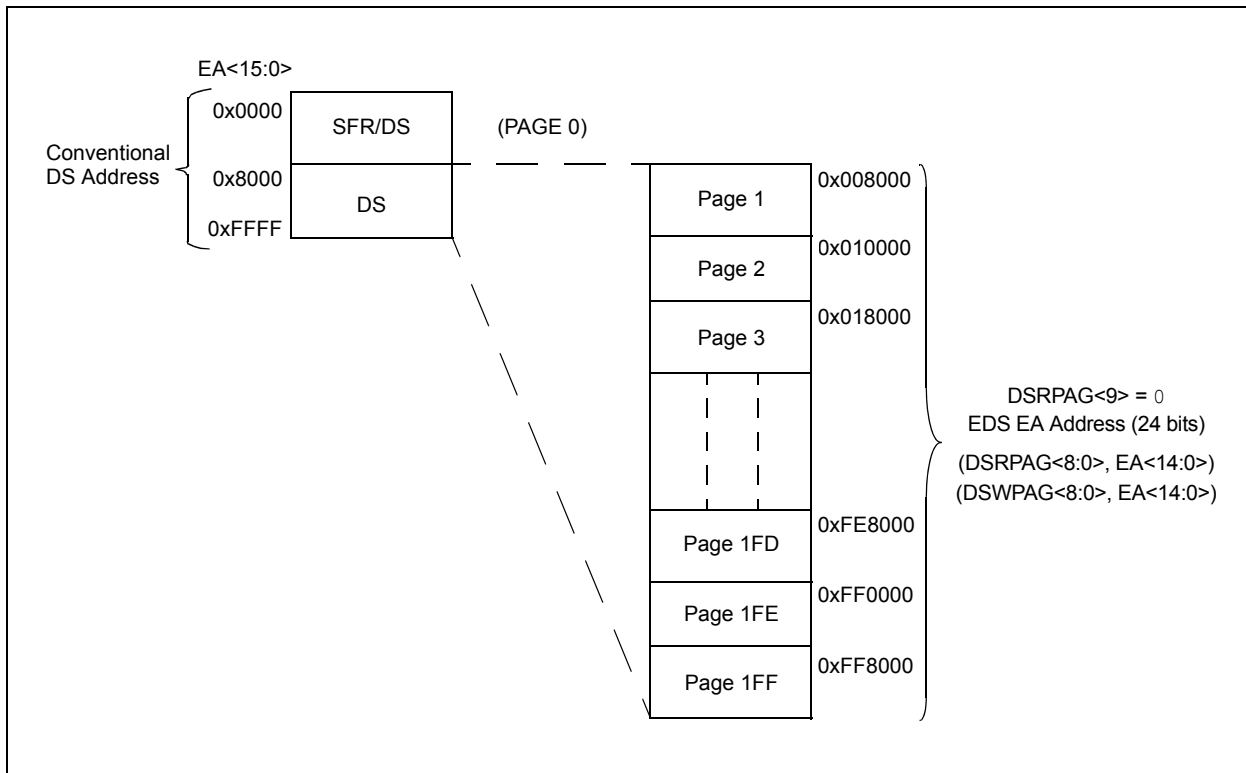

2: Clearing DSxPAG in software has no effect.

The remaining pages including both EDS and PSV pages are only accessible using the DSRPAG or DSWPAG registers in combination with the upper 32 Kbytes, 0x8000 to 0xFFFF, of the base address, where base address bit, EA<15> = 1.

For example, when DSRPAG = 0x01 or DSWPAG = 0x01, accesses to the upper 32 Kbytes, 0x8000 to 0xFFFF, of the data space will map to the EDS address range of 0x008000 to 0x00FFFF. When DSRPAG = 0x02 or DSWPAG = 0x02, accesses to the upper 32 Kbytes of the data space will map to the EDS address range of 0x010000 to 0x017FFF and so on, as shown in the EDS memory map in [Figure 4-7](#).

For more information of the PSV page access using Data Space Page registers refer to **Section 4.5 “Program Space Visibility from Data Space”** in **Section 4. “Program Memory”** (DS70613) of the “dsPIC33E/PIC24E Family Reference Manual”.

FIGURE 4-7: EDS MEMORY MAP

4.4.3 EDS ARBITRATION AND BUS MASTER PRIORITY

EDS accesses from bus masters in the system are arbitrated.

The arbiter for data memory (including EDS) arbitrates between the CPU, the DMA, the USB module and the ICD module. In the event of coincidental access to a bus by the bus masters, the arbiter determines which bus master access has the highest priority. The other bus masters are suspended and processed after the access of the bus by the bus master with the highest priority.

By default, the CPU is Bus Master 0 (M0) with the highest priority and the ICD is Bus Master 4 (M4) with the lowest priority. The remaining bus masters (USB and DMA Controllers) are allocated to M2 and M3,

respectively (M1 is reserved and cannot be used). The user application may raise or lower the priority of the masters to be above that of the CPU by setting the appropriate bits in the EDS Bus Master Priority Control (MSTRPR) register. All bus masters with raised priorities will maintain the same priority relationship relative to each other (i.e., M1 being highest and M3 being lowest, with M2 in between). Also, all the bus masters with priorities below that of the CPU maintain the same priority relationship relative to each other. The priority schemes for bus masters with different MSTRPR values are tabulated in Table 4-74.

This bus master priority control allows the user application to manipulate the real-time response of the system, either statically during initialization, or dynamically in response to real-time events.

TABLE 4-74: EDS BUS ARBITER PRIORITY

Priority	MSTRPR<15:0> Bit Setting ⁽¹⁾			
	0x0000	0x0008	0x0020	0x0028
M0 (highest)	CPU	USB	DMA	USB
M1	Reserved	CPU	CPU	DMA
M2	USB	Reserved	Reserved	CPU
M3	DMA	DMA	USB	Reserved
M4 (lowest)	ICD	ICD	ICD	ICD

Note 1: All other values of MSTRPR<15:0> are reserved.

FIGURE 4-8: EDS ARBITER ARCHITECTURE

4.4.4 SOFTWARE STACK

The W15 register serves as a dedicated software Stack Pointer (SP) and is automatically modified by exception processing, subroutine calls and returns; however, W15 can be referenced by any instruction in the same manner as all other W registers. This simplifies reading, writing and manipulating of the Stack Pointer (for example, creating stack frames).

Note: To protect against misaligned stack accesses, W15<0> is fixed to '0' by the hardware.

W15 is initialized to 0x1000 during all Resets. This address ensures that the SP points to valid RAM in all dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices and permits stack availability for non-maskable trap exceptions. These can occur before the SP is initialized by the user software. You can reprogram the SP during initialization to any location within data space.

The Stack Pointer always points to the first available free word and fills the software stack working from lower toward higher addresses. Figure 4-9 illustrates how it pre-decrements for a stack pop (read) and post-increments for a stack push (writes).

When the PC is pushed onto the stack, PC<15:0> is pushed onto the first available stack word, then PC<22:16> is pushed into the second available stack location. For a PC push during any CALL instruction, the MSB of the PC is zero-extended before the push, as shown in Figure 4-9. During exception processing, the MSB of the PC is concatenated with the lower 8 bits of the CPU STATUS Register, SR. This allows the contents of SRL to be preserved automatically during interrupt processing.

Note 1: For main system Stack Pointer (W15) coherency, W15 is never subject to (EDS) paging and is therefore, restricted to the address range of 0x0000 to 0xFFFF. The same applies to W14 when used as a Stack Frame Pointer (SFA = 1).

2: As the stack can be placed in and across X, Y and DMA RAM spaces, care must be exercised regarding its use, particularly with regard to local automatic variables in a C development environment.

FIGURE 4-9: CALL STACK FRAME

4.5 Instruction Addressing Modes

The addressing modes, shown in Table 4-75, form the basis of the addressing modes optimized to support the specific features of individual instructions. The addressing modes provided in the MAC class of instructions differ from those in the other instruction types.

4.5.1 FILE REGISTER INSTRUCTIONS

Most file register instructions use a 13-bit address field (f) to directly address data present in the first 8192 bytes of data memory (Near Data Space). Most file register instructions employ a working register, W0, which is denoted as WREG in these instructions. The destination is typically either the same file register or WREG (with the exception of the MUL instruction), which writes the result to a register or register pair. The MOV instruction allows additional flexibility and can access the entire data space.

4.5.2 MCU INSTRUCTIONS

The three-operand MCU instructions are of the form:
 Operand 3 = Operand 1 <function> Operand 2
 where Operand 1 is always a working register (that is, the addressing mode can only be Register Direct), which is referred to as Wb. Operand 2 can be a W register, fetched from data memory, or a 5-bit literal. The result location can be either a W register or a data memory location. The following addressing modes are supported by MCU instructions:

- Register Direct
- Register Indirect
- Register Indirect Post-Modified
- Register Indirect Pre-Modified
- 5-bit or 10-bit Literal

Note: Not all instructions support all of the addressing modes given above. Individual instructions can support different subsets of these addressing modes.

TABLE 4-75: FUNDAMENTAL ADDRESSING MODES SUPPORTED

Addressing Mode	Description
File Register Direct	The address of the file register is specified explicitly.
Register Direct	The contents of a register are accessed directly.
Register Indirect	The contents of Wn forms the Effective Address (EA).
Register Indirect Post-Modified	The contents of Wn forms the EA. Wn is post-modified (incremented or decremented) by a constant value.
Register Indirect Pre-Modified	Wn is pre-modified (incremented or decremented) by a signed constant value to form the EA.
Register Indirect with Register Offset (Register Indexed)	The sum of Wn and Wb forms the EA.
Register Indirect with Literal Offset	The sum of Wn and a literal forms the EA.

4.5.3 MOVE AND ACCUMULATOR INSTRUCTIONS

Move instructions (dsPIC33EPXXXMU806/810/814 and PIC24EPXXXGU810/814) and the DSP accumulator class of instructions (dsPIC33EPXXXMU806/810/814 only) provide a greater degree of addressing flexibility than other instructions. In addition to the addressing modes supported by most MCU instructions, move and accumulator instructions also support Register Indirect with Register Offset Addressing mode, also referred to as Register Indexed mode.

Note: For the MOV instructions, the addressing mode specified in the instruction can differ for the source and destination EA. However, the 4-bit Wb (Register Offset) field is shared by both source and destination (but typically only used by one).

In summary, the following addressing modes are supported by move and accumulator instructions:

- Register Direct
- Register Indirect
- Register Indirect Post-modified
- Register Indirect Pre-modified
- Register Indirect with Register Offset (Indexed)
- Register Indirect with Literal Offset
- 8-Bit Literal
- 16-Bit Literal

Note: Not all instructions support all the addressing modes given above. Individual instructions may support different subsets of these addressing modes.

4.5.4 MAC INSTRUCTIONS (dsPIC33EPXXXMU806/810/814 DEVICES ONLY)

The dual source operand DSP instructions (CLR, ED, EDAC, MAC, MPY, MPY.N, MOVSA and MSC), also referred to as MAC instructions, use a simplified set of addressing modes to allow the user application to effectively manipulate the Data Pointers through register indirect tables.

The two-source operand prefetch registers must be members of the set {W8, W9, W10, W11}. For data reads, W8 and W9 are always directed to the X RAGU, and W10 and W11 are always directed to the Y AGU. The Effective Addresses generated (before and after modification) must, therefore, be valid addresses within X data space for W8 and W9 and Y data space for W10 and W11.

Note: Register Indirect with Register Offset Addressing mode is available only for W9 (in X space) and W11 (in Y space).

In summary, the following addressing modes are supported by the MAC class of instructions:

- Register Indirect
- Register Indirect Post-Modified by 2
- Register Indirect Post-Modified by 4
- Register Indirect Post-Modified by 6
- Register Indirect with Register Offset (Indexed)

4.5.5 OTHER INSTRUCTIONS

Besides the addressing modes outlined previously, some instructions use literal constants of various sizes. For example, BRA (branch) instructions use 16-bit signed literals to specify the branch destination directly, whereas the DISI instruction uses a 14-bit unsigned literal field. In some instructions, such as ULNK, the source of an operand or result is implied by the opcode itself. Certain operations, such as NOP, do not have any operands.

4.6 Modulo Addressing (dsPIC33EPXXXMU806/810/814 Devices Only)

Modulo Addressing mode is a method of providing an automated means to support circular data buffers using hardware. The objective is to remove the need for software to perform data address boundary checks when executing tightly looped code, as is typical in many DSP algorithms.

Modulo Addressing can operate in either data or Program Space (since the Data Pointer mechanism is essentially the same for both). One circular buffer can be supported in each of the X (which also provides the pointers into Program Space) and Y data spaces. Modulo Addressing can operate on any W Register Pointer. However, it is not advisable to use W14 or W15 for Modulo Addressing since these two registers are used as the Stack Frame Pointer and Stack Pointer, respectively.

In general, any particular circular buffer can be configured to operate in only one direction as there are certain restrictions on the buffer start address (for incrementing buffers), or end address (for decrementing buffers), based upon the direction of the buffer.

The only exception to the usage restrictions is for buffers that have a power-of-two length. As these buffers satisfy the start and end address criteria, they can operate in a bidirectional mode (that is, address boundary checks are performed on both the lower and upper address boundaries).

4.6.1 START AND END ADDRESS

The Modulo Addressing scheme requires that a starting and ending address be specified and loaded into the 16-bit Modulo Buffer Address registers: XMODSRT, XMODEND, YMODSRT and YMODEND (see Table 4-1).

Note: Y space Modulo Addressing EA calculations assume word-sized data (LSb of every EA is always clear).

The length of a circular buffer is not directly specified. It is determined by the difference between the corresponding start and end addresses. The maximum possible length of the circular buffer is 32K words (64 Kbytes).

4.6.2 W ADDRESS REGISTER SELECTION

The Modulo and Bit-Reversed Addressing Control register, MODCON<15:0>, contains enable flags as well as a W register field to specify the W Address registers. The XWM and YWM fields select the registers that operate with Modulo Addressing:

- If XWM = 1111, X RAGU and X WAGU Modulo Addressing is disabled.
- If YWM = 1111, Y AGU Modulo Addressing is disabled.

The X Address Space Pointer W register (XWM), to which Modulo Addressing is to be applied, is stored in MODCON<3:0> (see Table 4-1). Modulo Addressing is enabled for X data space when XWM is set to any value other than '1111' and the XMODEN bit is set at MODCON<15>.

The Y Address Space Pointer W register (YWM) to which Modulo Addressing is to be applied is stored in MODCON<7:4>. Modulo Addressing is enabled for Y data space when YWM is set to any value other than '1111' and the YMODEN bit is set at MODCON<14>.

FIGURE 4-10: MODULO ADDRESSING OPERATION EXAMPLE

4.6.3 MODULO ADDRESSING APPLICABILITY

Modulo Addressing can be applied to the Effective Address (EA) calculation associated with any W register. Address boundaries check for addresses equal to:

- The upper boundary addresses for incrementing buffers
- The lower boundary addresses for decrementing buffers

It is important to realize that the address boundaries check for addresses less than or greater than the upper (for incrementing buffers) and lower (for decrementing buffers) boundary addresses (not just equal to). Address changes can, therefore, jump beyond boundaries and still be adjusted correctly.

Note: The modulo corrected Effective Address is written back to the register only when Pre-Modify or Post-Modify Addressing mode is used to compute the Effective Address. When an address offset (such as [W7 + W2]) is used, Modulo Addressing correction is performed but the contents of the register remain unchanged.

4.7 Bit-Reversed Addressing (dsPIC33EPXXXMU806/810/814 Devices Only)

Bit-Reversed Addressing mode is intended to simplify data reordering for radix-2 FFT algorithms. It is supported by the X AGU for data writes only.

The modifier, which can be a constant value or register contents, is regarded as having its bit order reversed. The address source and destination are kept in normal order. Thus, the only operand requiring reversal is the modifier.

4.7.1 BIT-REVERSED ADDRESSING IMPLEMENTATION

Bit-Reversed Addressing mode is enabled in any of these situations:

- BWMx bits (W register selection) in the MODCON register are any value other than '1111' (the stack cannot be accessed using Bit-Reversed Addressing)
- The BREN bit is set in the XBREV register
- The addressing mode used is Register Indirect with Pre-Increment or Post-Increment

If the length of a bit-reversed buffer is $M = 2^N$ bytes, the last 'N' bits of the data buffer start address must be zeros.

XB<14:0> is the Bit-Reversed Address modifier, or 'pivot point,' which is typically a constant. In the case of an FFT computation, its value is equal to half of the FFT data buffer size.

Note: All bit-reversed EA calculations assume word-sized data (LSb of every EA is always clear). The XB value is scaled accordingly to generate compatible (byte) addresses.

When enabled, Bit-Reversed Addressing is executed only for Register Indirect with Pre-Increment or Post-Increment Addressing and word-sized data writes. It does not function for any other addressing mode or for byte-sized data and normal addresses are generated instead. When Bit-Reversed Addressing is active, the W Address Pointer is always added to the address modifier (XB) and the offset associated with the Register Indirect Addressing mode is ignored. In addition, as word-sized data is a requirement, the LSB of the EA is ignored (and always clear).

Note: Modulo Addressing and Bit-Reversed Addressing can be enabled simultaneously using the same W register, but Bit-Reversed Addressing operation will always take precedence for data writes when enabled.

If Bit-Reversed Addressing has already been enabled by setting the BREN (XBREV<15>) bit, a write to the XBREV register should not be immediately followed by an indirect read operation using the W register that has been designated as the Bit-Reversed Pointer.

FIGURE 4-11: BIT-REVERSED ADDRESS EXAMPLE

TABLE 4-76: BIT-REVERSED ADDRESS SEQUENCE (16-ENTRY)

Normal Address					Bit-Reversed Address				
A3	A2	A1	A0	Decimal	A3	A2	A1	A0	Decimal

4.8 Interfacing Program and Data Memory Spaces

The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 architecture uses a 24-bit wide Program Space and a 16-bit wide data space. The architecture is also a modified Harvard scheme, meaning that data can also be present in the Program Space. To use this data successfully, it must be accessed in a way that preserves the alignment of information in both spaces.

Aside from normal execution, the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 architecture provides two methods by which Program Space can be accessed during operation:

- Using table instructions to access individual bytes or words anywhere in the Program Space
- Remapping a portion of the Program Space into the data space (Program Space Visibility)

Table instructions allow an application to read or write to small areas of the program memory. This capability makes the method ideal for accessing data tables that need to be updated periodically. It also allows access to all bytes of the program word. The remapping method allows an application to access a large block of data on a read-only basis, which is ideal for look-ups from a large table of static data. The application can only access the least significant word of the program word.

TABLE 4-77: PROGRAM SPACE ADDRESS CONSTRUCTION

Access Type	Access Space	Program Space Address				
		<23>	<22:16>	<15>	<14:1>	<0>
Instruction Access (Code Execution)	User	0	PC<22:1>			0
		0xx xxxx xxxx xxxx xxxx xxx0				
TBLRD/TBLWT (Byte/Word Read/Write)	User	TBLPAG<7:0>		Data EA<15:0>		
		0xxx xxxx		xxxx xxxx xxxx xxxx		
	Configuration	TBLPAG<7:0>		Data EA<15:0>		
		1xxx xxxx		xxxx xxxx xxxx xxxx		

FIGURE 4-12: DATA ACCESS FROM PROGRAM SPACE ADDRESS GENERATION

Note 1: The Least Significant bit (LSb) of Program Space addresses is always fixed as '0' to maintain word alignment of data in the program and data spaces.

2: Table operations are not required to be word-aligned. Table read operations are permitted in the configuration memory space.

4.8.1 DATA ACCESS FROM PROGRAM MEMORY USING TABLE INSTRUCTIONS

The `TBLRDL` and `TBLWTL` instructions offer a direct method of reading or writing the lower word of any address within the Program Space without going through data space. The `TBLRDH` and `TBLWTH` instructions are the only method to read or write the upper 8 bits of a Program Space word as data.

The PC is incremented by two for each successive 24-bit program word. This allows program memory addresses to directly map to data space addresses. Program memory can thus be regarded as two 16-bit wide word address spaces, residing side by side, each with the same address range. `TBLRDL` and `TBLWTL` access the space that contains the least significant data word. `TBLRDH` and `TBLWTH` access the space that contains the upper data byte.

Two table instructions are provided to move byte or word-sized (16-bit) data to and from Program Space. Both function as either byte or word operations.

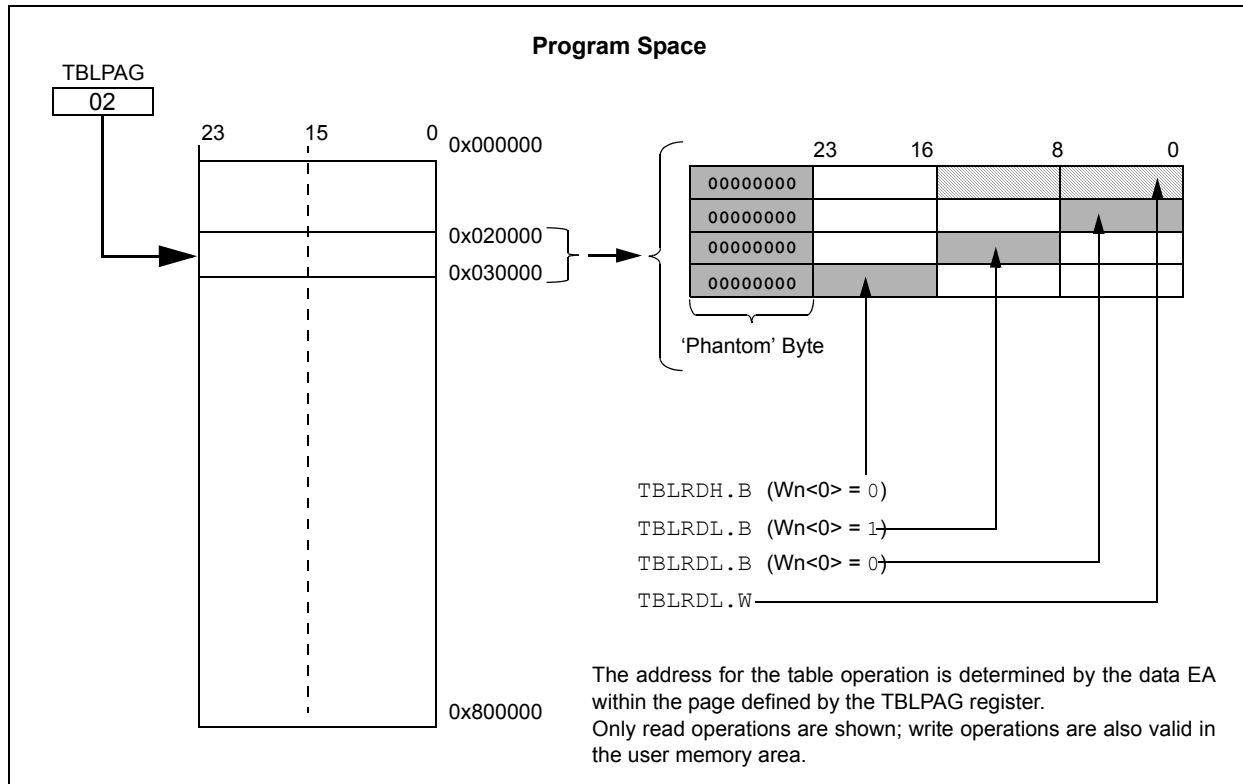

- `TBLRDL` (Table Read Low):
 - In Word mode, this instruction maps the lower word of the Program Space location ($P<15:0>$) to a data address ($D<15:0>$).

- In Byte mode, either the upper or lower byte of the lower program word is mapped to the lower byte of a data address. The upper byte is selected when Byte Select is '1'; the lower byte is selected when it is '0'.
- `TBLRDH` (Table Read High):
 - In Word mode, this instruction maps the entire upper word of a program address ($P<23:16>$) to a data address. The 'phantom' byte ($D<15:8>$), is always '0'.
 - In Byte mode, this instruction maps the upper or lower byte of the program word to $D<7:0>$ of the data address, in the `TBLRDL` instruction. The data is always '0' when the upper 'phantom' byte is selected (Byte Select = 1).

In a similar fashion, two table instructions, `TBLWTH` and `TBLWTL`, are used to write individual bytes or words to a Program Space address. The details of their operation are explained in [Section 5.0 "Flash Program Memory"](#).

For all table operations, the area of program memory space to be accessed is determined by the Table Page register (`TBLPAG`). `TBLPAG` covers the entire program memory space of the device, including user application and configuration spaces. When `TBLPAG<7> = 0`, the table page is located in the user memory space. When `TBLPAG<7> = 1`, the page is located in configuration space.

FIGURE 4-13: ACCESSING PROGRAM MEMORY WITH TABLE INSTRUCTIONS

5.0 FLASH PROGRAM MEMORY

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 5. “Flash Programming”** (DS70609) of the “dsPIC33E/PIC24E Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices contain internal Flash program memory for storing and executing application code. The memory is readable, writable and erasable during normal operation over the entire VDD range.

Flash memory can be programmed in two ways:

- In-Circuit Serial Programming™ (ICSP™) programming capability
- Run-Time Self-Programming (RTSP)

ICSP allows a dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 device to be serially programmed while in the end application circuit. This is done with two lines for programming clock and programming data (one of the alternate programming

pin pairs: PGECx/PGEDx), and three other lines for power (VDD), ground (VSS) and Master Clear (MCLR). This allows customers to manufacture boards with unprogrammed devices and then program the device just before shipping the product. This also allows the most recent firmware or a custom firmware to be programmed.

RTSP is accomplished using TBLRD (table read) and TBLWT (table write) instructions. With RTSP, the user application can write program memory data either in blocks or ‘rows’ of 128 instructions (384 bytes) at a time or a single program memory word, and erase program memory in blocks or ‘pages’ of 1024 instructions (3072 bytes) at a time.

5.1 Table Instructions and Flash Programming

Regardless of the method used, all programming of Flash memory is done with the table read and table write instructions. These allow direct read and write access to the program memory space from the data memory while the device is in normal operating mode. The 24-bit target address in the program memory is formed using bits<7:0> of the TBLPAG register and the Effective Address (EA) from a W register, specified in the table instruction, as shown in [Figure 5-1](#).

The TBLRDL and the TBLWTL instructions are used to read or write to bits<15:0> of program memory. TBLRDL and TBLWTL can access program memory in both Word and Byte modes.

The TBLRDH and TBLWTH instructions are used to read or write to bits<23:16> of program memory. TBLRDH and TBLWTH can also access program memory in Word or Byte mode.

FIGURE 5-1: ADDRESSING FOR TABLE REGISTERS

5.2 RTSP Operation

The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 Flash program memory array is organized into rows of 128 instructions or 384 bytes. RTSP allows the user application to erase a page of memory, which consists of eight rows (1024 instructions) at a time, and to program one row or one word at a time. Table 32-12 lists typical erase and programming times. The 8-row erase pages and single row write rows are edge-aligned from the beginning of program memory, on boundaries of 3072 bytes and 384 bytes, respectively.

The program memory implements holding buffers, which are located in the write latch area, that can contain 128 instructions of programming data. Prior to the actual programming operation, the write data must be loaded into the buffers sequentially. The instruction words loaded must always be from a group of 64 boundary.

The basic sequence for RTSP programming is to set up a Table Pointer, then do a series of TBLWT instructions to load the buffers. Programming is performed by setting the control bits in the NVMCON register. A total of 128 TBLWTL and TBLWTH instructions are required to load the instructions.

All of the table write operations are single-word writes (two instruction cycles) because only the buffers are written. A programming cycle is required for programming each row. For more information on erasing and programming Flash memory, refer to Section 5. “Flash Programming” (DS70609) in the “dsPIC33E/PIC24E Family Reference Manual”.

5.3 Programming Operations

A complete programming sequence is necessary for programming or erasing the internal Flash in RTSP mode. The processor stalls (waits) until the programming operation is finished.

The programming time depends on the FRC accuracy (see Table 32-19) and the value of the FRC Oscillator Tuning register (see Register 9-4). Use the following formula to calculate the minimum and maximum values for the Row Write Time, Page Erase Time and Word Write Cycle Time parameters (see Table 32-12).

EQUATION 5-1: PROGRAMMING TIME

$$T = \frac{11064 \text{ Cycles}}{7.37 \text{ MHz} \times (\text{FRC Accuracy})\% \times (\text{FRC Tuning})\%}$$

For example, if the device is operating at +125°C, the FRC accuracy will be ±5%. If the TUN<5:0> bits (see Register 9-4) are set to 'b1111111, the minimum row write time is equal to Equation 5-2.

EQUATION 5-2: MINIMUM ROW WRITE TIME

$$T_{RW} = \frac{11064 \text{ Cycles}}{7.37 \text{ MHz} \times (1 + 0.05) \times (1 - 0.00375)} = 1.435 \text{ ms}$$

The maximum row write time is equal to Equation 5-3.

EQUATION 5-3: MAXIMUM ROW WRITE TIME

$$T_{RW} = \frac{11064 \text{ Cycles}}{7.37 \text{ MHz} \times (1 - 0.05) \times (1 - 0.00375)} = 1.586 \text{ ms}$$

Setting the WR bit (NVMCON<15>) starts the operation and the WR bit is automatically cleared when the operation is finished.

5.4 Flash Program Memory Resources

Many useful resources related to Flash program memory are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

<p>Note: In the event you are not able to access the product page using the link above, enter this URL in your browser: http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en554310</p>

5.5 Control Registers

Four SFRs are used to read and write the program Flash memory: NVMCON, NVMKEY, NVMADRU and NVMADR.

The NVMCON register ([Register 5-1](#)) controls which blocks are to be erased, which memory type is to be programmed and the start of the programming cycle.

NVMKEY ([Register 5-4](#)) is a write-only register that is used for write protection. To start a programming or erase sequence, the user application must consecutively write 0x55 and 0xAA to the NVMKEY register.

There are two NVM Address registers: NVMADRU and NVMADR. These two registers, when concatenated, form the 24-bit Effective Address (EA) of the selected row or word for programming operations, or the selected page for erase operations.

The NVMADRU register is used to hold the upper 8 bits of the EA, while the NVMADR register is used to hold the lower 16 bits of the EA.

REGISTER 5-1: NVMCON: NON-VOLATILE MEMORY (NVM) CONTROL REGISTER

R/SO-0 ⁽¹⁾	R/W-0 ⁽¹⁾	R/W-0 ⁽¹⁾	R/W-0	U-0	U-0	U-0	U-0

—	—	—	—	NVMOP<3:0> ^(3,4)			
bit 7							bit 0

Legend:	SO = Settable Only bit
R = Readable bit	W = Writable bit
-n = Value at POR	'1' = Bit is set
	U = Unimplemented bit, read as '0'
	'0' = Bit is cleared
	x = Bit is unknown

- bit 15 **WR:** Write Control bit⁽¹⁾
 1 = Initiates a Flash memory program or erase operation; the operation is self-timed and the bit is cleared by hardware once operation is complete
 0 = Program or erase operation is complete and inactive
- bit 14 **WREN:** Write Enable bit⁽¹⁾
 1 = Enables Flash program/erase operations
 0 = Inhibits Flash program/erase operations
- bit 13 **WRERR:** Write Sequence Error Flag bit⁽¹⁾
 1 = An improper program or erase sequence attempt or termination has occurred (bit is set automatically on any set attempt of the WR bit)
 0 = The program or erase operation completed normally
- bit 12 **NVMSIDL:** NVM Stop-in-Idle Control bit⁽²⁾
 1 = Flash voltage regulator goes into Stand-by mode during Idle mode
 0 = Flash voltage regulator is active during Idle mode
- bit 11-4 **Unimplemented:** Read as '0'
- bit 3-0 **NVMOP<3:0>:** NVM Operation Select bits^(1,3,4)
 1111 = Reserved
 1110 = Reserved
 1101 = Bulk erase primary program Flash memory
 1100 = Reserved
 1011 = Reserved
 1010 = Bulk erase auxiliary program Flash memory
 0011 = Memory page erase operation
 0010 = Memory row program operation
 0001 = Memory word program operation⁽⁵⁾
 0000 = Program a single Configuration register byte

- Note 1:** These bits can only be reset on a POR.
- 2:** If this bit is set, upon exiting Idle mode, there is a delay (TVREG) before Flash memory becomes operational.
 - 3:** All other combinations of NVMOP<3:0> are unimplemented.
 - 4:** Execution of the PWRSAV instruction is ignored while any of the NVM operations are in progress.
 - 5:** Two adjacent words are programmed during execution of this operation.

 bit 7-0 **NVMKEY<7:0>:** Key Register (write-only) bits

NOTES:

6.0 RESETS

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 8. “Reset”** (DS70602) of the “dsPIC33E/PIC24E Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The Reset module combines all Reset sources and controls the device Master Reset Signal, $\overline{\text{SYSRST}}$. The following is a list of device Reset sources:

- POR: Power-on Reset
- BOR: Brown-out Reset
- MCLR: Master Clear Pin Reset
- SWR: `RESET` Instruction
- WDTO: Watchdog Timer Reset
- CM: Configuration Mismatch Reset
- TRAPR: Trap Conflict Reset
- IOPUWR: Illegal Condition Device Reset
 - Illegal Opcode Reset
 - Uninitialized W Register Reset
 - Security Reset

A simplified block diagram of the Reset module is shown in [Figure 6-1](#).

Any active source of Reset will make the $\overline{\text{SYSRST}}$ signal active. On system Reset, some of the registers associated with the CPU and peripherals are forced to a known Reset state and some are unaffected.

Note: Refer to the specific peripheral section or **Section 4.0 “Memory Organization”** of this manual for register Reset states.

FIGURE 6-1: RESET SYSTEM BLOCK DIAGRAM

6.1 Resets Resources

Many useful resources related to Resets are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:
<http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en554310>

6.1.1 KEY RESOURCES

- **Section 8. “Reset”** (DS70602) in the “*dsPIC33E/PIC24E Family Reference Manual*”
- Code Samples
- Application Notes
- Software Libraries
- Webinars
- All related “*dsPIC33E/PIC24E Family Reference Manual*” Sections
- Development Tools

6.2 RCON Control Register

All types of device Resets set a corresponding status bit in the RCON register to indicate the type of Reset (see [Register 6-1](#)).

A POR clears all the bits, except for the POR and BOR bits (RCON<1:0>), that are set. The user application can set or clear any bit at any time during code execution. The RCON bits only serve as status bits. Setting a particular Reset status bit in software does not cause a device Reset to occur.

The RCON register also has other bits associated with the Watchdog Timer and device power-saving states. The function of these bits is discussed in other sections of this manual.

Note: The status bits in the RCON register should be cleared after they are read so that the next RCON register value after a device Reset is meaningful.

REGISTER 6-1: RCON: RESET CONTROL REGISTER⁽¹⁾

R/W-0	R/W-0	U-0	U-0	R/W-0	U-0	R/W-0	R/W-0
TRAPR	IOPUWR	—	—	VREGSF	—	CM	VREGS
bit 15							bit 8

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-1	R/W-1
EXTR	SWR	SWDTEN ⁽²⁾	WDTO	SLEEP	IDLE	BOR	POR
bit 7							bit 0

Legend:

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared
		x = Bit is unknown

- bit 15 **TRAPR:** Trap Reset Flag bit
 1 = A Trap Conflict Reset has occurred
 0 = A Trap Conflict Reset has not occurred
- bit 14 **IOPUWR:** Illegal Opcode or Uninitialized W Access Reset Flag bit
 1 = An illegal opcode detection, an illegal address mode or uninitialized W register used as an Address Pointer caused a Reset
 0 = An illegal opcode or uninitialized W Reset has not occurred
- bit 13-12 **Unimplemented:** Read as '0'
- bit 11 **VREGSF:** Flash Voltage Regulator Standby During Sleep bit
 1 = Flash voltage regulator is active during Sleep
 0 = Flash voltage regulator goes into Standby mode during Sleep
- bit 10 **Unimplemented:** Read as '0'
- bit 9 **CM:** Configuration Mismatch Flag bit
 1 = A Configuration Mismatch Reset has occurred.
 0 = A Configuration Mismatch Reset has NOT occurred
- bit 8 **VREGS:** Voltage Regulator Standby During Sleep bit
 1 = Voltage regulator is active during Sleep
 0 = Voltage regulator goes into Standby mode during Sleep
- bit 7 **EXTR:** External Reset ($\overline{\text{MCLR}}$) Pin bit
 1 = A Master Clear (pin) Reset has occurred
 0 = A Master Clear (pin) Reset has not occurred
- bit 6 **SWR:** Software Reset (Instruction) Flag bit
 1 = A RESET instruction has been executed
 0 = A RESET instruction has not been executed
- bit 5 **SWDTEN:** Software Enable/Disable of WDT bit⁽²⁾
 1 = WDT is enabled
 0 = WDT is disabled
- bit 4 **WDTO:** Watchdog Timer Time-out Flag bit
 1 = WDT time-out has occurred
 0 = WDT time-out has not occurred

Note 1: All of the Reset status bits can be set or cleared in software. Setting one of these bits in software does not cause a device Reset.

2: If the FWDTEN Configuration bit is '1' (unprogrammed), the WDT is always enabled, regardless of the SWDTEN bit setting.

REGISTER 6-1: RCON: RESET CONTROL REGISTER⁽¹⁾ (CONTINUED)

- bit 3 **SLEEP:** Wake-up from Sleep Flag bit
 1 = Device has been in Sleep mode
 0 = Device has not been in Sleep mode
- bit 2 **IDLE:** Wake-up from Idle Flag bit
 1 = Device was in Idle mode
 0 = Device was not in Idle mode
- bit 1 **BOR:** Brown-out Reset Flag bit
 1 = A Brown-out Reset has occurred
 0 = A Brown-out Reset has not occurred
- bit 0 **POR:** Power-on Reset Flag bit
 1 = A Power-on Reset has occurred
 0 = A Power-on Reset has not occurred

- Note 1:** All of the Reset status bits can be set or cleared in software. Setting one of these bits in software does not cause a device Reset.
- 2:** If the FWDTEN Configuration bit is '1' (unprogrammed), the WDT is always enabled, regardless of the SWDTEN bit setting.

7.0 INTERRUPT CONTROLLER

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 6. “Interrupts”** (DS70600) of the “*dsPIC33E/PIC24E Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 interrupt controller reduces the numerous peripheral interrupt request signals to a single interrupt request signal to the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 CPU.

The interrupt controller has the following features:

- Up to eight processor exceptions and software traps
- Eight user-selectable priority levels
- Interrupt Vector Table (IVT) with a unique vector for each interrupt or exception source
- Fixed priority within a specified user priority level
- Fixed interrupt entry and return latencies

7.1 Interrupt Vector Table

The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 Interrupt Vector Table (IVT), shown in [Figure 7-1](#), resides in the General Segment of program memory, starting at location, 0x000004, and is used when executing code from the General Segment. The IVT contains seven non-maskable trap vectors and up to 114 sources of interrupt. In general, each interrupt source has its own vector. Each interrupt vector contains a 24-bit wide address. The value programmed into each interrupt vector location is the starting address of the associated Interrupt Service Routine (ISR).

Interrupt vectors are prioritized in terms of their natural priority. This priority is linked to their position in the vector table. Lower addresses generally have a higher natural priority. For example, the interrupt associated with vector 0 takes priority over interrupts at any other vector address.

Note: Any unimplemented or unused vector locations in the IVT should be programmed with the address of a default interrupt handler routine that contains a `RESET` instruction.

7.2 Auxiliary Interrupt Vector

When code is being executed in the Auxiliary Segment, a special single interrupt vector, located at address, 0x7FFFFA, is used for all interrupt sources and traps. Once vectored to this single routine, the `VECNUM<7:0>` bits (`INTTREG<7:0>`, [Register 7-7](#)) can be examined to determine the source of the interrupt or trap so that it can be properly processed.

7.3 Reset Sequence

A device Reset is not a true exception because the interrupt controller is not involved in the Reset process. The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices clear their registers in response to a Reset, which forces the PC to zero. The digital signal controller then begins program execution at location, 0x000000. A `GOTO` instruction at the Reset address can redirect program execution to the appropriate start-up routine.

Note: Reset locations are also located in the Auxiliary Segment at the addresses 0x7FFFFC and 0x7FFFFE. The Reset Target Vector Select bit, `RSTPRI (FICD<2>)` controls whether the primary (General Segment) or Auxiliary Segment Reset location is used.

FIGURE 7-1: dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 INTERRUPT VECTOR TABLE

Note 1: This interrupt source is available on dsPIC33EPXXX(MC/MU)806/810/814 devices only.

Note 2: This interrupt source is available on dsPIC33EPXXXMU8XX and PIC24EPXXXGU8XX devices only.

7.4 Interrupt Resources

Many useful resources related to Interrupts are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:
<http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en554310>

7.4.1 KEY RESOURCES

- **Section 6. “Interrupts”** (DS70600) in the “*dsPIC33E/PIC24E Family Reference Manual*”
- Code Samples
- Application Notes
- Software Libraries
- Webinars
- All related “*dsPIC33E/PIC24E Family Reference Manual*” Sections
- Development Tools

7.5 Interrupt Control and Status Registers

dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices implement the following registers for the interrupt controller:

- INTCON1-INTCON4
- INTTREG

7.5.1 INTCON1 THROUGH INTCON4

Global interrupt control functions are controlled from INTCON1, INTCON2, INTCON3 and INTCON4.

INTCON1 contains the Interrupt Nesting Disable bit (NSTDIS) as well as the control and status flags for the processor trap sources.

The INTCON2 register controls external interrupt request signal behavior and software trap enable. This register also contains the Global Interrupt Enable bit (GIE).

INTCON3 contains the status flags for the USB, DMA and DO stack overflow status trap sources.

The INTCON4 register contains the software generated Hard Trap Status bit (SGHT).

7.5.2 IFSx

The IFS registers maintain all of the interrupt request flags. Each source of interrupt has a status bit, which is set by the respective peripherals or external signal and is cleared via software.

7.5.3 IECx

The IEC registers maintain all of the interrupt enable bits. These control bits are used to individually enable interrupts from the peripherals or external signals.

7.5.4 IPCx

The IPC registers are used to set the Interrupt Priority Level for each source of interrupt. Each user interrupt source can be assigned to one of eight priority levels.

7.5.5 INTTREG

The INTTREG register contains the associated interrupt vector number and the new CPU Interrupt Priority Level, which are latched into the vector number (VECNUM<7:0>) and Interrupt level bit (ILR<3:0>) fields in the INTTREG register. The new Interrupt Priority Level is the priority of the pending interrupt.

The interrupt sources are assigned to the IFSx, IECx and IPCx registers in the same sequence as they are listed in [Table 7-1](#). For example, the INT0 (External Interrupt 0) is shown as having Vector Number 8 and a natural order priority of 0. Thus, the INT0IF bit is found in IFS0<0>, the INT0IE bit in IEC0<0> and the INT0IP bits in the first position of IPC0 (IPC0<2:0>).

7.5.6 STATUS/CONTROL REGISTERS

Although these registers are not specifically part of the interrupt control hardware, two of the CPU Control registers contain bits that control interrupt functionality. For more information on these registers refer to **Section 2. “CPU”** (DS70359) in the “*dsPIC33E/PIC24E Family Reference Manual*”.

- The CPU STATUS register, SR, contains the IPL<2:0> bits (SR<7:5>). These bits indicate the current CPU Interrupt Priority Level. The user software can change the current CPU priority level by writing to the IPL bits.
- The CORCON register contains the IPL3 bit which, together with IPL<2:0>, also indicates the current CPU priority level. IPL3 is a read-only bit so that trap events cannot be masked by the user software.

All Interrupt registers are described in [Register 7-3](#) through [Register 7-7](#) in the following pages.

REGISTER 7-1: SR: CPU STATUS REGISTER⁽¹⁾

R/W-0	R/W-0	R/W-0	R/W-0	R/C-0	R/C-0	R-0	R/W-0
OA	OB	SA	SB	OAB	SAB	DA	DC
bit 15						bit 8	

R/W-0 ⁽³⁾	R/W-0 ⁽³⁾	R/W-0 ⁽³⁾	R-0	R/W-0	R/W-0	R/W-0	R/W-0
IPL<2:0> ⁽²⁾			RA	N	OV	Z	C
bit 7						bit 0	

Legend:	C = Clearable bit
R = Readable bit	W = Writable bit
-n = Value at POR	'1' = Bit is set
	U = Unimplemented bit, read as '0'
	'0' = Bit is cleared
	x = Bit is unknown

- bit 7-5 **IPL<2:0>**: CPU Interrupt Priority Level Status bits^(2,3)
- 111 = CPU Interrupt Priority Level is 7 (15, user interrupts are disabled)
 - 110 = CPU Interrupt Priority Level is 6 (14)
 - 101 = CPU Interrupt Priority Level is 5 (13)
 - 100 = CPU Interrupt Priority Level is 4 (12)
 - 011 = CPU Interrupt Priority Level is 3 (11)
 - 010 = CPU Interrupt Priority Level is 2 (10)
 - 001 = CPU Interrupt Priority Level is 1 (9)
 - 000 = CPU Interrupt Priority Level is 0 (8)

- Note 1:** For complete register details, see [Register 3-1: “SR: CPU Status Register”](#).
- 2:** The IPL<2:0> bits are concatenated with the IPL<3> bit (CORCON<3>) to form the CPU Interrupt Priority Level. The value in parentheses indicates the IPL, if IPL<3> = 1.
- 3:** The IPL<2:0> Status bits are read-only when NSTDIS (INTCON1<15>) = 1.

REGISTER 7-2: CORCON: CORE CONTROL REGISTER⁽¹⁾

R/W-0	U-0	R/W-0	R/W-0	R/W-0	R-0	R-0	R-0
VAR	—	US<1:0>		EDT	DL<2:0>

NOTES:

8.0 DIRECT MEMORY ACCESS (DMA)

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 22. “Direct Memory Access (DMA)”** (DS70348) of the “*dsPIC33E/PIC24E Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The DMA controller transfers data between peripheral data registers and data space SRAM. The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 DMA subsystem uses dual-ported SRAM memory (DPSRAM) and register structures that allow the DMA to operate across its own, independent address and data buses with no impact on CPU operation. This architecture eliminates the need for cycle stealing, which halts the CPU when a higher priority DMA transfer is requested. Both the CPU and DMA controller can write and read to/from

addresses within data space without interference, such as CPU stalls, resulting in maximized, real-time performance. Alternatively, DMA operation and data transfer to/from the memory and peripherals are not impacted by CPU processing. For example, when a Run-Time Self-Programming (RTSP) operation is performed, the CPU does not execute any instructions until RTSP is finished. This condition, however, does not impact data transfer to/from memory and the peripherals.

In addition, DMA can access entire data memory space (SRAM and DPSRAM). The Data Memory Bus Arbiter is utilized when either the CPU or DMA attempts to access non-dual ported SRAM, resulting in potential DMA or CPU stalls.

The DMA controller supports up to 15 independent channels. Each channel can be configured for transfers to or from selected peripherals. Some of the peripherals supported by the DMA controller include:

- ECAN™
- Data Converter Interface (DCI)
- Analog-to-Digital Converter (ADC)
- Serial Peripheral Interface (SPI)
- UART
- Input Capture
- Output Compare
- Parallel Master Port (PMP)

Refer to [Table 8-1](#) for a complete list of supported peripherals.

FIGURE 8-1: DMA CONTROLLER

In addition, DMA transfers can be triggered by timers as well as external interrupts. Each DMA channel is unidirectional. Two DMA channels must be allocated to read and write to a peripheral. If more than one channel receive a request to transfer data, a simple fixed priority scheme, based on channel number, dictates which channel completes the transfer and which channel, or channels, are left pending. Each DMA channel moves a block of data, after which it generates an interrupt to the CPU to indicate that the block is available for processing.

The DMA controller provides these functional capabilities:

- Up to 15 DMA Channels
- Register Indirect With Post-Increment Addressing mode
- Register Indirect Without Post-Increment Addressing mode

- Peripheral Indirect Addressing mode (peripheral generates destination address)
- CPU Interrupt after Half or Full Block Transfer Complete
- Byte or Word Transfers
- Fixed Priority Channel Arbitration
- Manual (software) or Automatic (peripheral DMA requests) Transfer Initiation
- One-Shot or Auto-Repeat Block Transfer modes
- Ping-Pong mode (automatic switch between two DPSRAM start addresses after each block transfer complete)
- DMA Request for Each Channel can be Selected from Any Supported Interrupt Source
- Debug Support Features

The peripherals that can utilize DMA are listed in [Table 8-1](#).

8.1 DMA Resources

Many useful resources related to DMA are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:
<http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en554310>

8.1.1 KEY RESOURCES

- **Section 22. “Direct Memory Access (DMA)”** (DS70348) in the “*dsPIC33E/PIC24E Family Reference Manual*”
- Code Samples
- Application Notes
- Software Libraries
- Webinars
- All related “*dsPIC33E/PIC24E Family Reference Manual*” Sections
- Development Tools

8.2 DMA Control Registers

Each DMAC Channel x (where x = 0 through 14) contains the following registers:

- 16-Bit DMA Channel Control register (DMAxCON)
- 16-Bit DMA Channel IRQ Select register (DMAxREQ)
- 32-Bit DMA RAM Primary Start Address register (DMAxSTA)
- 32-Bit DMA RAM Secondary Start Address register (DMAxSTB)
- 16-Bit DMA Peripheral Address register (DMAxPAD)
- 14-Bit DMA Transfer Count register (DMAxCNT)

Additional status registers (DMPWC, DMARQC, DMAPPS, DMALCA and DSADR) are common to all DMAC channels. These status registers provide information on write and request collisions, as well as on last address and channel access information.

The DMA Interrupt Flags (DMAxIF) are located in an IFSx register in the interrupt controller. The corresponding interrupt enable control bits (DMAxIE) are located in an IECx register in the interrupt controller, and the corresponding interrupt priority control bits (DMAxIP) are located in an IPCx register in the interrupt controller.

REGISTER 8-1: DMAxCON: DMA CHANNEL x CONTROL REGISTER

NOTES:

9.0 OSCILLATOR CONFIGURATION

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 7. “Oscillator”** (DS70580) of the “*dsPIC33E/PIC24E Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The oscillator system provides:

- Four external and internal oscillator options
- Auxiliary oscillator that provides clock source to the USB module (if available)
- On-chip Phase-Locked Loop (PLL) to boost internal operating frequency on select internal and external oscillator sources
- On-the-fly clock switching between various clock sources
- Doze mode for system power savings
- Fail-Safe Clock Monitor (FSCM) that detects clock failure and permits safe application recovery or shutdown
- Nonvolatile Configuration bits for clock source selection

A simplified diagram of the oscillator system is shown in [Figure 9-1](#).

FIGURE 9-1: OSCILLATOR SYSTEM DIAGRAM

9.1 CPU Clocking System

The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 family of devices provides seven system clock options:

- Fast RC (FRC) Oscillator
- FRC Oscillator with Phase-Locked Loop (PLL)
- Primary (XT, HS or EC) Oscillator
- Primary Oscillator with PLL
- Secondary (LP) Oscillator
- Low-Power RC (LPRC) Oscillator
- FRC Oscillator with postscaler

Instruction execution speed or device operating frequency, F_{CY} , is given by Equation 9-1.

EQUATION 9-1: DEVICE OPERATING FREQUENCY

$$F_{CY} = F_{OSC}/2$$

Figure 9-2 is a block diagram of the PLL module.

Equation 9-2 provides the relation between input frequency (F_{IN}) and output frequency (F_{OSC}).

Equation 9-3 provides the relation between input frequency (F_{IN}) and VCO frequency (F_{VCO}).

FIGURE 9-2: PLL BLOCK DIAGRAM

EQUATION 9-2: Fosc CALCULATION

$$F_{OSC} = F_{IN} \times \left(\frac{M}{N1 \times N2} \right) = F_{IN} \times \left(\frac{(PLLDIV + 2)}{(PLLPRE + 2) \times 2(PLLPOST + 1)} \right)$$

Where,
 $N1 = PLLPRE + 2$
 $N2 = 2 \times (PLLPOST + 1)$
 $M = PLLDIV + 2$

EQUATION 9-3: Fvco CALCULATION

$$F_{VCO} = F_{IN} \times \left(\frac{M}{N1} \right) = F_{IN} \times \left(\frac{(PLLDIV + 2)}{(PLLPRE + 2)} \right)$$

Figure 9-3 illustrates a block diagram of the auxiliary PLL module.

Note: The auxiliary PLL module is only available on dsPIC33EPXXXMU8XX and PIC24EPXXXGU8XX devices.

FIGURE 9-3: APLL BLOCK DIAGRAM

Equation 9-4 shows the relationship between the auxiliary PLL input clock frequency (F_{AIN}) and the F_{AVCO} frequency (F_{AVCO}).

EQUATION 9-4: F_{AVCO} CALCULATION

$$F_{AVCO} = F_{AIN} \times \left(\frac{M}{N1}\right)$$

TABLE 9-1: CONFIGURATION BIT VALUES FOR CLOCK SELECTION

Oscillator Mode	Oscillator Source	POSCMD<1:0>	FNOSC<2:0>	See Notes
Fast RC Oscillator with Divide-by-N (FRCDIVN)	Internal	xx	111	1, 2
Fast RC Oscillator with Divide-by-16 (FRCDIV16)	Internal	xx	110	1
Low-Power RC Oscillator (LPRC)	Internal	xx	101	1
Secondary (Timer1) Oscillator (SOSC)	Secondary	xx	100	1
Primary Oscillator (HS) with PLL (HSPLL)	Primary	10	011	—
Primary Oscillator (XT) with PLL (XTPLL)	Primary	01	011	—
Primary Oscillator (EC) with PLL (ECPLL)	Primary	00	011	1
Primary Oscillator (HS)	Primary	10	010	—
Primary Oscillator (XT)	Primary	01	010	—
Primary Oscillator (EC)	Primary	00	010	1
Fast RC Oscillator (FRC) with Divide-by-N and PLL (FRCPLL)	Internal	xx	001	1
Fast RC Oscillator (FRC)	Internal	xx	000	1

Note 1: OSC2 pin function is determined by the OSCIOFNC Configuration bit.

2: This is the default oscillator mode for an unprogrammed (erased) device.

9.2 Oscillator Resources

Many useful resources related to the Oscillator are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:
<http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en554310>

9.3 Oscillator Control Registers

REGISTER 9-1: OSCCON: OSCILLATOR CONTROL REGISTER^(1,3)

U-0	R-0	R-0	R-0	U-0	R/W-y	R/W-y	R/W-y
—	COSC<2:0>			—	NOSC<2:0> ⁽²⁾		
bit 15				bit 8			

R/W-0	R/W-0	R-0	U-0	R/C-0	U-0	R/W-0	R/W-0
CLKLOCK	IOLOCK	LOCK	—	CF	—	LPOSCEN	OSWEN
bit 7							bit 0

Legend:	y = Value Set from Configuration bits on POR	C = Clearable bit
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared
		x = Bit is unknown

bit 15 **Unimplemented:** Read as '0'

bit 14-12 **COSC<2:0>:** Current Oscillator Selection bits (read-only)
 111 = Fast RC Oscillator (FRC) with Divide-by-N
 110 = Fast RC Oscillator (FRC) with Divide-by-16
 101 = Low-Power RC Oscillator (LPRC)
 100 = Secondary Oscillator (SOSC)
 011 = Primary Oscillator (XT, HS, EC) with PLL
 010 = Primary Oscillator (XT, HS, EC)
 001 = Fast RC Oscillator (FRC) with Divide-by-N and PLL
 000 = Fast RC Oscillator (FRC)

bit 11 **Unimplemented:** Read as '0'

bit 10-8 **NOSC<2:0>:** New Oscillator Selection bits⁽²⁾
 111 = Fast RC Oscillator (FRC) with Divide-by-N
 110 = Fast RC Oscillator (FRC) with Divide-by-16
 101 = Low-Power RC Oscillator (LPRC)
 100 = Secondary Oscillator (SOSC)
 011 = Primary Oscillator (XT, HS, EC) with PLL
 010 = Primary Oscillator (XT, HS, EC)
 001 = Fast RC Oscillator (FRC) with Divide-by-N and PLL
 000 = Fast RC Oscillator (FRC)

bit 7 **CLKLOCK:** Clock Lock Enable bit
 1 = If (FCKSM0 = 1), then clock and PLL configurations are locked
 If (FCKSM0 = 0), then clock and PLL configurations may be modified
 0 = Clock and PLL selections are not locked, configurations may be modified

bit 6 **IOLOCK:** I/O Lock Enable bit
 1 = I/O lock is active
 0 = I/O lock is not active

bit 5 **LOCK:** PLL Lock Status bit (read-only)
 1 = Indicates that PLL is in lock or PLL start-up timer is satisfied
 0 = Indicates that PLL is out of lock, start-up timer is in progress or PLL is disabled

bit 4 **Unimplemented:** Read as '0'

- Note 1:** Writes to this register require an unlock sequence. Refer to **Section 7. "Oscillator"** (DS70580) in the "dsPIC33E/PIC24E Family Reference Manual" (available from the Microchip web site) for details.
- 2:** Direct clock switches between any Primary Oscillator mode with PLL and FRCPLL mode are not permitted. This applies to clock switches in either direction. In these instances, the application must switch to FRC mode as a transition clock source between the two PLL modes.
- 3:** This register resets only on a Power-on Reset (POR).

REGISTER 9-1: OSCCON: OSCILLATOR CONTROL REGISTER^(1,3) (CONTINUED)

- bit 3 **CF:** Clock Fail Detect bit (read/clear by application)
 1 = FSCM has detected clock failure
 0 = FSCM has not detected clock failure
- bit 2 **Unimplemented:** Read as '0'
- bit 1 **LPOSCEN:** Secondary (LP) Oscillator Enable bit
 1 = Enables Secondary Oscillator
 0 = Disables Secondary Oscillator
- bit 0 **OSWEN:** Oscillator Switch Enable bit
 1 = Requests oscillator switch to selection specified by NOSC<2:0> bits
 0 = Oscillator switch is complete

- Note 1:** Writes to this register require an unlock sequence. Refer to **Section 7. "Oscillator"** (DS70580) in the *"dsPIC33E/PIC24E Family Reference Manual"* (available from the Microchip web site) for details.
- 2:** Direct clock switches between any Primary Oscillator mode with PLL and FRCPLL mode are not permitted. This applies to clock switches in either direction. In these instances, the application must switch to FRC mode as a transition clock source between the two PLL modes.
- 3:** This register resets only on a Power-on Reset (POR).

REGISTER 9-2: CLKDIV: CLOCK DIVISOR REGISTER⁽²⁾

R/W-0	R/W-0	R/W-1	R/W-1	R/W-0	R/W-0	R/W-0	R/W-0
ROI	DOZE<2:0> ⁽³⁾			DOZEN ^(1,4)	FRCDIV<2:0>		
bit 15				bit 8			

R/W-0	R/W-1	U-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
PLLPOST<1:0>		—	PLLPRE<4:0>				
bit 7							bit 0

Legend:	y = Value set from Configuration bits on POR		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

- bit 15 **ROI:** Recover on Interrupt bit
 1 = Interrupts will clear the DOZEN bit and the processor clock and peripheral clock ratio is set to 1:1
 0 = Interrupts have no effect on the DOZEN bit
- bit 14-12 **DOZE<2:0>:** Processor Clock Reduction Select bits⁽³⁾
 111 = Fcy divided by 128
 110 = Fcy divided by 64
 101 = Fcy divided by 32
 100 = Fcy divided by 16
 011 = Fcy divided by 8 (default)
 010 = Fcy divided by 4
 001 = Fcy divided by 2
 000 = Fcy divided by 1
- bit 11 **DOZEN:** Doze Mode Enable bit^(1,4)
 1 = DOZE<2:0> field specifies the ratio between the peripheral clocks and the processor clocks
 0 = Processor clock and peripheral clock ratio forced to 1:1
- bit 10-8 **FRCDIV<2:0>:** Internal Fast RC Oscillator Postscaler bits
 111 = FRC divided by 256
 110 = FRC divided by 64
 101 = FRC divided by 32
 100 = FRC divided by 16
 011 = FRC divided by 8
 010 = FRC divided by 4
 001 = FRC divided by 2
 000 = FRC divided by 1 (default)
- bit 7-6 **PLLPOST<1:0>:** PLL VCO Output Divider Select bits (also denoted as 'N2', PLL postscaler)
 11 = Output divided by 8
 10 = Reserved
 01 = Output divided by 4 (default)
 00 = Output divided by 2
- bit 5 **Unimplemented:** Read as '0'

- Note 1:** This bit is cleared when the ROI bit is set and an interrupt occurs.
- Note 2:** This register resets only on a Power-on Reset (POR).
- Note 3:** DOZE<2:0> bits can only be written to when the DOZEN bit is clear. If DOZEN = 1, any writes to DOZE<2:0> are ignored.
- Note 4:** The DOZEN bit cannot be set if DOZE<2:0> = 000. If DOZE<2:0> = 000, any attempt by user software to set the DOZEN bit is ignored.

REGISTER 9-2: CLKDIV: CLOCK DIVISOR REGISTER⁽²⁾ (CONTINUED)

bit 4-0 **PLLPRE<4:0>**: PLL Phase Detector Input Divider Select bits (also denoted as 'N1', PLL prescaler)
11111 = Input divided by 33
•
•
•
00001 = Input divided by 3
00000 = Input divided by 2 (default)

- Note 1:** This bit is cleared when the ROI bit is set and an interrupt occurs.
2: This register resets only on a Power-on Reset (POR).
3: DOZE<2:0> bits can only be written to when the DOZEN bit is clear. If DOZEN = 1, any writes to DOZE<2:0> are ignored.
4: The DOZEN bit cannot be set if DOZE<2:0> = 000. If DOZE<2:0> = 000, any attempt by user software to set the DOZEN bit is ignored.

10.0 POWER-SAVING FEATURES

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 9. “Watch-dog Timer and Power-Saving Modes”** (DS70615) of the “*dsPIC33E/PIC24E Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices provide the ability to manage power consumption by selectively managing clocking to the CPU and the peripherals. In general, a lower clock frequency and a reduction in the number of circuits being clocked constitutes lower consumed power.

dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices can manage power consumption in four ways:

- Clock frequency
- Instruction-based Sleep and Idle modes
- Software-controlled Doze mode
- Selective peripheral control in software

Combinations of these methods can be used to selectively tailor an application’s power consumption while still maintaining critical application features, such as timing-sensitive communications.

10.1 Clock Frequency and Clock Switching

The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices allow a wide range of clock frequencies to be selected under application control. If the system clock configuration is not locked, users can choose low-power or high-precision oscillators by simply changing the NOSCx bits (OSCCON<10:8>). The process of changing a system clock during operation, as well as limitations to the process, are discussed in more detail in **Section 9.0 “Oscillator Configuration”**.

EXAMPLE 10-1: PWRSAV INSTRUCTION SYNTAX

```
PWRSAV #SLEEP_MODE ; Put the device into SLEEP mode
PWRSAV #IDLE_MODE ; Put the device into IDLE mode
```

10.2 Instruction-Based Power-Saving Modes

The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices have two special power-saving modes that are entered through the execution of a special PWRSAV instruction. Sleep mode stops clock operation and halts all code execution. Idle mode halts the CPU and code execution, but allows peripheral modules to continue operation. The assembler syntax of the PWRSAV instruction is shown in **Example 10-1**.

Note: SLEEP_MODE and IDLE_MODE are constants defined in the assembler include file for the selected device.

Sleep and Idle modes can be exited as a result of an enabled interrupt, WDT time-out or a device Reset. When the device exits these modes, it is said to wake up.

10.2.1 SLEEP MODE

The following occur in Sleep mode:

- The system clock source is shut down. If an on-chip oscillator is used, it is turned off.
- The device current consumption is reduced to a minimum, provided that no I/O pin is sourcing current.
- The Fail-Safe Clock Monitor does not operate, since the system clock source is disabled.
- The LPRC clock continues to run in Sleep mode if the WDT is enabled.
- The WDT, if enabled, is automatically cleared prior to entering Sleep mode.
- Some device features or peripherals can continue to operate. This includes items such as the input change notification on the I/O ports, or peripherals that use an external clock input.
- Any peripheral that requires the system clock source for its operation is disabled.

The device wakes up from Sleep mode on any of the these events:

- Any interrupt source that is individually enabled
- Any form of device Reset
- A WDT time-out

On wake-up from Sleep mode, the processor restarts with the same clock source that was active when Sleep mode was entered.

10.2.2 IDLE MODE

The following occur in Idle mode:

- The CPU stops executing instructions.
- The WDT is automatically cleared.
- The system clock source remains active. By default, all peripheral modules continue to operate normally from the system clock source, but can also be selectively disabled (see [Section 10.4 “Peripheral Module Disable”](#)).
- If the WDT or FSCM is enabled, the LPRC also remains active.

The device wakes from Idle mode on any of these events:

- Any interrupt that is individually enabled
- Any device Reset
- A WDT time-out

On wake-up from Idle mode, the clock is reapplied to the CPU and instruction execution will begin (2-4 clock cycles later), starting with the instruction following the `PWRSVAV` instruction, or the first instruction in the ISR.

10.2.3 INTERRUPTS COINCIDENT WITH POWER SAVE INSTRUCTIONS

Any interrupt that coincides with the execution of a `PWRSVAV` instruction is held off until entry into Sleep or Idle mode has completed. The device then wakes up from Sleep or Idle mode.

10.3 Doze Mode

The preferred strategies for reducing power consumption are changing clock speed and invoking one of the power-saving modes. In some circumstances, this cannot be practical. For example, it may be necessary for an application to maintain uninterrupted synchronous communication, even while it is doing nothing else. Reducing system clock speed can introduce communication errors, while using a power-saving mode can stop communications completely.

Doze mode is a simple and effective alternative method to reduce power consumption while the device is still executing code. In this mode, the system clock continues to operate from the same source and at the same speed. Peripheral modules continue to be clocked at the same speed, while the CPU clock speed is reduced. Synchronization between the two clock domains is maintained, allowing the peripherals to access the SFRs while the CPU executes code at a slower rate.

Doze mode is enabled by setting the DOZEN bit (`CLKDIV<11>`). The ratio between peripheral and core clock speed is determined by the `DOZE<2:0>` bits (`CLKDIV<14:12>`). There are eight possible configurations, from 1:1 to 1:128, with 1:1 being the default setting.

Programs can use Doze mode to selectively reduce power consumption in event-driven applications. This allows clock-sensitive functions, such as synchronous communications, to continue without interruption while the CPU idles, waiting for something to invoke an interrupt routine. An automatic return to full-speed CPU operation on interrupts can be enabled by setting the ROI bit (`CLKDIV<15>`). By default, interrupt events have no effect on Doze mode operation.

For example, suppose the device is operating at 20 MIPS and the ECAN module has been configured for 500 kbps based on this device operating speed. If the device is placed in Doze mode with a clock frequency ratio of 1:4, the ECAN module continues to communicate at the required bit rate of 500 kbps, but the CPU now starts executing instructions at a frequency of 5 MIPS.

10.4 Peripheral Module Disable

The Peripheral Module Disable (PMD) registers provide a method to disable a peripheral module by stopping all clock sources supplied to that module. When a peripheral is disabled using the appropriate PMD control bit, the peripheral is in a minimum power consumption state. The control and status registers associated with the peripheral are also disabled, so writes to those registers do not have effect and read values are invalid.

A peripheral module is enabled only if both the associated bit in the PMD register is cleared and the peripheral is supported by the specific dsPIC[®] DSC variant. If the peripheral is present in the device, it is enabled in the PMD register by default.

Note: If a PMD bit is set, the corresponding module is disabled after a delay of one instruction cycle. Similarly, if a PMD bit is cleared, the corresponding module is enabled after a delay of one instruction cycle (assuming the module control registers are already configured to enable module operation).

10.5 Power-Saving Resources

Many useful resources related to Power-Saving features are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:
<http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en554310>

NOTES:

11.0 I/O PORTS

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 10. “I/O Ports”** (DS70598) of the “*dsPIC33E/PIC24E Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

All of the device pins (except VDD, VSS, $\overline{\text{MCLR}}$ and OSC1/CLKI) are shared among the peripherals and the parallel I/O ports. All I/O input ports feature Schmitt Trigger inputs for improved noise immunity.

11.1 Parallel I/O (PIO) Ports

Generally, a parallel I/O port that shares a pin with a peripheral is subservient to the peripheral. The peripheral’s output buffer data and control signals are provided to a pair of multiplexers. The multiplexers select whether the peripheral or the associated port has ownership of the output data and control signals of the I/O pin. The logic also prevents “loop through,” in which a port’s digital output can drive the input of a peripheral that shares the same pin. [Figure 11-1](#) illustrates how ports are shared with other peripherals and the associated I/O pin to which they are connected.

When a peripheral is enabled and the peripheral is actively driving an associated pin, the use of the pin as a general purpose output pin is disabled. The I/O pin can be read, but the output driver for the parallel port bit is disabled. If a peripheral is enabled, but the peripheral is not actively driving a pin, that pin can be driven by a port.

All port pins have eight registers directly associated with their operation as digital I/O. The Data Direction register (TRISx) determines whether the pin is an input or an output. If the data direction bit is a ‘1’, then the pin is an input. All port pins are defined as inputs after a Reset. Reads from the latch (LATx) read the latch. Writes to the latch write the latch. Reads from the port (PORTx) read the port pins, while writes to the port pins write the latch.

Any bit and its associated data and control registers that are not valid for a particular device is disabled. This means the corresponding LATx and TRISx registers and the port pin are read as zeros.

When a pin is shared with another peripheral or function that is defined as an input only, it is nevertheless regarded as a dedicated port because there is no other competing source of outputs.

FIGURE 11-1: BLOCK DIAGRAM OF A TYPICAL SHARED PORT STRUCTURE

11.1.1 OPEN-DRAIN CONFIGURATION

In addition to the PORT, LAT and TRIS registers for data control, some port pins can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Control register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The open-drain feature allows the generation of outputs higher than VDD (e.g., 5V on a 5V tolerant pin) by using external pull-up resistors. The maximum open-drain voltage allowed is the same as the maximum VIH specification for that pin.

See the “[Pin Diagrams](#)” section for the available pins and their functionality.

11.2 Configuring Analog and Digital Port Pins

The ANSELx register controls the operation of the analog port pins. The port pins that are to function as analog inputs or outputs must have their corresponding ANSELx and TRISx bits set. In order to use port pins for I/O functionality with digital modules, such as Timers, UARTs, etc., the corresponding ANSELx bit must be cleared.

The ANSELx register has a default value of 0xFFFF; therefore, all pins that share analog functions are analog (not digital) by default. Refer to the Pinout I/O Descriptions ([Table 1-1](#) in [Section 1.0 “Device Overview”](#)) for the complete list of analog pins.

If the TRISx bit is cleared (output) while the ANSELx bit is set, the digital output level (VOH or VOL) is converted by an analog peripheral, such as the ADC module or Comparator module.

When the PORT register is read, all pins configured as analog input channels are read as cleared (a low level).

Pins configured as digital inputs do not convert an analog input. Analog levels on any pin defined as a digital input (including the pins defined as Analog in [Table 1-1](#) in [Section 1.0 “Device Overview”](#)) can cause the input buffer to consume current that exceeds the device specifications.

11.2.1 I/O PORT WRITE/READ TIMING

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically this instruction would be an NOP, as shown in [Example 11-1](#).

11.3 Input Change Notification

The input change notification function of the I/O ports allows the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices to generate interrupt requests to the processor in response to a Change-of-State (COS) on selected input pins. This feature can detect input Change-of-States even in Sleep mode, when the clocks are disabled. Every I/O port pin can be selected (enabled) for generating an interrupt request on a Change-of-State.

Three control registers are associated with the CN functionality of each I/O port. The CNENx registers contain the CN interrupt enable control bits for each of the input pins. Setting any of these bits enables a CN interrupt for the corresponding pins.

Each I/O pin also has a weak pull-up and a weak pull-down connected to it. The pull-ups act as a current source or sink source connected to the pin, and eliminate the need for external resistors when push-button or keypad devices are connected. The pull-ups and pull-downs are enabled separately using the CNPUx and the CNPDx registers, which contain the control bits for each of the pins. Setting any of the control bits enables the weak pull-ups and/or pull-downs for the corresponding pins.

Note: Pull-ups and pull-downs on change notification pins should always be disabled when the port pin is configured as a digital output.

EXAMPLE 11-1: PORT WRITE/READ EXAMPLE

```

MOV    0xFF00, W0    ; Configure PORTB<15:8>
                        ; as inputs
MOV    W0, TRISB    ; and PORTB<7:0>
                        ; as outputs
NOP                                ; Delay 1 cycle
BTSS   PORTB, #13   ; Next Instruction

```

11.4 Peripheral Pin Select

A major challenge in general purpose devices is providing the largest possible set of peripheral features while minimizing the conflict of features on I/O pins. The challenge is even greater on low pin-count devices. In an application where more than one peripheral needs to be assigned to a single pin, inconvenient workarounds in application code or a complete redesign may be the only option.

Peripheral Pin Select configuration provides an alternative to these choices by enabling peripheral set selection and their placement on a wide range of I/O pins. By increasing the pinout options available on a particular device, users can better tailor the device to their entire application, rather than trimming the application to fit the device.

The Peripheral Pin Select configuration feature operates over a fixed subset of digital I/O pins. Users may independently map the input and/or output of most digital peripherals to any one of these I/O pins. Peripheral Pin Select is performed in software and generally does not require the device to be reprogrammed. Hardware safeguards are included that prevent accidental or spurious changes to the peripheral mapping once it has been established.

11.4.1 AVAILABLE PINS

The number of available pins is dependent on the particular device and its pin count. Pins that support the Peripheral Pin Select feature include the designation “RPn” or “RPIn” in their full pin designation, where “RP” designates a remappable function for input or output and “RPI” designates a remappable functions for input only, and “n” is the remappable pin number.

11.4.2 AVAILABLE PERIPHERALS

The peripherals managed by the Peripheral Pin Select are all digital only peripherals. These include general serial communications (UART and SPI), general purpose timer clock inputs, timer-related peripherals (input capture and output compare) and interrupt-on-change inputs.

In comparison, some digital-only peripheral modules are never included in the Peripheral Pin Select feature. This is because the peripheral’s function requires special I/O circuitry on a specific port and cannot be easily connected to multiple pins. These modules include I²C and the PWM. A similar requirement excludes all modules with analog inputs, such as the ADC Converter.

A key difference between remappable and non-remappable peripherals is that remappable peripherals are not associated with a default I/O pin. The peripheral must always be assigned to a specific I/O pin before it can be used. In contrast, non-remappable peripherals are always available on a default pin, assuming that the peripheral is active and not conflicting with another peripheral.

When a remappable peripheral is active on a given I/O pin, it takes priority over all other digital I/O and digital communication peripherals associated with the pin. Priority is given regardless of the type of peripheral that is mapped. Remappable peripherals never take priority over any analog functions associated with the pin.

11.4.3 CONTROLLING PERIPHERAL PIN SELECT

Peripheral Pin Select features are controlled through two sets of SFRs: one to map peripheral inputs and one to map outputs. Because they are separately controlled, a particular peripheral’s input and output (if the peripheral has both) can be placed on any selectable function pin without constraint.

The association of a peripheral to a peripheral-selectable pin is handled in two different ways, depending on whether an input or output is being mapped.

11.4.4 INPUT MAPPING

The inputs of the Peripheral Pin Select options are mapped on the basis of the peripheral. That is, a control register associated with a peripheral dictates the pin it will be mapped to. The RPINR_x registers are used to configure peripheral input mapping (see Register 11-1 through Register 11-22). Each register contains sets of 7-bit fields, with each set associated with one of the remappable peripherals (see Table 11-1). Programming a given peripheral’s bit field with an appropriate 7-bit value maps the RPn/RPIn pin with the corresponding value to that peripheral (see Table 11-2). For any given device, the valid range of values for any bit field corresponds to the maximum number of Peripheral Pin Selections supported by the device.

For example, Figure 11-2 illustrates remappable pin selection for the U1RX input.

Note 1: See Section 11.4.4.2 “Virtual Connections” for more information on selecting this pin assignment.

11.4.4.1 Output Mapping

In contrast to inputs, the outputs of the Peripheral Pin Select options are mapped on the basis of the pin. In this case, a control register associated with a particular pin dictates the peripheral output to be mapped. The RPORx registers are used to control output mapping. Like the RPINRx registers, each register contains sets of 6 bit fields, with each set associated with one RPn pin (see Register 11-44 through Register 11-51). The value of the bit field corresponds to one of the peripherals and that peripheral's output is mapped to the pin (see Table 11-3 and Figure 11-3).

A null output is associated with the Output Register Reset value of '0'. This is done to ensure that remappable outputs remain disconnected from all output pins by default.

FIGURE 11-3: MULTIPLEXING OF REMAPPABLE OUTPUT FOR RPn

TABLE 11-3: OUTPUT SELECTION FOR REMAPPABLE PINS (RPn)

Function	RPnR<5:0>	Output Name

Note 1: This function is available in dsPIC33EPXXX(MC/MU)806/810/814 devices only.

11.4.4.2 Virtual Connections

The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices support virtual (internal) connections to the output of the comparator modules, CMP1OUT, CMP2OUT and CMP3OUT (see Figure 25-1 in [Section 25.0 “Comparator Module”](#)). In addition, dsPIC33EPXXXMU806/810/814 devices support virtual connections to the filtered QEI module inputs, FINDX1, FHOME1, FINDX2 and FHOME2 (see Figure 17-1 in [Section 17.0 “Quadrature Encoder Interface \(QEI\) Module \(dsPIC33EPXXX\(MC/MU\)8XX Devices Only\)”](#)).

Virtual connections provide a simple way of inter-peripheral connection without utilizing a physical pin. For example, by setting the FLT1R<6:0> bits of the RPNR12 register to the value of `\b0000001`, the output of the analog comparator, CMP1OUT, will be connected to the PWM Fault 1 input, which allows the analog comparator to trigger PWM Faults without the use of an actual physical pin on the device.

Virtual connection to the QEI module allows peripherals to be connected to the QEI digital filter input. To utilize this filter, the QEI module must be enabled, and its inputs must be connected to a physical RPN/RPIn pin. [Example 11-2](#) illustrates how the input capture module can be connected to the QEI digital filter.

11.4.4.3 Mapping Limitations

The control schema of the peripheral select pins is not limited to a small range of fixed peripheral configurations. There are no mutual or hardware enforced lockouts between any of the peripheral mapping SFRs. Literally any combination of peripheral mappings across any or all of the RPN/RPIn pins is possible. This includes both many-to-one and one-to-many mappings of peripheral inputs and outputs to pins. While such mappings may be technically possible from a configuration point of view, they may not be supportable from an electrical point of view.

EXAMPLE 11-2: CONNECTING IC1 TO HOME1 DIGITAL FILTER INPUT ON PIN 3 OF THE dsPIC33EP512MU810 DEVICE

```
RPINR15 = 0x5600;    /* Connect the QEI1 HOME1 input to RP86 (pin 3) */
RPINR7  = 0x009;    /* Connect the IC1 input to the digital filter on the FHOME1 input */

QEI1IOC = 0x4000;   /* Enable the QEI digital filter */
QEI1CON = 0x8000;   /* Enable the QEI module */
```

11.5 I/O Helpful Tips

1. In some cases, certain pins, as defined in Table 32-9 in Section 32.0 “Electrical Characteristics” under “Injection Current”, have internal protection diodes to VDD and VSS; the term “Injection Current” is also referred to as “Clamp Current”. On designated pins, with sufficient external current-limiting precautions by the user, I/O pin input voltages are allowed to be greater or less than the data sheet absolute maximum ratings with respect to the VSS and VDD supplies. Note that when the user application forward biases either of the high or low side internal input clamp diodes, that the resulting current being injected into the device that is clamped internally by the VDD and VSS power rails, may affect the ADC accuracy by four to six counts.
2. I/O pins that are shared with any analog input pin, (i.e., ANx, see Table 1-1 in Section 1.0 “Device Overview”), are always analog pins by default after any Reset. Consequently, configuring a pin as an analog input pin, automatically disables the digital input pin buffer and any attempt to read the digital input level by reading PORTx or LATx will always return a ‘0’, regardless of the digital logic level on the pin. To use a pin as a digital I/O pin on a shared analog pin (see Table 1-1 in Section 1.0 “Device Overview”), the user application needs to configure the Analog Pin Configuration registers in the I/O ports module (i.e., ANSELx) by setting the appropriate bit that corresponds to that I/O port pin to a ‘0’.

Note: Although it is not possible to use a digital input pin when its analog function is enabled, it is possible to use the digital I/O output function, TRISx = 0x0, while the analog function is also enabled. However, this is not recommended, particularly if the analog input is connected to an external analog voltage source, which would create signal contention between the analog signal and the output pin driver.

3. Most I/O pins have multiple functions. Referring to the device pin diagrams in the data sheet, the priorities of the functions allocated to any pins are indicated by reading the pin name from left to right. The left most function name takes precedence over any function to its right in the naming convention. For example: AN16/T2CK/T7CK/RC1; this indicates that AN16 is the highest priority in this example and will supersede all other functions to its right in the list. Those other functions to its right, even if enabled, would not work as long as any other function to its left was enabled. This rule applies to all of the functions listed for a given pin. Dedicated peripheral functions are always higher priority than remappable functions. I/O pins are always the lowest priority.

4. Each pin has an internal weak pull-up resistor and pull-down resistor that can be configured using the CNPUx and CNPDx registers, respectively. These resistors eliminate the need for external resistors in certain applications. The internal pull-up is up to $\sim(VDD-0.8)$, not VDD. This value is still above the minimum V_{IH} of CMOS and TTL devices.

5. When driving LEDs directly, the I/O pin can source or sink more current than what is specified in the V_{OH}/I_{OH} and V_{OL}/I_{OL} DC characteristic specification. The respective I_{OH} and I_{OL} current rating only applies to maintaining the corresponding output at or above the V_{OH} and at or below the V_{OL} levels. However, for LEDs, unlike digital inputs of an externally connected device, they are not governed by the same minimum V_{IH}/V_{IL} levels. An I/O pin output can safely sink or source any current less than that listed in the absolute maximum rating section of the data sheet. For example:

$$V_{OH} = 2.4V @ I_{OH} = -8 \text{ mA and } V_{DD} = 3.3V$$

The maximum output current sourced by any 8 mA I/O pin = 12 mA.

LED source current < 12 mA is technically permitted. Refer to the V_{OH}/I_{OH} graphs in Section 32.0 “Electrical Characteristics” for additional information.

6. The Peripheral Pin Select (PPS) pin mapping rules are as follows:
 - a) Only one “output” function can be active on a given pin at any time regardless if it is a dedicated or remappable function (one pin, one output).
 - b) It is possible to assign a “remappable output” function to multiple pins and externally short or tie them together for increased current drive.
 - c) If any “dedicated output” function is enabled on a pin, it will take precedence over any remappable “output” function.
 - d) If any “dedicated digital” (input or output) function is enabled on a pin, any number of “input” remappable functions can be mapped to the same pin.
 - e) If any “dedicated analog” function(s) are enabled on a given pin, “digital input(s)” of any kind will all be disabled, although a single “digital output”, at the user’s cautionary discretion, can be enabled and active as long as there is no signal contention with an external analog input signal. For example, it is possible for the ADC to convert the digital output logic level, or to toggle a digital output on a comparator or ADC input, provided there is no external analog input, such as for a built-in self test.
 - f) Any number of “input” remappable functions can be mapped to the same pin(s) at the same time, including any pin with a single output from either a dedicated or remappable “output”.

- g) The TRIS registers control *only* the digital I/O output buffer. Any other dedicated or remappable active “output” will automatically override the TRIS setting. The TRIS register *does not* control the digital logic “input” buffer. Remappable digital “inputs” do not automatically override TRIS settings, which means that the TRIS bit must be set to input for pins with only remappable input function(s) assigned.
- h) All analog pins are enabled by default after any Reset and the corresponding digital input buffer on the pin is disabled. Only the Analog Pin Select registers control the digital input buffer, *not* the TRIS register. The user must disable the analog function on a pin using the Analog Pin Select registers in order to use any “digital input(s)” on a corresponding pin, no exceptions.

11.6 I/O Resources

Many useful resources related to I/O are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

<p>Note: In the event you are not able to access the product page using the link above, enter this URL in your browser: http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en554301</p>

NOTES:

12.0 TIMER1

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 11. “Timers”** (DS70362) of the “dsPIC33E/PIC24E Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The Timer1 module is a 16-bit timer, which can serve as the time counter for the real-time clock, or operate as a free-running interval timer/counter.

The Timer1 module has the following unique features over other timers:

- Can be operated from the low-power 32 kHz crystal oscillator available on the device.
- Can be operated in Asynchronous Counter mode from an external clock source.
- The external clock input (T1CK) can optionally be synchronized to the internal device clock and clock synchronization is performed after the prescaler.

The unique features of Timer1 allow it to be used for Real-Time Clock (RTC) applications. A block diagram of Timer1 is shown in [Figure 12-1](#).

The Timer1 module can operate in one of the following modes:

- Timer mode
- Gated Timer mode
- Synchronous Counter mode
- Asynchronous Counter mode

In Timer and Gated Timer modes, the input clock is derived from the internal instruction cycle clock (Fcy). In Synchronous and Asynchronous Counter modes, the input clock is derived from the external clock input at the T1CK pin.

The Timer modes are determined by the following bits:

- Timer Clock Source Control bit (TCS): T1CON<1>
- Timer Synchronization Control bit (TSYNC): T1CON<2>
- Timer Gate Control bit (TGATE): T1CON<6>

Timer control bit setting for different operating modes are given in the [Table 12-1](#).

TABLE 12-1: TIMER MODE SETTINGS

Mode	TCS	TGATE	TSYNC
Timer	0	0	x
Gated Timer	0	1	x
Synchronous Counter	1	x	1
Asynchronous Counter	1	x	0

FIGURE 12-1: 16-BIT TIMER1 MODULE BLOCK DIAGRAM

- Note 1:** FP is the peripheral clock.
Note 2: See [Section 9.0 “Oscillator Configuration”](#) for information on enabling the Secondary Oscillator (SOSC).

12.1 Timer Resources

Many useful resources related to Timers are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:
<http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en554310>

 00 = 1:1
- bit 3 **Unimplemented:** Read as '0'
- bit 2 **TSYNC:** Timer1 External Clock Input Synchronization Select bit⁽¹⁾
 When TCS = 1:
 1 = Synchronizes external clock input
 0 = Does not synchronize external clock input
 When TCS = 0:
 This bit is ignored.
- bit 1 **TCS:** Timer1 Clock Source Select bit⁽¹⁾
 1 = External clock from T1CK pin (on the rising edge)
 0 = Internal clock (FP)
- bit 0 **Unimplemented:** Read as '0'

Note 1: When Timer1 is enabled in External Synchronous Counter mode (TCS = 1, TSYNC = 1, TON = 1), any attempts by user software to write to the TMR1 register are ignored.

NOTES:

13.0 TIMER2/3, TIMER4/5, TIMER6/7 AND TIMER8/9

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 11. “Timers”** (DS70362) of the “*dsPIC33E/PIC24E Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The Timer2/3, Timer4/5, Timer6/7 and Timer8/9 modules are 32-bit timers, which can also be configured as four independent 16-bit timers with selectable operating modes.

As a 32-bit timer, Timer2/3, Timer4/5, Timer6/7 and Timer8/9 operate in three modes:

- Two Independent 16-Bit Timers (e.g., Timer2 and Timer3) with all 16-Bit Operating modes (except Asynchronous Counter mode)
- Single 32-Bit Timer
- Single 32-Bit Synchronous Counter

They also support these features:

- Timer Gate Operation
- Selectable Prescaler Settings
- Timer Operation during Idle and Sleep modes
- Interrupt on a 32-Bit Period Register Match
- Time Base for Input Capture and Output Compare Modules (Timer2 and Timer3 only)
- ADC1 Event Trigger (Timer2/3 only)
- ADC2 Event Trigger (Timer4/5 only)

Individually, all eight of the 16-bit timers can function as synchronous timers or counters. They also offer the features listed above, except for the event trigger; this is implemented only with Timer2/3. The operating modes and enabled features are determined by setting the appropriate bit(s) in the T2CON, T3CON, T4CON, T5CON, T6CON, T7CON, T8CON and T9CON registers. T2CON, T4CON, T6CON and T8CON are shown in generic form in [Register 13-1](#). T3CON, T5CON, T7CON and T9CON are shown in [Register 13-2](#).

For 32-bit timer/counter operation, Timer2, Timer4, Timer6 or Timer8 is the least significant word; Timer3, Timer5, Timer7 or Timer9 is the most significant word of the 32-bit timers.

Note: For 32-bit operation, T3CON, T5CON, T7CON and T9CON control bits are ignored. Only T2CON, T4CON, T6CON and T8CON control bits are used for setup and control. Timer2, Timer4, Timer6 and Timer8 clock and gate inputs are utilized for the 32-bit timer modules, but an interrupt is generated with the Timer3, Timer5, Timer7 and Timer9 interrupt flags.

A block diagram for an example 32-bit timer pair is shown [Figure 13-3](#).

Note: Only Timer2, 3, 4 and 5 can trigger a DMA data transfer.

- bit 3-2 **Unimplemented:** Read as '0'
- bit 1 **TCS:** Timery Clock Source Select bit^(1,3)
 1 = External clock from TyCK pin (on the rising edge)
 0 = Internal clock (FP)
- bit 0 **Unimplemented:** Read as '0'

- Note 1:** When 32-bit operation is enabled (T2CON<3> = 1), these bits have no effect on Timery operation; all timer functions are set through TxCON.
- 2:** When 32-bit timer operation is enabled (T32 = 1) in the Timer Control register (TxCON<3>), the TSIDL bit must be cleared to operate the 32-bit timer in Idle mode.
- 3:** The TyCK pin is not available on all timers. Refer to the “[Pin Diagrams](#)” section for the available pins.

NOTES:

14.0 INPUT CAPTURE

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 12. "Input Capture"** (DS70352) of the "dsPIC33E/PIC24E Family Reference Manual", which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The input capture module is useful in applications requiring frequency (period) and pulse measurement. The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices support up to 16 input capture channels.

Key features of the input capture module include:

- Hardware-configurable for 32-bit operation in all modes by cascading two adjacent modules
- Synchronous and Trigger modes of output compare operation, with up to 30 user-selectable Trigger/Sync sources available
- A 4-level FIFO buffer for capturing and holding timer values for several events
- Configurable interrupt generation
- Up to six clock sources available for each module, driving a separate internal 16-bit counter

Note: Only IC1, IC2, IC3 and IC4 can trigger a DMA data transfer. If DMA data transfers are required, the FIFO buffer size must be set to '1' (IC1<1:0> = 00).

NOTES:

15.0 OUTPUT COMPARE

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 13. “Output Compare”** (DS70358) of the “dsPIC33E/PIC24E Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The output compare module can select one of eight available clock sources for its time base. The module compares the value of the timer with the value of one or two Compare registers, depending on the operating mode selected. The state of the output pin changes when the timer value matches the Compare register value. The output compare module generates either a single output pulse, or a sequence of output pulses, by changing the state of the output pin on the compare match events. The output compare module can also generate interrupts on compare match events.

Note 1: Only OC1, OC2, OC3 and OC4 can trigger a DMA data transfer.

2: See **Section 13. “Output Compare”** (DS70358) in the “dsPIC33E/PIC24E Family Reference Manual” for OCxR and OCxRS register restrictions.

16.0 HIGH-SPEED PWM MODULE (dsPIC33EPXXX(MC/MU)8XX DEVICES ONLY)

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 14. “High-Speed PWM”** (DS70645) of the “*dsPIC33E/PIC24E Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33EPXXX(MC/MU)806/810/814 devices support a dedicated Pulse-Width Modulation (PWM) module with up to 14 outputs.

The high-speed PWM module consists of the following major features:

- Two master time base modules with Special Event Triggers
- PWM module input clock prescaler
- Two synchronization inputs
- Two synchronization outputs
- Up to seven PWM generators
- Two PWM outputs per generator (PWMxH and PWMxL)
- Individual period, duty cycle and phase shift for each PWM output
- Period, duty cycle, phase shift and dead-time resolution of 8.32 ns
- Immediate update mode for PWM period, duty cycle and phase shift
- Independent Fault and current-limited inputs for each PWM
- Cycle-by-Cycle and Latched Fault modes
- PWM time-base capture upon current limit
- Seven Fault inputs and three comparator outputs available for Faults and current limits
- Programmable ADC trigger with interrupt for each PWM pair

- Complementary PWM outputs
- Push-Pull PWM outputs
- Redundant PWM outputs
- Edge-Aligned PWM mode
- Center-Aligned PWM mode
- Variable Phase PWM mode
- Multi-Phase PWM mode
- Fixed Off Time PWM mode
- Current-Limit PWM mode
- Current Reset PWM mode
- PWMxH and PWMxL output override control
- PWMxH and PWMxL output pin swapping
- Chopping mode (also known as Gated mode)
- Dead-time insertion
- Dead-time compensation
- Enhanced Leading-Edge Blanking (LEB)
- 8 mA PWM pin output drive

Note: Duty cycle, dead time, phase shift and frequency resolution is 16.64 ns in Center-Aligned PWM mode.

The high-speed PWM module contains up to seven PWM generators. Each PWM generator provides two PWM outputs: PWMxH and PWMxL. Two master time base generators provide a synchronous signal as a common time base to synchronize the various PWM outputs. Each generator can operate independently or in synchronization with either of the two master time bases. The individual PWM outputs are available on the output pins of the device. The input Fault signals and current-limited signals, when enabled, can monitor and protect the system by placing the PWM outputs into a known “safe” state.

Each PWM can generate a trigger to the ADC module to sample the analog signal at a specific instance during the PWM period. In addition, the high-speed PWM module also generates two Special Event Triggers to the ADC module based on the two master time bases.

The high-speed PWM module can synchronize itself with an external signal or can act as a synchronizing source to any external device. The SYNC11 and SYNC12 pins are the input pins, which can synchronize the high-speed PWM module with an external signal. The SYNCO1 and SYNCO2 pins are output pins that provides a synchronous signal to an external device.

Figure 16-1 illustrates an architectural overview of the high-speed PWM module and its interconnection with the CPU and other peripherals.

bit 15-0 **PWMCAP<15:0>**: Captured PWM Time Base Value bits^(1,2)
 The value in this register represents the captured PWM time base value when a leading edge is detected on the current-limit input.

- Note 1:** The capture feature is only available on primary output (PWM_xH).
Note 2: This feature is active only after LEB processing on the current-limit input signal is complete.

17.0 QUADRATURE ENCODER INTERFACE (QEI) MODULE (dsPIC33EPXXX(MC/MU)8XX DEVICES ONLY)

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 15. “Quadrature Encoder Interface (QEI)”** (DS70601) of the “*dsPIC33E/PIC24E Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

This chapter describes the Quadrature Encoder Interface (QEI) module and associated operational modes. The QEI module provides the interface to incremental encoders for obtaining mechanical position data.

The operational features of the QEI module include:

- 32-Bit Position Counter
- 32-Bit Index Pulse Counter
- 32-Bit Interval Timer
- 16-Bit Velocity Counter
- 32-Bit Position Initialization/Capture/Compare High Register
- 32-Bit Position Compare Low Register
- x4 Quadrature Count mode
- External Up/Down Count mode
- External Gated Count mode
- External Gated Timer mode
- Internal Timer mode

[Figure 17-1](#) illustrates the QEI block diagram.

Note: An ‘x’ used in the names of pins, control/status bits and registers denotes a particular Quadrature Encoder Interface (QEI) module number (x = 1 or 2).

FIGURE 17-1: QEI BLOCK DIAGRAM

17.1 QEI Resources

Many useful resources related to QEI are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:
<http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en554310>

NOTES:

18.0 SERIAL PERIPHERAL INTERFACE (SPI)

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 18. “Serial Peripheral Interface (SPI)”** (DS70569) of the “dsPIC33E/PIC24E Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The SPI module is a synchronous serial interface useful for communicating with other peripheral or microcontroller devices. These peripheral devices can be serial EEPROMs, shift registers, display drivers, ADC Converters, etc. The SPI module is compatible with the Motorola® SPI and SIOP interfaces.

Four SPI modules are provided on a single device. These modules, which are designated as SPI1, SPI2, SPI3 and SPI4, are functionally identical with the exception that SPI2 is not remappable. The dedicated SDI2, SDO2 and SCK2 connections provide improved performance over SPI1, SPI3 and SPI4 (see **Section 32.0 “Electrical Characteristics”**). Each SPI module includes an eight-word FIFO buffer and allows DMA bus connections. When using the SPI module with DMA, FIFO operation can be disabled.

Note: In this section, the SPI modules are referred to together as SPIx, or separately as SPI1, SPI2, SPI3 and SPI4. Special Function Registers follow a similar notation. For example, SPIxCON refers to the control register for the SPI1, SPI2, SPI3 or SPI4 module.

The SPIx serial interface consists of four pins, as follows:

- SDIx: Serial Data Input
- SDOx: Serial Data Output
- SCKx: Shift Clock Input or Output
- SSx/FSYNCx: Active-Low Slave Select or Frame Synchronization I/O Pulse

The SPIx module can be configured to operate with two, three or four pins. In 3-pin mode, SSx is not used. In 2-pin mode, neither SDOx nor SSx is used.

Figure 18-1 illustrates the block diagram of the SPI module in Standard and Enhanced modes.

FIGURE 18-1: SPIx MODULE BLOCK DIAGRAM

18.1 SPI Helpful Tips

1. In Frame mode, if there is a possibility that the master may not be initialized before the slave:
 - a) If FRMPOL (SPIxCON2<13>) = 1, use a pull-down resistor on SSx.
 - b) If FRMPOL = 0, use a pull-up resistor on SSx.

Note: This insures that the first frame transmission after initialization is not shifted or corrupted.

2. In Non-Framed 3-Wire mode, (i.e., not using SSx from a master):
 - a) If CKP (SPIxCON1<6>) = 1, always place a pull-up resistor on SSx.
 - b) If CKP = 0, always place a pull-down resistor on SSx.

Note: This will insure that during power-up and initialization, the master/slave will not lose synchronization due to an errant SCKx transition that would cause the slave to accumulate data shift errors, for both transmit and receive, appearing as corrupted data.

3. FRMEN (SPIxCON2<15>) = 1 and SSEN (SPIxCON1<7>) = 1 are exclusive and invalid. In Frame mode, SCKx is continuous and the Frame Sync pulse is active on the SSx pin, which indicates the start of a data frame.

Note: Not all third-party devices support Frame mode timing. Refer to the SPIx electrical characteristics for details.

4. In Master mode only, set the SMP bit (SPIxCON1<9>) to a '1' for the fastest SPI data rate possible. The SMP bit can only be set at the same time or after the MSTEN bit (SPIxCON1<5>) is set.

To avoid invalid slave read data to the master, the user's master software must ensure enough time for slave software to fill its write buffer before the user application initiates a master write/read cycle. It is always advisable to preload the SPIxBUF Transmit register in advance of the next master transaction cycle. SPIxBUF is transferred to the SPIx Shift register and is empty once the data transmission begins.

18.2 SPI Resources

Many useful resources related to SPI are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:
<http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en554301>

	U = Unimplemented bit, read as '0'
	'0' = Bit is cleared
	x = Bit is unknown
	U = Unimplemented bit, read as '0'

- bit 15 **SPIEN:** SPIx Enable bit
 1 = Enables the module and configures SCKx, SDOx, SDIx and \overline{SSx} as serial port pins
 0 = Disables the module
- bit 14 **Unimplemented:** Read as '0'
- bit 13 **SPISIDL:** SPIx Stop in Idle Mode bit
 1 = Discontinues the module operation when device enters Idle mode
 0 = Continues the module operation in Idle mode
- bit 12-11 **Unimplemented:** Read as '0'
- bit 10-8 **SPIBEC<2:0>:** SPIx Buffer Element Count bits (valid in Enhanced Buffer mode)
Master mode:
 Number of SPIx transfers that are pending.
Slave mode:
 Number of SPIx transfers that are unread.
- bit 7 **SRMPT:** SPIx Shift Register (SPIxSR) Empty bit (valid in Enhanced Buffer mode)
 1 = SPIx Shift register is empty and Ready-to-Send or receive the data
 0 = SPIx Shift register is not empty
- bit 6 **SPIROV:** SPIx Receive Overflow Flag bit
 1 = A new byte/word is completely received and discarded; the user application has not read the previous data in the SPIxBUF register
 0 = No overflow has occurred
- bit 5 **SRXMPT:** SPIx Receive FIFO Empty bit (valid in Enhanced Buffer mode)
 1 = RX FIFO is empty
 0 = RX FIFO is not empty
- bit 4-2 **SISEL<2:0>:** SPIx Buffer Interrupt Mode bits (valid in Enhanced Buffer mode)
 111 = Interrupt when the SPIx transmit buffer is full
 110 = Interrupt when last bit is shifted into SPIxSR, and as a result, the TX FIFO is empty
 101 = Interrupt when the last bit is shifted out of SPIxSR and the transmit is complete
 100 = Interrupt when one data is shifted into the SPIxSR, and as a result, the TX FIFO has one open memory location
 011 = Interrupt when the SPIx receive buffer is full
 010 = Interrupt when the SPIx receive buffer is 3/4 or more full
 001 = Interrupt when data is available in the receive buffer (SRMPT bit is set)
 000 = Interrupt when the last data in the receive buffer is read, and as a result, the buffer is empty (SRXMPT bit is set)

REGISTER 18-1: SPIxSTAT: SPIx STATUS AND CONTROL REGISTER (CONTINUED)

bit 1 **SPITBF:** SPIx Transmit Buffer Full Status bit

1 = Transmit has not yet started, SPIx transmit buffer is full

0 = Transmit has started, SPIx transmit buffer is empty

Standard Buffer Mode:

Automatically set in hardware when the core writes to the SPIxBUF location, loading the SPIx transmit buffer. Automatically cleared in hardware when the SPIx module transfers data from the SPIx transmit buffer to SPIxSR.

Enhanced Buffer Mode:

Automatically set in hardware when CPU writes to the SPIxBUF location, loading the last available buffer location. Automatically cleared in hardware when a buffer location is available for a CPU write operation.

bit 0 **SPIRBF:** SPIx Receive Buffer Full Status bit

1 = Receive complete, SPIx receive buffer is full

0 = Receive is incomplete, SPIx receive buffer is empty

Standard Buffer Mode:

Automatically set in hardware when SPIx transfers data from SPIxSR to the SPIx receive buffer. Automatically cleared in hardware when the core reads the SPIxBUF location, reading the SPIx receive buffer.

Enhanced Buffer Mode:

Automatically set in hardware when SPIx transfers data from SPIxSR to the buffer, filling the last unread buffer location. Automatically cleared in hardware when a buffer location is available for a transfer from SPIxSR.

 1 = Internal SPIx clock is disabled, pin functions as I/O
 0 = Internal SPIx clock is enabled
- bit 11 **DISSDO:** Disable SDOx Pin bit
 1 = SDOx pin is not used by the module; pin functions as I/O
 0 = SDOx pin is controlled by the module
- bit 10 **MODE16:** Word/Byte Communication Select bit
 1 = Communication is word-wide (16 bits)
 0 = Communication is byte-wide (8 bits)
- bit 9 **SMP:** SPIx Data Input Sample Phase bit⁽⁴⁾
Master mode:
 1 = Input data is sampled at end of data output time
 0 = Input data is sampled at middle of data output time
Slave mode:
 The SMP bit must be cleared when SPIx module is used in Slave mode.
- bit 8 **CKE:** SPIx Clock Edge Select bit⁽¹⁾
 1 = Serial output data changes on transition from active clock state to Idle clock state (refer to bit 6)
 0 = Serial output data changes on transition from Idle clock state to active clock state (refer to bit 6)
- bit 7 **SSEN:** Slave Select Enable bit (Slave mode)⁽²⁾
 1 = SSx pin is used for Slave mode
 0 = SSx pin is not used by module, pin is controlled by port function
- bit 6 **CKP:** Clock Polarity Select bit
 1 = Idle state for clock is a high level; active state is a low level
 0 = Idle state for clock is a low level; active state is a high level
- bit 5 **MSTEN:** Master Mode Enable bit
 1 = Master mode
 0 = Slave mode

- Note 1:** The CKE bit is not used in the Framed SPIx modes. Program this bit to '0' for Framed SPIx modes (FRMEN = 1).
- 2:** This bit must be cleared when FRMEN = 1.
- 3:** Do not set both primary and secondary prescalers to a value of 1:1.
- 4:** The SMP bit must be set only after setting the MSTEN bit. The SMP bit remains cleared if MSTEN = 0.

REGISTER 18-2: SPIxCON1: SPIx CONTROL REGISTER 1 (CONTINUED)

NOTES:

19.0 INTER-INTEGRATED CIRCUIT™ (I²C™)

- Note 1:** This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 19. “Inter-Integrated Circuit™ (I²C™)”** (DS70330) of the “*dsPIC33E/PIC24E Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).
- 2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 family of devices contain two Inter-Integrated Circuit (I²C) modules: I2C1 and I2C2.

The I²C module provides complete hardware support for both Slave and Multi-Master modes of the I²C serial communication standard, with a 16-bit interface.

The I²C module has a 2-pin interface:

- The SCLx pin is the clock.
- The SDAx pin is the data.

The I²C module offers the following key features:

- I²C interface supporting both Master and Slave modes of operation.
- I²C Slave mode supports 7 and 10-bit addressing.
- I²C Master mode supports 7 and 10-bit addressing.
- I²C port allows bidirectional transfers between master and slaves.
- Serial clock synchronization for I²C port can be used as a handshake mechanism to suspend and resume serial transfer (SCLREL control).
- I²C supports multi-master operation, detects bus collision and arbitrates accordingly.
- IPMI support
- SMBus support

R = Readable bit	W = Writable bit
-n = Value at POR	'1' = Bit is set
	'0' = Bit is cleared
	x = Bit is unknown
	U = Unimplemented bit, read as '0'

- bit 15 **I2CEN:** I2Cx Enable bit
 1 = Enables the I2Cx module and configures the SDAx and SCLx pins as serial port pins
 0 = Disables the I2Cx module; all I²C™ pins are controlled by port functions
- bit 14 **Unimplemented:** Read as '0'
- bit 13 **I2CSIDL:** I2Cx Stop in Idle Mode bit
 1 = Discontinues module operation when device enters an Idle mode
 0 = Continues module operation in Idle mode
- bit 12 **SCLREL:** SCLx Release Control bit (when operating as I²C slave)
 1 = Releases SCLx clock
 0 = Holds SCLx clock low (clock stretch)
If STREN = 1:
 The bit is R/W (i.e., software can write '0' to initiate stretch and write '1' to release clock). Hardware is clear at beginning of every slave data byte transmission. Hardware is clear at the end of every slave address byte reception. Hardware is clear at end of every slave data byte reception.
If STREN = 0:
 The bit is R/S (i.e., software can only write '1' to release clock). Hardware is clear at beginning of every slave data byte transmission. Hardware is clear at the end of every slave address byte reception.
- bit 11 **IPMIEN:** Intelligent Peripheral Management Interface (IPMI) Enable bit⁽¹⁾
 1 = IPMI mode is enabled; all addresses Acknowledged
 0 = IPMI mode is disabled
- bit 10 **A10M:** 10-Bit Slave Address bit
 1 = I2CxADD is a 10-bit slave address
 0 = I2CxADD is a 7-bit slave address
- bit 9 **DISSLW:** Disable Slew Rate Control bit
 1 = Slew rate control is disabled
 0 = Slew rate control is enabled
- bit 8 **SMEN:** SMBus Input Levels bit
 1 = Enables I/O pin thresholds compliant with the SMBus specification
 0 = Disables SMBus input thresholds
- bit 7 **GCEN:** General Call Enable bit (when operating as I²C slave)
 1 = Enables interrupt when a general call address is received in the I2CxRSR (module is enabled for reception)
 0 = General call address is disabled

Note 1: When performing master operations, ensure that the IPMIEN bit is '0'.

REGISTER 19-1: I2CxCON: I2Cx CONTROL REGISTER (CONTINUED)

- bit 6 **STREN:** SCLx Clock Stretch Enable bit (when operating as I²C slave)
Used in conjunction with the SCLREL bit.
1 = Enables software or receives clock stretching
0 = Disables software or receives clock stretching
- bit 5 **ACKDT:** Acknowledge Data bit (when operating as I²C master, applicable during master receive)
Value that is transmitted when the software initiates an Acknowledge sequence.
1 = Sends NACK during Acknowledge
0 = Sends ACK during Acknowledge
- bit 4 **ACKEN:** Acknowledge Sequence Enable bit (when operating as I²C master, applicable during master receive)
1 = Initiates Acknowledge sequence on SDAx and SCLx pins and transmits the ACKDT data bit. Hardware is clear at the end of a master Acknowledge sequence.
0 = Acknowledge sequence is not in progress
- bit 3 **RCEN:** Receive Enable bit (when operating as I²C master)
1 = Enables Receive mode for I²C. Hardware is clear at the end of the eighth bit of a master receive data byte.
0 = Receive sequence is not in progress
- bit 2 **PEN:** Stop Condition Enable bit (when operating as I²C master)
1 = Initiates Stop condition on SDAx and SCLx pins. Hardware is clear at the end of a master Stop sequence.
0 = Stop condition is not in progress
- bit 1 **RSEN:** Repeated Start Condition Enable bit (when operating as I²C master)
1 = Initiates Repeated Start condition on SDAx and SCLx pins. Hardware is clear at the end of a master Repeated Start sequence.
0 = Repeated Start condition is not in progress
- bit 0 **SEN:** Start Condition Enable bit (when operating as I²C master)
1 = Initiates Start condition on SDAx and SCLx pins. Hardware is clear at the end of a master Start sequence.
0 = Start condition is not in progress

Note 1: When performing master operations, ensure that the IPMIEN bit is '0'.

REGISTER 19-2: I2CxSTAT: I2Cx STATUS REGISTER

R = Readable bit	W = Writable bit	HS = Hardware Settable bit	HSC = Hardware Settable/Clearable bit
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

- bit 15 **ACKSTAT:** Acknowledge Status bit
(when operating as I²C™ master, applicable to master transmit operation)
1 = NACK received from slave
0 = ACK received from slave
Hardware is set or clear at the end of a slave Acknowledge.
- bit 14 **TRSTAT:** Transmit Status bit (when operating as I²C master, applicable to master transmit operation)
1 = Master transmit is in progress (8 bits + ACK)
0 = Master transmit is not in progress
Hardware is set at the beginning of a master transmission. Hardware is clear at the end of a slave Acknowledge.
- bit 13-11 **Unimplemented:** Read as '0'
- bit 10 **BCL:** Master Bus Collision Detect bit
1 = A bus collision has been detected during a master operation
0 = No collision
Hardware is set at detection of a bus collision.
- bit 9 **GCSTAT:** General Call Status bit
1 = General call address was received
0 = General call address was not received
Hardware is set when an address matches the general call address. Hardware is clear at a Stop detection.
- bit 8 **ADD10:** 10-Bit Address Status bit
1 = 10-bit address was matched
0 = 10-bit address was not matched
Hardware is set at a match of the 2nd byte of a matched 10-bit address. Hardware is clear at a Stop detection.
- bit 7 **IWCOL:** Write Collision Detect bit
1 = An attempt to write to the I2CxTRN register failed because the I²C module is busy
0 = No collision
Hardware is set at an occurrence of a write to I2CxTRN while busy (cleared by software).
- bit 6 **I2COV:** I2Cx Receive Overflow Flag bit
1 = A byte was received while the I2CxRCV register is still holding the previous byte
0 = No overflow
Hardware is set at an attempt to transfer I2CxRSR to I2CxRCV (cleared by software).
- bit 5 **D_A:** Data/Address bit (when operating as I²C slave)
1 = Indicates that the last byte received was data
0 = Indicates that the last byte received was a device address
Hardware is clear at a device address match. Hardware is set by reception of a slave byte.
- bit 4 **P:** Stop bit
1 = Indicates that a Stop bit has been detected last
0 = Stop bit was not detected last
Hardware is set or clear when a Start, Repeated Start or Stop is detected.

REGISTER 19-2: I2CxSTAT: I2Cx STATUS REGISTER (CONTINUED)

- bit 3 **S:** Start bit
1 = Indicates that a Start (or Repeated Start) bit has been detected last
0 = Start bit was not detected last
Hardware is set or clear when a Start, Repeated Start or Stop is detected.
- bit 2 **R_W:** Read/Write Information bit (when operating as I²C slave)
1 = Read – indicates data transfer is output from a slave
0 = Write – indicates data transfer is input to a slave
Hardware is set or clear after reception of an I²C device address byte.
- bit 1 **RBF:** Receive Buffer Full Status bit
1 = Receive is complete, I2CxRCV is full
0 = Receive is not complete, I2CxRCV is empty
Hardware is set when I2CxRCV is written with a received byte. Hardware is clear when software reads I2CxRCV.
- bit 0 **TBF:** Transmit Buffer Full Status bit
1 = Transmit is in progress, I2CxTRN is full
0 = Transmit is complete, I2CxTRN is empty
Hardware is set when software writes to I2CxTRN. Hardware is clear at completion of a data transmission.

REGISTER 19-3: I2CxMSK: I2Cx SLAVE MODE ADDRESS MASK REGISTER

bit 15-10 **Unimplemented:** Read as '0'

bit 9-0 **AMSKx:** Mask for Address bit x Select bit

For 10-Bit Address:

- 1 = Enables masking for bit Ax of incoming message address; bit match is not required in this position
- 0 = Disables masking for bit Ax; bit match is required in this position

For 7-Bit Address (I2CxMSK<6:0> only):

- 1 = Enables masking for bit Ax + 1 of incoming message address; bit match is not required in this position
- 0 = Disable masking for bit Ax + 1; bit match is required in this position

20.0 UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER (UART)

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 17. "UART"** (DS70582) of the "*dsPIC33E/PIC24E Family Reference Manual*", which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 family of devices contains four UART modules.

The Universal Asynchronous Receiver Transmitter (UART) module is one of the serial I/O modules available in the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 device family. The UART is a full-duplex, asynchronous system that can communicate with peripheral devices, such as personal computers, LIN/J2602, RS-232 and RS-485 interfaces. The module also supports a hardware flow control option with the UxCTS and UxRTS pins, and also includes an IrDA® encoder and decoder.

The primary features of the UARTx module are:

- Full-Duplex, 8 or 9-Bit Data Transmission through the UxTX and UxRX Pins
- Even, Odd or No Parity Options (for 8-bit data)
- One or Two Stop bits
- Hardware Flow Control Option with $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ Pins
- Fully Integrated Baud Rate Generator with 16-Bit Prescaler
- Baud Rates Ranging from 4.375 Mbps to 67 bps at 16x mode at 70 MIPS
- Baud Rates Ranging from 17.5 Mbps to 267 bps at 4x mode at 70 MIPS
- 4-Deep First-In First-Out (FIFO) Transmit Data Buffer
- 4-Deep FIFO Receive Data Buffer
- Parity, Framing and Buffer Overrun Error Detection
- Support for 9-bit mode with Address Detect (9th bit = 1)
- Transmit and Receive Interrupts
- A Separate Interrupt for All UARTx Error Conditions
- Loopback mode for Diagnostic Support
- Support for Sync and Break Characters
- Support for Automatic Baud Rate Detection
- IrDA® Encoder and Decoder Logic
- 16x Baud Clock Output for IrDA Support

A simplified block diagram of the UARTx module is shown in [Figure 20-1](#). The UARTx module consists of these key hardware elements:

- Baud Rate Generator
- Asynchronous Transmitter
- Asynchronous Receiver

FIGURE 20-1: UARTx SIMPLIFIED BLOCK DIAGRAM

20.1 UARTx Helpful Tips

1. In multi-node direct-connect UARTx networks, UARTx receive inputs react to the complementary logic level defined by the URXINV bit (UxMODE<4>), which defines the Idle state, the default of which is logic high (i.e., URXINV = 0). Because remote devices do not initialize at the same time, it is likely that one of the devices, because the RX line is floating, will trigger a Start bit detection and will cause the first byte received, after the device has been initialized, to be invalid. To avoid this situation, the user should use a pull-up or pull-down resistor on the RX pin depending on the value of the URXINV bit.
 - a) If URXINV = 0, use a pull-up resistor on the RX pin.
 - b) If URXINV = 1, use a pull-down resistor on the RX pin.
2. The first character received on a wake-up from Sleep mode, caused by activity on the UxRX pin of the UARTx module, will be invalid. In Sleep mode, peripheral clocks are disabled. By the time the oscillator system has restarted and stabilized from Sleep mode, the baud rate bit sampling clock, relative to the incoming UxRX bit timing, is no longer synchronized resulting in the first character being invalid. This is to be expected.

20.2 UARTx Resources

Many useful resources related to the UARTx are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

<p>Note: In the event you are not able to access the product page using the link above, enter this URL in your browser: http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en554310</p>

20.3 UARTx Registers

REGISTER 20-1: UxMODE: UARTx MODE REGISTER

R/W-0	U-0	R/W-0	R/W-0	R/W-0	U-0	R/W-0	R/W-0
UARTEN ⁽¹⁾	—	USIDL	IREN ⁽²⁾	RTSMD	—	UEN<1:0>	
bit 15						bit 8	

R/W-0, HC	R/W-0	R/W-0, HC	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
WAKE	LPBACK	ABAUD	URXINV	BRGH	PDSEL<1:0>		STSEL
bit 7						bit 0	

Legend:	HC = Hardware Clearable bit
R = Readable bit	W = Writable bit
-n = Value at POR	'1' = Bit is set
	'0' = Bit is cleared
	x = Bit is unknown
	U = Unimplemented bit, read as '0'

- bit 15 **UARTEN:** UARTx Enable bit⁽¹⁾
 1 = UARTx is enabled; all UARTx pins are controlled by UARTx as defined by UEN<1:0>
 0 = UARTx is disabled; all UARTx pins are controlled by port latches; UARTx power consumption is minimal
- bit 14 **Unimplemented:** Read as '0'
- bit 13 **USIDL:** UARTx Stop in Idle Mode bit
 1 = Discontinues module operation when device enters Idle mode
 0 = Continues module operation in Idle mode
- bit 12 **IREN:** IrDA[®] Encoder and Decoder Enable bit⁽²⁾
 1 = IrDA encoder and decoder are enabled
 0 = IrDA encoder and decoder are disabled
- bit 11 **RTSMD:** Mode Selection for $\overline{\text{UxRTS}}$ Pin bit
 1 = $\overline{\text{UxRTS}}$ pin in Simplex mode
 0 = $\overline{\text{UxRTS}}$ pin in Flow Control mode
- bit 10 **Unimplemented:** Read as '0'
- bit 9-8 **UEN<1:0>:** UARTx Pin Enable bits
 11 = UxTX, UxRX and BCLK pins are enabled and used; $\overline{\text{UxCTS}}$ pin is controlled by port latches
 10 = UxTX, UxRX, UxCTS and UxRTS pins are enabled and used
 01 = UxTX, UxRX and $\overline{\text{UxRTS}}$ pins are enabled and used; UxCTS pin is controlled by port latches
 00 = UxTX and UxRX pins are enabled and used; UxCTS and UxRTS/BCLK pins are controlled by port latches
- bit 7 **WAKE:** Wake-up on Start Bit Detect During Sleep Mode Enable bit
 1 = UARTx continues to sample the UxRX pin; interrupt is generated on falling edge; bit is cleared in hardware on following rising edge
 0 = No wake-up is enabled
- bit 6 **LPBACK:** UARTx Loopback Mode Select bit
 1 = Enables Loopback mode
 0 = Loopback mode is disabled
- bit 5 **ABAUD:** Auto-Baud Enable bit
 1 = Enables baud rate measurement on the next character – requires reception of a Sync field (55h) before other data; cleared in hardware upon completion
 0 = Baud rate measurement is disabled or has completed

Note 1: Refer to Section 17. “UART” (DS70582) in the “dsPIC33E/PIC24E Family Reference Manual” for information on enabling the UARTx module for receive or transmit operation.

2: This feature is only available for the 16x BRG mode (BRGH = 0).

REGISTER 20-1: UxMODE: UARTx MODE REGISTER (CONTINUED)

- bit 4 **URXINV:** Receive Polarity Inversion bit
 1 = UxRX Idle state is '0'
 0 = UxRX Idle state is '1'
- bit 3 **BRGH:** High Baud Rate Enable bit
 1 = BRG generates 4 clocks per bit period (4x baud clock, High-Speed mode)
 0 = BRG generates 16 clocks per bit period (16x baud clock, Standard mode)
- bit 2-1 **PDSEL<1:0>:** Parity and Data Selection bits
 11 = 9-bit data, no parity
 10 = 8-bit data, odd parity
 01 = 8-bit data, even parity
 00 = 8-bit data, no parity
- bit 0 **STSEL:** Stop Bit Selection bit
 1 = Two Stop bits
 0 = One Stop bit

- Note 1:** Refer to **Section 17. "UART"** (DS70582) in the *"dsPIC33E/PIC24E Family Reference Manual"* for information on enabling the UARTx module for receive or transmit operation.
- 2:** This feature is only available for the 16x BRG mode (BRGH = 0).

- bit 15,13 **UTXISEL<1:0>:** UARTx Transmission Interrupt Mode Selection bits
 - 11 = Reserved; do not use
 - 10 = Interrupt when a character is transferred to the Transmit Shift Register (TSR) and as a result, the transmit buffer becomes empty
 - 01 = Interrupt when the last character is shifted out of the Transmit Shift Register; all transmit operations are completed
 - 00 = Interrupt when a character is transferred to the Transmit Shift Register (this implies there is at least one character open in the transmit buffer)

- bit 14 **UTXINV:** UARTx Transmit Polarity Inversion bit
 - If IREN = 0:
 - 1 = UxTX Idle state is '0'
 - 0 = UxTX Idle state is '1'
 - If IREN = 1:
 - 1 = IrDA encoded, UxTX Idle state is '1'
 - 0 = IrDA encoded, UxTX Idle state is '0'

- bit 12 **Unimplemented:** Read as '0'
- bit 11 **UTXBRK:** UARTx Transmit Break bit
 - 1 = Sends Sync Break on next transmission – Start bit, followed by twelve '0' bits, followed by Stop bit; cleared by hardware upon completion
 - 0 = Sync Break transmission is disabled or completed

- bit 10 **UTXEN:** UARTx Transmit Enable bit⁽¹⁾
 - 1 = Transmit is enabled, UxTX pin is controlled by UARTx
 - 0 = Transmit is disabled, any pending transmission is aborted and the buffer is reset; UxTX pin controlled by port

- bit 9 **UTXBF:** UARTx Transmit Buffer Full Status bit (read-only)
 - 1 = Transmit buffer is full
 - 0 = Transmit buffer is not full, at least one more character can be written

- bit 8 **TRMT:** Transmit Shift Register Empty bit (read-only)
 - 1 = Transmit Shift Register is empty and transmit buffer is empty (the last transmission has completed)
 - 0 = Transmit Shift Register is not empty, a transmission is in progress or queued

- bit 7-6 **URXISEL<1:0>:** UARTx Receive Interrupt Mode Selection bits
 - 11 = Interrupt is set on UxRSR transfer making the receive buffer full (i.e., has 4 data characters)
 - 10 = Interrupt is set on UxRSR transfer making the receive buffer 3/4 full (i.e., has 3 data characters)
 - 0x = Interrupt is set when any character is received and transferred from the UxRSR to the receive buffer; receive buffer has one or more characters

Note 1: Refer to **Section 17. "UART"** (DS70582) in the "*dsPIC33E/PIC24E Family Reference Manual*" for information on enabling the UARTx module for transmit operation.

REGISTER 20-2: UxSTA: UARTx STATUS AND CONTROL REGISTER (CONTINUED)

- bit 5 **ADDEN:** Address Character Detect bit (bit 8 of received data = 1)
1 = Address Detect mode is enabled; if 9-bit mode is not selected, this does not take effect
0 = Address Detect mode is disabled
- bit 4 **RIDLE:** Receiver Idle bit (read-only)
1 = Receiver is Idle
0 = Receiver is active
- bit 3 **PERR:** Parity Error Status bit (read-only)
1 = Parity error has been detected for the current character (character at the top of the receive FIFO)
0 = Parity error has not been detected
- bit 2 **FERR:** Framing Error Status bit (read-only)
1 = Framing error has been detected for the current character (character at the top of the receive FIFO)
0 = Framing error has not been detected
- bit 1 **OERR:** Receive Buffer Overrun Error Status bit (read/clear only)
1 = Receive buffer has overflowed
0 = Receive buffer has not overflowed; clearing a previously set OERR bit (1 → 0 transition) resets the receiver buffer and the UxRSR to the empty state
- bit 0 **URXDA:** Receive Buffer Data Available bit (read-only)
1 = Receive buffer has data, at least one more character can be read
0 = Receive buffer is empty

Note 1: Refer to **Section 17. “UART”** (DS70582) in the *“dsPIC33E/PIC24E Family Reference Manual”* for information on enabling the UARTx module for transmit operation.

21.0 ENHANCED CAN (ECAN™) MODULE

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 21. “Enhanced Controller Area Network (ECAN™)”** (DS70353) of the “*dsPIC33E/PIC24E Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

21.1 Overview

The Enhanced Controller Area Network (ECAN) module is a serial interface, useful for communicating with other CAN modules or microcontroller devices. This interface/protocol was designed to allow communications within noisy environments. The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices contain two ECAN modules.

The ECANx module is a communication controller implementing the CAN 2.0 A/B protocol, as defined in the BOSCH CAN Specification. The module supports CAN 1.2, CAN 2.0A, CAN 2.0B Passive and CAN 2.0B Active versions of the protocol. The module implementation is a full CAN system. The CAN Specification is not covered within this data sheet. The reader can refer to the BOSCH CAN specification for further details.

The ECANx module features are as follows:

- Implementation of the CAN Protocol, CAN 1.2, CAN 2.0A and CAN 2.0B
- Standard and Extended Data Frames
- 0-8 Bytes Data Length
- Programmable Bit Rate up to 1 Mbit/sec
- Automatic Response to Remote Transmission Requests
- Up to 8 Transmit Buffers with Application-Specific Prioritization and Abort Capability (each buffer can contain up to 8 bytes of data)
- Up to 32 Receive Buffers (each buffer can contain up to 8 bytes of data)
- Up to 16 Full (standard/extended identifier) Acceptance Filters
- Three Full Acceptance Filter Masks
- DeviceNet™ Addressing Support
- Programmable Wake-up Functionality with Integrated Low-Pass Filter
- Programmable Loopback mode Supports Self-Test Operation
- Signaling via Interrupt Capabilities for all CAN Receiver and Transmitter Error States
- Programmable Clock Source
- Programmable Link to Input Capture Module (IC2 for the ECAN1 and ECAN2 modules) for Time-Stamping and Network Synchronization
- Low-Power Sleep and Idle mode

The CAN bus module consists of a protocol engine and message buffering/control. The CAN protocol engine handles all functions for receiving and transmitting messages on the CAN bus. Messages are transmitted by first loading the appropriate data registers. Status and errors can be checked by reading the appropriate registers. Any message detected on the CAN bus is checked for errors and then matched against filters to see if it should be received and stored in one of the receive registers.

FIGURE 21-1: ECANx MODULE BLOCK DIAGRAM

Note: x = 1 or 2.

21.2 Modes of Operation

The ECANx module can operate in one of several operation modes selected by the user. These modes include:

- Initialization mode
- Disable mode
- Normal Operation mode
- Listen Only mode
- Listen All Messages mode
- Loopback mode

Modes are requested by setting the REQOP<2:0> bits (CxCTRL1<10:8>). Entry into a mode is Acknowledged by monitoring the OPMODE<2:0> bits (CxCTRL1<7:5>). The module does not change the mode and the OPMODE bits until a change in mode is acceptable, generally during bus Idle time, which is defined as at least 11 consecutive recessive bits.

21.3 ECAN Resources

Many useful resources related to ECAN are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

<p>Note: In the event you are not able to access the product page using the link above, enter this URL in your browser: http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en554310</p>

- bit 7 **TXENm:** TX/RX Buffer Selection bit
 1 = Buffer TRBn is a transmit buffer
 0 = Buffer TRBn is a receive buffer
- bit 6 **TXABTm:** Message Aborted bit⁽¹⁾
 1 = Message was aborted
 0 = Message completed transmission successfully
- bit 5 **TXLARBm:** Message Lost Arbitration bit⁽¹⁾
 1 = Message lost arbitration while being sent
 0 = Message did not lose arbitration while being sent
- bit 4 **TXERRm:** Error Detected During Transmission bit⁽¹⁾
 1 = A bus error occurred while the message was being sent
 0 = A bus error did not occur while the message was being sent
- bit 3 **TXREQm:** Message Send Request bit
 1 = Requests that a message be sent; the bit automatically clears when the message is successfully sent
 0 = Clearing the bit to '0' while set requests a message abort
- bit 2 **RTRENm:** Auto-Remote Transmit Enable bit
 1 = When a remote transmit is received, TXREQm will be set
 0 = When a remote transmit is received, TXREQm will be unaffected
- bit 1-0 **TXmPRI<1:0>:** Message Transmission Priority bits
 11 = Highest message priority
 10 = High intermediate message priority
 01 = Low intermediate message priority
 00 = Lowest message priority

Note 1: This bit is cleared when TXREQm is set.

Note: The buffers, SID, EID, DLC, Data Field and Receive Status registers are located in DMA RAM.

21.5 ECAN Message Buffers

ECAN Message Buffers are part of DMA RAM memory. They are not ECAN Special Function Registers. The user application must directly write into the DMA RAM area that is configured for ECAN Message Buffers. The location and size of the buffer area is defined by the user application.

bit 15-13 **Unimplemented:** Read as '0'
 bit 12-8 **FILHIT<4:0>**: Filter Hit Code bits⁽¹⁾
 Encodes the number of the filter that resulted in writing this buffer.
 bit 7-0 **Unimplemented:** Read as '0'

Note 1: Only written by the module for receive buffers, unused for transmit buffers.

22.0 USB ON-THE-GO (OTG) MODULE (dsPIC33EPXXXMU8XX AND PIC24EPGU8XX DEVICES ONLY)

Note 1: This data sheet is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 25. “USB On-The-Go (OTG)”** (DS70571) of the “*dsPIC33E/PIC24E Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

22.1 Overview

The Universal Serial Bus (USB) On-The-Go (OTG) module includes the following features:

- USB Full-Speed Support for Host and Device
- Low-Speed Host Support
- USB On-The-Go Support
- Integrated Signaling Resistors
- Integrated Analog Comparators for VBUS Monitoring
- Integrated USB Transceiver
- Hardware Performs Transaction Handshaking
- Endpoint Buffering Anywhere in System RAM
- Integrated DMA Controller to Access System RAM
- Support for all four transfer types:
 - Control
 - Interrupt
 - Bulk Data
 - Isochronous
- Queueing of up to Four Endpoint Transfers without Servicing
- USB 5V Charge Pump Controller

The USB module contains the analog and digital components to provide a USB 2.0 full-speed and low-speed embedded host, full-speed device or OTG implementation with a minimum of external components.

The USB module consists of the clock generator, the USB voltage comparators, the transceiver, the Serial Interface Engine (SIE), pull-up and pull-down resistors, and the register interface. [Figure 22-1](#) illustrates the block diagram of the USB OTG module.

The device auxiliary clock generator provides the 48 MHz clock required for USB communication. The voltage comparators monitor the voltage on the VBUS pin to determine the state of the bus. The transceiver provides the analog translation between the USB bus and the digital logic. The SIE is a state machine that transfers data to and from the endpoint buffers and generates the protocol for data transfers. The integrated pull-up and pull-down resistors eliminate the need for external signaling components. The register interface allows the CPU to configure and communicate with the module.

Note: The implementation and use of the USB specifications and other third party specifications or technology may require a license from various entities, including, but not limited to USB Implementers Forum, Inc. (also referred to as USB-IF). It is your responsibility to obtain more information regarding any applicable licensing obligations.

22.2 Clearing USB OTG Interrupts

Unlike device level interrupts, the USB OTG interrupt status flags are not freely writable in software. All USB OTG flag bits are implemented as hardware set-only bits. Additionally, these bits can only be cleared in software by writing a ‘1’ to their locations (i.e., performing a BSET instruction). Writing a ‘0’ to a flag bit (i.e., a BCLR instruction) has no effect.

Note: Throughout this section, a bit that can only be cleared by writing a ‘1’ to its location is referred to as “Write ‘1’ to clear bit”. In register descriptions, this function is indicated by the descriptor, “K”.

FIGURE 22-1: USB INTERFACE DIAGRAM

22.3 USB OTG Resources

Many useful resources related to USB OTG are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:
<http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en554310>

bit 7-0 **FRM<7:0>:** 11-Bit Frame Number Lower 8 bits

These register bits are updated with the current frame number whenever a SOF token is received.

NOTES:

23.0 10-BIT/12-BIT ANALOG-TO-DIGITAL CONVERTER (ADC)

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 16. “Analog-to-Digital Converter (ADC)”** (DS70621) of the “*dsPIC33E/PIC24E Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices have two ADC modules, ADC1 and ADC2. The ADC1 module supports up to 32 analog input channels. The ADC2 module supports up to 16 analog input channels.

On ADC1, the AD12B bit (AD1CON1<10>) allows each of the ADC modules to be configured by the user as either a 10-bit, 4 Sample-and-Hold (S&H) ADC (default configuration) or a 12-bit, 1 S&H ADC.

Note: The ADC1 module needs to be disabled before modifying the AD12B bit.

The ADC2 module only supports 10-bit operation with 4 S&H.

23.1 Key Features

The 10-bit ADC configuration has the following key features:

- Successive Approximation (SAR) Conversion
- Conversion Speeds of up to 1.1 Msps
- Up to 32 Analog Input Pins
- External Voltage Reference Input Pins
- Simultaneous Sampling of up to Four Analog Input Pins
- Automatic Channel Scan mode
- Selectable Conversion Trigger Source
- Selectable Buffer Fill modes
- Four Result Alignment Options (signed/unsigned, fractional/integer)
- Operation during CPU Sleep and Idle modes

The 12-bit ADC configuration supports all the above features, except:

- In the 12-bit configuration, conversion speeds of up to 500 ksps are supported
- There is only one S&H amplifier in the 12-bit configuration, so simultaneous sampling of multiple channels is not supported.

Depending on the particular device pinout, the ADC can have up to 32 analog input pins, designated AN0 through AN31. In addition, there are two analog input pins for external voltage reference connections. These voltage reference inputs can be shared with other analog input pins. The actual number of analog input pins and external voltage reference input configuration depends on the specific device.

A block diagram of the ADC module is shown in [Figure 23-1](#). [Figure 23-2](#) provides a diagram of the ADC conversion clock period.

FIGURE 23-1: ADCx MODULE BLOCK DIAGRAM

- Note 1:** VREF+, VREF- inputs can be multiplexed with other analog inputs.
- Note 2:** Channels 1, 2 and 3 are not applicable for the 12-bit mode of operation.
- Note 3:** For dsPIC33EPXXX(GP/MC/MU)806 and PIC24EPXXXGP806 devices, y = 0-15 and 24-31; for ADC2, y = 15; for all others, y = 32.
- Note 4:** When ADDMAEN (ADxCON4<8>) = 1, enabling DMA, only ADCxBUF0 is used.

FIGURE 23-2: ADC_x CONVERSION CLOCK PERIOD BLOCK DIAGRAM

23.2 ADC Helpful Tips

1. The SMP1x control bits in the ADxCON2 registers:
 - a) Determine when the ADC interrupt flag is set and an interrupt is generated, if enabled.
 - b) When the CSCNA bit in the ADxCON2 register is set to '1', this determines when the ADC analog scan channel list, defined in the AD1CSSL/AD1CSSH registers, starts over from the beginning.
 - c) When the DMA peripheral is not used (ADDMAEN = 0), this determines when the ADC Result Buffer Pointer to ADC1BUF0-ADC1BUFF gets reset back to the beginning at ADC1BUF0.
 - d) When the DMA peripheral is used (ADDMAEN = 1), this determines when the DMA Address Pointer is incremented after a sample/conversion operation. ADC1BUF0 is the only ADC buffer used in this mode. The ADC Result Buffer Pointer to ADC1BUF0-ADC1BUFF gets reset back to the beginning at ADC1BUF0. The DMA address is incremented after completion of every 32nd sample/conversion operation. Conversion results are stored in the ADC1BUF0 register for transfer to RAM using DMA.
2. When the DMA module is disabled (ADDMAEN = 0), the ADC has 16 result buffers. ADC conversion results are stored sequentially in ADC1BUF0-ADC1BUFF, regardless of which analog inputs are being used subject to the SMP1x bits and the condition described in 1c) above. There is no relationship between the ANx input being measured and which ADC buffer (ADC1BUF0-ADC1BUFF) that the conversion results will be placed in.
3. When the DMA module is disabled (ADDMAEN = 1), the ADC module has only 1 ADC result buffer (i.e., ADC1BUF0) per ADC peripheral and the ADC conversion result must be read, either by the CPU or DMA controller, before the next ADC conversion is complete to avoid overwriting the previous value.
4. The DONE bit (ADxCON1<0>) is only cleared at the start of each conversion and is set at the completion of the conversion, but remains set indefinitely, even through the next sample phase until the next conversion begins. If application code is monitoring the DONE bit in any kind of software loop, the user must consider this behavior because the CPU code execution is faster than the ADC. As a result, in Manual Sample mode, particularly where the user's code is setting the SAMP bit (ADxCON1<1>), the DONE bit should also be cleared by the user application just before setting the SAMP bit.

23.3 ADC Resources

Many useful resources related to Analog-to-Digital conversion are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:
<http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en554310>

- bit 15 **ADON:** ADC Operating Mode bit
1 = ADC module is operating
0 = ADC is off
- bit 14 **Unimplemented:** Read as '0'
- bit 13 **ADSIDL:** ADC Stop in Idle Mode bit
1 = Discontinues module operation when device enters Idle mode
0 = Continues module operation in Idle mode
- bit 12 **ADDMABM:** DMA Buffer Build Mode bit
1 = DMA buffers are written in the order of conversion; the module provides an address to the DMA channel that is the same as the address used for the non-DMA stand-alone buffer
0 = DMA buffers are written in Scatter/Gather mode; the module provides a Scatter/Gather address to the DMA channel, based on the index of the analog input and the size of the DMA buffer
- bit 11 **Unimplemented:** Read as '0'
- bit 10 **AD12B:** ADC 10-Bit or 12-Bit Operation Mode bit⁽¹⁾
1 = 12-bit, 1-channel ADC operation
0 = 10-bit, 4-channel ADC operation
- bit 9-8 **FORM<1:0>:** Data Output Format bits
For 10-Bit Operation:
11 = Signed fractional (DOUT = sddd dddd dd00 0000, where s = .NOT.d<9>)
10 = Fractional (DOUT = dddd dddd dd00 0000)
01 = Signed integer (DOUT = ssss sssd dddd dddd, where s = .NOT.d<9>)
00 = Integer (DOUT = 0000 00dd dddd dddd)
For 12-Bit Operation:
11 = Signed fractional (DOUT = sddd dddd dddd 0000, where s = .NOT.d<11>)
10 = Fractional (DOUT = dddd dddd dddd 0000)
01 = Signed Integer (DOUT = ssss sddd dddd dddd, where s = .NOT.d<11>)
00 = Integer (DOUT = 0000 dddd dddd dddd)

- Note 1:** This bit is only available in the ADC1 module. In the ADC2 module, this bit is unimplemented and is read as '0'.
- 2:** This setting is available in dsPIC33EPXXX(MC/MU)806/810/814 devices only.
- 3:** Do not clear the DONE bit in software if ADC Sample Auto-Start is enabled (ASAM = 1).

REGISTER 23-1: ADxCON1: ADCx CONTROL REGISTER 1 (CONTINUED)

- bit 7-5 **SSRC<2:0>**: Sample Clock Source Select bits
If SSRCG = 1:
111 = Reserved
110 = PWM Generator 7 primary trigger compare ends sampling and starts conversion⁽²⁾
101 = PWM Generator 6 primary trigger compare ends sampling and starts conversion⁽²⁾
100 = PWM Generator 5 primary trigger compare ends sampling and starts conversion⁽²⁾
011 = PWM Generator 4 primary trigger compare ends sampling and starts conversion⁽²⁾
010 = PWM Generator 3 primary trigger compare ends sampling and starts conversion⁽²⁾
001 = PWM Generator 2 primary trigger compare ends sampling and starts conversion⁽²⁾
000 = PWM Generator 1 primary trigger compare ends sampling and starts conversion⁽²⁾
If SSRCG = 0:
111 = Internal counter ends sampling and starts conversion (auto-convert)
110 = Reserved
101 = PWM secondary Special Event Trigger ends sampling and starts conversion⁽²⁾
100 = Timer5 compare ends sampling and starts conversion
011 = PWM primary Special Event Trigger ends sampling and starts conversion⁽²⁾
010 = Timer3 compare ends sampling and starts conversion
001 = Active transition on the INTO pin ends sampling and starts conversion
000 = Clearing the Sample bit (SAMP) ends sampling and starts conversion (Manual mode)
- bit 4 **SSRCG**: Sample Clock Source Group bit
(See bits<7-5> for details.)
- bit 3 **SIMSAM**: Simultaneous Sample Select bit (only applicable when CHPS<1:0> = 01 or 1x)
When AD12B = 1, SIMSAM is: U-0, Unimplemented, Read as '0'
1 = Samples CH0, CH1, CH2, CH3 simultaneously (when CHPS<1:0> = 1x); or samples CH0 and CH1 simultaneously (when CHPS<1:0> = 01)
0 = Samples multiple channels individually in sequence
- bit 2 **ASAM**: ADC Sample Auto-Start bit⁽³⁾
1 = Sampling begins immediately after the last conversion; SAMP bit is auto-set
0 = Sampling begins when the SAMP bit is set
- bit 1 **SAMP**: ADC Sample Enable bit
1 = ADC S&H amplifiers are sampling
0 = ADC S&H amplifiers are holding
If ASAM = 0, software can write '1' to begin sampling. Automatically set by hardware if ASAM = 1.
If SSRC = 000, software can write '0' to end sampling and start conversion. If SSRC ≠ 000, automatically cleared by hardware to end sampling and start conversion.
- bit 0 **DONE**: ADC Conversion Status bit⁽³⁾
1 = ADC conversion cycle is completed.
0 = ADC conversion has not started or is in progress
Automatically set by hardware when ADC conversion is complete. Software can write '0' to clear the DONE status (software not allowed to write '1'). Clearing this bit does NOT affect any operation in progress. Automatically cleared by hardware at the start of a new conversion.

Note 1: This bit is only available in the ADC1 module. In the ADC2 module, this bit is unimplemented and is read as '0'.

2: This setting is available in dsPIC33EPXXX(MC/MU)806/810/814 devices only.

3: Do not clear the DONE bit in software if ADC Sample Auto-Start is enabled (ASAM = 1).

NOTES:

24.0 DATA CONVERTER INTERFACE (DCI) MODULE

Note 1: This data sheet is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “Section 20. Data Converter Interface (DCI)” (DS70356) of the “dsPIC33E/PIC24E Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 “Memory Organization” in this data sheet for device-specific register and bit information.

24.1 Module Introduction

The Data Converter Interface (DCI) module allows simple interfacing of devices, such as audio coder/decoders (Codecs), ADC and D/A Converters. The following interfaces are supported:

- Framed Synchronous Serial Transfer (Single or Multi-Channel)
- Inter-IC Sound (I²S) Interface
- AC-Link Compliant mode

General features include:

- Programmable word size up to 16 bits
- Supports up to 16 time slots, for a maximum frame size of 256 bits
- Data buffering for up to 4 samples without CPU overhead

FIGURE 24-1: DCI MODULE BLOCK DIAGRAM

24.2 DCI Resources

Many useful resources related to DCI are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:
<http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en554310>

NOTES:

25.0 COMPARATOR MODULE

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 26. “Op Amp/Comparator”** (DS70357) of the “dsPIC33E/PIC24E Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The comparator module provides three comparators that can be configured in different ways. As shown in [Figure 25-1](#), individual comparator options are specified by the comparator module’s Special Function Register (SFR) control bits.

These options allow users to:

- Select the edge for trigger and interrupt generation
- Configure the comparator voltage reference and band gap
- Configure output blanking and masking

The comparator operating mode is determined by the input selections (i.e., whether the input voltage is compared to a second input voltage or to an internal voltage reference).

bit 7					bit 0		

Legend:

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared
		x = Bit is unknown

- bit 15-11 **Unimplemented:** Read as '0'
- bit 10 **VREFSEL:** Voltage Reference Select bit
 - 1 = CVREFIN = VREF+
 - 0 = CVREFIN is generated by the resistor network
- bit 9-8 **BGSEL<1:0>:** Band Gap Reference Source Select bits
 - 11 = IVREF = VREF+⁽²⁾
 - 10 = IVREF = 0.20V (nominal)
 - 01 = IVREF = 0.60V (nominal)
 - 00 = IVREF = 2.20V (nominal)
- bit 7 **CVREN:** Comparator Voltage Reference Enable bit
 - 1 = Comparator voltage reference circuit powered on
 - 0 = Comparator voltage reference circuit powered down
- bit 6 **CVROE:** Comparator Voltage Reference Output Enable bit⁽¹⁾
 - 1 = Voltage level is output on CVREF pin
 - 0 = Voltage level is disconnected from CVREF pin
- bit 5 **CVRR:** Comparator Voltage Reference Range Selection bit
 - 1 = CVRSRC/24 step-size
 - 0 = CVRSRC/32 step-size
- bit 4 **CVRSS:** Comparator Voltage Reference Source Selection bit
 - 1 = Comparator voltage reference source, CVRSRC = (VREF+) – (VREF-)⁽²⁾
 - 0 = Comparator voltage reference source, CVRSRC = AVDD – AVSS
- bit 3-0 **CVR<3:0>** Comparator Voltage Reference Value Selection $0 \leq \text{CVR}<3:0> \leq 15$ bits
 - When CVRR = 1:
CVREFIN = (CVR<3:0>/24) • (CVRSRC)
 - When CVRR = 0:
CVREFIN = 1/4 • (CVRSRC) + (CVR<3:0>/32) • (CVRSRC)

Note 1: CVROE overrides the TRIS bit setting.
Note 2: Selecting BGSEL<1:0> = 11 and CVRSS = 1 is invalid and will produce unpredictable results.

26.0 REAL-TIME CLOCK AND CALENDAR (RTCC)

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 29. “Real-Time Clock and Calendar (RTCC)”** (DS70584) of the “*dsPIC33E/PIC24E Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

This chapter discusses the Real-Time Clock and Calendar (RTCC) module and its operation.

Some of the key features of this module are:

- Time: Hours, Minutes and Seconds
- 24-Hour Format (military time)
- Calendar: Weekday, Date, Month and Year
- Alarm Configurable
- Year Range: 2000 to 2099
- Leap Year Correction
- BCD Format for Compact Firmware
- Optimized for Low-Power Operation
- User Calibration with Auto-Adjust
- Calibration Range: ± 2.64 Seconds Error per Month
- Requirements: External 32.768 kHz Clock Crystal
- Alarm Pulse or Seconds Clock Output on RTCC Pin

The RTCC module is intended for applications where accurate time must be maintained for extended periods with minimum to no intervention from the CPU. The RTCC module is optimized for low-power usage to provide extended battery lifetime while keeping track of time.

The RTCC module is a 100-year clock and calendar with automatic leap year detection. The range of the clock is from 00:00:00 (midnight) on January 1, 2000 to 23:59:59 on December 31, 2099.

The hours are available in 24-hour (military time) format. The clock provides a granularity of one second with half-second visibility to the user.

FIGURE 26-1: RTCC BLOCK DIAGRAM

26.1 Writing to the RTCC Timer

Note: To allow the RTCC module to be clocked by the secondary crystal oscillator, the Secondary Oscillator Enable (LPOSCEN) bit in the Oscillator Control (OSCCON<1>) register must be set. For further details, refer to **Section 7. “Oscillator”** (DS70580) in the “*dsPIC33E/PIC24E Family Reference Manual*”.

The user application can configure the time and calendar by writing the desired seconds, minutes, hours, weekday, date, month and year to the RTCC registers. Under normal operation, writes to the RTCC Timer registers are not allowed. Attempted writes will appear to execute normally, but the contents of the registers will remain unchanged. To write to the RTCC register, the RTCWREN bit (RCFGCAL<13>) must be set. Setting the RTCWREN bit allows writes to the RTCC registers. Conversely, clearing the RTCWREN bit prevents writes.

To set the RTCWREN bit, the following procedure must be executed. The RTCWREN bit can be cleared at any time:

1. Write 0x55 to NVMKEY.
2. Write 0xAA to NVMKEY.
3. Set the RTCWREN bit using a single-cycle instruction.

The RTCC module is enabled by setting the RTCEN bit (RCFGCAL<15>). To set or clear the RTCEN bit, the RTCWREN bit (RCFGCAL<13>) must be set.

If the entire clock (hours, minutes and seconds) needs to be corrected, it is recommended that the RTCC module should be disabled to avoid coincidental write operation when the timer increments. Therefore, it stops the clock from counting while writing to the RTCC Timer register.

26.2 RTCC Resources

Many useful resources related to RTCC are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:
<http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en554310>

26.3 RTCC Registers

REGISTER 26-1: RCFGAL: RTCC CALIBRATION AND CONFIGURATION REGISTER⁽¹⁾

R/W-0	U-0	R/W-0	R-0	R-0	R/W-0	R/W-0	R/W-0
RTCEN ⁽²⁾	—	RTCWREN	RTCSYNC	HALFSEC ⁽³⁾	RTCOE	RTCPTR<1:0>	
bit 15						bit 8	

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
CAL<7:0>							
bit 7						bit 0	

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

- bit 15 **RTCEN:** RTCC Enable bit⁽²⁾
 1 = RTCC module is enabled
 0 = RTCC module is disabled
- bit 14 **Unimplemented:** Read as '0'
- bit 13 **RTCWREN:** RTCC Value Registers Write Enable bit
 1 = RTCVAL register can be written to by the user application
 0 = RTCVAL register is locked out from being written to by the user application
- bit 12 **RTCSYNC:** RTCC Value Registers Read Synchronization bit
 1 = A rollover is about to occur in 32 clock edges (approximately 1 ms)
 0 = A rollover will not occur
- bit 11 **HALFSEC:** Half-Second Status bit⁽³⁾
 1 = Second half period of a second
 0 = First half period of a second
- bit 10 **RTCOE:** RTCC Output Enable bit
 1 = RTCC output is enabled
 0 = RTCC output is disabled
- bit 9-8 **RTCPTR<1:0>:** RTCC Value Register Pointer bits
 Points to the corresponding RTCC Value register when reading the RTCVAL register; the RTCPTR<1:0> value decrements on every access of the RTCVAL register until it reaches '00'.

- Note 1:** The RCFGAL register is only affected by a POR.
- Note 2:** A write to the RTCEN bit is only allowed when RTCWREN = 1.
- Note 3:** This bit is read-only. It is cleared when the lower half of the MINSEC register is written.

REGISTER 26-1: RCFGAL: RTCC CALIBRATION AND CONFIGURATION REGISTER⁽¹⁾ (CONTINUED)

bit 7-0 **CAL<7:0>**: RTCC Drift Calibration bits
01111111 = Maximum positive adjustment; adds 508 RTCC clock pulses every one minute
•
•
•
00000001 = Minimum positive adjustment; adds four RTCC clock pulses every one minute
00000000 = No adjustment
11111111 = Minimum negative adjustment; subtracts four RTCC clock pulses every one minute
•
•
•
10000000 = Maximum negative adjustment; subtracts 512 RTCC clock pulses every one minute

- Note 1:** The RCFGAL register is only affected by a POR.
2: A write to the RTCEN bit is only allowed when RTCWREN = 1.
3: This bit is read-only. It is cleared when the lower half of the MINSEC register is written.

REGISTER 26-2: PADCFG1: PAD CONFIGURATION CONTROL REGISTER

bit 7						bit 0	

Legend:

R = Readable bit W = Writable bit U = Unimplemented bit, read as '0'
 -n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

- bit 15-2 **Unimplemented:** Read as '0'
- bit 1 **RTSECSEL:** RTCC Seconds Clock Output Select bit⁽¹⁾
 1 = RTCC seconds clock is selected for the RTCC pin
 0 = RTCC alarm pulse is selected for the RTCC pin
- bit 0 Not used by the RTCC module.

Note 1: To enable the actual RTCC output, the RTCOE bit (RCFGCAL<10>) must be set.

REGISTER 26-3: ALCFGRPT: ALARM CONFIGURATION REGISTER

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
ALRMEN	CHIME	AMASK<3:0>			ALRMPTR<1:0>		
bit 15							bit 8

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
ARPT<7:0>							
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

- bit 15 **ALRMEN:** Alarm Enable bit
 1 = Alarm is enabled (cleared automatically after an alarm event whenever ARPT<7:0> = 0x00 and CHIME = 0)
 0 = Alarm is disabled
- bit 14 **CHIME:** Chime Enable bit
 1 = Chime is enabled; ARPT<7:0> bits are allowed to roll over from 0x00 to 0xFF
 0 = Chime is disabled; ARPT<7:0> bits stop once they reach 0x00
- bit 13-10 **AMASK<3:0>:** Alarm Mask Configuration bits
 0000 = Every half second
 0001 = Every second
 0010 = Every 10 seconds
 0011 = Every minute
 0100 = Every 10 minutes
 0101 = Every hour
 0110 = Once a day
 0111 = Once a week
 1000 = Once a month
 1001 = Once a year (except when configured for February 29th, once every 4 years)
 101x = Reserved – do not use
 11xx = Reserved – do not use
- bit 9-8 **ALRMPTR<1:0>:** Alarm Value Register Window Pointer bits
 Points to the corresponding Alarm Value registers when reading the ALRMVAL register. The ALRMPTR<1:0> value decrements on every read or write of ALRMVAL until it reaches '00'.
- bit 7-0 **ARPT<7:0>:** Alarm Repeat Counter Value bits
 11111111 = Alarm will repeat 255 more times
 •
 •
 •
 00000000 = Alarm will not repeat
 The counter decrements on any alarm event. The counter is prevented from rolling over from 0x00 to 0xFF unless CHIME = 1.

REGISTER 26-4: RTCVAL (WHEN RTCPTR<1:0> = 11): YEAR VALUE REGISTER⁽¹⁾

27.0 PROGRAMMABLE CYCLIC REDUNDANCY CHECK (CRC) GENERATOR

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 27. “Programmable Cyclic Redundancy Check (CRC)”** (DS70346) of the “dsPIC33E/PIC24E Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The programmable CRC generator offers the following features:

- User-Programmable (up to 32nd order) Polynomial CRC Equation
- Interrupt Output
- Data FIFO

The programmable CRC generator provides a hardware implemented method of quickly generating checksums for various networking and security applications. It offers the following features:

- User-Programmable CRC Polynomial Equation, up to 32 bits
- Programmable Shift Direction (little or big-endian)
- Independent Data and Polynomial Lengths
- Configurable Interrupt Output
- Data FIFO

A simplified block diagram of the CRC generator is shown in **Figure 27-1**. A simple version of the CRC shift engine is shown in **Figure 27-2**.

FIGURE 27-1: PROGRAMMABLE CRC BLOCK DIAGRAM

FIGURE 27-2: CRC SHIFT ENGINE DETAIL

27.1 Overview

The CRC module can be programmed for CRC polynomials of up to the 32nd order, using up to 32 bits. Polynomial length, which reflects the highest exponent in the equation, is selected by the PLEN<4:0> bits (CRCCON2<4:0>).

The CRCXORL and CRCXORH registers control which exponent terms are included in the equation. Setting a particular bit includes that exponent term in the equation; functionally, this includes an XOR operation on the corresponding bit in the CRC engine. Clearing the bit disables the XOR.

For example, consider two CRC polynomials, one a 16-bit equation and the other a 32-bit equation:

$x^{16} + x^{12} + x^5 + 1$ <p style="text-align: center;">and</p> $x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$
--

To program these polynomials into the CRC generator, set the register bits as shown in Table 27-1.

Note that the appropriate positions are set to '1' to indicate that they are used in the equation (for example, X26 and X23). The 0 bit required by the equation is always XORed; thus, X0 is a don't care. For a polynomial of length, N, it is assumed that the Nth bit will always be used, regardless of the bit setting. Therefore, for a polynomial length of 32, there is no 32nd bit in the CRCxOR register.

TABLE 27-1: CRC SETUP EXAMPLES FOR 16 AND 32-BIT POLYNOMIAL

CRC Control Bits	Bit Values	
	16-Bit Polynomial	32-Bit Polynomial
PLEN<4:0>	01111	11111
X<31:16>	0000 0000 0000 000x	0000 0100 1100 0001
X<15:0>	0001 0000 0010 000x	0001 1101 1011 011x

27.2 Programmable CRC Resources

Many useful resources related to Programmable CRC are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:

bit 7							bit 0

Legend:

R = Readable bit W = Writable bit U = Unimplemented bit, read as '0'
 -n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

- bit 15 **CRCEN:** CRC Enable bit
 1 = CRC module is enabled
 0 = CRC module is disabled, all state machines, pointers and CRCWDAT/CRCDAT are reset; other SFRs are not reset
- bit 14 **Unimplemented:** Read as '0'
- bit 13 **CSIDL:** CRC Stop in Idle Mode bit
 1 = Discontinues module operation when device enters Idle mode
 0 = Continues module operation in Idle mode
- bit 12-8 **VWORD<4:0>:** Pointer Value bits
 Indicates the number of valid words in the FIFO. Has a maximum value of 8 when PLEN<4:0> > 7 or 16 when PLEN<4:0> ≤ 7.
- bit 7 **CRCFUL:** FIFO Full bit
 1 = FIFO is full
 0 = FIFO is not full
- bit 6 **CRCMPT:** FIFO Empty Bit
 1 = FIFO is empty
 0 = FIFO is not empty
- bit 5 **CRCISEL:** CRC Interrupt Selection bit
 1 = Interrupt on FIFO is empty; final word of data is still shifting through CRC
 0 = Interrupt on shift is complete and CRCWDAT results are ready
- bit 4 **CRCGO:** Start CRC bit
 1 = Starts CRC serial shifter
 0 = CRC serial shifter is turned off
- bit 3 **LENDIAN:** Data Word Little-Endian Configuration bit
 1 = Data word is shifted into the CRC starting with the LSb (little endian)
 0 = Data word is shifted into the CRC starting with the MSb (big endian)
- bit 2-0 **Unimplemented:** Read as '0'

NOTES:

28.0 PARALLEL MASTER PORT (PMP)

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 28. “Parallel Master Port (PMP)”** (DS70576) of the “dsPIC33E/PIC24E Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The Parallel Master Port (PMP) module is a parallel 8-bit I/O module, specifically designed to communicate with a wide variety of parallel devices, such as communication peripherals, LCDs, external memory devices and microcontrollers. Because the interface to parallel peripherals varies significantly, the PMP is highly configurable.

Key features of the PMP module include:

- Eight Data Lines
- Up to 16 Programmable Address Lines
- Up to 2 Chip Select Lines
- Programmable Strobe Options:
 - Individual read and write strobes, or
 - Read/ $\overline{\text{Write}}$ strobe with enable strobe
- Address Auto-Increment/Auto-Decrement
- Programmable Address/Data Multiplexing
- Programmable Polarity on Control Signals
- Legacy Parallel Slave Port (PSP) Support
- Enhanced Parallel Slave Support:
 - Address support
 - 4-byte deep auto-incrementing buffer
- Programmable Wait States

FIGURE 28-1: PMP MODULE PINOUT AND CONNECTIONS TO EXTERNAL DEVICES

28.1 PMP Resources

Many useful resources related to PMP are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:
<http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en554310>

29.0 SPECIAL FEATURES

Note: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the related section of the “dsPIC33E/PIC24E Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices include several features intended to maximize application flexibility and reliability, and minimize cost through elimination of external components. These are:

- Flexible Configuration
- Watchdog Timer (WDT)
- Code Protection and CodeGuard™ Security
- JTAG Boundary Scan Interface
- In-Circuit Serial Programming™ (ICSP™)
- In-Circuit Emulation

29.1 Configuration Bits

The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices provide nonvolatile memory implementation for device Configuration bits. Refer to **Section 30. “Device Configuration”** (DS70618) of the “dsPIC33E/PIC24E Family Reference Manual” for more information on this implementation.

The Configuration bits can be programmed (read as ‘0’), or left unprogrammed (read as ‘1’), to select various device configurations. These bits are mapped, starting at program memory location, 0xF80000.

The individual Configuration bit descriptions for the Configuration registers are shown in [Table 29-2](#).

Note that address, 0xF80000, is beyond the user program memory space. It belongs to the configuration memory space (0x800000-0xFFFFF), which can only be accessed using table reads and table writes.

To prevent inadvertent configuration changes during code execution, some programmable Configuration bits are write-once. For such bits, changing a device configuration requires that the device be reset. For other Configuration bits, the device configuration changes immediately after an RTSP operation. The RTSP effect column in [Table 29-2](#) indicates when the device configuration changes after a bit is modified using RTSP.

The device Configuration register map is shown in [Table 29-1](#).

TABLE 29-1: DEVICE CONFIGURATION REGISTER MAP

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

FCKSM<1:0>	FOSC	Immediate	Clock Switching Mode bits 1x = Clock switching is disabled, Fail-Safe Clock Monitor is disabled 01 = Clock switching is enabled, Fail-Safe Clock Monitor is disabled 00 = Clock switching is enabled, Fail-Safe Clock Monitor is enabled
IOL1WAY	FOSC	Immediate	Peripheral Pin Select Configuration bit 1 = Allows only one reconfiguration 0 = Allows multiple reconfigurations
OSCIOFNC	FOSC	Immediate	OSC2 Pin Function bit (except in XT and HS modes) 1 = OSC2 is the clock output 0 = OSC2 is the general purpose digital I/O pin
POSCMD<1:0>	FOSC	Immediate	Primary Oscillator Mode Select bits 11 = Primary Oscillator is disabled 10 = HS Crystal Oscillator mode 01 = XT Crystal Oscillator mode 00 = EC (External Clock) mode
FWDTEN	FWDT	Immediate	Watchdog Timer Enable bit 1 = Watchdog Timer is always enabled (LPRC Oscillator cannot be disabled. Clearing the SWDTEN bit in the RCON register has no effect.) 0 = Watchdog Timer is enabled/disabled by user software (LPRC can be disabled by clearing the SWDTEN bit in the RCON register.)

Note 1: BOR should always be enabled for proper operation (BOREN = 1).

2: This register can only be modified when code protection and write protection are disabled for both the General and Auxiliary Segments (APL = 1, AWRP = 1, APLK = 0, GSS = 1, GWRP = 1 and GSSK = 0).

TABLE 29-2: CONFIGURATION BITS DESCRIPTION (CONTINUED)

Bit Field	Register	RTSP Effect	Description
WINDIS	FWDT	Immediate	Watchdog Timer Window Enable bit 1 = Watchdog Timer is in Non-Window mode 0 = Watchdog Timer is in Window mode
PLLKEN	FWDT	Immediate	PLL Lock Wait Enable bit 1 = Clock switches to the PLL source will wait until the PLL lock signal is valid 0 = Clock switch will not wait for PLL lock
WDTPRE	FWDT	Immediate	Watchdog Timer Prescaler bit 1 = 1:128 0 = 1:32
APLK<1:0>	FAS ⁽²⁾	Immediate	Auxiliary Segment Key bits These bits must be set to '00' if AWRP = 1 and APL = 1. These bits must be set to '11' for any other value of the AWRP and APL bits. Any mismatch between either the AWRP or APL bits and the APLK bits (as described above), will result in code protection becoming enabled for the Auxiliary Segment. A Flash bulk erase will be required to unlock the device.
APL	FAS ⁽²⁾	Immediate	Auxiliary Segment Code-Protect bit 1 = Auxiliary program memory is not code-protected 0 = Auxiliary program memory is code-protected
AWRP	FAS ⁽²⁾	Immediate	Auxiliary Segment Write-Protect bit 1 = Auxiliary program memory is not write-protected 0 = Auxiliary program memory is write-protected
WDTPOST<3:0>	FWDT	Immediate	Watchdog Timer Postscaler bits 1111 = 1:32,768 1110 = 1:16,384 • • • 0001 = 1:2 0000 = 1:1
FPWRT<2:0>	FPOR	Immediate	Power-on Reset Timer Value Select bits 111 = PWRT = 128 ms 110 = PWRT = 64 ms 101 = PWRT = 32 ms 100 = PWRT = 16 ms 011 = PWRT = 8 ms 010 = PWRT = 4 ms 001 = PWRT = 2 ms 000 = PWRT = Disabled
BOREN ⁽¹⁾	FPOR	Immediate	Brown-out Reset (BOR) Detection Enable bit 1 = BOR is enabled 0 = BOR is disabled
ALTI2C2	FPOR	Immediate	Alternate I ² C™ pins for I2C2 bit 1 = I2C2 is mapped to the SDA2/SCL2 pins 0 = I2C2 is mapped to the ASDA2/ASCL2 pins
ALTI2C1	FPOR	Immediate	Alternate I ² C pins for I2C1 bit 1 = I2C1 is mapped to the SDA1/SCL1 pins 0 = I2C1 is mapped to the ASDA1/ASCL1 pins

Note 1: BOR should always be enabled for proper operation (BOREN = 1).

2: This register can only be modified when code protection and write protection are disabled for both the General and Auxiliary Segments (APL = 1, AWRP = 1, APLK = 0, GSS = 1, GWRP = 1 and GSSK = 0).

TABLE 29-2: CONFIGURATION BITS DESCRIPTION (CONTINUED)

Bit Field	Register	RTSP Effect	Description
JTAGEN	FICD	Immediate	JTAG Enable bit 1 = JTAG is enabled 0 = JTAG is disabled
RSTPRI	FICD	On any device Reset	Reset Target Vector Select bit 1 = Device will reset to Primary Flash Reset location 0 = Device will reset to Auxiliary Flash Reset location
ICS<1:0>	FICD	Immediate	ICD Communication Channel Select bits 11 = Communicate on PGEC1 and PGED1 10 = Communicate on PGEC2 and PGED2 01 = Communicate on PGEC3 and PGED3 00 = Reserved, do not use

- Note 1:** BOR should always be enabled for proper operation (BOREN = 1).
- 2:** This register can only be modified when code protection and write protection are disabled for both the General and Auxiliary Segments (APL = 1, AWRP = 1, APLK = 0, GSS = 1, GWRP = 1 and GSSK = 0).

29.2 On-Chip Voltage Regulator

All of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices power their core digital logic at a nominal 1.8V. This can create a conflict for designs that are required to operate at a higher typical voltage, such as 3.3V. To simplify system design, all devices in the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 family incorporate an on-chip regulator that allows the device to run its core logic from VDD.

The regulator provides power to the core from the other VDD pins. A low-ESR (less than 1 Ohms) capacitor (such as tantalum or ceramic) must be connected to the VCAP pin (Figure 29-1). This helps to maintain the stability of the regulator. The recommended value for the filter capacitor is provided in Table 32-13 located in Section 32.0 “Electrical Characteristics”.

Note: It is important for the low-ESR capacitor to be placed as close as possible to the VCAP pin.

FIGURE 29-1: CONNECTIONS FOR THE ON-CHIP VOLTAGE REGULATOR^(1,2,3)

29.3 Brown-out Reset (BOR)

The Brown-out Reset module is based on an internal voltage reference circuit that monitors the regulated supply voltage, VCAP. The main purpose of the BOR module is to generate a device Reset when a brown-out condition occurs. Brown-out conditions are generally caused by glitches on the AC mains (for example, missing portions of the AC cycle waveform due to bad power transmission lines, or voltage sags due to excessive current draw when a large inductive load is turned on).

A BOR generates a Reset pulse, which resets the device. The BOR selects the clock source based on the device Configuration bit values (FNOSC<2:0> and POSCMD<1:0>).

If an oscillator mode is selected, the BOR activates the Oscillator Start-up Timer (OST). The system clock is held until OST expires. If the PLL is used, the clock is held until the LOCK bit (OSCCON<5>) is ‘1’.

Concurrently, the Power-up Timer (PWRT) Time-out (TPWRT) is applied before the internal Reset is released. If TPWRT = 0 and a crystal oscillator is being used, then a nominal delay of TFSCM is applied. The total delay in this case is TFSCM. Refer to Parameter SY35 in Table 32-22 of Section 32.0 “Electrical Characteristics” for specific TFSCM values.

The BOR Status bit (RCON<1>) is set to indicate that a BOR has occurred. The BOR circuit, continues to operate while in Sleep or Idle modes and resets the device should VDD fall below the BOR threshold voltage.

29.4 Watchdog Timer (WDT)

For dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices, the WDT is driven by the LPRC Oscillator. When the WDT is enabled, the clock source is also enabled.

29.4.1 PRESCALER/POSTSCALER

The nominal WDT clock source from LPRC is 32 kHz. This feeds a prescaler that can be configured for either 5-bit (divide-by-32) or 7-bit (divide-by-128) operation. The prescaler is set by the WDTPRE Configuration bit. With a 32 kHz input, the prescaler yields a nominal WDT Time-out (T_{WDT}) period of 1 ms in 5-bit mode or 4 ms in 7-bit mode.

A variable postscaler divides down the WDT prescaler output and allows for a wide range of time-out periods. The postscaler is controlled by the WDTPOST<3:0> Configuration bits (FWDT<3:0>), which allow the selection of 16 settings, from 1:1 to 1:32,768. Using the prescaler and postscaler, time-out periods ranging from 1 ms to 131 seconds can be achieved.

The WDT, prescaler and postscaler are reset:

- On any device Reset
- On the completion of a clock switch, whether invoked by software (i.e., setting the OSWEN bit after changing the NOSC bits) or by hardware (i.e., Fail-Safe Clock Monitor)
- When a PWRSAV instruction is executed (i.e., Sleep or Idle mode is entered)
- When the device exits Sleep or Idle mode to resume normal operation
- By a CLRWDT instruction during normal execution

Note: The CLRWDT and PWRSAV instructions clear the prescaler and postscaler counts when executed.

29.4.2 SLEEP AND IDLE MODES

If the WDT is enabled, it continues to run during Sleep or Idle modes. When the WDT time-out occurs, the device wakes the device and code execution continues from where the PWRSAV instruction was executed. The corresponding SLEEP or IDLE bits (RCON<3,2>) need to be cleared in software after the device wakes up.

29.4.3 ENABLING WDT

The WDT is enabled or disabled by the FWDTEN Configuration bit in the FWDT Configuration register. When the FWDTEN Configuration bit is set, the WDT is always enabled.

The WDT can be optionally controlled in software when the FWDTEN Configuration bit has been programmed to '0'. The WDT is enabled in software by setting the SWDTEN control bit (RCON<5>). The SWDTEN control bit is cleared on any device Reset. The software WDT option allows the user application to enable the WDT for critical code segments and disable the WDT during non-critical segments for maximum power savings.

Note: If the WINDIS bit (FWDT<6>) is cleared, the CLRWDT instruction should be executed by the application software only during the last 1/4 of the WDT period. This CLRWDT instruction window can be determined by using a timer. If a CLRWDT instruction is executed before this window, a WDT Reset occurs.

The WDT flag bit, WDTO (RCON<4>), is not automatically cleared following a WDT time-out. To detect subsequent WDT events, the flag must be cleared in software.

FIGURE 29-2: WDT BLOCK DIAGRAM

29.5 JTAG Interface

dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices implement a JTAG interface, which supports boundary scan device testing. Detailed information on this interface is provided in future revisions of the document.

Note: Refer to **Section 24. “Programming and Diagnostics”** (DS70608) of the *“dsPIC33E/PIC24E Family Reference Manual”* for further information on usage, configuration and operation of the JTAG interface.

29.6 In-Circuit Serial Programming

The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices can be serially programmed while in the end application circuit. This is done with two lines for clock and data, and three other lines for power, ground and the programming sequence. Serial programming allows customers to manufacture boards with unprogrammed devices and then program the digital signal controller just before shipping the product. Serial programming also allows the most recent firmware or a custom firmware to be programmed. Refer to the *“dsPIC33E/PIC24E Flash Programming Specification”* (DS70619) for details about In-Circuit Serial Programming (ICSP).

Any of the three pairs of programming clock/data pins can be used:

- PGEC1 and PGED1
- PGEC2 and PGED2
- PGEC3 and PGED3

29.7 In-Circuit Debugger

When MPLAB® ICD 3 or REAL ICE™ is selected as a debugger, the in-circuit debugging functionality is enabled. This function allows simple debugging functions when used with MPLAB IDE. Debugging functionality is controlled through the PGECx (Emulation/Debug Clock) and PGEDx (Emulation/Debug Data) pin functions.

Any of the three pairs of debugging clock/data pins can be used:

- PGEC1 and PGED1
- PGEC2 and PGED2
- PGEC3 and PGED3

To use the in-circuit debugger function of the device, the design must implement ICSP connections to \overline{MCLR} , VDD, VSS and the PGECx/PGEDx pin pair. In addition, when the feature is enabled, some of the resources are not available for general use. These resources include the first 80 bytes of data RAM and two I/O pins.

29.8 Code Protection and CodeGuard™ Security

The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices offer basic implementation of CodeGuard Security that supports only General Segment (GS) security. This feature helps protect individual Intellectual Property in collaborative system designs.

When coupled with software encryption libraries, CodeGuard Security can be used to securely update Flash even when multiple IPs reside on the single chip. The code protection features vary depending on the actual dsPIC33E implemented. The following sections provide an overview of these features.

The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices do not support Boot Segment (BS), Secure Segment (SS) and RAM protection.

Note: Refer to **Section 23. “CodeGuard™ Security”** (DS70634) of the *“dsPIC33E/PIC24E Family Reference Manual”* for further information on usage, configuration and operation of CodeGuard Security.

NOTES:

30.0 INSTRUCTION SET SUMMARY

Note: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the related section of the “dsPIC33E/PIC24E Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

The dsPIC33EP instruction set is almost identical to that of the dsPIC30F and dsPIC33F. The PIC24EP instruction set is almost identical to that of the PIC24F and PIC24H.

Most instructions are a single program memory word (24 bits). Only three instructions require two program memory locations.

Each single-word instruction is a 24-bit word, divided into an 8-bit opcode, which specifies the instruction type and one or more operands, which further specify the operation of the instruction.

The instruction set is highly orthogonal and is grouped into five basic categories:

- Word or byte-oriented operations
- Bit-oriented operations
- Literal operations
- DSP operations
- Control operations

Table 30-1 lists the general symbols used in describing the instructions.

The dsPIC33E instruction set summary in Table 30-2 lists all the instructions, along with the status flags affected by each instruction.

Most word or byte-oriented W register instructions (including barrel shift instructions) have three operands:

- The first source operand, which is typically a register ‘Wb’ without any address modifier
- The second source operand, which is typically a register ‘Ws’ with or without an address modifier
- The destination of the result, which is typically a register ‘Wd’ with or without an address modifier

However, word or byte-oriented file register instructions have two operands:

- The file register specified by the value ‘f’
- The destination, which could be either the file register ‘f’ or the W0 register, which is denoted as ‘WREG’

Most bit-oriented instructions (including simple rotate/shift instructions) have two operands:

- The W register (with or without an address modifier) or file register (specified by the value of ‘Ws’ or ‘f’)
- The bit in the W register or file register (specified by a literal value or indirectly by the contents of register ‘Wb’)

The literal instructions that involve data movement can use some of the following operands:

- A literal value to be loaded into a W register or file register (specified by ‘k’)
- The W register or file register where the literal value is to be loaded (specified by ‘Wb’ or ‘f’)

However, literal instructions that involve arithmetic or logical operations use some of the following operands:

- The first source operand, which is a register ‘Wb’ without any address modifier
- The second source operand, which is a literal value
- The destination of the result (only if not the same as the first source operand), which is typically a register ‘Wd’ with or without an address modifier

The MAC class of DSP instructions can use some of the following operands:

- The accumulator (A or B) to be used (required operand)
- The W registers to be used as the two operands
- The X and Y address space prefetch operations
- The X and Y address space prefetch destinations
- The accumulator write-back destination

The other DSP instructions do not involve any multiplication and can include:

- The accumulator to be used (required)
- The source or destination operand (designated as Wso or Wdo, respectively) with or without an address modifier
- The amount of shift specified by a W register ‘Wn’ or a literal value

The control instructions can use some of the following operands:

- A program memory address
- The mode of the table read and table write instructions

Most instructions are a single word. Certain double-word instructions are designed to provide all the required information in these 48 bits. In the second word, the 8 MSBs are '0's. If this second word is executed as an instruction (by itself), it executes as a NOP.

The double-word instructions execute in two instruction cycles.

Most single-word instructions are executed in a single instruction cycle, unless a conditional test is true, or the Program Counter is changed as a result of the instruction, or a PSV or table read is performed. In these cases, the execution takes multiple instruction cycles

with the additional instruction cycle(s) executed as a NOP. Certain instructions that involve skipping over the subsequent instruction require either two or three cycles if the skip is performed, depending on whether the instruction being skipped is a single-word or two-word instruction. Moreover, double-word moves require two cycles.

Note: For more details on the instruction set, refer to the "16-bit MCU and DSC Programmer's Reference Manual" (DS70157).

TABLE 30-1: SYMBOLS USED IN OPCODE DESCRIPTIONS

Field	Description
#text	Means literal defined by "text"
(text)	Means "content of text"
[text]	Means "the location addressed by text"
{ }	Optional field or operation
a ∈ {b, c, d}	a is selected from the set of values b, c, d
<n:m>	Register bit field
.b	Byte mode selection
.d	Double-Word mode selection
.S	Shadow register select
.w	Word mode selection (default)
Acc	One of two accumulators {A, B}
AWB	Accumulator Write-Back Destination Address register ∈ {W13, [W13]+ = 2}
bit4	4-bit bit selection field (used in word addressed instructions) ∈ {0...15}
C, DC, N, OV, Z	MCU Status bits: Carry, Digit Carry, Negative, Overflow, Sticky Zero
Expr	Absolute address, label or expression (resolved by the linker)
f	File register address ∈ {0x0000...0x1FFF}
lit1	1-bit unsigned literal ∈ {0,1}
lit4	4-bit unsigned literal ∈ {0...15}
lit5	5-bit unsigned literal ∈ {0...31}
lit8	8-bit unsigned literal ∈ {0...255}
lit10	10-bit unsigned literal ∈ {0...255} for Byte mode, {0:1023} for Word mode
lit14	14-bit unsigned literal ∈ {0...16384}
lit16	16-bit unsigned literal ∈ {0...65535}
lit23	23-bit unsigned literal ∈ {0...8388608}; LSb must be '0'
None	Field does not require an entry, can be blank
OA, OB, SA, SB	DSP Status bits: ACCA Overflow, ACCB Overflow, ACCA Saturate, ACCB Saturate
PC	Program Counter
Slit10	10-bit signed literal ∈ {-512...511}
Slit16	16-bit signed literal ∈ {-32768...32767}
Slit6	6-bit signed literal ∈ {-16...16}
Wb	Base W register ∈ {W0...W15}
Wd	Destination W register ∈ { Wd, [Wd], [Wd++], [Wd--], [++Wd], [--Wd] }
Wdo	Destination W register ∈ { Wnd, [Wnd], [Wnd++], [Wnd--], [++Wnd], [--Wnd], [Wnd+Wb] }
Wm,Wn	Dividend, Divisor Working register pair (Direct Addressing)

TABLE 30-1: SYMBOLS USED IN OPCODE DESCRIPTIONS (CONTINUED)

Field	Description
Wm*Wm	Multiplicand and Multiplier working register pair for Square instructions $\in \{W4 * W4, W5 * W5, W6 * W6, W7 * W7\}$
Wm*Wn	Multiplicand and Multiplier working register pair for DSP instructions $\in \{W4 * W5, W4 * W6, W4 * W7, W5 * W6, W5 * W7, W6 * W7\}$
Wn	One of 16 working registers $\in \{W0...W15\}$
Wnd	One of 16 destination working registers $\in \{W0...W15\}$
Wns	One of 16 source working registers $\in \{W0...W15\}$
WREG	W0 (working register used in file register instructions)
Ws	Source W register $\in \{Ws, [Ws], [Ws++] , [Ws--], [+Ws], [--Ws] \}$
Wso	Source W register $\in \{Wns, [Wns], [Wns++] , [Wns--], [++Wns], [--Wns], [Wns+Wb] \}$
Wx	X Data Space Prefetch Address register for DSP instructions $\in \{[W8] + = 6, [W8] + = 4, [W8] + = 2, [W8], [W8] - = 6, [W8] - = 4, [W8] - = 2, [W9] + = 6, [W9] + = 4, [W9] + = 2, [W9], [W9] - = 6, [W9] - = 4, [W9] - = 2, [W9 + W12], \text{none}\}$
Wxd	X Data Space Prefetch Destination register for DSP instructions $\in \{W4...W7\}$
Wy	Y Data Space Prefetch Address register for DSP instructions $\in \{[W10] + = 6, [W10] + = 4, [W10] + = 2, [W10], [W10] - = 6, [W10] - = 4, [W10] - = 2, [W11] + = 6, [W11] + = 4, [W11] + = 2, [W11], [W11] - = 6, [W11] - = 4, [W11] - = 2, [W11 + W12], \text{none}\}$
Wyd	Y Data Space Prefetch Destination register for DSP instructions $\in \{W4...W7\}$

NOTES:

31.0 DEVELOPMENT SUPPORT

The PIC® microcontrollers and dsPIC® digital signal controllers are supported with a full range of software and hardware development tools:

- Integrated Development Environment
 - MPLAB® IDE Software
- Compilers/Assemblers/Linkers
 - MPLAB C Compiler for Various Device Families
 - HI-TECH C® for Various Device Families
 - MPASM™ Assembler
 - MPLINK™ Object Linker/
MPLIB™ Object Librarian
 - MPLAB Assembler/Linker/Librarian for Various Device Families
- Simulators
 - MPLAB SIM Software Simulator
- Emulators
 - MPLAB REAL ICE™ In-Circuit Emulator
- In-Circuit Debuggers
 - MPLAB ICD 3
 - PICKit™ 3 Debug Express
- Device Programmers
 - PICKit™ 2 Programmer
 - MPLAB PM3 Device Programmer
- Low-Cost Demonstration/Development Boards, Evaluation Kits and Starter Kits

31.1 MPLAB Integrated Development Environment Software

The MPLAB IDE software brings an ease of software development previously unseen in the 8/16/32-bit microcontroller market. The MPLAB IDE is a Windows® operating system-based application that contains:

- A single graphical interface to all debugging tools
 - Simulator
 - Programmer (sold separately)
 - In-Circuit Emulator (sold separately)
 - In-Circuit Debugger (sold separately)
- A full-featured editor with color-coded context
- A multiple project manager
- Customizable data windows with direct edit of contents
- High-level source code debugging
- Mouse over variable inspection
- Drag and drop variables from source to watch windows
- Extensive on-line help
- Integration of select third party tools, such as IAR C Compilers

The MPLAB IDE allows you to:

- Edit your source files (either C or assembly)
- One-touch compile or assemble, and download to emulator and simulator tools (automatically updates all project information)
- Debug using:
 - Source files (C or assembly)
 - Mixed C and assembly
 - Machine code

MPLAB IDE supports multiple debugging tools in a single development paradigm, from the cost-effective simulators, through low-cost in-circuit debuggers, to full-featured emulators. This eliminates the learning curve when upgrading to tools with increased flexibility and power.

31.2 MPLAB C Compilers for Various Device Families

The MPLAB C Compiler code development systems are complete ANSI C compilers for Microchip's PIC18, PIC24 and PIC32 families of microcontrollers and the dsPIC30 and dsPIC33 families of digital signal controllers. These compilers provide powerful integration capabilities, superior code optimization and ease of use.

For easy source level debugging, the compilers provide symbol information that is optimized to the MPLAB IDE debugger.

31.3 HI-TECH C for Various Device Families

The HI-TECH C Compiler code development systems are complete ANSI C compilers for Microchip's PIC family of microcontrollers and the dsPIC family of digital signal controllers. These compilers provide powerful integration capabilities, omniscient code generation and ease of use.

For easy source level debugging, the compilers provide symbol information that is optimized to the MPLAB IDE debugger.

The compilers include a macro assembler, linker, pre-processor, and one-step driver, and can run on multiple platforms.

31.4 MPASM Assembler

The MPASM Assembler is a full-featured, universal macro assembler for PIC10/12/16/18 MCUs.

The MPASM Assembler generates relocatable object files for the MPLINK Object Linker, Intel® standard HEX files, MAP files to detail memory usage and symbol reference, absolute LST files that contain source lines and generated machine code and COFF files for debugging.

The MPASM Assembler features include:

- Integration into MPLAB IDE projects
- User-defined macros to streamline assembly code
- Conditional assembly for multi-purpose source files
- Directives that allow complete control over the assembly process

31.5 MPLINK Object Linker/ MPLIB Object Librarian

The MPLINK Object Linker combines relocatable objects created by the MPASM Assembler and the MPLAB C18 C Compiler. It can link relocatable objects from precompiled libraries, using directives from a linker script.

The MPLIB Object Librarian manages the creation and modification of library files of precompiled code. When a routine from a library is called from a source file, only the modules that contain that routine will be linked in with the application. This allows large libraries to be used efficiently in many different applications.

The object linker/library features include:

- Efficient linking of single libraries instead of many smaller files
- Enhanced code maintainability by grouping related modules together
- Flexible creation of libraries with easy module listing, replacement, deletion and extraction

31.6 MPLAB Assembler, Linker and Librarian for Various Device Families

MPLAB Assembler produces relocatable machine code from symbolic assembly language for PIC24, PIC32 and dsPIC devices. MPLAB C Compiler uses the assembler to produce its object file. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. Notable features of the assembler include:

- Support for the entire device instruction set
- Support for fixed-point and floating-point data
- Command line interface
- Rich directive set
- Flexible macro language
- MPLAB IDE compatibility

31.7 MPLAB SIM Software Simulator

The MPLAB SIM Software Simulator allows code development in a PC-hosted environment by simulating the PIC MCUs and dsPIC[®] DSCs on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a comprehensive stimulus controller. Registers can be logged to files for further run-time analysis. The trace buffer and logic analyzer display extend the power of the simulator to record and track program execution, actions on I/O, most peripherals and internal registers.

The MPLAB SIM Software Simulator fully supports symbolic debugging using the MPLAB C Compilers, and the MPASM and MPLAB Assemblers. The software simulator offers the flexibility to develop and debug code outside of the hardware laboratory environment, making it an excellent, economical software development tool.

31.8 MPLAB REAL ICE In-Circuit Emulator System

MPLAB REAL ICE In-Circuit Emulator System is Microchip's next generation high-speed emulator for Microchip Flash DSC and MCU devices. It debugs and programs PIC[®] Flash MCUs and dsPIC[®] Flash DSCs with the easy-to-use, powerful graphical user interface of the MPLAB Integrated Development Environment (IDE), included with each kit.

The emulator is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with either a connector compatible with in-circuit debugger systems (RJ11) or with the new high-speed, noise tolerant, Low-Voltage Differential Signal (LVDS) interconnection (CAT5).

The emulator is field upgradable through future firmware downloads in MPLAB IDE. In upcoming releases of MPLAB IDE, new devices will be supported, and new features will be added. MPLAB REAL ICE offers significant advantages over competitive emulators including low-cost, full-speed emulation, run-time variable watches, trace analysis, complex breakpoints, a ruggedized probe interface and long (up to three meters) interconnection cables.

31.9 MPLAB ICD 3 In-Circuit Debugger System

MPLAB ICD 3 In-Circuit Debugger System is Microchip's most cost effective high-speed hardware debugger/programmer for Microchip Flash Digital Signal Controller (DSC) and microcontroller (MCU) devices. It debugs and programs PIC[®] Flash microcontrollers and dsPIC[®] DSCs with the powerful, yet easy-to-use graphical user interface of MPLAB Integrated Development Environment (IDE).

The MPLAB ICD 3 In-Circuit Debugger probe is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with a connector compatible with the MPLAB ICD 2 or MPLAB REAL ICE systems (RJ-11). MPLAB ICD 3 supports all MPLAB ICD 2 headers.

31.10 PICKit 3 In-Circuit Debugger/ Programmer and PICKit 3 Debug Express

The MPLAB PICKit 3 allows debugging and programming of PIC[®] and dsPIC[®] Flash microcontrollers at a most affordable price point using the powerful graphical user interface of the MPLAB Integrated Development Environment (IDE). The MPLAB PICKit 3 is connected to the design engineer's PC using a full speed USB interface and can be connected to the target via an Microchip debug (RJ-11) connector (compatible with MPLAB ICD 3 and MPLAB REAL ICE). The connector uses two device I/O pins and the reset line to implement in-circuit debugging and In-Circuit Serial Programming[™].

The PICKit 3 Debug Express include the PICKit 3, demo board and microcontroller, hookup cables and CDROM with user's guide, lessons, tutorial, compiler and MPLAB IDE software.

31.11 PICkit 2 Development Programmer/Debugger and PICkit 2 Debug Express

The PICkit™ 2 Development Programmer/Debugger is a low-cost development tool with an easy to use interface for programming and debugging Microchip's Flash families of microcontrollers. The full featured Windows® programming interface supports baseline (PIC10F, PIC12F5xx, PIC16F5xx), midrange (PIC12F6xx, PIC16F), PIC18F, PIC24, dsPIC30, dsPIC33, and PIC32 families of 8-bit, 16-bit, and 32-bit microcontrollers, and many Microchip Serial EEPROM products. With Microchip's powerful MPLAB Integrated Development Environment (IDE) the PICkit™ 2 enables in-circuit debugging on most PIC® microcontrollers. In-Circuit-Debugging runs, halts and single steps the program while the PIC microcontroller is embedded in the application. When halted at a breakpoint, the file registers can be examined and modified.

The PICkit 2 Debug Express include the PICkit 2, demo board and microcontroller, hookup cables and CDROM with user's guide, lessons, tutorial, compiler and MPLAB IDE software.

31.12 MPLAB PM3 Device Programmer

The MPLAB PM3 Device Programmer is a universal, CE compliant device programmer with programmable voltage verification at VDDMIN and VDDMAX for maximum reliability. It features a large LCD display (128 x 64) for menus and error messages and a modular, detachable socket assembly to support various package types. The ICSP™ cable assembly is included as a standard item. In Stand-Alone mode, the MPLAB PM3 Device Programmer can read, verify and program PIC devices without a PC connection. It can also set code protection in this mode. The MPLAB PM3 connects to the host PC via an RS-232 or USB cable. The MPLAB PM3 has high-speed communications and optimized algorithms for quick programming of large memory devices and incorporates an MMC card for file storage and data applications.

31.13 Demonstration/Development Boards, Evaluation Kits, and Starter Kits

A wide variety of demonstration, development and evaluation boards for various PIC MCUs and dsPIC DSCs allows quick application development on fully functional systems. Most boards include prototyping areas for adding custom circuitry and provide application firmware and source code for examination and modification.

The boards support a variety of features, including LEDs, temperature sensors, switches, speakers, RS-232 interfaces, LCD displays, potentiometers and additional EEPROM memory.

The demonstration and development boards can be used in teaching environments, for prototyping custom circuits and for learning about various microcontroller applications.

In addition to the PICDEM™ and dsPICDEM™ demonstration/development board series of circuits, Microchip has a line of evaluation kits and demonstration software for analog filter design, KEELOQ® security ICs, CAN, IrDA®, PowerSmart battery management, SEEVAL® evaluation system, Sigma-Delta ADC, flow rate sensing, plus many more.

Also available are starter kits that contain everything needed to experience the specified device. This usually includes a single application and debug capability, all on one board.

Check the Microchip web page (www.microchip.com) for the complete list of demonstration, development and evaluation kits.

32.0 ELECTRICAL CHARACTERISTICS

This section provides an overview of dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 electrical characteristics. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 family are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these or any other conditions above the parameters indicated in the operation listings of this specification is not implied.

Absolute Maximum Ratings

(See Note 1)

Ambient temperature under bias	-40°C to +125°C
Storage temperature	-65°C to +150°C
Voltage on VDD with respect to VSS	-0.3V to +4.0V
Voltage on any pin that is not 5V tolerant, with respect to VSS ⁽³⁾	-0.3V to (VDD + 0.3V)
Voltage on any 5V tolerant pin with respect to VSS when VDD ≥ 3.0V ⁽³⁾	-0.3V to +5.5V
Voltage on any 5V tolerant pin with respect to VSS when VDD < 3.0V ⁽³⁾	-0.3V to 3.6V
Voltage on D+ OR D- pin with respect to VUSB3V3	-0.3V to (VUSB3V3 + 0.3V)
Voltage on VBUS with respect to VSS	-0.3V to +5.5V
Maximum current out of VSS pin	320 mA
Maximum current into VDD pin ⁽²⁾	320 mA
Maximum current sourced/sunk by any 4x I/O pin ⁽⁴⁾	15 mA
Maximum current sourced/sunk by any 8x I/O pin ⁽⁴⁾	25 mA
Maximum current sunk by all ports	200 mA
Maximum current sourced by all ports ⁽²⁾	200 mA

Note 1: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

2: Maximum allowable current is a function of device maximum power dissipation (see [Table 32-2](#)).

3: See the “[Pin Diagrams](#)” section for the 5V tolerant pins.

4: Characterized but not tested.

32.1 DC Characteristics

TABLE 32-1: OPERATING MIPS VS. VOLTAGE

Characteristic	VDD Range (in Volts)	Temp Range (in °C)	Maximum MIPS
			dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814
—	2.95V-3.6V ⁽¹⁾	-40°C to +85°C	70
—	2.95V-3.6V ⁽¹⁾	-40°C to +125°C	60

Note 1: Device is functional at $V_{BORMIN} < V_{DD} < V_{DDMIN}$. Analog modules: ADC, Comparator and DAC will have degraded performance. Device functionality is tested but not characterized. Refer to Parameter [BO10](#) in [Table 32-11](#) for the minimum and maximum BOR values.

TABLE 32-2: THERMAL OPERATING CONDITIONS

Rating	Symbol	Min.	Typ.	Max.	Unit
Industrial Temperature Devices					
Operating Junction Temperature Range	TJ	-40	—	+125	°C
Operating Ambient Temperature Range	TA	-40	—	+85	°C
Extended Temperature Devices					
Operating Junction Temperature Range	TJ	-40	—	+140	°C
Operating Ambient Temperature Range	TA	-40	—	+125	°C
Power Dissipation: Internal chip power dissipation: $P_{INT} = V_{DD} \times (I_{DD} - \Sigma I_{OH})$ I/O Pin Power Dissipation: $I/O = \Sigma (\{V_{DD} - V_{OH}\} \times I_{OH}) + \Sigma (V_{OL} \times I_{OL})$	PD	PINT + PI/O			W
Maximum Allowed Power Dissipation	PDMAX	$(T_J - T_A)/\theta_{JA}$			W

TABLE 32-3: THERMAL PACKAGING CHARACTERISTICS

Characteristic	Symbol	Typ.	Max.	Unit	Notes
Package Thermal Resistance, 64-pin QFN (9x9 mm)	θ_{JA}	28	—	°C/W	1
Package Thermal Resistance, 64-pin TQFP (10x10 mm)	θ_{JA}	47	—	°C/W	1
Package Thermal Resistance, 100-pin TQFP (12x12 mm)	θ_{JA}	43	—	°C/W	1
Package Thermal Resistance, 100-pin TQFP (14x14 mm)	θ_{JA}	43	—	°C/W	1
Package Thermal Resistance, 121-pin TFBGA (10x10 mm)	θ_{JA}	40	—	°C/W	1
Package Thermal Resistance, 144-pin LQFP (20x20 mm)	θ_{JA}	33	—	°C/W	1
Package Thermal Resistance, 144-pin TQFP (16x16 mm)	θ_{JA}	33	—	°C/W	1

Note 1: Junction to ambient thermal resistance, Theta-JA (θ_{JA}) numbers are achieved by package simulations.

TABLE 32-4: DC TEMPERATURE AND VOLTAGE SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param.	Symbol	Characteristic	Min.	Typ. ⁽¹⁾	Max.	Units	Conditions
Operating Voltage							
DC10	VDD	Supply Voltage⁽³⁾	3.0	—	3.6	V	
DC12	VDR	RAM Data Retention Voltage⁽²⁾	1.8	—	—	V	
DC16	VPOR	VDD Start Voltage to Ensure Internal Power-on Reset Signal	—	—	VSS	V	
DC17	SVDD	VDD Rise Rate to Ensure Internal Power-on Reset Signal	1.0	—	—	V/ms	0-3.0V in 3 ms

- Note 1:** Data in “Typ” column is at 3.3V, +25°C unless otherwise stated.
- 2:** This is the limit to which VDD may be lowered without losing RAM data.
- 3:** Device is functional at VBORMIN < VDD < VDDMIN. Analog modules: ADC, Comparator and DAC will have degraded performance. Device functionality is tested but not characterized. Refer to Parameter [BO10](#) in [Table 32-11](#) for the minimum and maximum BOR values.

TABLE 32-5: DC CHARACTERISTICS: OPERATING CURRENT (IDD)

DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended			
Param. ⁽²⁾	Typ. ⁽³⁾	Max.	Units	Conditions		
Operating Current (IDD)⁽¹⁾						
DC20d	12	18	mA	-40°C	3.3V	10 MIPS
DC20a	12	18	mA	+25°C		
DC20b	13	20	mA	+85°C		
DC20c	14	21	mA	+125°C		
DC22d	23	35	mA	-40°C	3.3V	20 MIPS
DC22a	24	36	mA	+25°C		
DC22b	24	36	mA	+85°C		
DC22c	25	38	mA	+125°C		
DC24d	42	63	mA	-40°C	3.3V	40 MIPS
DC24a	43	65	mA	+25°C		
DC24b	44	66	mA	+85°C		
DC24c	45	68	mA	+125°C		
DC25d	61	92	mA	-40°C	3.3V	60 MIPS
DC25a	62	93	mA	+25°C		
DC25b	62	93	mA	+85°C		
DC25c	63	95	mA	+125°C		
DC26d	69	104	mA	-40°C	3.3V	70 MIPS
DC26a	70	105	mA	+25°C		
DC26b	70	105	mA	+85°C		

Note 1: IDD is primarily a function of the operating voltage and frequency. Other factors, such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature, also have an impact on the current consumption. The test conditions for all IDD measurements are as follows:

- Oscillator is configured in EC mode and external clock is active, OSC1 is driven with external square wave from rail-to-rail (EC Clock Overshoot/Undershoot < 250 mV required)
- CLKO is configured as an I/O input pin in the Configuration Word
- All I/O pins are configured as inputs and pulled to VSS
- MCLR = VDD, WDT and FSCM are disabled
- CPU, SRAM, program memory and data memory are operational
- No peripheral modules are operating; however, every peripheral is being clocked (defined PMDx bits are set to zero and unimplemented PMDx bits are set to one)
- CPU is executing `while(1)` statement
- JTAG is disabled

2: These parameters are characterized but not tested in manufacturing.

3: Data in “Typ” column is at 3.3V, +25°C unless otherwise stated.

TABLE 32-6: DC CHARACTERISTICS: IDLE CURRENT (I_{IDLE})

DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended			
Param. ⁽²⁾	Typ. ⁽³⁾	Max.	Units	Conditions		
Idle Current (I_{IDLE})⁽¹⁾						
DC40d	6	10	mA	-40°C	3.3V	10 MIPS
DC40a	7	12	mA	+25°C		
DC40b	8	13	mA	+85°C		
DC40c	9	15	mA	+125°C		
DC42d	11	18	mA	-40°C	3.3V	20 MIPS
DC42a	12	20	mA	+25°C		
DC42b	13	21	mA	+85°C		
DC42c	15	24	mA	+125°C		
DC44d	23	37	mA	-40°C	3.3V	40 MIPS
DC44a	24	39	mA	+25°C		
DC44b	25	40	mA	+85°C		
DC44c	27	44	mA	+125°C		
DC45d	34	55	mA	-40°C	3.3V	60 MIPS
DC45a	35	56	mA	+25°C		
DC45b	36	58	mA	+85°C		
DC45c	38	61	mA	+125°C		
DC46d	39	63	mA	-40°C	3.3V	70 MIPS
DC46a	41	66	mA	+25°C		
DC46b	42	68	mA	+85°C		

Note 1: Base I_{IDLE} current is measured as follows:

- CPU core is off, oscillator is configured in EC mode and external clock is active, OSC1 is driven with external square wave from rail-to-rail (EC Clock Overshoot/Undershoot < 250 mV required)
- CLKO is configured as an I/O input pin in the Configuration Word
- External Secondary Oscillator (SOSC) is disabled (i.e., SOSCO and SOSCI pins are configured as digital I/O inputs)
- All I/O pins are configured as inputs and pulled to V_{SS}
- MCLR = V_{DD}, WDT and FSCM are disabled
- No peripheral modules are operating; however, every peripheral is being clocked (defined PMDx bits are set to zero and unimplemented PMDx bits are set to one)
- The NVMSIDL bit (NVMCON<12>) = 1 (i.e., Flash regulator is set to stand-by while the device is in Idle mode)
- JTAG is disabled

2: These parameters are characterized but not tested in manufacturing.

3: Data in “Typ” column is at 3.3V, +25°C unless otherwise stated.

TABLE 32-7: DC CHARACTERISTICS: POWER-DOWN CURRENT (IPD)

DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended		
Param.	Typ. ⁽²⁾	Max.	Units	Conditions	
Power-Down Current (IPD)⁽¹⁾					
DC60d	50	100	μA	-40°C	3.3V Base Power-Down Current ^(1,4)
DC60a	60	200	μA	$+25^{\circ}\text{C}$	
DC60b	250	500	μA	$+85^{\circ}\text{C}$	
DC60c	1600	3000	μA	$+125^{\circ}\text{C}$	
DC61d	8	10	μA	-40°C	3.3V Watchdog Timer Current: ΔI_{WDT} ⁽³⁾
DC61a	10	15	μA	$+25^{\circ}\text{C}$	
DC61b	12	20	μA	$+85^{\circ}\text{C}$	
DC61c	13	25	μA	$+125^{\circ}\text{C}$	

Note 1: IPD (Sleep) current is measured as follows:

- CPU core is off, oscillator is configured in EC mode and external clock is active, OSC1 is driven with external square wave from rail-to-rail (EC Clock Overshoot/Undershoot < 250 mV required)
- CLKO is configured as an I/O input pin in the Configuration Word
- External Secondary Oscillator (SOSC) is disabled (i.e., SOSCO and SOSCI pins are configured as digital I/O inputs)
- All I/O pins are configured as inputs and pulled to Vss
- $\overline{\text{MCLR}} = \text{VDD}$, WDT and FSCM are disabled, all peripheral modules are disabled (PMDx bits are all ones)
- The VREGS bit (RCON<8>) = 0 (i.e., core regulator is set to stand-by while the device is in Sleep mode)
- RTCC is disabled
- The VREGSF bit (RCON<11>) = 0 (i.e., Flash regulator is set to stand-by while the device is in Sleep mode)
- JTAG is disabled

2: Data in the “Typ” column is at 3.3V, +25°C unless otherwise stated.

3: The Watchdog Timer current is the additional current consumed when the WDT module is enabled. This current should be added to the base IPD current.

4: These currents are measured on the device containing the most memory in this family.

TABLE 32-8: DC CHARACTERISTICS: DOZE CURRENT (IDOZE)⁽¹⁾

DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Parameter	Typ. ⁽²⁾	Max.	Doze Ratio	Units	Conditions		
DC73a	57	86	1:2	mA	-40°C	3.3V	70 MIPS
DC73g	40	60	1:128	mA			
DC70a	58	87	1:2	mA	+25°C	3.3V	70 MIPS
DC70g	41	62	1:128	mA			
DC71a	58	87	1:2	mA	+85°C	3.3V	70 MIPS
DC71g	42	63	1:128	mA			
DC72a	53	80	1:2	mA	+125°C	3.3V	60 MIPS
DC72g	38	57	1:128	mA			

Note 1: IDOZE is primarily a function of the operating voltage and frequency. Other factors, such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature, also have an impact on the current consumption. The test conditions for all IDOZE measurements are as follows:

- Oscillator is configured in EC mode and external clock is active, OSC1 is driven with external square wave from rail-to-rail with Overshoot/Undershoot < 250 mV
- CLKO is configured as an I/O input pin in the Configuration Word
- All I/O pins are configured as inputs and pulled to VSS
- MCLR = VDD, WDT and FSCM are disabled
- CPU, SRAM, program memory and data memory are operational
- No peripheral modules are operating; however, every peripheral is being clocked (defined PMDx bits are set to zero and unimplemented PMDx bits are set to one)
- CPU executing `while(1)` statement
- JTAG is disabled

2: Data in the “Typ” column is at 3.3V, +25°C unless otherwise stated.

TABLE 32-9: DC CHARACTERISTICS: I/O PIN INPUT SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param.	Symbol	Characteristic	Min.	Typ ⁽¹⁾	Max.	Units	Conditions
DI10 DI11 DI15 DI16 DI18 DI19	VIL	Input Low Voltage					
		I/O Pins	VSS	—	0.2 VDD	V	PMPTTL = 1
		PMP Pins	VSS	—	0.15 VDD	V	
		MCLR	VSS	—	0.2 VDD	V	
		I/O Pins with OSC1 or SOSC1	VSS	—	0.2 VDD	V	
		I/O Pins with SDAx, SCLx	VSS	—	0.3 VDD	V	SMBus disabled
I/O Pins with SDAx, SCLx	VSS	—	0.8	V	SMBus enabled		
DI20	VIH	Input High Voltage					
		I/O Pins Not 5V Tolerant ⁽⁴⁾	0.7 VDD	—	VDD	V	PMPTTL = 1
		I/O Pins 5V Tolerant ⁽⁴⁾	0.7 VDD	—	5.3	V	
		PMP Pins	0.25 VDD + 0.8	—	—	V	
		I/O Pins with SDAx, SCLx	0.7 VDD	—	5.3	V	SMBus disabled
I/O Pins with SDAx, SCLx	2.1	—	5.3	V	SMBus enabled		
DI30	ICNPU	Change Notification Pull-up Current	50	250	400	μA	VDD = 3.3V, VPIN = VSS
DI31	ICNPD	Change Notification Pull-down Current⁽¹⁰⁾	—	50	—	μA	VDD = 3.3V, VPIN = VDD

- Note 1:** Data in “Typ” column is at 3.3V, +25°C unless otherwise stated.
- 2:** The leakage current on the MCLR pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current can be measured at different input voltages.
- 3:** Negative current is defined as current sourced by the pin.
- 4:** See “Pin Diagrams” for the 5V tolerant I/O pins.
- 5:** VIL source < (VSS – 0.3). Characterized but not tested.
- 6:** Non-5V tolerant pins VIH source > (VDD + 0.3), 5V tolerant pins VIH source > 5.5V. Characterized but not tested.
- 7:** Digital 5V tolerant pins cannot tolerate any “positive” input injection current from input sources > 5.5V.
- 8:** Injection currents > | 0 | can affect the ADC results by approximately 4-6 counts.
- 9:** Any number and/or combination of I/O pins not excluded under IICL or IICH conditions are permitted, provided the mathematical “absolute instantaneous” sum of the input injection currents from all pins do not exceed the specified limit. Characterized but not tested.
- 10:** These parameters are characterized, but not tested.

TABLE 32-9: DC CHARACTERISTICS: I/O PIN INPUT SPECIFICATIONS (CONTINUED)

DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended				
Param.	Symbol	Characteristic	Min.	Typ ⁽¹⁾	Max.	Units	Conditions
DI50	I _{IL}	Input Leakage Current ^(2,3) I/O Pins 5V Tolerant ⁽⁴⁾	—	—	±1	μA	V _{SS} ≤ V _{PIN} ≤ V _{DD} , Pin at high-impedance
DI51		I/O Pins Not 5V Tolerant ⁽⁴⁾	—	—	±1	μA	V _{SS} ≤ V _{PIN} ≤ V _{DD} , Pin at high-impedance, $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$
DI51a		I/O Pins Not 5V Tolerant ⁽⁴⁾	—	—	±1	μA	Analog pins shared with external reference pins, $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$
DI51b		I/O Pins Not 5V Tolerant ⁽⁴⁾	—	—	±1	μA	V _{SS} ≤ V _{PIN} ≤ V _{DD} , Pin at high-impedance, $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$
DI51c		I/O Pins Not 5V Tolerant ⁽⁴⁾	—	—	±1	μA	Analog pins shared with external reference pins, $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$
DI55		MCLR	—	—	±1	μA	V _{SS} ≤ V _{PIN} ≤ V _{DD}
DI56		OSC1	—	—	±1	μA	V _{SS} ≤ V _{PIN} ≤ V _{DD} , XT and HS modes

Note 1: Data in “Typ” column is at 3.3V, +25°C unless otherwise stated.

- 2:** The leakage current on the MCLR pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current can be measured at different input voltages.
- 3:** Negative current is defined as current sourced by the pin.
- 4:** See “Pin Diagrams” for the 5V tolerant I/O pins.
- 5:** V_{IL} source < (V_{SS} – 0.3). Characterized but not tested.
- 6:** Non-5V tolerant pins V_{IH} source > (V_{DD} + 0.3), 5V tolerant pins V_{IH} source > 5.5V. Characterized but not tested.
- 7:** Digital 5V tolerant pins cannot tolerate any “positive” input injection current from input sources > 5.5V.
- 8:** Injection currents > |0| can affect the ADC results by approximately 4-6 counts.
- 9:** Any number and/or combination of I/O pins not excluded under I_{ICL} or I_{ICH} conditions are permitted, provided the mathematical “absolute instantaneous” sum of the input injection currents from all pins do not exceed the specified limit. Characterized but not tested.

TABLE 32-10: DC CHARACTERISTICS: I/O PIN OUTPUT SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended				
Param.	Symbol	Characteristic	Min.	Typ.	Max.	Units	Conditions
DO10	VOL	Output Low Voltage I/O Pins: 4x Sink Driver Pins – All I/O Pins except OSC2 and SOSCO	—	—	0.4	V	$I_{OL} \leq 10 \text{ mA}$, $V_{DD} = 3.3\text{V}$
		Output Low Voltage I/O Pins: 8x Sink Driver Pins – OSC2 and SOSCO	—	—	0.4	V	$I_{OL} \leq 15 \text{ mA}$, $V_{DD} = 3.3\text{V}$
DO20	VOH	Output High Voltage I/O Pins: 4x Sink Driver Pins – All I/O Pins except OSC2 and SOSCO	2.4	—	—	V	$I_{OH} \geq -10 \text{ mA}$, $V_{DD} = 3.3\text{V}$
		Output High Voltage I/O Pins: 8x Sink Driver Pins – OSC2 and SOSCO	2.4	—	—	V	$I_{OH} \geq -15 \text{ mA}$, $V_{DD} = 3.3\text{V}$
DO20A	VOH1	Output High Voltage I/O Pins: 4x Sink Driver Pins – All I/O Pins except OSC2 and SOSCO	1.5 ⁽¹⁾	—	—	V	$I_{OH} \geq -14 \text{ mA}$, $V_{DD} = 3.3\text{V}$
			2.0 ⁽¹⁾	—	—		$I_{OH} \geq -12 \text{ mA}$, $V_{DD} = 3.3\text{V}$
			3.0 ⁽¹⁾	—	—		$I_{OH} \geq -7 \text{ mA}$, $V_{DD} = 3.3\text{V}$
		Output High Voltage I/O Pins: 8x Sink Driver Pins – OSC2 and SOSCO	1.5 ⁽¹⁾	—	—	V	$I_{OH} \geq -22 \text{ mA}$, $V_{DD} = 3.3\text{V}$
			2.0 ⁽¹⁾	—	—		$I_{OH} \geq -18 \text{ mA}$, $V_{DD} = 3.3\text{V}$
			3.0 ⁽¹⁾	—	—		$I_{OH} \geq -10 \text{ mA}$, $V_{DD} = 3.3\text{V}$

Note 1: Parameters are characterized, but not tested.

TABLE 32-11: ELECTRICAL CHARACTERISTICS: BOR

DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V ⁽²⁾ (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended				
Param.	Symbol	Characteristic	Min. ⁽¹⁾	Typ.	Max.	Units	Conditions
BO10	VBOR	BOR Event on VDD Transition High-to-Low	2.7	—	2.9	V	VDD

Note 1: Parameters are for design guidance only and are not tested in manufacturing.

2: Device is functional at $V_{BORMIN} < V_{DD} < V_{DDMIN}$. Analog modules: ADC, Comparator and DAC will have degraded performance. Device functionality is tested but not characterized.

TABLE 32-12: DC CHARACTERISTICS: PROGRAM MEMORY

DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param.	Symbol	Characteristic	Min.	Typ ⁽¹⁾	Max.	Units	Conditions
Program Flash Memory							
D130	EP	Cell Endurance	10,000	—	—	E/W	-40°C to +125°C
D131	VPR	VDD for Read	3.0	—	3.6	V	
D132b	VPEW	VDD for Self-Timed Write	3.0	—	3.6	V	
D134	TRETD	Characteristic Retention	20	—	—	Year	Provided no other specifications are violated, -40°C to +125°C
D135	IDDP	Supply Current during Programming	—	10	—	mA	
D136a	TRW	Row Write Time	1.32	—	1.74	ms	TRW = 11064 FRC cycles, TA = +85°C, See Note 2
D136b	TRW	Row Write Time	1.28	—	1.79	ms	TRW = 11064 FRC cycles, TA = +125°C, See Note 2
D137a	TPE	Page Erase Time	20.1	—	26.5	ms	TPE = 168517 FRC cycles, TA = +85°C, See Note 2
D137b	TPE	Page Erase Time	19.5	—	27.3	ms	TPE = 168517 FRC cycles, TA = +125°C, See Note 2
D138a	TWW	Word Write Cycle Time	42.3	—	55.9	μs	TWW = 355 FRC cycles, TA = +85°C, See Note 2
D138b	TWW	Word Write Cycle Time	41.1	—	57.6	μs	TWW = 355 FRC cycles, TA = +125°C, See Note 2

Note 1: Data in “Typ” column is at 3.3V, +25°C unless otherwise stated.

Note 2: Other conditions: FRC = 7.37 MHz, TUN<5:0> = 'b0111111 (for Minimum), TUN<5:0> = 'b100000 (for Maximum). This parameter depends on the FRC accuracy (see [Table 32-20](#)) and the value of the FRC Oscillator Tuning register (see [Register 9-4](#)). For complete details on calculating the Minimum and Maximum time, see [Section 5.3 “Programming Operations”](#).

TABLE 32-13: INTERNAL VOLTAGE REGULATOR SPECIFICATIONS

Standard Operating Conditions (unless otherwise stated): Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended							
Param.	Symbol	Characteristics	Min.	Typ	Max.	Units	Comments
—	CEFC ⁽¹⁾	External Filter Capacitor Value	4.7	10	—	μF	Capacitor must have a low series resistance (< 1 Ohm)

Note 1: Typical VCAP (CEFC) voltage = 1.8V when VDD ≥ VDDMIN.

32.2 AC Characteristics and Timing Parameters

This section defines the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 AC characteristics and timing parameters.

TABLE 32-14: TEMPERATURE AND VOLTAGE SPECIFICATIONS – AC

AC CHARACTERISTICS	Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated)
	Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended Operating voltage V_{DD} range as described in Section 32.1 “DC Characteristics” .

FIGURE 32-1: LOAD CONDITIONS FOR DEVICE TIMING SPECIFICATIONS

TABLE 32-15: CAPACITIVE LOADING REQUIREMENTS ON OUTPUT PINS

Param.	Symbol	Characteristic	Min.	Typ.	Max.	Units	Conditions
DO50	Cosco	OSC2 Pin	—	—	15	pF	In XT and HS modes when external clock is used to drive OSC1
DO56	Cio	All I/O Pins and OSC2	—	—	50	pF	EC mode
DO58	Cb	SCLx, SDAx	—	—	400	pF	In I ² C™ mode

FIGURE 32-2: EXTERNAL CLOCK TIMING

TABLE 32-16: EXTERNAL CLOCK TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended				
Param.	Symbol	Characteristic	Min.	Typ. ⁽¹⁾	Max.	Units	Conditions
OS10	FIN	External CLKI Frequency (External clocks allowed only in EC and ECPLL modes)	DC	—	60	MHz	EC
		Oscillator Crystal Frequency	3.5 10 32.4	— — 32.768	10 40 33.1	MHz MHz kHz	XT HS SOSC
OS20	Tosc	$T_{osc} = 1/F_{osc}$	8.33 7.14	— —	DC DC	ns ns	+125°C +85°C
OS25	Tcy	Instruction Cycle Time ⁽²⁾	16.67 14.28	— —	DC DC	ns ns	+125°C +85°C
OS30	TosL, TosH	External Clock In (OSC1) High or Low Time	$0.375 \times T_{osc}$	—	$0.625 \times T_{osc}$	ns	EC
OS31	TosR, TosF	External Clock In (OSC1) Rise or Fall Time	—	—	20	ns	EC
OS40	TckR	CLKO Rise Time ⁽³⁾	—	5.2	—	ns	
OS41	TckF	CLKO Fall Time ⁽³⁾	—	5.2	—	ns	
OS42	GM	External Oscillator Transconductance ⁽⁴⁾	—	12	—	mA/V	HS, $V_{DD} = 3.3V$, $T_A = +25^{\circ}\text{C}$
			—	6	—	mA/V	XT, $V_{DD} = 3.3V$, $T_A = +25^{\circ}\text{C}$

Note 1: Data in “Typ” column is at 3.3V, +25°C unless otherwise stated.

2: Instruction cycle period (Tcy) equals two times the input oscillator time base period. All specified values are based on characterization data for that particular oscillator type under standard operating conditions with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at “Minimum” values with an external clock applied to the OSC1 pin. When an external clock input is used, the “Maximum” cycle time limit is “DC” (no clock) for all devices.

3: Measurements are taken in EC mode. The CLKO signal is measured on the OSC1 pin.

4: This parameter is characterized, but not tested in manufacturing.

TABLE 32-17: PLL CLOCK TIMING SPECIFICATIONS

AC CHARACTERISTICS		Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended					
Param.	Symbol	Characteristic	Min.	Typ. ⁽¹⁾	Max.	Units	Conditions
OS50	FPLLI	PLL Voltage Controlled Oscillator (VCO) Input Frequency Range	0.8	—	8.0	MHz	ECPLL, XTPLL modes
OS51	FSYS	On-Chip VCO System Frequency	120	—	340	MHz	
OS52	TLOCK	PLL Start-up Time (Lock Time)	0.9	1.5	3.1	mS	
OS53	DCLK	CLKO Stability (Jitter) ⁽²⁾	-5	0.5	5	%	

Note 1: Data in “Typ” column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: This jitter specification is based on clock cycle-by-clock cycle measurements. To get the effective jitter for individual time bases or communication clocks used by the application, use the following formula:

$$Effective\ Jitter = \frac{DCLK}{\sqrt{\frac{FOSC}{Time\ Base\ or\ Communication\ Clock}}}$$

For example, if Fosc = 120 MHz and the SPI bit rate = 10 MHz, the effective jitter is as follows:

$$Effective\ Jitter = \frac{DCLK}{\sqrt{\frac{120}{10}}} = \frac{DCLK}{\sqrt{12}} = \frac{DCLK}{3.464}$$

**TABLE 32-18: AUXILIARY PLL CLOCK TIMING SPECIFICATIONS
(dsPIC33EPXXXMU8XX AND PIC24EPXXXGU8XX DEVICES ONLY)**

AC CHARACTERISTICS		Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended					
Param.	Symbol	Characteristic	Min.	Typ. ⁽¹⁾	Max.	Units	Conditions
OS54	AFPLLI	PLL Voltage Controlled Oscillator (VCO) Input Frequency Range	3	—	5.5	MHz	ECPLL, XTPLL modes
OS55	AFSYS	On-Chip VCO System Frequency	60	—	120	MHz	
OS56	ATLOCK	PLL Start-up Time (Lock Time)	0.9	1.5	3.1	mS	
OS57	ADCLK	CLKO Stability (Jitter)	-2	0.25	2	%	

Note 1: Data in “Typ” column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

TABLE 32-19: INTERNAL FRC ACCURACY

AC CHARACTERISTICS		Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended					
Param.	Characteristic	Min.	Typ.	Max.	Units	Conditions	
Internal FRC Accuracy @ FRC Frequency = 7.37 MHz⁽¹⁾							
F20a	FRC	-2	—	+2	%	-40°C ≤ TA ≤ +85°C	VDD = 3.0-3.6V
F20b	FRC	-5	—	+5	%	-40°C ≤ TA ≤ +125°C	VDD = 3.0-3.6V

Note 1: Frequency calibrated at +25°C and 3.3V. TUNx bits can be used to compensate for temperature drift.

TABLE 32-20: INTERNAL LPRC ACCURACY

AC CHARACTERISTICS		Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended					
Param.	Characteristic	Min.	Typ.	Max.	Units	Conditions	
LPRC @ 32.768 kHz⁽¹⁾							
F21a	LPRC	-20	±6	+20	%	-40°C ≤ TA ≤ +85°C	VDD = 3.0-3.6V
F21b	LPRC	-50	—	+50	%	-40°C ≤ TA ≤ +125°C	VDD = 3.0-3.6V

Note 1: Change of LPRC frequency as VDD changes.

FIGURE 32-3: I/O TIMING CHARACTERISTICS

TABLE 32-21: I/O TIMING REQUIREMENTS

AC CHARACTERISTICS		Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended					
Param.	Symbol	Characteristic	Min.	Typ. ⁽¹⁾	Max.	Units	Conditions
DO31	TioR	Port Output Rise Time	—	5	10	ns	
DO32	TioF	Port Output Fall Time	—	5	10	ns	
DI35	TINP	INTx Pin High or Low Time (input)	20	—	—	ns	
DI40	TRBP	CNx High or Low Time (input)	2	—	—	Tcy	

Note 1: Data in “Typ” column is at 3.3V, +25°C unless otherwise stated.

FIGURE 32-4: POWER-ON RESET TIMING CHARACTERISTICS

FIGURE 32-5: BOR AND MASTER CLEAR RESET TIMING CHARACTERISTICS

TABLE 32-22: RESET, WATCHDOG TIMER, OSCILLATOR START-UP TIMER, POWER-UP TIMER TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended				
Param.	Symbol	Characteristic ⁽¹⁾	Min.	Typ. ⁽²⁾	Max.	Units	Conditions
SY00	TPU	Power-up Period	—	400	600	μs	
SY10	TOST	Oscillator Start-up Time	—	1024 TOSC	—	—	TOSC = OSC1 period
SY11	TPWRT	Power-up Timer Period	—	—	—	—	See Section 29.1 “Configuration Bits” and LPRC Parameters F21a and F21b (Table 32-20)
SY12	TWDT	Watchdog Timer Time-out Period	—	—	—	—	See Section 29.4 “Watchdog Timer (WDT)” and LPRC Parameters F21a and F21b (Table 32-20)
SY13	TIOZ	I/O High-Impedance from MCLR Low or Watchdog Timer Reset	0.68	0.72	1.2	μs	
SY20	TMCLR	MCLR Pulse Width (low)	2	—	—	μs	
SY30	TBOR	BOR Pulse Width (low)	1	—	—	μs	
SY35	TFSCM	Fail-Safe Clock Monitor Delay	—	500	900	μs	-40°C to $+85^{\circ}\text{C}$
SY36	TVREG	Voltage Regulator Standby-to-Active Mode Transition Time	—	—	30	μs	
SY37	TOSCDFRC	FRC Oscillator Start-up Delay	—	—	29	μs	
SY38	TOSCDLPRC	LPRC Oscillator Start-up Delay	—	—	70	μs	

Note 1: These parameters are characterized but not tested in manufacturing.

Note 2: Data in “Typ” column is at 3.3V, $+25^{\circ}\text{C}$ unless otherwise stated.

FIGURE 32-6: TIMER1-TIMER9 EXTERNAL CLOCK TIMING CHARACTERISTICS

TABLE 32-23: TIMER1 EXTERNAL CLOCK TIMING REQUIREMENTS⁽¹⁾

AC CHARACTERISTICS				Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param.	Symbol	Characteristic ⁽²⁾		Min.	Typ.	Max.	Units	Conditions
TA10	TTXH	TxCK High Time	Synchronous mode	Greater of: 20 or (Tcy + 20)/N	—	—	ns	Must also meet Parameter TA15, N = prescaler value (1, 8, 64, 256)
			Asynchronous	35	—	—	ns	
TA11	TTXL	TxCK Low Time	Synchronous mode	Greater of: 20 or (Tcy + 20)/N	—	—	ns	Must also meet Parameter TA15, N = prescaler value (1, 8, 64, 256)
			Asynchronous	10	—	—	ns	
TA15	TTXP	TxCK Input Period	Synchronous mode	Greater of: 40 or (2 Tcy + 40)/N	—	—	ns	N = prescale value (1, 8, 64, 256)
OS60	Ft1	SOSC1/T1CK Oscillator Input Frequency Range (oscillator enabled by setting bit, TCS (T1CON<1>))		DC	—	50	kHz	
TA20	TCKEXTMRL	Delay from External TxCK Clock Edge to Timer Increment		0.75 Tcy + 40	—	1.75 Tcy + 40	ns	

Note 1: Timer1 is a Type A.

Note 2: These parameters are characterized, but are not tested in manufacturing.

TABLE 32-24: TIMER2, TIMER4, TIMER6, TIMER8 (TYPE B TIMER) EXTERNAL CLOCK TIMING REQUIREMENTS

AC CHARACTERISTICS				Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended				
Param.	Symbol	Characteristic ⁽¹⁾		Min.	Typ.	Max.	Units	Conditions
TB10	TtxH	TxCK High Time	Synchronous mode	Greater of: 20 or (T _{CY} + 20)/N	—	—	ns	Must also meet Parameter TB15 , N = prescale value (1, 8, 64, 256)
TB11	TtxL	TxCK Low Time	Synchronous mode	Greater of: 20 or (T _{CY} + 20)/N	—	—	ns	Must also meet Parameter TB15 , N = prescale value (1, 8, 64, 256)
TB15	TtxP	TxCK Input Period	Synchronous mode	Greater of: 40 or (2 T _{CY} + 40)/N	—	—	ns	N = prescale value (1, 8, 64, 256)
TB20	TCKEXTMRL	Delay from External TxCK Clock Edge to Timer Increment		0.75 T _{CY} + 40	—	1.75 T _{CY} + 40	ns	

Note 1: These parameters are characterized, but are not tested in manufacturing.

TABLE 32-25: TIMER3, TIMER5, TIMER7, TIMER9 (TYPE C TIMER) EXTERNAL CLOCK TIMING REQUIREMENTS

AC CHARACTERISTICS				Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended				
Param.	Symbol	Characteristic ⁽¹⁾		Min.	Typ.	Max.	Units	Conditions
TC10	TtxH	TxCK High Time	Synchronous	T _{CY} + 20	—	—	ns	Must also meet Parameter TC15
TC11	TtxL	TxCK Low Time	Synchronous	T _{CY} + 20	—	—	ns	Must also meet Parameter TC15
TC15	TtxP	TxCK Input Period	Synchronous, with Prescaler	2 T _{CY} + 40	—	—	ns	N = prescale value (1, 8, 64, 256)
TC20	TCKEXTMRL	Delay from External TxCK Clock Edge to Timer Increment		0.75 T _{CY} + 40	—	1.75 T _{CY} + 40	ns	

Note 1: These parameters are characterized, but are not tested in manufacturing.

FIGURE 32-7: TIMERQ (QEI MODULE) EXTERNAL CLOCK TIMING CHARACTERISTICS

TABLE 32-26: QEI MODULE EXTERNAL CLOCK TIMING REQUIREMENTS

AC CHARACTERISTICS				Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended				
Param.	Symbol	Characteristic ⁽¹⁾		Min.	Typ.	Max.	Units	Conditions
TQ10	TtQH	TQCK High Time	Synchronous, with Prescaler	[Greater of (12.5 or 0.5 Tcy)/N] + 25	—	—	ns	Must also meet Parameter TQ15
TQ11	TtQL	TQCK Low Time	Synchronous, with Prescaler	[Greater of (12.5 or 0.5 Tcy)/N] + 25	—	—	ns	Must also meet Parameter TQ15
TQ15	TtQP	TQCP Input Period	Synchronous, with Prescaler	[Greater of (25 or Tcy)/N] + 50	—	—	ns	
TQ20	TCKEXTMRL	Delay from External TxCK Clock Edge to Timer Increment		—	1	Tcy	—	

Note 1: These parameters are characterized but not tested in manufacturing.

FIGURE 32-8: INPUT CAPTURE (IC_x) TIMING CHARACTERISTICS

TABLE 32-27: INPUT CAPTURE MODULE (IC_x) TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended			
Param.	Symbol	Characteristics ⁽¹⁾	Min.	Max.	Units	Conditions
IC10	TccL	IC _x Input Low Time	[Greater of (12.5 or 0.5 Tcy)/N] + 25	—	ns	Must also meet Parameter IC15
IC11	TccH	IC _x Input High Time	[Greater of (12.5 or 0.5 Tcy)/N] + 25	—	ns	Must also meet Parameter IC15
IC15	TccP	IC _x Input Period	[Greater of (25 or 1 Tcy)/N] + 50	—	ns	

Note 1: These parameters are characterized, but not tested in manufacturing.

FIGURE 32-9: OUTPUT COMPARE MODULE (OCx) TIMING CHARACTERISTICS

TABLE 32-28: OUTPUT COMPARE MODULE (OCx) TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended				
Param.	Symbol	Characteristic ⁽¹⁾	Min.	Typ.	Max.	Units	Conditions
OC10	TccF	OCx Output Fall Time	—	—	—	ns	See Parameter DO32
OC11	TccR	OCx Output Rise Time	—	—	—	ns	See Parameter DO31

Note 1: These parameters are characterized but not tested in manufacturing.

FIGURE 32-10: OCx/PWMx MODULE TIMING CHARACTERISTICS

TABLE 32-29: OCx/PWMx MODE TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended				
Param.	Symbol	Characteristic ⁽¹⁾	Min.	Typ.	Max.	Units	Conditions
OC15	TFD	Fault Input to PWM I/O Change	—	—	$T_{CY} + 20$	ns	
OC20	TFLT	Fault Input Pulse Width	$T_{CY} + 20$	—	—	ns	

Note 1: These parameters are characterized but not tested in manufacturing.

FIGURE 32-11: HIGH-SPEED PWMx MODULE FAULT TIMING CHARACTERISTICS (dsPIC33EPXXX(MC/MU)806/810/814 DEVICES ONLY)

FIGURE 32-12: HIGH-SPEED PWMx MODULE TIMING CHARACTERISTICS (dsPIC33EPXXX(MC/MU)806/810/814 DEVICES ONLY)

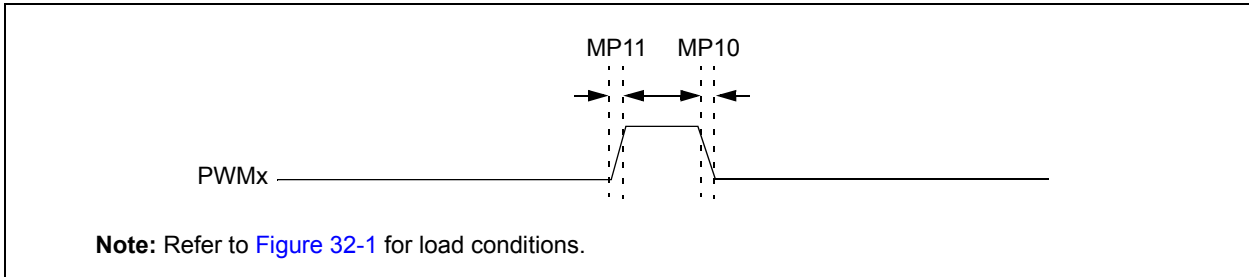

TABLE 32-30: HIGH-SPEED PWMx MODULE TIMING REQUIREMENTS (dsPIC33EPXXX(MC/MU)806/810/814 DEVICES ONLY)

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended				
Param.	Symbol	Characteristic ⁽¹⁾	Min.	Typ.	Max.	Units	Conditions
MP10	T _{FPWM}	PWM Output Fall Time	—	—	—	ns	See Parameter DO32
MP11	T _{RPWM}	PWM Output Rise Time	—	—	—	ns	See Parameter DO31
MP20	T _{FD}	Fault Input ↓ to PWM I/O Change	—	—	15	ns	
MP30	T _{FH}	Fault Input Pulse Width	15	—	—	ns	

Note 1: These parameters are characterized but not tested in manufacturing.

(dsPIC33EPXXX(MC/MU)806/810/814 DEVICES ONLY)

TABLE 32-31: QUADRATURE DECODER TIMING REQUIREMENTS
(dsPIC33EPXXX(MC/MU)806/810/814 DEVICES ONLY)

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended			
Param.	Symbol	Characteristic ⁽¹⁾	Typ. ⁽²⁾	Max.	Units	Conditions
TQ30	TQuL	Quadrature Input Low Time	6 TcY	—	ns	
TQ31	TQuH	Quadrature Input High Time	6 TcY	—	ns	
TQ35	TQuIN	Quadrature Input Period	12 TcY	—	ns	
TQ36	TQuP	Quadrature Phase Period	3 TcY	—	ns	
TQ40	TQuFL	Filter Time to Recognize Low with Digital Filter	$3 * N * TcY$	—	ns	N = 1, 2, 4, 16, 32, 64, 128 and 256 (Note 3)
TQ41	TQuFH	Filter Time to Recognize High with Digital Filter	$3 * N * TcY$	—	ns	N = 1, 2, 4, 16, 32, 64, 128 and 256 (Note 3)

- Note 1:** These parameters are characterized but not tested in manufacturing.
- Note 2:** Data in “Typ” column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.
- Note 3:** N = Index Channel Digital Filter Clock Divide Select bits. Refer to **Section 15. “Quadrature Encoder Interface (QEI)”** (DS70601) in the “dsPIC33E/PIC24E Family Reference Manual”. Please see the Microchip web site for the latest family reference manual sections.

FIGURE 32-14: QEI MODULE INDEX PULSE TIMING CHARACTERISTICS (dsPIC33EPXXX(MC/MU)806/810/814 DEVICES ONLY)

TABLE 32-32: QEI INDEX PULSE TIMING REQUIREMENTS (dsPIC33EPXXX(MC/MU)MU806/810/814 DEVICES ONLY)

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended			
Param.	Symbol	Characteristic ⁽¹⁾	Min.	Max.	Units	Conditions
TQ50	TqIL	Filter Time to Recognize Low with Digital Filter	$3 * N * T_{CY}$	—	ns	$N = 1, 2, 4, 16, 32, 64, 128$ and 256 (Note 2)
TQ51	TqiH	Filter Time to Recognize High with Digital Filter	$3 * N * T_{CY}$	—	ns	$N = 1, 2, 4, 16, 32, 64, 128$ and 256 (Note 2)
TQ55	Tqidxr	Index Pulse Recognized to Position Counter Reset (ungated index)	$3 T_{CY}$	—	ns	

Note 1: These parameters are characterized but not tested in manufacturing.

Note 2: Alignment of index pulses to QEA and QEB is shown for position counter Reset timing only. Shown for forward direction only (QEA leads QEB). Same timing applies for reverse direction (QEA lags QEB) but index pulse recognition occurs on the falling edge.

TABLE 32-33: SPI1, SPI3 AND SPI4 MAXIMUM DATA/CLOCK RATE SUMMARY

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended

2: The typical value for this parameter is 130 ns.

3: These parameters are characterized, but not tested in manufacturing.

**TABLE 32-53: USB OTG MODULE SPECIFICATIONS
(dsPIC33EPXXXMU8XX AND PIC24EPXXXGU8XX DEVICES ONLY)**

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param.	Symbol	Characteristics ⁽¹⁾	Min.	Typ.	Max.	Units	Conditions
USB313	VUSB3V3 ⁽²⁾	USB Voltage	3.0	—	3.6	V	Voltage on bus must be in this range for proper USB operation
USB315	VILUSB	Input Low Voltage for USB Buffer	—	—	0.8	V	
USB316	VIHUSB	Input High Voltage for USB Buffer	2.0	—	—	V	
USB318	VDIFS	Differential Input Sensitivity	—	—	0.2	V	
USB319	VCM	Differential Common-Mode Range	0.8	—	2.5	V	The difference between D+ and D- must be within this range while VCM is met
USB320	ZOUT	Driver Output Impedance	28.0	—	44.0	Ω	
USB321	VOL	Voltage Output Low	0.0	—	0.3	V	14.25 kΩ load connected to 3.6V
USB322	VOH	Voltage Output High	2.8	—	3.6	V	14.25 kΩ load connected to ground

Note 1: These parameters are characterized but not tested in manufacturing.

2: If the USB module is not being used, this pin must be connected to VDD.

TABLE 32-54: ADC MODULE SPECIFICATIONS

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (see Note 3) (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended				
Param.	Symbol	Characteristic	Min.	Typ.	Max.	Units	Conditions
Device Supply							
AD01	AVDD ⁽²⁾	Module VDD Supply	Greater of VDD – 0.3 or 3.0	—	Lesser of VDD + 0.3 or 3.6	V	
AD02	AVSS	Module VSS Supply	VSS – 0.3	—	VSS + 0.3	V	
Reference Inputs							
AD05	VREFH	Reference Voltage High	AVSS + 2.5	—	AVDD	V	See Note 1, VREFH = VREF+, VREFL = VREF-
AD05a			3.0	—	3.6	V	VREFH = AVDD, VREFL = AVSS = 0
AD06	VREFL	Reference Voltage Low	AVSS	—	AVDD – 2.5	V	See Note 1
AD06a			0	—	0	V	VREFH = AVDD, VREFL = AVSS = 0
AD07	VREF	Absolute Reference Voltage	2.5	—	3.6	V	VREF = VREFH – VREFL
AD08	IREF	Current Drain	—	—	10 600	μA μA	ADC off ADC on
AD09	IAD	Operating Current	—	9.0	—	mA	ADC operating in 10-bit mode, see Note 1
			—	3.2	—	mA	ADC operating in 12-bit mode, see Note 1
Analog Input							
AD12	VINH	Input Voltage Range, VINH	VINL	—	VREFH	V	This voltage reflects Sample & Hold Channels 0, 1, 2 and 3 (CH0-CH3), positive input
AD13	VINL	Input Voltage Range, VINL	VREFL	—	AVSS + 1V	V	This voltage reflects Sample & Hold Channels 0, 1, 2 and 3 (CH0-CH3), negative input
AD17	RIN	Recommended Impedance of Analog Voltage Source	—	—	200	Ω	

- Note 1:** These parameters are not characterized or tested in manufacturing.
- Note 2:** The voltage difference between AVDD and VDD cannot exceed 300 mV at any time during operation or start-up.
- Note 3:** Device is functional at $V_{BORMIN} < V_{DD} < V_{DDMIN}$. Analog modules: ADC, Comparator and DAC will have degraded performance. Device functionality is tested but not characterized. Refer to Parameter BO10 in Table 32-11 for the minimum and maximum BOR values.

TABLE 32-55: ADC MODULE SPECIFICATIONS (12-BIT MODE)

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (see Note 1) (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended				
Param.	Symbol	Characteristic	Min.	Typ.	Max.	Units	Conditions
ADC Accuracy (12-Bit Mode) – Measurements with External VREF+/VREF-							
AD20a	Nr	Resolution	12 Data Bits			bits	
AD21a	INL	Integral Nonlinearity	-2	—	+2	LSb	VINL = AVSS = VREFL = 0V, AVDD = VREFH = 3.6V
AD22a	DNL	Differential Nonlinearity	>-1	—	<1	LSb	VINL = AVSS = VREFL = 0V, AVDD = VREFH = 3.6V
AD23a	GERR	Gain Error	1.25	1.5	3	LSb	VINL = AVSS = VREFL = 0V, AVDD = VREFH = 3.6V
AD24a	E0FF	Offset Error	1.25	1.52	2	LSb	VINL = AVSS = VREFL = 0V, AVDD = VREFH = 3.6V
AD25a	—	Monotonicity	—	—	—	—	Guaranteed ⁽²⁾
ADC Accuracy (12-Bit Mode) – Measurements with Internal VREF+/VREF-							
AD20a	Nr	Resolution	12 data bits			bits	
AD21a	INL	Integral Nonlinearity	-2	—	+2	LSb	VINL = AVSS = 0V, AVDD = 3.6V
AD22a	DNL	Differential Nonlinearity	>-1	—	<1	LSb	VINL = AVSS = 0V, AVDD = 3.6V
AD23a	GERR	Gain Error	2	3	7	LSb	VINL = AVSS = 0V, AVDD = 3.6V
AD24a	E0FF	Offset Error	2	3	5	LSb	VINL = AVSS = 0V, AVDD = 3.6V
AD25a	—	Monotonicity	—	—	—	—	Guaranteed ⁽²⁾
Dynamic Performance (12-Bit Mode)							
AD30a	THD	Total Harmonic Distortion	—	—	-75	dB	
AD31a	SINAD	Signal to Noise and Distortion	68.5	69.5	—	dB	
AD32a	SFDR	Spurious Free Dynamic Range	80	—	—	dB	
AD33a	FNYQ	Input Signal Bandwidth	—	—	250	kHz	
AD34a	ENOB	Effective Number of Bits	11.09	11.3	—	bits	

Note 1: Device is functional at $V_{BORMIN} < V_{DD} < V_{DDMIN}$. Analog modules: ADC, Comparator and DAC will have degraded performance. Device functionality is tested but not characterized. Refer to Parameter [BO10](#) in [Table 32-11](#) for the minimum and maximum BOR values.

2: The Analog-to-Digital conversion result never decreases with an increase in input voltage and has no missing codes.

TABLE 32-56: ADC MODULE SPECIFICATIONS (10-BIT MODE)

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (see Note 1) (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param.	Symbol	Characteristic	Min.	Typ.	Max.	Units	Conditions
ADC Accuracy (10-Bit Mode) – Measurements with External VREF+/VREF-							
AD20b	Nr	Resolution	10 data bits			bits	
AD21b	INL	Integral Nonlinearity	-1	—	+1	LSb	VINL = AVSS = VREFL = 0V, AVDD = VREFH = 3.6V
AD22b	DNL	Differential Nonlinearity	>-1	—	<1	LSb	VINL = AVSS = VREFL = 0V, AVDD = VREFH = 3.6V
AD23b	GERR	Gain Error	1	3	6	LSb	VINL = AVSS = VREFL = 0V, AVDD = VREFH = 3.6V
AD24b	E _{OFF}	Offset Error	1	2	3	LSb	VINL = AVSS = VREFL = 0V, AVDD = VREFH = 3.6V
AD25b	—	Monotonicity	—	—	—	—	Guaranteed ⁽²⁾
ADC Accuracy (10-Bit Mode) – Measurements with Internal VREF+/VREF-							
AD20b	Nr	Resolution	10 data bits			bits	
AD21b	INL	Integral Nonlinearity	-1.5	—	+1.5	LSb	VINL = AVSS = 0V, AVDD = 3.6V
AD22b	DNL	Differential Nonlinearity	>-1	—	<1	LSb	VINL = AVSS = 0V, AVDD = 3.6V
AD23b	GERR	Gain Error	1	5	6	LSb	VINL = AVSS = 0V, AVDD = 3.6V
AD24b	E _{OFF}	Offset Error	1	2	5	LSb	VINL = AVSS = 0V, AVDD = 3.6V
AD25b	—	Monotonicity	—	—	—	—	Guaranteed ⁽²⁾
Dynamic Performance (10-Bit Mode)							
AD30b	THD	Total Harmonic Distortion	—	—	-64	dB	
AD31b	SINAD	Signal to Noise and Distortion	57	58.5	—	dB	
AD32b	SFDR	Spurious Free Dynamic Range	72	—	—	dB	
AD33b	F _{NYQ}	Input Signal Bandwidth	—	—	550	kHz	
AD34b	ENOB	Effective Number of Bits	9.16	9.4	—	bits	

Note 1: Device is functional at $V_{BORMIN} < V_{DD} < V_{DDMIN}$. Analog modules: ADC, Comparator and DAC will have degraded performance. Device functionality is tested but not characterized. Refer to Parameter **BO10** in [Table 32-11](#) for the minimum and maximum BOR values.

2: The Analog-to-Digital conversion result never decreases with an increase in input voltage and has no missing codes.

FIGURE 32-37: ADC CONVERSION (12-BIT MODE) TIMING CHARACTERISTICS
(ASAM = 0, SSRC<2:0> = 000, SSRCG = 0)

TABLE 32-57: ADC CONVERSION (12-BIT MODE) TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (see Note 4) (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended				
Param.	Symbol	Characteristic	Min.	Typ. ⁽²⁾	Max.	Units	Conditions
Clock Parameters							
AD50	TAD	ADC Clock Period	117.6	—	—	ns	
AD51	tRC	ADC Internal RC Oscillator Period	—	250	—	ns	
Conversion Rate							
AD55	tCONV	Conversion Time	—	14 TAD	—	ns	
AD56	FCNV	Throughput Rate	—	—	500	Ksps	
AD57	TSAMP	Sample Time	3 TAD	—	—	—	
Timing Parameters							
AD60	tPCS	Conversion Start from Sample Trigger ⁽¹⁾	2 TAD	—	3 TAD	—	Auto-Convert Trigger not selected
AD61	tPSS	Sample Start from Setting Sample (SAMP) bit ⁽¹⁾	2 TAD	—	3 TAD	—	
AD62	tCSS	Conversion Completion to Sample Start (ASAM = 1) ⁽¹⁾	—	0.5 TAD	—	—	
AD63	tDPU	Time to Stabilize Analog Stage from ADC Off to ADC On ⁽¹⁾	—	—	20	μs	See Note 3

- Note 1:** Because the sample caps will eventually lose charge, clock rates below 10 kHz may affect linearity performance, especially at elevated temperatures.
- 2:** These parameters are characterized but not tested in manufacturing.
- 3:** The tDPU parameter is the time required for the ADC module to stabilize at the appropriate level when the module is turned on (ADON (ADxCON1<15>) = 1). During this time, the ADC result is indeterminate.
- 4:** Device is functional at $V_{BORMIN} < V_{DD} < V_{DDMIN}$. Analog modules: ADC, Comparator and DAC will have degraded performance. Device functionality is tested but not characterized. Refer to Parameter [BO10](#) in [Table 32-11](#) for the minimum and maximum BOR values.

TABLE 32-58: ADC CONVERSION (10-BIT MODE) TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (see Note 4) (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended				
Param.	Symbol	Characteristic	Min.	Typ. ⁽¹⁾	Max.	Units	Conditions
Clock Parameters							
AD50	TAD	ADC Clock Period	76	—	—	ns	
AD51	tRC	ADC Internal RC Oscillator Period	—	250	—	ns	
Conversion Rate							
AD55	tCONV	Conversion Time	—	12 TAD	—	—	
AD56	FCNV	Throughput Rate	—	—	1.1	Msp/s	Using sequential sampling
AD57	TSAMP	Sample Time	2 TAD	—	—	—	
Timing Parameters							
AD60	tPCS	Conversion Start from Sample Trigger ⁽²⁾	2 TAD	—	3 TAD	—	Auto-Convert Trigger not selected
AD61	tPSS	Sample Start from Setting Sample (SAMP) bit ⁽²⁾	2 TAD	—	3 TAD	—	
AD62	tCSS	Conversion Completion to Sample Start (ASAM = 1) ⁽²⁾	—	0.5 TAD	—	—	
AD63	tDPU	Time to Stabilize Analog Stage from ADC Off to ADC On ⁽²⁾	—	—	20	μs	See Note 3

- Note 1:** These parameters are characterized but not tested in manufacturing.
- 2:** Because the sample caps will eventually lose charge, clock rates below 10 kHz may affect linearity performance, especially at elevated temperatures.
- 3:** The tDPU parameter is the time required for the ADC module to stabilize at the appropriate level when the module is turned on (ADON (ADxCON1<15>) = 1). During this time, the ADC result is indeterminate.
- 4:** Device is functional at $V_{BORMIN} < V_{DD} < V_{DDMIN}$. Analog modules: ADC, Comparator and DAC will have degraded performance. Device functionality is tested but not characterized. Refer to Parameter [BO10](#) in [Table 32-11](#) for the minimum and maximum BOR values.

FIGURE 32-40: DCI MODULE (MULTI-CHANNEL, I²S MODES) TIMING CHARACTERISTICS

TABLE 32-59: DCI MODULE (MULTI-CHANNEL, I²S MODES) TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param.	Symbol	Characteristic ⁽¹⁾	Min.	Typ. ⁽²⁾	Max.	Units	Conditions
CS10	TcSCKL	CSCK Input Low Time (CSCK pin is an input)	Tcy/2 + 20	—	—	ns	
		CSCK Output Low Time ⁽³⁾ (CSCK pin is an output)	30	—	—	ns	
CS11	TcSCKH	CSCK Input High Time (CSCK pin is an input)	Tcy/2 + 20	—	—	ns	
		CSCK Output High Time ⁽³⁾ (CSCK pin is an output)	30	—	—	ns	
CS20	TcSCKF	CSCK Output Fall Time (CSCK pin is an output)	—	—	—	ns	See Parameter DO32
CS21	TcSCKR	CSCK Output Rise Time (CSCK pin is an output)	—	—	—	ns	See Parameter DO31
CS30	TcSDOF	CSDO Data Output Fall Time	—	—	—	ns	See Parameter DO32
CS31	TcSDOR	CSDO Data Output Rise Time	—	—	—	ns	See Parameter DO31
CS35	TdV	Clock Edge to CSDO Data Valid	—	—	10	ns	
CS36	TdIV	Clock Edge to CSDO Tri-Stated	10	—	20	ns	
CS40	TcSDI	Setup Time of CSDI Data Input to CSCK Edge (CSCK pin is input or output)	20	—	—	ns	
CS41	THCSDI	Hold Time of CSDI Data Input to CSCK Edge (CSCK pin is input or output)	20	—	—	ns	
CS50	TcOFSF	COFS Fall Time (COFS pin is output)	—	—	—	ns	See Parameter DO32
CS51	TcOFSR	COFS Rise Time (COFS pin is output)	—	—	—	ns	See Parameter DO31
CS55	TsCOFS	Setup Time of COFS Data Input to CSCK Edge (COFS pin is input)	20	—	—	ns	
CS56	THCOFS	Hold Time of COFS Data Input to CSCK Edge (COFS pin is input)	20	—	—	ns	

Note 1: These parameters are characterized but not tested in manufacturing.

Note 2: Data in “Typ” column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

Note 3: The minimum clock period for CSCK is 100 ns. Therefore, the clock generated in Master mode must not violate this specification.

FIGURE 32-41: DCI MODULE (AC-LINK MODE) TIMING CHARACTERISTICS

TABLE 32-60: DCI MODULE (AC-LINK MODE) TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended				
Param.	Symbol	Characteristic ^(1,2)	Min.	Typ. ⁽³⁾	Max.	Units	Conditions
CS60	TBCLKL	BIT_CLK Low Time	36	40.7	45	ns	
CS61	TBCLKH	BIT_CLK High Time	36	40.7	45	ns	
CS62	TBCLK	BIT_CLK Period	—	81.4	—	ns	Bit clock is input
CS65	TSACL	Input Setup Time to Falling Edge of BIT_CLK	—	—	10	ns	
CS66	THACL	Input Hold Time from Falling Edge of BIT_CLK	—	—	10	ns	
CS70	TSYNCL	Sync Data Output Low Time	—	19.5	—	μs	
CS71	TSYNCH	Sync Data Output High Time	—	1.3	—	μs	
CS72	TSYNC	Sync Data Output Period	—	20.8	—	μs	
CS77	TRACL	Rise Time, Sync, SDATA_OUT	—	—	—	ns	See Parameter DO32
CS78	TFACL	Fall Time, Sync, SDATA_OUT	—	—	—	ns	See Parameter DO31
CS80	TOVDACL	Output Valid Delay from Rising Edge of BIT_CLK	—	—	15	ns	

- Note 1:** These parameters are characterized but not tested in manufacturing.
Note 2: These values assume the BIT_CLK frequency is 12.288 MHz.
Note 3: Data in “Typ” column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

TABLE 32-61: COMPARATOR TIMING SPECIFICATIONS

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (see Note 3) (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param.	Symbol	Characteristic ⁽¹⁾	Min.	Typ.	Max.	Units	Conditions
300	TRESP	Response Time ⁽²⁾	—	150	400	ns	
301	TMC2OV	Comparator Mode Change to Output Valid	—	—	10	μs	

- Note 1:** Parameters are characterized but not tested.
- 2:** Response time is measured with one comparator input at (VDD – 1.5)/2, while the other input transitions from VSS to VDD.
- 3:** Device is functional at VBORMIN < VDD < VDDMIN. Analog modules: ADC, Comparator and DAC will have degraded performance. Device functionality is tested but not characterized. Refer to Parameter [BO10](#) in [Table 32-11](#) for the minimum and maximum BOR values.

TABLE 32-62: COMPARATOR MODULE SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (see Note 2) (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param.	Symbol	Characteristic ⁽¹⁾	Min.	Typ.	Max.	Units	Conditions
D300	VIOFF	Input Offset Voltage	—	±10	—	mV	
D301	VICM	Input Common-Mode Voltage	AVSS	—	AVDD	V	
D302	CMRR	Common-Mode Rejection Ratio	-54	—	—	dB	
D305	IVREF	Internal Voltage Reference	0.19	0.20	0.21	V	BGSEL<1:0> = 10
			0.57	0.60	0.63	V	BGSEL<1:0> = 01
			1.14	1.20	1.26	V	BGSEL<1:0> = 00

- Note 1:** Parameters are characterized but not tested.
- 2:** Device is functional at VBORMIN < VDD < VDDMIN. Analog modules: ADC, Comparator and DAC will have degraded performance. Device functionality is tested but not characterized. Refer to Parameter [BO10](#) in [Table 32-11](#) for the minimum and maximum BOR values.

TABLE 32-63: COMPARATOR REFERENCE VOLTAGE SETTling TIME SPECIFICATIONS

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (see Note 3) (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param.	Symbol	Characteristic ⁽²⁾	Min.	Typ.	Max.	Units	Conditions
VR310	TSET	Settling Time ⁽¹⁾	—	—	10	μs	

- Note 1:** Settling time measured while CVRR = 1 and CVR<3:0> bits transition from '0000' to '1111'.
- Note 2:** These parameters are characterized, but not tested in manufacturing.
- Note 3:** Device is functional at VBORMIN < VDD < VDDMIN. Analog modules: ADC, Comparator and DAC will have degraded performance. Device functionality is tested but not characterized. Refer to Parameter [BO10](#) in [Table 32-11](#) for the minimum and maximum BOR values.

TABLE 32-64: COMPARATOR REFERENCE VOLTAGE SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (see Note 2) (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param.	Symbol	Characteristic ⁽¹⁾	Min.	Typ.	Max.	Units	Conditions
VRD310	CVRES	Resolution	CVRSRC/24	—	CVRSRC/32	LSb	
VRD311	CVRAA	Absolute Accuracy	—	—	0.5	LSb	
VRD312	CVRL	Maximum Load on CVREF Output Pin	—	—	0.75	μA	AVDD = 3.6V, CVRSS = 0, CVRR = 0, CVR<3:0> = 1111

- Note 1:** These parameters are characterized, but not tested in manufacturing.
- Note 2:** Device is functional at VBORMIN < VDD < VDDMIN. Analog modules: ADC, Comparator and DAC will have degraded performance. Device functionality is tested but not characterized. Refer to Parameter [BO10](#) in [Table 32-11](#) for the minimum and maximum BOR values.

FIGURE 32-42: PARALLEL SLAVE PORT TIMING

Example

64-Lead TQFP (10x10x1 mm)

Example

100-Lead TQFP (12x12x1 mm)

Example

100-Lead TQFP (14x14x1 mm)

Example

Legend: XX...X Customer-specific information
 Y Year code (last digit of calendar year)
 YY Year code (last 2 digits of calendar year)
 WW Week code (week of January 1 is week '01')
 NNN Alphanumeric traceability code
 (e3) Pb-free JEDEC designator for Matte Tin (Sn)
 * This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

34.1 Package Marking Information (Continued)

121-Lead TFBGA (10x10x1.2 mm)

Example

144-Lead LQFP (20x20x1.4 mm)

Example

144-Lead TQFP (16x16x1 mm)

Example

34.2 Package Details

64-Lead Plastic Quad Flat, No Lead Package (MR) – 9x9x0.9 mm Body [QFN]
With 7.15 x 7.15 Exposed Pad [QFN]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

Microchip Technology Drawing C04-149C Sheet 1 of 2

**64-Lead Plastic Quad Flat, No Lead Package (MR) – 9x9x0.9 mm Body [QFN]
With 7.15 x 7.15 Exposed Pad [QFN]**

Note: For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

		Units	MILLIMETERS		
Dimension Limits			MIN	NOM	MAX
Number of Pins	N		64

APPENDIX A: REVISION HISTORY

Revision A (December 2009)

This is the initial released version of this document.

Revision B (July 2010)

This revision includes minor typographical and formatting changes throughout the data sheet text.

The major changes are referenced by their respective section in Table A-1.

TABLE A-1: MAJOR SECTION UPDATES

Section Name	Update Description
“High-Performance, 16-bit Digital Signal Controllers and Microcontrollers”	<p>Removed reference to dual triggers for Motor Control Peripherals.</p> <p>Relocated the VBUSST pin in all pin diagrams (see “Pin Diagrams”, Table 2 and Table 3).</p> <p>Added SCK2, SDI2, SDO2 pins in pin location 4,5 and 6 respectively in 64-pin QFN.</p> <p>Added SCK2, SDI2, SDO2 pins in pin location 4,5 and 6 respectively in 64-pin TQFP.</p> <p>Added SCK2, SDI2, SDO2 pins in pin location 10,11 and 12 respectively in 100-pin TQFP.</p> <p>Added SCK2, SDI2, SDO2 pins in Table 2 and Table 3.</p> <p>Moved the RP30 pin to pin location 95, and the RP31 pin to pin location 96 in the 144-pin TQFP and 144-pin LQFP pin diagrams.</p>
Section 1.0 “Device Overview”	Removed the SCL1 and SDA1 pins from the Pinout I/O Descriptions (see Table 1-1).
Section 2.0 “Guidelines for Getting Started with 16-bit Digital Signal Controllers and Microcontrollers”	Removed Section 2.8 “Configuration of Analog and Digital Pins During ICSP Operations”
Section 3.0 “CPU”	<p>Added Note 4 to the CPU Status Register (SR) in Register 3-1.</p> <p>Added the VAR bit (CORCON<15>) to Register 3-2.</p>

TABLE A-1: MAJOR SECTION UPDATES (CONTINUED)

Section Name	Update Description
<p>Section 4.0 “Memory Organization”</p>	<p>Added the Write Latch and Auxiliary Interrupt Vector to the Program Memory Map (see Figure 4-1).</p> <p>Updated the All Resets value for the DSRPAG and DSWPAG registers in the CPU Core Register Maps (see Table 4-1 and Table 4-2).</p> <p>Updated the All Resets value for the INTCON2 register in the Interrupt Controller Register Maps (see Table 4-3 through Table 4-6).</p> <p>Updated the All Resets values for all registers in the Output Compare 1 - Output Compare 16 Register Map, with the exception of the OCxTMR and OCxCON1 registers (see Table 4-9).</p> <p>Removed the DTM bit (TRGCON1<7> from all PWM Generator # Register Maps (see Table 4-11 through Table 4-17).</p> <p>Updated the All Resets value for the QEI1IOC register in the QEI1 Register Map (see Table 4-18).</p> <p>Updated the All Resets value for the QEI2IOC register in the QEI1 Register Map (see Table 4-19).</p> <p>Added Note 4 to the USB OTG Register Map (see Table 4-25)</p> <p>Updated all addresses in the Real-Time Clock and Calendar Register Map (see Table 4-34).</p> <p>Removed RPINR22 from Table 4-37 through Table 4-40.</p> <p>Updated the All Resets values for all registers in the Peripheral Pin Select Input Register Maps and modified the RPIN37-RPINR43 registers (see Table 4-37 through Table 4-40).</p> <p>Added the VREGSF bit (RCON<11>) to the System Control Register Map (see Table 4-43).</p> <p>Added the REFOMD bit (PMD4<3>) to the PMD Register Maps (see Table 4-44 through Table 4-47).</p> <p>Changed the bit range for CNT from <15:0> to <13:0> for all DMAxCNT registers in the DMAC Register Map (see Table 4-49).</p> <p>Updated the All Resets value and removed the ANSC15 and ANSC12 bits in the ANSLEC registers in the PORTC Register Maps (see Table 4-52 and Table 4-53).</p> <p>Updated DSxPAG and Page Description of O, Read and U, Read in Table 4-66.</p> <p>Added Note to the Table 4-67.</p> <p>Updated Arbiter Architecture in Figure 4-8.</p> <p>Updated the Unimplemented value and removed the LATG3 and LATG2 bits in the LATG registers and the CNPUG3 and CNPUG2 bits from the CNPUG registers in the PORTG Register Maps (see Table 4-60 and Table 4-61)</p> <p>Updated the All Resets value and removed the TRISG3 and TRISG2 bits in the TRISG registers and the ODCG3 and ODCG2 bits from the ODCG registers in the PORTG Register Maps (see Table 4-60 and Table 4-61).</p>
<p>Section 5.0 “Flash Program Memory”</p>	<p>Updated the NVMOP<3:0> = 1110 definition to Reserved and added Note 6 to the Nonvolatile Memory (NVM) Control Register (see Register 5-1).</p>
<p>Section 6.0 “Resets”</p>	<p>Added the VREGSF bit (RCON<11>) to the Reset Control Register (see Register 6-1).</p>

TABLE A-1: MAJOR SECTION UPDATES (CONTINUED)

Section Name	Update Description
Section 7.0 “Interrupt Controller”	<p>Added the VAR bit (CORCON<15>) to the Core Control Register (see Register 7-2)</p> <p>Changed the default POR value for the GIE bit (INTCON2<15>) to R/W-1 (see Register 7-4).</p> <p>Changed the VECNUM<7:0> = 11111111 pending interrupt vector number to 263 in the Interrupt Control and Status Register (see Register 7-7).</p>
Section 8.0 “Direct Memory Access (DMA)”	<p>Updated Section 8.1 “DMAC Registers”.</p> <p>Updated DMA Controller in Figure 8-1.</p> <p>Added Note 1 to the DMA Channel x Peripheral Address Register (see Register 8-7).</p> <p>Added Note 1 and Note 2 to the DMA Channel x Transfer Count Register (see Register 8-8).</p> <p>Updated all RQCOLx bit definitions, changing Peripheral Write to Transfer Request in the DMA Request Collision Status Register (see Register 8-12).</p>
Section 9.0 “Oscillator Configuration”	<p>Added the Reference Oscillator Control Register (see Register 9-7).</p> <p>Added Note 3 and 4 to the CLKDIV Register (see Register 9-2)</p>
Section 10.0 “Power-Saving Features”	<p>Added the DCIMD and C2MD bits to the Peripheral Module Disable Control Register 1 (see Register 10-1)</p> <p>Added the IC6MD, IC5MD, IC4MD, IC3MD, OC8MD, OC7MD, OC6MD, and OC5MD bits to the Peripheral Module Disable Control Register 2 (see Register 10-2)</p> <p>Added the T9MD, T8MD, T7MD, and T6MD bits and removed the DSC1MD bit in the Peripheral Module Disable Control Register 3 (see Register 10-3).</p> <p>Added the REFOMD bit (PMD4<3>) to the Peripheral Module Disable Control Register 4 (see Register 10-4).</p>
Section 11.0 “I/O Ports”	<p>Updated the first paragraph of Section 11.2 “Configuring Analog and Digital Port Pins”.</p> <p>Updated the PWM Fault, Dead-Time Compensation, and Synch Input register numbers of the Selectable Input Sources (see Table 11-2).</p> <p>Removed RPINR22 register.</p> <p>Bit names and definitions were modified in the following registers:</p> <ul style="list-style-type: none"> • Peripheral Pin Select Input Register 37 (see Register 11-37) • Peripheral Pin Select Input Register 38 (see Register 11-38) • Peripheral Pin Select Input Register 39 (see Register 11-39) • Peripheral Pin Select Input Register 40 (see Register 11-40) • Peripheral Pin Select Input Register 41 (see Register 11-41) • Peripheral Pin Select Input Register 42 (see Register 11-42) • Peripheral Pin Select Input Register 43 (see Register 11-43)
Section 12.0 “Timer1”	<p>Added Note in Register 12-1.</p>
Section 14.0 “Input Capture”	<p>Added Note 1 to the Input Capture Block Diagram (see Figure 14-1).</p>
Section 15.0 “Output Compare”	<p>Added Note 1 to the Output Compare Module Block Diagram (see Figure 15-1).</p> <p>Added Note 2 to the Output Compare x Control Register 2 (see Register 15-2).</p>
Section 16.0 “High-Speed PWM Module (dsPIC33EPXXXMU806/810/814 Devices Only)”	<p>Added Comparator bit values for the CLSRC<4:0> and FLTSRC<4:0> bits in the PWM Fault Current-Limit Control Register (see Register 16-21).</p>

TABLE A-1: MAJOR SECTION UPDATES (CONTINUED)

Section Name	Update Description
Section 17.0 “Quadrature Encoder Interface (QEI) Module (dsPIC33EPXXXMU806/810/814 Devices Only)”	Reordered the bit values for the OUTFNC<1:0> bits and updated the default POR bit value to ‘x’ for the HOME, INDEX, QEB, and QEA bits in the QEI I/O Control Register (see Register 17-2).
Section 23.0 “10-bit/12-bit Analog-to-Digital Converter (ADC)”	Updated VREFL in the ADC1 and ADC2 Module Block Diagram (see Figure 23-1).
Section 25.0 “Comparator Module”	Added Note 1 to the Comparator I/O Operating Modes (see Figure 25-1). Removed the CLPWR bit (CMxCON<12>) (see Register 25-2).
Section 29.0 “Special Features”	Added a new first paragraph to Section 29.1 “Configuration Bits”
Section 30.0 “Instruction Set Summary”	The following instructions have been updated (see Table 30-2): <ul style="list-style-type: none"> • BRA • CALL • CPBEQ • CPBGT • CPBLT • CPBNE • GOTO • MOVPAQ • MUL • RCALL • RETFIE • RETLW • RETURN • TBLRDH • TBLRDL
Section 32.0 “Electrical Characteristics”	Updated the Typical and Maximum values for DC Characteristics: Operating Current (IDD) (see Table 32-5). Updated the Typical and Maximum values for DC Characteristics: Idle Current (IDLE) (see Table 32-6). Updated the Maximum values for DC Characteristics: Power-down Current (IPD) (see Table 32-7). Updated the Maximum values for DC Characteristics: Doze Current (IDOZE) (see Table 32-8). Updated the parameter numbers for Internal FRC Accuracy (see Table 32-19). Updated the parameter numbers and the Typical value for parameter F21b for Internal RC Accuracy (see Table 32-20). Updated the Minimum value for PM6 and the Typical and Maximum values for PM7 in Parallel Master Port Read Requirements (see Table 32-52). Added DMA Module Timing Requirements (see Table 32-54).

Revision C (May 2011)

This revision includes minor typographical and formatting changes throughout the data sheet text.

These global changes were implemented:

- All instances of VDDCORE have been removed.
- References to remappable pins have been updated to clarify output-only pins (RPn) versus input/output pins (RPIIn).
- The minimum VDD value was changed from 2.7V to 3.0V to adhere to the current BOR specification.

The major changes are referenced by their respective section in Table A-2.

TABLE A-2: MAJOR SECTION UPDATES

Section Name	Update Description
High-Performance, 16-bit Digital Signal Controllers and Microcontrollers	Removed the shading for D+/RG2 and D-/RG3 pin designations in all pin diagrams, as these pins are not 5V tolerant. References to remappable pins have been updated to clarify input/output pins (RPn) and input-only pins (RPIIn).
Section 2.0 “Guidelines for Getting Started with 16-bit Digital Signal Controllers and Microcontrollers”	Add information on the VUSB pin in Section 2.1 “Basic Connection Requirements” . Updated the title of Section 2.3 to Section 2.3 “CPU Logic Filter Capacitor Connection (VCAP)” and modified the first paragraph.
Section 3.0 “CPU”	Added Note 2 to the Programmer’s Model Register Descriptions (see Table 3-1).
Section 4.0 “Memory Organization”	Added the CANCKS bit (CxCTRL1<11>) to the ECAN1 and ECAN 2 Register Maps (see Table 4-26 and Table 4-29). Added the SBOREN bit (RCON<13>) to the System Control Register Map (see Table 4-43). Added Note 1 to the PORTG Register maps (see Table 4-60 and Table 4-61). Updated the Page Description for DSRPAG = 0x1FF and DSRPAG = 0x200 in Table 4-66. Updated the second paragraph of Section 4.2.9 “EDS Arbitration and Bus Master Priority” . Updated the last note box in Section 4.2.10 “Software Stack” .
Section 5.0 “Flash Program Memory”	Updated the equation formatting in Section 5.3 “Programming Operations” . Added the Non-Volatile Memory Upper Address (NVMADRU) and Non-Volatile Memory Address (NVMADR) registers (see Register 5-2 and Register 5-3).
Section 6.0 “Resets”	Added Security Reset to the Reset System Block Diagram (see Figure 6-1). Added the SBOREN bit (RCON<13>) and Notes 3 and 4 to the Reset Control register (see Register 6-1).
Section 11.0 “I/O Ports”	References to remappable pins have been updated to clarify input/output pins (RPn) and input-only pins (RPIIn). Added the new column, Input/Output, to Input Pin Selection for Selectable Input Sources (see Table 11-2).
Section 17.0 “Quadrature Encoder Interface (QEI) Module (dsPIC33EPXXXMU806/810/814 Devices Only)”	Updated the definition for the INTHLD<31:0> bits (see Register 17-19 and Register 17-20).

TABLE A-2: MAJOR SECTION UPDATES (CONTINUED)

Section Name	Update Description
Section 21.0 “Enhanced CAN (ECAN™) Module”	Added the CANCKS bit to the ECAN Control Register 1 (CiCTRL1) (see Register 21-1).
Section 22.0 “USB On-The-Go (OTG) Module”	Removed the USB 3.3V Regulator logic from the USB Interface Diagram (see Figure 22-1).
Section 23.0 “10-bit/12-bit Analog-to-Digital Converter (ADC)”	Updated the ADC Conversion Clock Period Block Diagram (see Figure 23-2).
Section 29.0 “Special Features”	<p>Updated the last paragraph of Section 29.1 “Configuration Bits”</p> <p>Added a note box after the last paragraph of Section 29.3 “BOR: Brown-out Reset (BOR)”.</p> <p>Added the RTSP Effect column to the Configuration Bits Description (see Table 29-2).</p>
Section 30.0 “Instruction Set Summary”	Updated all Status Flags Affected to None for the MOV instruction and added Note 2 (see Table 30-2).
Section 32.0 “Electrical Characteristics”	<p>Updated the Absolute Maximum Ratings (see page 457).</p> <p>Added Note 1 to the Operating MIPS vs. Voltage (see Table 32-1).</p> <p>Added parameter DI31 (ICNPD) to the I/O Pin Input Specifications (see Table 32-9).</p> <p>Updated the Minimum value for parameter DO26 in the I/O Pin Output Specifications (see Table 32-10).</p> <p>Updated the Minimum value for parameter D132b and the Minimum and Maximum values for parameters D136a, D136b, D137a, D137b, D138a, and D138b in the Program Memory specification (see Table 32-12).</p> <p>Updated the Minimum, Typical, and Maximum values for parameter OS10 (Oscillator Crystal Frequency: SOSC) in the External Clock Timing Requirements (see Table 32-16).</p> <p>Added Note 2 to the PLL Clock Timing Specifications (see Table 32-17).</p> <p>Updated all Timer1 External Clock Timing Requirements (see Table 32-23).</p> <p>Replaced Table 32-34 with Timer2, Timer4, Timer6, Timer8 External Clock Timing Requirements and Timer3, Timer5, Timer7, Timer9 External Clock Timing Requirements (see Table 32-24 and Table 32-25, respectively).</p> <p>Updated the Maximum value for parameter OC15 and the Minimum value for parameter OC20 in the OC/PWM Mode Timing Requirements (see Table 32-29).</p> <p>Updated the Operating Temperature in the ECAN Module I/O Timing Requirements and USB OTG Timing Requirements (see Table 32-51 and Table 32-53, respectively).</p> <p>Updated all SPI specifications (see Figure 32-15 through Figure 32-30 and Table 32-33 through Table 32-48).</p> <p>Removed Note 4 from the DCI Module Timing Requirements (see Table 32-59).</p> <p>Updated the Standard Operating Conditions voltage for the Comparator Specifications (see Table 32-61 through Table 32-64).</p>

Revision D (August 2011)

This revision includes minor typographical and formatting changes throughout the data sheet text.

The Data Converter Interface (DCI) module is available on all dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 devices. References throughout the document have been updated accordingly.

The following pin name changes were implemented throughout the document:

- C1INA renamed to C1IN1+
- C1INB renamed to C1IN2-
- C1INC renamed to C1IN1-
- C1IND renamed to C1IN3-
- C2INA renamed to C2IN1+
- C2INB renamed to C2IN2-
- C2INC renamed to C2IN1-
- C2IND renamed to C2IN3-
- C3INA renamed to C3IN1+
- C3INB renamed to C3IN2-
- C3INC renamed to C3IN1-
- C3IND renamed to C3IN3-

The other major changes are referenced by their respective section in Table A-3.

TABLE A-3: MAJOR SECTION UPDATES

Section Name	Update Description
Section 1.0 “Device Overview”	Added Section 1.1 “Referenced Sources” .
Section 2.0 “Guidelines for Getting Started with 16-bit Digital Signal Controllers and Microcontrollers”	Updated the Note in Section 2.1 “Basic Connection Requirements” .
Section 3.0 “CPU”	Updated Section 3.1 “Registers” .
Section 4.0 “Memory Organization”	Updated FIGURE 4-3: “Data Memory Map for dsPIC33EP512MU810/814 Devices with 52 KB RAM” and FIGURE 4-5: “Data Memory Map for dsPIC33EP256MU806/810/814 Devices with 28 KB RAM” . Updated the IFS3, IEC3, IPC14, and IPC15 SFRs in the Interrupt Controller Register Map (see Table 4-6). Updated the SMPI bits for the AD1CON2 and AD2CON2 SFRs in the ADC1 and ADC2 Register Map (see Table 4-23). Updated the All Resets values for the CLKDIV and PLLFBD SFRs and removed the SBOREN bit in the System Control Register Map (see Table 4-43).
Section 6.0 “Resets”	Removed the SBOREN bit and Notes 3 and 4 from the Reset Control Register (see Register 6-1).
Section 8.0 “Direct Memory Access (DMA)”	Removed Note 2 from the DMA Channel x IRQ Select Register (see Register 8-2).
Section 9.0 “Oscillator Configuration”	Updated the PLL Block Diagram (see Figure 9-2). Updated the value at PORT and the default designations for the DOZE<2:0>, FRCDIV<2:0>, and PLLPOST<1:0> bits in the Clock Divisor Register and the PLLDIV<8:0> bits in the PLLFBD register (see Register 9-2 and Register 9-3).
Section 23.0 “10-bit/12-bit Analog-to-Digital Converter (ADC)”	Added Note 4 and updated the ADC Buffer names in the ADCx Module Block Diagram (see Figure 23-1). Added Note 3 to the ADCx Control Register 1 (see Register 23-1). Added the new ADC2 Control Register 2 (see Register 23-3). Updated the SMPI<4:0> bit value definitions in the ADC1 Control Register 2 (see Register 23-2).

TABLE A-3: MAJOR SECTION UPDATES (CONTINUED)

Section Name	Update Description
Section 25.0 “Comparator Module”	Updated the Comparator I/O Operating Modes diagram (see Figure 25-1). Added Note 2 to the Comparator Voltage Reference Control Register (see Register 25-6).
Section 29.0 “Special Features”	Added Note 3 to the Connections for the On-chip Voltage Regulator (see Figure 29-1).
Section 32.0 “Electrical Characteristics”	<p>Removed the Voltage on VCAP with respect to VSS from the Absolute Maximum Ratings⁽¹⁾.</p> <p>Removed Note 3 and parameter DC18 from the DC Temperature and Voltage Specifications (see Table 32-4).</p> <p>Updated the notes in the DC Characteristics: Operating Current (IDD) (see Table 32-5).</p> <p>Updated the notes in the DC Characteristics: Idle Current (IDLE) (see Table 32-6).</p> <p>Updated the Typical and Maximum values for parameter DC60c and the notes in the DC Characteristics: Power-down Current (IPD) (see Table 32-7).</p> <p>Updated the notes in the DC Characteristics: Doze Current (IDOZE) (see Table 32-8).</p> <p>Updated the conditions for parameters DI60a and DI60b (see Table 32-9).</p> <p>Updated the conditions for parameter BO10 in the BOR Electrical Characteristics (see Table 32-10).</p> <p>Added Note 1 to the Internal Voltage Regulator Specifications (see Table 32-13).</p> <p>Updated the Minimum and Maximum values for parameter OS53 in the PLL Clock Timing Specifications (see Table 32-17).</p> <p>Updated the Minimum and Maximum values for parameter F21b in the Internal LPRC Accuracy specifications (see Table 32-20).</p> <p>Added Note 2 to the ADC Module Specifications (see Table 32-54).</p>

Revision E (August 2011)

This revision includes the following updates to **Section 32.0 “Electrical Characteristics”**:

- The maximum HS value for parameter OS10 was updated (see Table 32-16)
- The OC/PWM Module Timing Characteristics for OCx were updated (see Figure 32-10)
- The Maximum Data Rate values were updated for the SPI1, SPI3, and SPI4 Maximum Data/Clock Rate Summary (see Table 32-33)
- These SPI1, SPI3, and SPI4 Timing Requirements were updated:
 - Maximum value for parameter SP10 and the minimum clock period value for SCKx in Note 3 (see Table 32-34, Table 32-35, and Table 32-36)
 - Maximum value for parameter SP70 and the minimum clock period value for SCKx in Note 3 (see Table 32-38 and Table 32-40)
- The Maximum Data Rate values were updated for the SPI2 Maximum Data/Clock Rate Summary (see Table 32-41)
- These SPI2 Timing Requirements were updated:
 - Maximum value for parameter SP10 and the minimum clock period value for SCKx in Note 3 (see Table 32-42, Table 32-43, and Table 32-44)
 - Maximum value for parameter SP70 and the minimum clock period value for SCKx in Note 3 (see Table 32-45 through Table 32-48)
 - Minimum value for parameters SP40 and SP41 see Table 32-43 through Table 32-48)
- These ADC Module Specifications were updated (see Table 32-54):
 - Minimum value for parameter AD05
 - Maximum value for parameter AD06
 - Minimum value for parameter AD07

Revision F (February 2012)

This revision includes typographical and formatting changes throughout the data sheet text.

Throughout the document, references to the package formerly known as XBGA where changed to TFBGA.

In addition, where applicable, new sections were added to each peripheral chapter that provide information and links to related resources, as well as helpful tips. For examples, see [Section 18.1 “SPI Helpful Tips”](#) and [Section 18.2 “SPI Resources”](#). The major changes are referenced by their respective section in [Table A-4](#).

TABLE A-4: MAJOR SECTION UPDATES

Section Name	Update Description
“16-Bit Microcontrollers and Digital Signal Controllers with High-Speed PWM, USB and Advanced Analog”	<p>The content on the first page of this section was extensively reworked to provide the reader with the key features and functionality of this device family in an “at-a-glance” format.</p> <p>The following devices were added to the Controller Families table (see Table 1 and the “Pin Diagrams” section):</p> <ul style="list-style-type: none"> • dsPIC33EP512MC806 • dsPIC33EP512GP806 • PIC24EP512GP806
Section 2.0 “Guidelines for Getting Started with 16-Bit Digital Signal Controllers and Microcontrollers”	Added Section 2.9 “Application Examples”
Section 3.0 “CPU”	Updated the Status Register information in the Programmer’s Model (see Figure 3-2).
Section 4.0 “Memory Organization”	<p>Added Interrupt Controller Register Maps (see Table 4-6 and Table 4-7).</p> <p>Added Peripheral Pin Select Output Register Map (see Table 4-39).</p> <p>Added PMD Register Maps (see Table 4-50 and Table 4-51).</p> <p>Added PORTF Register Map (see Table 4-64).</p> <p>Added PORTG Register Map (see Table 4-67).</p> <p>Updated the second note in Section 4.7 “Bit-Reversed Addressing (dsPIC33EPXXXMU806/810/814 Devices Only)”.</p>
Section 11.0 “I/O Ports”	Added RPOR10: Peripheral Pin Select Output Register 10 (see Register 11-54).
Section 14.0 “Input Capture”	Updated the Input Capture Module Block Diagram (see Figure 14-1).
Section 15.0 “Output Compare”	Updated the Output Compare Module Block Diagram (see Figure 15-1).
Section 25.0 “Comparator Module”	<p>Updated the User-programmable Blanking Function Block Diagram (see Figure 25-3).</p> <p>Updated the bit definitions in the Comparator Mask Gating Control Register (see Register 25-4).</p>
Section 29.0 “Special Features”	Added Note 3 to the Configuration Bits Description (see Table 29-2).
Section 32.0 “Electrical Characteristics”	<p>Updated the I/O pin Absolute Maximum Ratings.</p> <p>Updated Note 1 in the DC Characteristics: Operating Current (see Table 32-5).</p> <p>Updated Note 1 in the DC Characteristics: Idle Current (see Table 32-6).</p> <p>Updated Note 1 in the DC Characteristics: Power-down Current (see Table 32-7).</p> <p>Updated Note 1 in the DC Characteristics: Doze Current (see Table 32-8).</p> <p>Removed parameters DO16 and DO26, added parameter DO26a, updated parameters DO10 and DO20, and added Note 1 in the DC Characteristics: I/O Pin Output Specifications (see Table 32-10).</p>

Revision G (October 2012)

This revision includes updates to the packaging diagrams in [Section 34.0 “Packaging Information”](#). Preliminary has been removed and there are minor text edits throughout the document.

THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQs), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support
- Development Systems Information Line

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: <http://microchip.com/support>

READER RESPONSE

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this document.

RE: Reader Response

From: Name _____

Company _____

Address _____

City / State / ZIP / Country _____

Telephone: (_____) _____ - _____ FAX: (_____) _____ - _____

Application (optional):

Would you like a reply? Y N

Device: dsPIC33EPXXX(GP/MC/MU)806/810/814 and
PIC24EPXXX(GP/GU)810/814

Literature Number: DS70616G

Questions:

1. What are the best features of this document?

2. How does this document meet your hardware and software development needs?

3. Do you find the organization of this document easy to follow? If not, why?

4. What additions to the document do you think would enhance the structure and subject?

5. What deletions from the document could be made without affecting the overall usefulness?

6. Is there any incorrect or misleading information (what and where)?

7. How would you improve this document?

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks

The Microchip name and logo, the Microchip logo, dsPIC, FlashFlex, KEELOQ, KEELOQ logo, MPLAB, PIC, PICmicro, PICSTART, PIC³² logo, rPIC, SST, SST Logo, SuperFlash and UNI/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

FilterLab, Hampshire, HI-TECH C, Linear Active Thermistor, MTP, SEEVAL and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Silicon Storage Technology is a registered trademark of Microchip Technology Inc. in other countries.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
== ISO/TS 16949 ==

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC[®] MCUs and dsPIC[®] DSCs, KEELOQ[®] code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
