EVB-LAN9354 Evaluation Board User's Guide

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

DOCUMENT REVISION HISTORY

Revision A (July 2015)

- Initial Release of this Document.

Chapter 1. Overview

1.1 INTRODUCTION

The LAN9354 is a fully featured, three-port 10/100 managed Ethernet switch designed for industrial and embedded applications where performance, flexibility, ease of integration and system cost control are required.

The LAN9354 combines all the functions of a 10/100 switch system, including the switch fabric, packet buffers, buffer manager, media access controllers (MACs), PHY transceivers, and serial management. IEEE 1588v2 is supported via the integrated IEEE 1588v2 hard-ware time stamp unit, which supports end-to-end and peer-to-peer transparent clocks.

The LAN9354 complies with the IEEE 802.3 (full/half-duplex 10BASE-T and 100BASE-TX) Ethernet protocol, IEEE 802.3az Energy Efficient Ethernet (EEE) (100Mbps only), and 802.1D/802.1Q management protocol specifications, enabling compatibility with industry standard Ethernet and Fast Ethernet applications.

100BASE-FX is supported via an external fiber transceiver and cable diagnostics (short, open and length) is included on the internal twisted pair copper interface.

The EVB-LAN9354 is an Evaluation Board (EVB) that utilizes the LAN9354 to provide a fully-functional three-port Ethernet switch with Single RMII. The EVB-LAN9354 provides two fully integrated MAC/PHY internet ports (Ports 1 & 2) via on-board RJ45 connectors. Port 0 provides two MII port connectors which support the following:

- An external RMII-Capable MAC (with LAN9354 in PHY mode), via the on-board 40-pin male MII connector
- An external RMII-Capable PHY (with LAN9354 in MAC mode), via the on-board 40-pin female MII connector

Power is supplied to the board via a +5V external wall mount power supply.

The EVB-LAN9354 includes a 64K x 8 I2C EEPROM that may be used to automatically load configuration settings from the EEPROM into the device at reset. An I2C host adapter interface header (10-pin, 2x5) is provided to simplify I2C based configuration. A simplified block diagram of the EVB-LAN9354 can be seen in Figure 1-1.

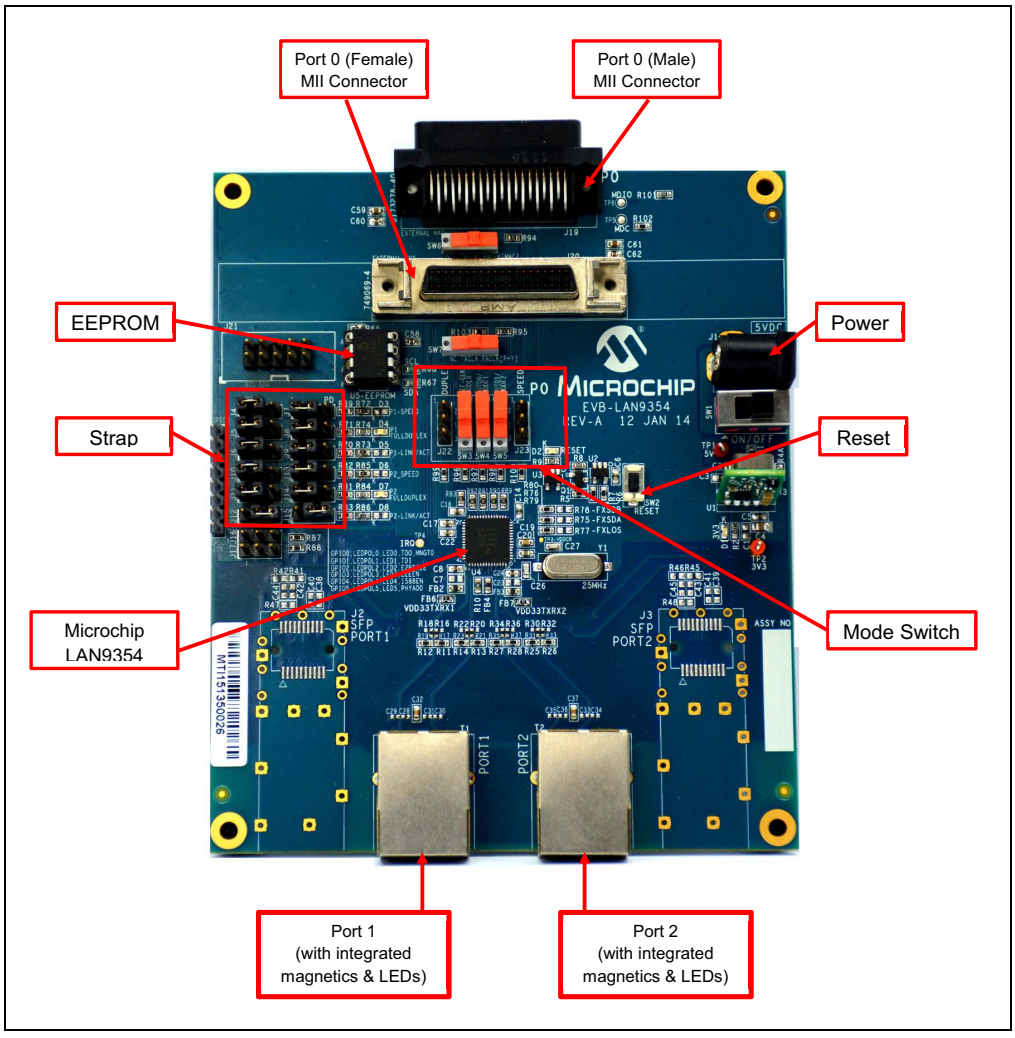
Chapter 2. Board Details

2.1 BOARD DETAILS

The following sections describe the various board features, including jumpers, LEDs, test points, system connections, and switches. A top view of the EVB-LAN9354 is shown in Figure 2-1.

FIGURE 2-1: LAN9354 BOARD REV-A



2.1.1 Power

DC 5V is applied through (J1) DC Socket, powered by a +5V external wall adapter switch (SW1) need to be ON position for the 5V to reach the 3.3V regulator. Glowing of Green LED (D1) indicates successful generation of 3.3V o/p. This Power is supplied to the LAN9354 and it has internal 1.2 V regulator which supplies power to the internal core logic.

2.1.2 Power-on Reset

A power-on reset occurs whenever power is initially applied to the LAN9354 or if the power is removed and reapplied to the LAN9354. This event resets all circuitry within the LAN9354. After initial power-on, the LAN9354 can be reset by pressing the reset switch (SW2). The reset LED D2 will assert (red) when the LAN9354 is in reset condition.

For stability, a delay of approximately 180ms is added from the +3.3V o/p to reset release.

2.1.3 Clock

The LAN9354 requires a fixed-frequency 25 MHz clock (±50 ppm) source for use by the internal clock oscillator and PLL. This is typically provided by attaching a 25 MHz crystal to the OSCI and OSCO pins. Optionally, this clock can be provided by driving the OSCI input pin with a single-ended 25 MHz clock source.

Chapter 3. Board Configuration

3.1 STRAP OPTIONS

The following tables describe the default settings and jumper descriptions for the EVB-LAN9354. These defaults are the recommended configurations for evaluation of the LAN9354. These settings may be changed as needed, however, any deviation from the defaults settings should be approached with care and knowledge of the schematics and datasheet. An incorrect jumper setting may disable the board.

3.1.1 Jumpers J4:J15

Jumpers J4 through J15 set various functions of the LAN9354. They can also be used as GPIOs, LED drivers. When used as LED drivers, as they are on the EVB-LAN9354, they are connected a specific way to set the strap value to a "1", and another way to set the strap value to a "0". Figure 3-1 illustrates the schematics connections with the D3 circuit as a pull-up, and the D4 circuit as a pull-down. To illuminate D3, the LAN9354 will drive the cathode of the D3 low. To illuminate D4, the LAN9354 will drive the cathode of the D4 high.

The J4 - J15 jumpers must be configured in pairs to identical settings in order to realize the D3 circuit or the D4 circuit. The pairings are as follows:

- J4 & J7
- J6 & J9
- J5 & J8
- J11 & J14
- J10 & J13
- J12 & J15

The following subsections detail the jumper pair settings, their associated strap settings, and the functional effects of setting the straps. All strap values are read during power-up and on the rising edge of nRST signal. Once the strap value is set, the LAN9354 will drive the LED's high or low for illumination according the strap value. For other designs which may use these pins as GPIOs refer to LAN9354 datasheet for additional information. In those cases, internal default straps must be changed by an I2C or SMI master or through EEPROM fields.

3.1.8 Copper and Fiber Mode Selections

The LAN9354 supports 100BASE-TX (Copper) and 100BASE-FX (Fiber) modes. In 100BASE-FX operation, the presence of the receive signal is indicated by the external transceiver as either an open-drain, CMOS level, Loss of Signal (SFP) or a LVPECL Signal Detect (SFF).

This EVB supports 100BASE-TX (Copper) and 100BASE-FX (Fiber) in SFP mode. By default Copper Mode is active. Fiber Mode is supported as an assembly option. To select the Copper or Fiber Mode, the respective strap and signal routing resister assembly options must to be configured.

Note: Vendor part number for SFP Transceiver: Finisar/FTLF1217P2.

3.1.8.1 COPPER MODE

The EVB-LAN9354 is set to Copper Mode by default. Table 3-14 details the required strap resistors settings for Copper Mode operation.
