## Hi-Speed USB 2.0 to 10/100/1000 Ethernet Controller

---

---

### Highlights

- Single Chip Hi-Speed USB 2.0 to 10/100/1000 Ethernet Controller
- 10/100/1000 Ethernet MAC with Full-Duplex Support
- 10/100/1000 Ethernet PHY with HP Auto-MDIX
- Integrated USB 2.0 Hi-Speed Device Controller
- Integrated USB 2.0 Hi-Speed PHY
- Implements Reduced Power Operating Modes
- Supports EEPROM-less Operation for Reduced BOM
- NetDetach provides automatic USB attach/detach when Ethernet cable is connected/removed

### Target Applications

- Embedded Systems/CE Devices
- Set-Top Boxes/PVRs
- Networked Printers
- USB Port Replicators
- Standalone USB to Ethernet Dongles
- Test Instrumentation/Industrial

### Key Benefits

- USB Device Controller
  - Fully compliant with USB Specification Revision 2.0
  - Supports HS (480 Mbps) and FS (12 Mbps) modes
  - Four endpoints supported
  - Supports vendor specific commands
  - Integrated USB 2.0 PHY
  - Remote wakeup supported
  - High-Performance 10/100/1000 Ethernet Controller
  - Fully compliant with IEEE802.3/802.3u/802.3ab
  - Integrated Ethernet MAC and PHY
  - 10BASE-T, 100BASE-TX, and 1000BASE-T support
  - Full- and half-duplex capability (only full-duplex operation at 1000Mbps)
  - Full-duplex flow control
  - Preamble generation and removal
  - Automatic 32-bit CRC generation and checking
  - 9 KB jumbo frame support
  - Automatic payload padding and pad removal
  - Loop-back modes

- Supports checksum offloads (IPv4, IPv6, TCP, UDP)
- Supports Microsoft NDIS 6.2 large send offload
- Supports IEEE 802.1q VLAN tagging
  - Ability to add and strip IEEE 802.1q VLAN tags
  - VLAN tag based packet filtering (all 4096 VIDs)
- Flexible address filtering modes
  - 33 exact matches (unicast or multicast)
  - 512-bit hash filter for multicast frames
  - Pass all multicast
  - Promiscuous unicast/multicast modes
  - Inverse filtering
  - Pass all incoming with status report
- Wakeup packet support
  - Perfect DA frame, wakeup frame, magic packet, broadcast frame, IPv6 & IPv4 TCP SYN
  - 8 programmable 128-bit wakeup frame filters
- ARP and NS offload
- PME pin support
- Integrated Ethernet PHY
  - Auto-negotiation
  - Automatic polarity detection and correction
  - HP Auto-MDIX support
  - Link status change wake-up detection
- Support for 5 status LEDs
- Supports various statistical counters
- Power and I/Os
  - Various low power modes
  - 12 GPIOs
  - Supports bus-powered and self-powered operation
  - Variable voltage I/O supply (2.5V/3.3V)
- Miscellaneous Features
  - EEPROM Controller
  - IEEE 1149.1 (JTAG) Boundary Scan
  - Requires single 25 MHz crystal
- Software
  - Windows XP/ Vista / Windows 7 Driver
  - Linux Driver
  - Win CE Driver
  - MAC OS Driver
  - EEPROM/Manufacturing Utility for Windows/DOS
  - PXE Support
  - DOS ODI Driver
- Packaging
  - 56-pin QFN (8x8 mm), RoHS compliant
- Environmental
  - Commercial Temperature Range (0°C to +70°C)
  - Industrial Temperature Range (-40°C to +85°C)

## TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at [docerrors@microchip.com](mailto:docerrors@microchip.com). We welcome your feedback.

### Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

<http://www.microchip.com>

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

### Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; <http://www.microchip.com>
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include -literature number) you are using.

### Customer Notification System

Register on our web site at [www.microchip.com](http://www.microchip.com) to receive the most current information on all of our products.

## 1.0 INTRODUCTION

### 1.1 Block Diagram

FIGURE 1-1: LAN7500/LAN7500I SYSTEM DIAGRAM

#### 1.1.1 OVERVIEW

The LAN7500/LAN7500i is a high performance Hi-Speed USB 2.0 to 10/100/1000 Ethernet controller. With applications ranging from embedded systems, set-top boxes, and PVRs, to USB port replicators, USB to Ethernet dongles, and test instrumentation, the device is a high performance and cost competitive USB to Ethernet connectivity solution.

The LAN7500/LAN7500i contains an integrated 10/100/1000 Ethernet MAC and PHY, Filtering Engine, USB PHY, Hi-Speed USB 2.0 device controller, TAP controller, EEPROM controller, and a FIFO controller with a total of 32 KB of internal packet buffering.

The internal USB 2.0 device controller and USB PHY are compliant with the USB 2.0 Hi-Speed standard. The device implements Control, Interrupt, Bulk-in, and Bulk-out USB Endpoints.

The Ethernet controller supports auto-negotiation, auto-polarity correction, HP Auto-MDIX, and is compliant with the IEEE 802.3, IEEE 802.3u, IEEE 802.3ab standards. ARP and NS offload is also supported.

Multiple power management features are provided, including various low power modes and “Magic Packet”, “Wake On LAN”, and “Link Status Change” wake events. These wake events can be programmed to initiate a USB remote wakeup.

An internal EEPROM controller exists to load various USB configuration information and the device MAC address. The integrated IEEE 1149.1 compliant TAP controller provides boundary scan via JTAG.

#### 1.1.2 USB

The USB portion of the LAN7500/LAN7500i integrates a Hi-Speed USB 2.0 device controller and USB PHY.

The USB device controller contains a USB low-level protocol interpreter which implements the USB bus protocol, packet generation/extraction, PID/Device ID parsing, and CRC coding/decoding, with autonomous error handling. The USB device controller is capable of operating in USB 2.0 Hi-Speed and Full-Speed compliant modes and contains autonomous protocol handling functions such as handling of suspend/resume/reset conditions, remote wakeup, and stall condition clearing on Setup packets. The USB device controller also autonomously handles error conditions such as retry for CRC and data toggle errors, and generates NYET, STALL, ACK and NACK handshake responses, depending on the endpoint buffer status.

The LAN7500/LAN7500i implements four USB endpoints: Control, Interrupt, Bulk-in, and Bulk-out. The Bulk-in and Bulk-out Endpoints allow for Ethernet reception and transmission respectively. Implementation of vendor-specific commands allows for efficient statistics gathering and access to the device’s system control and status registers.

## 1.1.3 FIFO CONTROLLER

The FIFO controller uses two internal SRAMs to buffer RX and TX traffic. Bulk-Out packets from the USB controller are directly stored into the TX buffer. The FIFO Controller is responsible for extracting Ethernet frames from the USB packet data and passing the frames to the MAC. Received Ethernet Frames are filtered by the Receive Filtering Engine and frames meeting the filtering constraints are stored into the RX buffer and become the basis for bulk-in packets.

## 1.1.4 ETHERNET

The LAN7500/LAN7500i integrates an IEEE 802.3/802.3u/802.3ab compliant PHY for twisted pair Ethernet applications and a 10/100/1000 Ethernet Media Access Controller (MAC).

The PHY can be configured for 1000 Mbps (1000BASE-T), 100 Mbps (100BASE-TX) or 10 Mbps (10BASE-T) operation in Full-Duplex mode. It can be configured for 100 Mbps or 10 Mbps operation in Half Duplex mode. The PHY block includes auto-negotiation, auto-polarity correction, and Auto-MDIX. Minimal external components are required for the utilization of the Integrated PHY.

The Ethernet MAC/PHY supports numerous power management wakeup features, including “Magic Packet”, “Wake on LAN”, and “Link Status Change”. Microsoft NDIS 6.2 and Windows 7 compliant ARP and NS offload support is also provided. The device will respond to an NS or ARP request by generating and transmitting a response. When received in a SUSPEND state, an NS or ARP request will not result in the generation of a wake event. Additionally, five status LEDs are supported.

## 1.1.5 FRAME FILTERING

The LAN7500/LAN7500i Receive Filtering Engine performs frame filtering. It supports 33 perfect address filters. These can be used to filter either the Ethernet source address or destination address. Additional address filtering is available via a 512-bit hash filter. The hash filter can perform unicast or multicast filtering.

VLAN tagged frames can be filtered via the VLAN ID. A 4096-bit table exists to support all possible VLAN IDs. The VLAN type can be programmed. Double tagging is supported.

## 1.1.6 HOST OFFLOADING

The LAN7500/LAN7500i supports a variety of TCP/UDP/IP checksum offloads to reduce the burden on the host processor. For Ethernet receive frames, the device can be configured to validate the IP checksum and UDP/TCP checksum. Both IPv4 and IPv6 packets are supported. A raw checksum across the layer 3 packet can also be provided.

For Ethernet transmitted frames, the device can be configured to calculate the IP checksum and UDP/TCP checksum. Additionally, Large Send Offload (LSO) is supported to further reduce host CPU loading.

## 1.1.7 POWER MANAGEMENT

The LAN7500/LAN7500i features four variations of USB suspend: SUSPEND0, SUSPEND1, SUSPEND2, and SUSPEND3. These modes allow the application to select the ideal balance of remote wakeup functionality and power consumption.

- **SUSPEND0:** Supports GPIO, “Wake On LAN”, “Magic Packet”, and “PHY Link Up” remote wakeup events. It, however, consumes the most power.
- **SUSPEND1:** Supports GPIO and “Link Status Change” for remote wakeup events. This suspend state consumes less power than SUSPEND0.
- **SUSPEND2:** Supports only GPIO assertion for a remote wakeup event. This is the default suspend mode for the device.
- **SUSPEND3:** Supports GPIO, “Good Packet”, and “PHY Link Up” remote wakeup events. A “Good Packet” is a received frame that is free of errors and passes certain filtering constraints independent of those imposed on “Wake On LAN” and “Magic Packet” frames. This suspend state consumes power at a level similar to the NORMAL state, however, it allows for power savings in the Host CPU, which greatly exceeds that of the LAN7500/LAN7500i. The driver may place the device in this state after prolonged periods of not receiving any Ethernet traffic.

## 1.1.8 EEPROM CONTROLLER

The LAN7500/LAN7500i contains an EEPROM controller for connection to an external EEPROM. This allows for the automatic loading of static configuration data upon pin reset, or software reset. The EEPROM can be configured to load USB descriptors, USB device configuration, and MAC address.

Custom operation without EEPROM is also provided.

# LAN7500/LAN7500I

---

## 1.1.9 GENERAL PURPOSE I/O

Twelve GPIOs are supported. All GPIOs can serve as remote wakeup events when the LAN7500/LAN7500i is in a suspended state.

## 1.1.10 TAP CONTROLLER

IEEE 1149.1 compliant TAP Controller supports boundary scan and various test modes.

The device includes an integrated JTAG boundary-scan test port for board-level testing. The interface consists of four pins (TDO, TDI, TCK and TMS) and includes a state machine, data register array, and an instruction register. The JTAG pins are described in [Table 2-3, "JTAG Pins," on page 10](#). The JTAG interface conforms to the IEEE Standard 1149.1 - 1990 *Standard Test Access Port (TAP) and Boundary-Scan Architecture*.

All input and output data is synchronous to the TCK test clock input. TAP input signals TMS and TDI are clocked into the test logic on the rising edge of TCK, while the output signal TDO is clocked on the falling edge.

The JTAG logic is reset when the TMS and TDI pins are high for five TCK periods.

The implemented IEEE 1149.1 instructions and their op codes are shown in [Table 1-1](#).

**TABLE 1-1: IEEE 1149.1 OP CODES**

| Instruction    | Op Code | Comment               |
|----------------|---------|-----------------------|
| Bypass         | 111     | Mandatory Instruction |
| Sample/Preload | 010     | Mandatory Instruction |
| EXTEST         | 000     | Mandatory Instruction |
| Clamp          | 011     | Optional Instruction  |
| HIGHZ          | 100     | Optional Instruction  |
| IDCODE         | 001     | Optional Instruction  |

**Note:** All digital I/O pins support IEEE 1149.1 operation. Analog pins and the XO pin do not support IEEE 1149.1 operation.

## 1.1.11 TEST FEATURES

Read/Write access to internal SRAMs is provided via the devices registers. JTAG based USB BIST is available.

## 1.1.12 SYSTEM SOFTWARE

LAN7500/LAN7500i software drivers are available for the following operating systems:

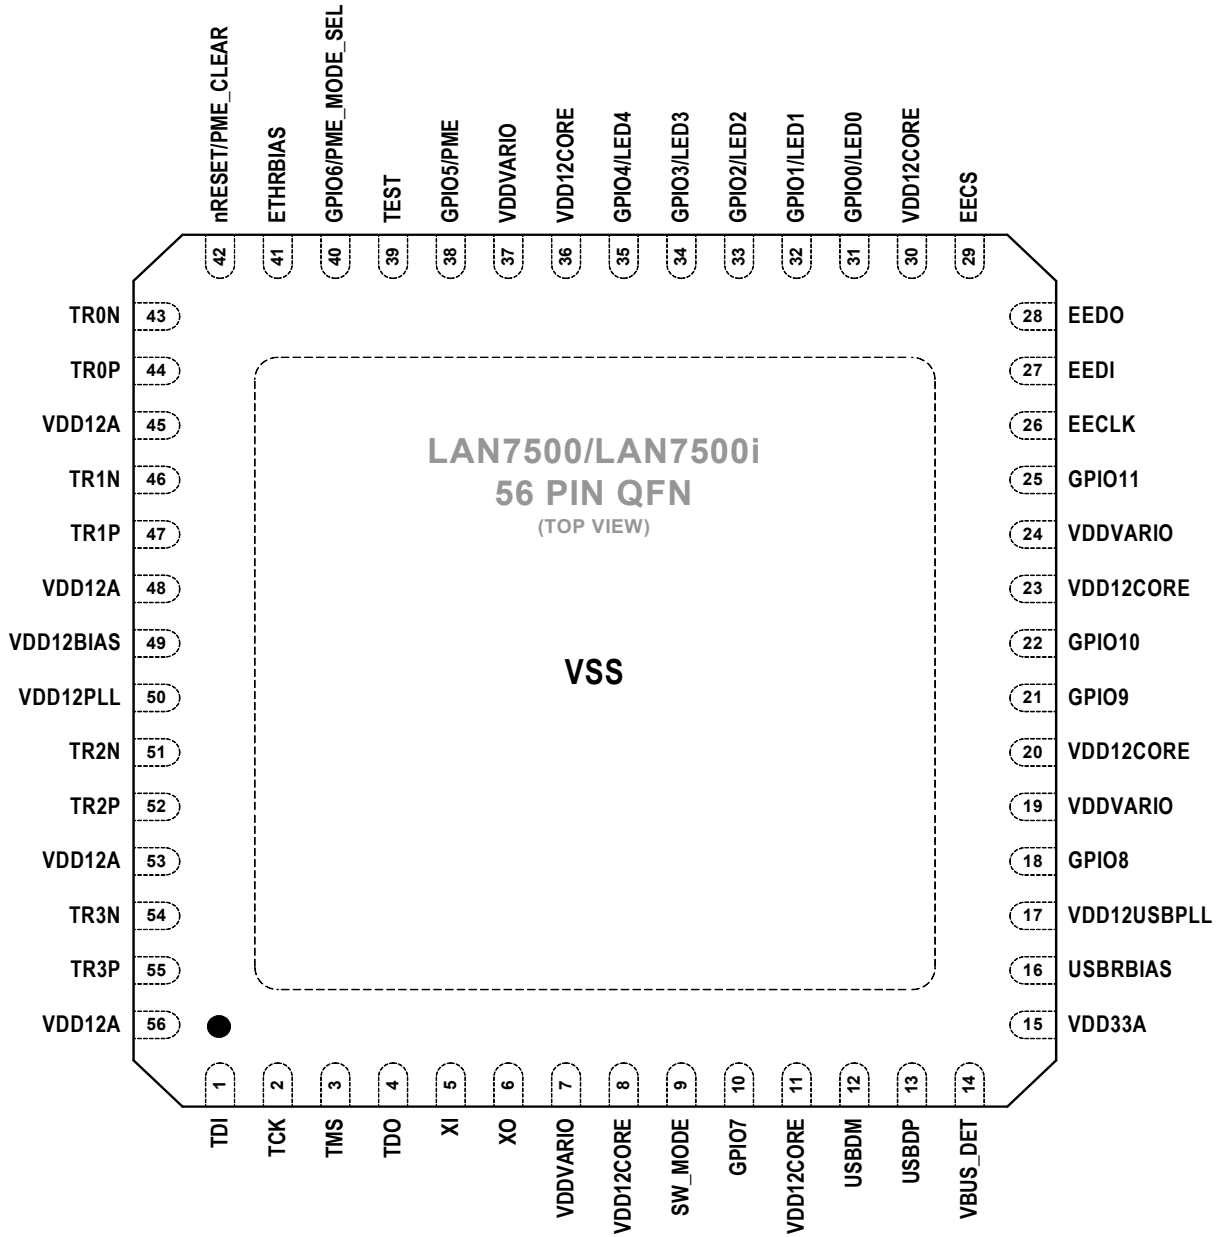

- Windows XP/ Vista/ Windows 7
- Win CE
- Linux
- MAC OS
- DOS ODI

In addition, an EEPROM programming utility is available for configuring the external EEPROM. PXE Support is also available.

# LAN7500/LAN7500I

## 2.0 PIN DESCRIPTION AND CONFIGURATION

FIGURE 2-1: LAN7500/LAN7500I 56-QFN PIN ASSIGNMENTS (TOP VIEW)

NOTE: Exposed pad (VSS) on bottom of package must be connected to ground

TABLE 2-1: GPIO PINS

| Num PINs | Name                  | Symbol | Buffer Type           | Description   |
|----------|-----------------------|--------|-----------------------|---|
| 1        | Indicator LED0        | LED0   | VOD8                  | Used in conjunction with <a href="#">LED1</a> . May be programmed to indicate Link and Speed or Link and Speed and Activity.  |
|          | General Purpose I/O 0 | GPIO0  | VIS/VO8/<br>VOD8 (PU) | This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output, or a Schmitt-triggered input.<br><br><b>Note:</b> This pin is configured as a GPIO by default. |
| 1        | Indicator LED1        | LED1   | VOD8                  | Used in conjunction with <a href="#">LED0</a> . May be programmed to indicate Ethernet Link and Speed or Link and Speed and Activity.   |
|          | General Purpose I/O 1 | GPIO1  | VIS/VO8/<br>VOD8 (PU) | This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output, or a Schmitt-triggered input.<br><br><b>Note:</b> This pin is configured as a GPIO by default. |
| 1        | Indicator LED2        | LED2   | VOD8                  | May be programmed to indicate Ethernet Link and Activity or just Activity.  |
|          | General Purpose I/O 2 | GPIO2  | VIS/VO8/<br>VOD8 (PU) | This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output, or a Schmitt-triggered input.<br><br><b>Note:</b> This pin is configured as a GPIO by default. |
| 1        | Indicator LED3        | LED3   | VOD8                  | May be programmed for use as an Ethernet Link indicator.  |
|          | General Purpose I/O 3 | GPIO3  | VIS/VO8/<br>VOD8 (PU) | This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output, or a Schmitt-triggered input.<br><br><b>Note:</b> This pin is configured as a GPIO by default. |
| 1        | Indicator LED4        | LED4   | VOD8                  | May be programmed to indicate Ethernet Full Duplex operation.   |
|          | General Purpose I/O 4 | GPIO4  | VIS/VO8/<br>VOD8 (PU) | This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output, or a Schmitt-triggered input.  |
| 1        | PME                   | PME    | VO8/<br>VOD8          | This pin may be used to signal PME when PME mode of operation is in effect. Refer to <a href="#">Section 4.0, "PME Operation,"</a> on page 27 for additional information.                             |
|          | General Purpose I/O 5 | GPIO5  | VIS/VO8/<br>VOD8 (PU) | This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output, or a Schmitt-triggered input.  |

**TABLE 2-1: GPIO PINS (CONTINUED)**

| Num PINs | Name                   | Symbol       | Buffer Type       | Description   |
|----------|------------------------|--------------|-------------------|---|
| 1        | PME Mode Select        | PME_MODE_SEL | VIS (PU)          | This pin may serve as the PME_MODE_SEL input when PME mode of operation is in effect. Refer to <a href="#">Section 4.0, "PME Operation," on page 27</a> for additional information. |
|          | General Purpose I/O 6  | GPIO6        | VIS/VO8/VOD8 (PU) | This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output, or a Schmitt-triggered input.  |
| 1        | General Purpose I/O 7  | GPIO7        | VIS/VO8/VOD8 (PU) | This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output, or a Schmitt-triggered input.  |
| 1        | General Purpose I/O 8  | GPIO8        | VIS/VO6/VOD6 (PU) | This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output, or a Schmitt-triggered input.  |
| 1        | General Purpose I/O 9  | GPIO9        | VIS/VO8/VOD8 (PU) | This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output, or a Schmitt-triggered input.  |
| 1        | General Purpose I/O 10 | GPIO10       | VIS/VO8/VOD8 (PU) | This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output, or a Schmitt-triggered input.  |
| 1        | General Purpose I/O 11 | GPIO11       | VIS/VO8/VOD8 (PU) | This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output, or a Schmitt-triggered input.  |

**TABLE 2-2: EEPROM PINS**

| Num PINs | Name               | Symbol | Buffer Type | Description  |
|----------|--------------------|--------|-------------|--|
| 1        | EEPROM Data In     | EEDI   | VIS (PD)    | This pin is driven by the EEDO output of the external EEPROM.  |
| 1        | EEPROM Data Out    | EEDO   | VO8         | This pin drives the EEDI input of the external EEPROM.   |
| 1        | EEPROM Chip Select | EECS   | VO8         | This pin drives the chip select output of the external EEPROM.<br><br><b>Note:</b> The EECS output may tri-state briefly during power-up. Some EEPROM devices may be prone to false selection during this time. When an EEPROM is used, an external pull-down resistor is recommended on this signal to prevent false selection. Refer to your EEPROM manufacturer's datasheet for additional information. |
| 1        | EEPROM Clock       | EECLK  | VO8         | This pin drives the EEPROM clock of the external EEPROM.   |

## 2.2 Buffer Types

TABLE 2-9: BUFFER TYPES

| Buffer Type | Description   |
|-------------|---|
| VIS         | Variable voltage Schmitt-triggered Input  |
| IS_5V       | 5V Tolerant Schmitt-triggered Input   |
| VO6         | Variable voltage output with 6mA sink and 6mA source  |
| VOD6        | Variable voltage open-drain output with 6mA sink  |
| VO8         | Variable voltage output with 8mA sink and 8mA source  |
| VOD8        | Variable voltage open-drain output with 8mA sink  |
| PU          | 50uA (typical) internal pull-up. Unless otherwise noted in the pin description, internal pull-ups are always enabled.<br><b>Note:</b> Internal pull-up resistors prevent unconnected inputs from floating. Do not rely on internal resistors to drive signals external to LAN7500/LAN7500i. When connected to a load that must be pulled high, an external resistor must be added.      |
| PD          | 50uA (typical) internal pull-down. Unless otherwise noted in the pin description, internal pull-downs are always enabled.<br><b>Note:</b> Internal pull-down resistors prevent unconnected inputs from floating. Do not rely on internal resistors to drive signals external to LAN7500/LAN7500i. When connected to a load that must be pulled low, an external resistor must be added. |
| AI          | Analog input  |
| AIO         | Analog bi-directional   |
| ICLK        | Crystal oscillator input pin  |
| OCLK        | Crystal oscillator output pin   |
| P           | Power pin   |

## 3.0 EEPROM CONTROLLER (EPC)

LAN7500/LAN7500i may use an external EEPROM to store the default values for the USB descriptors and the MAC address. The EEPROM controller supports most “93C56 or 93C66” type 256/512 byte EEPROMs. A total of nine address bits are used for connection to the device.

A 3-wire style 2K/4K EEPROM that is organized for 256/512 x 8-bit operation must be used.

The MAC address is used as the default Ethernet MAC address and is loaded into the device’s MAC address registers. If a properly configured EEPROM is not detected, it is the responsibility of the Host LAN Driver to set the IEEE addresses.

After a system-level reset occurs, the device will load the default values from a properly configured EEPROM. The device will not accept USB transactions from the Host until this process is completed.

The device’s EEPROM controller also allows the Host system to read, write and erase the contents of the Serial EEPROM.

### 3.1 EEPROM Format

Table 3-1 illustrates the format in which data is stored inside of the EEPROM.

Note the EEPROM offsets are given in units of 16-bit word offsets. A length field with a value of zero indicates that the field does not exist in the EEPROM. The device will use the field’s HW default value in this case.

**Note:** For the device descriptor, the only valid values for the length are 0 and 18.

**Note:** For the configuration and interface descriptor, the only valid values for the length are 0 and 18.

**Note:** The EEPROM programmer must ensure that if a string descriptor does not exist in the EEPROM, the referencing descriptor must contain 00h for the respective string index field.

**Note:** If all string descriptor lengths are zero, then a Language ID will not be supported.

**TABLE 3-1: EEPROM FORMAT**

| EEPROM Address | EEPROM Contents                                      |
|----------------|--|
| 00h            | A5h (EEPROM Programmed Indicator)                    |
| 01h            | MAC Address [7:0]                                    |
| 02h            | MAC Address [15:8]                                   |
| 03h            | MAC Address [23:16]                                  |

Table 3-3 describes the Configuration Flags 1.

**TABLE 3-3: CONFIGURATION FLAGS 1**

| Bits | Description  |
|------|--|
| 7    | <p><b>LED2_FUNCTION</b><br/>This bit specifies the functionality of LED2.</p> <p>0 = Link and Activity LED.<br/>1 = Activity LED.</p> <p><b>Note:</b> This bit is ignored if GPIOEN2 is not set in this flag byte.</p>         |
| 6:2  | <p><b>GPIOEN[4:0]</b><br/>This field specifies GPIO/LED functionality for GPIO[4:0].<br/>0 = GPIO Pin Functions as GPIO pin.<br/>1 = GPIO Pin Functions as LED.</p>  |
| 1    | <p><b>SW_MODE_SEL</b><br/>This bit specifies the modes of operation during which the SW_MODE pin will be asserted.</p> <p>0 = SW_MODE asserted in SUSPEND2.<br/>1 = SW_MODE asserted in SUSPEND2, SUSPEND1, and NetDetach.</p> |
| 0    | <p><b>SW_MODE_POL</b><br/>This bit selects the polarity of the SW_MODE pin.</p> <p>0 = Active low.<br/>1 = Active high.</p>  |

Table 3-4 describes the GPIO PME flags.

**TABLE 3-4: GPIO PME FLAGS**

| Bits | Description   |
|------|---|
| 7    | <p><b>GPIO PME Enable</b><br/>Setting this bit enables the assertion of the GPIO5 pin, as a result of a Wakeup (GPIO) pin, Magic Packet, or PHY Link Up. The host processor may use the GPIO5 pin to asynchronously wake up, in a manner analogous to a PCI PME pin.</p> <p>0 = The device does not support GPIO PME signaling.<br/>1 = The device supports GPIO PME signaling.</p> <p><b>Note:</b> When this bit is 0, the remaining GPIO PME parameters in this flag byte are ignored.</p>  |
| 6    | <p><b>GPIO PME Configuration</b><br/>This bit selects whether the GPIO PME is signaled on the GPIO5 pin as a level or a pulse. If pulse is selected, the duration of the pulse is determined by the setting of the GPIO PME Length bit of this flag byte. The level of the signal or the polarity of the pulse is determined by the GPIO PME Polarity bit of this flag byte.</p> <p>0 = GPIO PME is signaled via a level.<br/>1 = GPIO PME is signaled via a pulse.</p> <p><b>Note:</b> If GPIO PME Enable is 0, this bit is ignored.</p> |

# LAN7500/LAN7500I

TABLE 3-4: GPIO PME FLAGS (CONTINUED)

| Bits | Description   |
|------|---|
| 5    | <p><b>GPIO PME Length</b><br/>When the <a href="#">GPIO PME Configuration</a> bit of this flag byte indicates that the GPIO PME is signaled by a pulse on the <a href="#">GPIO5</a> pin, this bit determines the duration of the pulse.</p> <p>0 = GPIO PME pulse length is 1.5 mS.<br/>1 = GPIO PME pulse length is 150 mS.</p> <p><b>Note:</b> If <a href="#">GPIO PME Enable</a> is 0, this bit is ignored.</p>  |
| 4    | <p><b>GPIO PME Polarity</b><br/>Specifies the level of the signal or the polarity of the pulse used for GPIO PME signaling.</p> <p>0 = GPIO PME signaling polarity is low.<br/>1 = GPIO PME signaling polarity is high.</p> <p><b>Note:</b> If <a href="#">GPIO PME Enable</a> is 0, this bit is ignored.</p>   |
| 3    | <p><b>GPIO PME Buffer Type</b><br/>This bit selects the output buffer type for <a href="#">GPIO5</a>.</p> <p>0 = Open drain driver / open source<br/>1 = Push-Pull driver</p> <p><b>Note:</b> Buffer Type = 0, Polarity = 0 implies Open Drain<br/>Buffer Type = 0, Polarity = 1 implies Open Source</p> <p><b>Note:</b> If <a href="#">GPIO PME Enable</a> is 0, this bit is ignored.</p>  |
| 2    | <p><b>GPIO PME WOL Select</b><br/>Four types of wakeup events are supported; Magic Packet, Perfect DA, PHY Link Up, and Wakeup Pin(s) assertion. Wakeup Pin(s) are selected via the GPIO Wakeup Enables specified in bytes 1Eh and 1Fh of the EEPROM. This bit selects whether WOL events or Link Up wakeup events are supported.</p> <p>0 = WOL event wakeup supported.<br/>1 = PHY linkup wakeup supported.</p> <p><b>Note:</b> If WOL is selected, the <a href="#">PME Magic Packet Enable</a> and <a href="#">PME Perfect DA Enable</a> bits determine the WOL event(s) that will cause a wakeup.</p> <p><b>Note:</b> If <a href="#">GPIO PME Enable</a> is 0, this bit is ignored.</p> |
| 1    | <p><b>PME Magic Packet Enable</b><br/>When <a href="#">GPIO PME WOL Select</a> indicates WOL is selected, this bit enables/disables Magic Packet detection and wakeup.</p> <p>0 = Magic Packet event wakeup disabled.<br/>1 = Magic Packet event wakeup enabled.</p> <p><b>Note:</b> This bit is ignored if <a href="#">GPIO PME WOL Select</a> indicates WOL event wakeup not supported.</p>   |
| 0    | <p><b>PME Perfect DA Enable</b><br/>When <a href="#">GPIO PME WOL Select</a> indicates WOL is selected, this bit enables/disables Perfect DA detection and wakeup.</p> <p>0 = Perfect DA event wakeup disabled.<br/>1 = Perfect DA event wakeup enabled.</p> <p><b>Note:</b> This bit is ignored if <a href="#">GPIO PME WOL Select</a> indicates WOL event wakeup not supported.</p>   |

## 3.2 EEPROM Defaults

The signature value of 0xA5 is stored at address 0. A different signature value indicates to the EEPROM controller that no EEPROM or an un-programmed EEPROM is attached to the device. In this case, the hardware default values are used, as shown in [Table 3-5](#).

**TABLE 3-5: EEPROM DEFAULTS**

| Field                                 | Default Value |
|---------------------------------------|---------------|
| MAC Address                           | FFFFFFFFFFFFh |
| Full-Speed Polling Interval (mS)      | 01h           |
| Hi-Speed Polling Interval (mS)        | 04h           |
| <a href="#">Configuration Flags 0</a> | 1Bh           |
| Maximum Power (mA)                    | FAh           |
| Vendor ID                             | 0424h         |
| Product ID                            | 7500h         |

**Note:** Refer to the LAN7500/LAN7500i Vendor/Product ID application note for details on proper usage of these fields.

## 3.3 EEPROM Auto-Load

Certain system level resets (USB reset, nRESET, and SRST) cause the EEPROM contents to be loaded into the device. After a reset, the EEPROM controller attempts to read the first byte of data from the EEPROM. If the value A5h is read from the first address, then the EEPROM controller will assume that a programmed external Serial EEPROM is present.

**Note:** The USB reset only loads the MAC address.

## 3.4 An Example of EEPROM Format Interpretation

[Table 3-6](#) and [Table 3-7](#) provide an example of how the contents of a EEPROM are formatted. [Table 3-6](#) is a dump of the EEPROM memory (256-byte EEPROM), while [Table 3-7](#) illustrates, byte by byte, how the EEPROM is formatted. The industrial version of the device is used in the example.

**TABLE 3-6: DUMP OF EEPROM MEMORY**

| Offset Byte | Value (Hex)             |
|-------------|-------------------------|
| 0000h       | A5 12 34 56 78 9A BC 01 |

## 4.0 PME OPERATION

LAN7500/LAN7500i provides a mechanism for waking up a host system via PME mode of operation. PME signaling is only available while the device is operating in the self powered mode and a properly configured EEPROM is attached. [Figure 4-1](#) illustrates a typical application.

**FIGURE 4-1: TYPICAL APPLICATION**

# LAN7500/LAN7500i

---

The Host Processor is connected to a Chipset containing the Host USB Controller (HC). The USB Host Controller interfaces to LAN7500/LAN7500i via the DP/DM USB signals. An Embedded Controller (EC) signals the Chipset and the Host processor to power up via an Enable signal. The EC interfaces to LAN7500/LAN7500i via four signals. The PME signal is an input to the EC from the device that indicates the occurrence of a wakeup event. The VBUS\_DET output of the EC is used to indicate bus power availability. The PME\_CLEAR (nRESET) signal is used to clear the PME. The PME\_MODE\_SEL signal is sampled by the device when PME\_CLEAR (nRESET) is asserted and is used by the device to determine whether it should remain in PME mode or resume normal operation.

GPIO pins are used for PME handling. [GPIO5](#) is reserved for use as an output to signal the PME. [GPIO6](#) is reserved for use as the PME\_MODE\_SEL input.

The application scenario in [Figure 4-1](#) assumes that the Host Processor and the Chipset are powered off, the EC is operational, and the device is in PME mode, waiting for a wake event to occur. A wake event will result in the device signaling a PME event to the EC, which will then wake up the Host Processor and Chipset via the Enable signal. The EC asserts VBUS\_DET after the USB bus is powered, sets PME\_MODE\_SEL to determine whether the device is to begin normal operation or continue in PME mode, and asserts PME\_CLEAR (nRESET) to clear the PME.

The following wake events are supported:

- Wakeup Pin(s)

The GPIO pins not reserved for PME handling have the capability to wake up the device when operating in PME mode. In order for a GPIO to generate a wake event, its enable bit must be set

in the [GPIO\[11:8\] Wakeup Enables](#) or [GPIO\[7:0\] Wakeup Enables](#) bytes of the EEPROM, as appropriate. During PME mode of operation, the GPIOs used for signaling ([GPIO5](#) and [GPIO6](#)) are not affected by the values set in the corresponding bits of [GPIO\[7:0\] Wakeup Enables](#).

GPIOs 0 - 4 and 7 - 10 are available as wakeup pins in PME mode of operation and are active low by default.

- Magic Packet

Reception of a Magic Packet when in PME mode will result in a PME being asserted.

- Perfect DA match of Physical address

Reception of an Ethernet frame whose Destination address matches the device's MAC address will result in a PME being asserted.

- PHY Link Up

Detection of a PHY link partner when in PME mode will result in a PME being asserted.

In order to facilitate PME mode of operation, the [GPIO PME Enable](#) bit in the [GPIO PME Flags](#) field, must be set and all remaining [GPIO PME Flags](#) field bits must be appropriately configured for pulse or level signaling, buffer type, and GPIO PME WOL selection. The PME event is signaled on [GPIO5](#).

The PME\_MODE\_SEL pin ([GPIO6](#)) must be driven to the value that determines whether or not the device remains in PME mode of operation (1) or resumes normal operation (0) when the PME is recognized and cleared by the EC via PME\_CLEAR (nRESET) assertion.

**Note:** When in PME mode or nRESET will always cause the contents of the EEPROM to be reloaded.

[Figure 4-2](#) flowcharts PME operation while in Internal PHY mode. The following conditions hold:

EEPROM Configuration:

- [GPIO PME Enable](#) = 1 (enabled)
- [GPIO PME Configuration](#) = 0 (PME signaled via level on [GPIO5](#) pin)
- [GPIO PME Length](#) = 0 (NA)
- [GPIO PME Polarity](#) = 1 (high level signals event)
- [GPIO PME Buffer Type](#) = 1 (Push-Pull)
- [GPIO PME WOL Select](#) = 0 (Magic Packet wakeup)
- [Power Method](#) = 1 (self powered)
- MAC address for Magic Packet

PME signaling configuration:

- [GPIO5](#) signals PME
- [GPIO6](#) is PME\_MODE\_SEL

## 5.0 NETDETACH OPERATION

### 5.1 NetDetach

NetDetach is a mode of operation where the device detaches from the USB bus after the Ethernet cable is disconnected. This is advantageous for mobile devices, as an attached USB device may prevent the Host CPU from entering the ACPI C3 state. Allowing the CPU to enter the C3 state maximizes battery life, as the C3 state is the lowest of the four ACPI power states.

When detached, the device is in a low power state. After the Ethernet cable is reconnected, or a programmed GPIO pin asserts, the device automatically attaches to the USB bus.

## 7.0 OPERATIONAL CHARACTERISTICS

### 7.1 Absolute Maximum Ratings\*

|  |                                |
|--|--------------------------------|
| Supply Voltage (VDDVARIO) (Note 7-1)                               | -0.5V to +3.6V                 |
| Analog Supply Voltage (VDD12A) (Note 7-1)                          | -0.5V to +1.5V                 |
| Analog USB Supply Voltage (VDD33A) (Note 7-1)                      | -0.5V to +3.6V                 |
| Digital Core Supply Voltage (VDD12CORE) (Note 7-1)                 | -0.5V to +1.5V                 |
| Ethernet Magnetics Supply Voltage                                  | -0.5V to +3.6V                 |
| Positive voltage on signal pins, with respect to ground (Note 7-2) | +6.0V                          |
| Negative voltage on signal pins, with respect to ground (Note 7-3) | -0.5V                          |
| Positive voltage on XI, with respect to ground                     | +3.6V                          |
| Positive voltage on XO, with respect to ground                     | +2.5V                          |
| Ambient Operating Temperature in Still Air ( $T_A$ )               | Note 7-4                       |
| Junction to Ambient ( $\theta_{JA}$ )                              | 24.4°C/W                       |
| Junction to Top of Package ( $\Psi_{JT}$ )                         | 0.1°C/W                        |
| Storage Temperature  | -55°C to +150°C                |
| Lead Temperature Range   | Refer to JEDEC Spec. J-STD-020 |
| HBM ESD Performance  | JEDEC Class 3A                 |
| Latch-up Performance per EIA/JESD 78                               | ±150mA                         |

**Note 7-1** When powering this device from laboratory or system power supplies, it is important that the absolute maximum ratings not be exceeded or device failure can result. Some power supplies exhibit voltage spikes on their outputs when AC power is switched on or off. In addition, voltage transients on the AC power line may appear on the DC output. If this possibility exists, it is suggested that a clamp circuit be used.

**Note 7-2** This rating does not apply to the following pins: XI, XO, ETHRBIAS, USBRBIAS.

**Note 7-3** This rating does not apply to the following pins: ETHRBIAS, USBRBIAS.

**Note 7-4** 0°C to +70°C for commercial version, -40°C to +85°C for industrial version.

\*Stresses exceeding those listed in this section could cause permanent damage to the device. This is a stress rating only. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at any condition exceeding those indicated in Section 7.2, "Operating Conditions\*\*", Section 7.4, "DC Specifications", or any other applicable section of this specification is not implied. Note, device signals are NOT 5 volt tolerant unless specified otherwise.

### 7.2 Operating Conditions\*\*

|  |                  |
|--|------------------|
| Supply Voltage (VDDVARIO)                            | +2.25V to +3.6V  |
| Supply Voltage (VDD12A)                              | +1.14V to +1.26V |
| Analog USB Supply Voltage (VDD33A)                   | +3.0V to +3.6V   |
| Digital Core Supply Voltage (VDD12CORE)              | +1.14V to +1.26V |
| Ethernet Magnetics Supply Voltage                    | +2.25V to +3.6V  |
| Ambient Operating Temperature in Still Air ( $T_A$ ) | Note 7-4         |

\*\*Proper operation of the device is guaranteed only within the ranges specified in this section. After the device has completed power-up, VDDVARIO and the magnetics power supply must maintain their voltage level with ±10%. Varying the voltage greater than ±10% after the device has completed power-up can cause errors in device operation.

## 7.3 Power Consumption

This section details the power consumption of the device as measured during various modes of operation. For each mode of operation, two tables are provided: one for operation of VDDVARIO (and magnetics) at 2.5V, and the other for operation of VDDVARIO (and magnetics) at 3.3V. Power consumption values are provided for both the device-only, and for the device plus Ethernet components. Power dissipation is determined by temperature, supply voltage, and external source/sink requirements.

### 7.3.1 SUSPEND0

#### 7.3.1.1 VDDVARIO & Magnetics = 2.5V

**TABLE 7-1: SUSPEND0 CURRENT & POWER (VDDVARIO & MAGNETICS = 2.5V)**

| Parameter   | Min | Typical | MAX | Unit |
|---|-----|---------|-----|------|
| Supply current (VDD33A = 3.3V)  |     | 0.4     |     | mA   |
| Supply current (VDDVARIO = 2.5V)  |     | 3.1     |     | mA   |
| Supply current (VDD12CORE, VDD12BIAS, VDD12USBPLL, VDD12PLL, VDD12A = 1.2V) |     | 453     |     | mA   |
| Power Dissipation (Device Only)   |     | 553     |     | mW   |
| Power Dissipation (Device and Ethernet components)                          |     | 1047    |     | mW   |

#### 7.3.1.2 VDDVARIO & Magnetics = 3.3V

**TABLE 7-2: SUSPEND0 CURRENT & POWER (VDDVARIO & MAGNETICS = 3.3V)**

| Parameter   | Min | Typical | MAX | Unit |
|---|-----|---------|-----|------|
| Supply current (VDDVARIO, VDD33A = 3.3V)                                    |     | 3.5     |     | mA   |
| Supply current (VDD12CORE, VDD12BIAS, VDD12USBPLL, VDD12PLL, VDD12A = 1.2V) |     | 453     |     | mA   |
| Power Dissipation (Device Only)   |     | 556     |     | mW   |

# LAN7500/LAN7500I

**Note 7-5** This specification applies to all inputs and tri-stated bi-directional pins. Internal pull-down and pull-up resistors add  $\pm 50$   $\mu$ A per-pin (typical).

**Note 7-6** This is the total 5.5V input leakage for the entire device.

**Note 7-7** XI can optionally be driven from a 25 MHz single-ended clock oscillator.

# LAN7500/LAN7500I

---

**Note 7-14** Min/max voltages guaranteed as measured with 100Ω resistive load.

## 7.5 AC Specifications

This section details the various AC timing specifications of the device.

**Note:** The USB DP and USB DM pin timing adheres to the USB 2.0 specification. Refer to the Universal Serial Bus Revision 2.0 specification for detailed USB timing information.

**Note:** The Ethernet TX/RX pin timing adheres to the IEEE 802.3 specification. Refer to the IEEE 802.3 specification for detailed Ethernet timing information.

### 7.5.1 EQUIVALENT TEST LOAD

Output timing specifications assume the 25pF equivalent test load illustrated in [Figure 7-1](#) below, unless otherwise specified.

**FIGURE 7-1: OUTPUT EQUIVALENT TEST LOAD**

### 7.5.2 POWER SEQUENCE TIMING

Power supplies must adhere to the following rules:

- All power supplies of the same voltage must be powered up/down together.
- There is no power-up sequencing requirement, however all power supplies must reach operational levels within the time periods specified in [Table 7-15](#).
- There is no power-down sequencing or timing requirement, however the device must not be powered for an extended period of time without all supplies at operational levels.
- Following initial power-on, or if a power supply brownout occurs (i.e., one or more supplies drops below operational limits), a power-on reset must be executed once all power supplies reach operational levels. Refer to [Section 7.5.3, "Power-On Reset Timing," on page 43](#) for power-on reset requirements.
- With the exception of VBUS\_DET, do not drive input signals without power supplied to the device.

**Note:** Violation of these specifications may damage the device.

**FIGURE 7-2: POWER SEQUENCE TIMING**

**TABLE 7-15: POWER SEQUENCE TIMING VALUES**

| SYMBOL    | DESCRIPTION               | MIN | TYP | MAX | UNITS |
|-----------|---------------------------|-----|-----|-----|-------|
| $t_{pon}$ | Power supply turn on time | 0   |     | 25  | mS    |

**Note:** The VDDVARIO power supply can be run at 2.5V or 3.3V.

**Note:** The magnetics power supply can be run at 2.5V or 3.3V.

### 7.5.3 POWER-ON RESET TIMING

Figure 7-3 illustrates the nRESET timing requirements in relation to power-on. A hardware reset (nRESET assertion) is required following power-on. For proper operation, nRESET must be asserted for no less than  $t_{rstia}$ . The nRESET pin can be asserted at any time, but must not be deasserted before  $t_{purstd}$  after all external power supplies have reached operational levels.

**FIGURE 7-3: NRESET POWER-ON TIMING**

# LAN7500/LAN7500I

**TABLE 7-16: NRESET POWER-ON TIMING VALUES**

| SYMBOL              | DESCRIPTION  | MIN | TYP | MAX | UNITS         |
|---------------------|--|-----|-----|-----|---------------|
| $t_{\text{purstd}}$ | External power supplies at operational level to nRESET deassertion | 25  |     |     | mS            |
| $t_{\text{purstv}}$ | External power supplies at operational level to nRESET valid       | 0   |     |     | nS            |
| $t_{\text{rstia}}$  | nRESET input assertion time  | 100 |     |     | $\mu\text{S}$ |

**Note:** nRESET deassertion must be monotonic.

## 7.5.4 RESET TIMING

Figure 7-3 illustrates the nRESET pin timing requirements. When used, nRESET must be asserted for no less than  $t_{\text{rstia}}$ .

**Note:** A hardware reset (nRESET assertion) is required following power-on. Refer to [Section 7.5.3, "Power-On Reset Timing,"](#) on page 43 for additional information.

**FIGURE 7-4: NRESET TIMING**

**TABLE 7-17: NRESET TIMING VALUES**

| SYMBOL             | DESCRIPTION                 | MIN | TYP | MAX | UNITS         |
|--------------------|-----------------------------|-----|-----|-----|---------------|
| $t_{\text{rstia}}$ | nRESET input assertion time | 1   |     |     | $\mu\text{S}$ |

## 7.5.5 EEPROM TIMING

The following specifies the EEPROM timing requirements for the device:

**FIGURE 7-5: EEPROM TIMING**

**TABLE 7-18: EEPROM TIMING VALUES**

| SYMBOL         | DESCRIPTION                            | MIN  | TYP | MAX  | UNITS |
|----------------|--|------|-----|------|-------|
| $t_{ckcyc}$    | EECLK Cycle time                       | 1110 |     | 1130 | ns    |
| $t_{ckh}$      | EECLK High time                        | 550  |     | 570  | ns    |
| $t_{ckl}$      | EECLK Low time                         | 550  |     | 570  | ns    |
| $t_{cshckh}$   | EECS high before rising edge of EECLK  | 1070 |     |      | ns    |
| $t_{cklcs}$    | EECLK falling edge to EECS low         | 30   |     |      | ns    |
| $t_{dvckh}$    | EEDO valid before rising edge of EECLK | 550  |     |      | ns    |
| $t_{ckhinvid}$ | EEDO invalid after rising edge EECLK   | 550  |     |      | ns    |
| $t_{dsckh}$    | EEDI setup to rising edge of EECLK     | 90   |     |      | ns    |
| $t_{dhckh}$    | EEDI hold after rising edge of EECLK   | 0    |     |      | ns    |
| $t_{ckldis}$   | EECLK low to data disable (OUTPUT)     | 580  |     |      | ns    |
| $t_{cshdv}$    | EEDIO valid after EECS high (VERIFY)   |      |     | 600  | ns    |
| $t_{dhcsl}$    | EEDIO hold after EECS low (VERIFY)     | 0    |     |      | ns    |
| $t_{csl}$      | EECS low                               | 1070 |     |      | ns    |

# LAN7500/LAN7500I

## 7.5.6 JTAG TIMING

This section specifies the JTAG timing of the device. Please refer to [Section 1.1.10, "TAP Controller," on page 6](#) for additional details.

**FIGURE 7-6: JTAG TIMING**

**TABLE 7-19: JTAG TIMING VALUES**

| Symbol        | Description                              | Min              | Max              | Units | Notes |
|---------------|--|------------------|------------------|-------|-------|
| $t_{tckp}$    | TCK clock period                         | 66.67            |                  | ns    |       |
| $t_{tckhl}$   | TCK clock high/low time                  | $t_{tckp} * 0.4$ | $t_{tckp} * 0.6$ | ns    |       |
| $t_{su}$      | TDI, TMS setup to TCK rising edge        | 10               |                  | ns    |       |
| $t_h$         | TDI, TMS hold from TCK rising edge       | 10               |                  | ns    |       |
| $t_{dov}$     | TDO output valid from TCK falling edge   |                  | 16               | ns    |       |
| $t_{doinvld}$ | TDO output invalid from TCK falling edge | 0                |                  | ns    |       |

## 7.6 Clock Circuit

The device can accept either a 25 MHz crystal (preferred) or a 25 MHz single-ended clock oscillator ( $\pm 50$  ppm) input. If the single-ended clock oscillator method is implemented, XO should be left unconnected and XI should be driven with a nominal 0-3.3V clock signal. The input clock duty cycle is 40% minimum, 50% typical and 60% maximum.

It is recommended that a crystal utilizing matching parallel load capacitors be used for the crystal input/output signals (XI/XO). Either a 300uW or 100uW 25 MHz crystal may be utilized. The 300uW 25 MHz crystal specifications are detailed in [Section 7.6.1, "300uW 25 MHz Crystal Specification," on page 47](#). The 100uW 25 MHz crystal specifications are detailed in [Section 7.6.2, "100uW 25 MHz Crystal Specification," on page 48](#).

### 7.6.1 300UW 25 MHZ CRYSTAL SPECIFICATION

When utilizing a 300uW 25 MHz crystal, the following circuit design ([Figure 7-7](#)) and specifications ([Table 7-20](#)) are required to ensure proper operation.

**FIGURE 7-7: 300UW 25 MHZ CRYSTAL CIRCUIT**

**TABLE 7-20: 300UW 25 MHZ CRYSTAL SPECIFICATIONS**

| PARAMETER                           | SYMBOL     | MIN                       | NOM          | MAX                       | UNITS | NOTES                     |

# LAN7500/LAN7500I

- Note 7-15** The maximum allowable values for Frequency Tolerance and Frequency Stability are application dependent. Since any particular application must meet the IEEE  $\pm 50$  PPM Total PPM Budget, the combination of these two values must be approximately  $\pm 45$  PPM (allowing for aging).
- Note 7-16** Frequency Deviation Over Time is also referred to as Aging.
- Note 7-17** The total deviation for the Transmitter Clock Frequency is specified by IEEE 802.3u as  $\pm 50$  PPM.
- Note 7-18**  $0^{\circ}\text{C}$  for commercial version,  $-40^{\circ}\text{C}$  for industrial version.
- Note 7-19**  $+70^{\circ}\text{C}$  for commercial version,  $+85^{\circ}\text{C}$  for industrial version.
- Note 7-20** This number includes the pad, the bond wire and the lead frame. PCB capacitance is not included in this value. The XO/XI pin and PCB capacitance values are required to accurately calculate the value of the two external load capacitors. These two external load capacitors determine the accuracy of the 25.000 MHz frequency.

## 7.6.2 100uW 25 MHz CRYSTAL SPECIFICATION

When utilizing a 100uW 25 MHz crystal, the following circuit design (Figure 7-8) and specifications (Table 7-21) are required to ensure proper operation.

**FIGURE 7-8: 100uW 25 MHz CRYSTAL CIRCUIT**

**TABLE 7-21: 100uW 25 MHz CRYSTAL SPECIFICATIONS**

| Parameter                                  | Symbol                 | Min | Nom          | Max      | Units | Notes     |

| LAN7500/LAN7500i XI Pin Capacitance | —      | —                         | 3 typ | —                         | pF    | <a href="#">Note 7-27</a> |
| LAN7500/LAN7500i XO Pin Capacitance | —      | —                         | 3 typ | —                         | pF    | <a href="#">Note 7-27</a> |

**Note 7-21** The maximum allowable values for Frequency Tolerance and Frequency Stability are application dependent. Since any particular application must meet the IEEE  $\pm 50$  PPM Total PPM Budget, the combination of these two values must be approximately  $\pm 45$  PPM (allowing for aging).

**Note 7-22** Frequency Deviation Over Time is also referred to as Aging.

**Note 7-23** The total deviation for the Transmitter Clock Frequency is specified by IEEE 802.3u as  $\pm 100$  PPM.

**Note 7-24** The crystal must support 100uW operation to utilize this circuit.

**Note 7-25** 0°C for extended commercial version, -40°C for industrial version.

**Note 7-26** 70°C for commercial version, +85°C for industrial version.

**Note 7-27** This number includes the pad, the bond wire and the lead frame. PCB capacitance is not included in this value. The XI pin, XO pin and PCB capacitance values are required to accurately calculate the value of the two external load capacitors. The total load capacitance must be equivalent to what the crystal expects to see in the circuit so that the crystal oscillator will operate at 25.000 MHz.

| Rev. 1.0<br>(11-01-10)                                   | All   | Initial Release.   |

## THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at [www.microchip.com](http://www.microchip.com). This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

## CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at [www.microchip.com](http://www.microchip.com). Under "Support", click on "Customer Change Notification" and follow the registration instructions.

## CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

**Technical support is available through the web site at: <http://microchip.com/support>**

# LAN7500/LAN7500I

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

| <u>PART NO.</u>  | <u>[X]</u>  | - | <u>XXX</u> | - | <u>[X]<sup>(1)</sup></u> |
|--|---|---|------------|---|--------------------------|
| Device   | Temperature Range   |   | Package    |   | Tape and Reel Option     |
| <b>Device:</b>   | LAN7500   |   |            |   |                          |
| <b>Temperature Range:</b>  | Blank = 0°C to +70°C (Extended Commercial)<br>i = -40°C to +85°C (Industrial) |   |            |   |                          |
| <b>Package:</b>  | ABZJ = 56-pin QFN RoHS compliant package                                      |   |            |   |                          |
| <b>Tape and Reel Option:</b>   | Blank = Standard packaging (tray)   |   |            |   |                          |
| <b>Examples:</b>   |   |   |            |   |                          |
| a) LAN7500i-ABZJ<br>Industrial temperature,<br>56-pin QFN<br>Tray                          |   |   |            |   |                          |
| b) LAN7500-ABZJ<br>Extended commercial temperature,<br>56-pin QFN<br>Tray                  |   |   |            |   |                          |
| <b>Note:</b> This product meets the halogen maximum concentration values per IEC61249-2-21 |   |   |            |   |                          |

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

**QUALITY MANAGEMENT SYSTEM**  
**CERTIFIED BY DNV**  
**== ISO/TS 16949 ==**

*Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.*
