

## Single-Cell Li-Ion/Li-Polymer Battery Charge Management Controllers in 2x2 TDFN

### Features:

- Complete Linear Charge Management Controller:
  - Integrated pass transistor
  - Integrated current sense
  - Integrated Reverse Discharge Protection
- Constant-Current/Constant Voltage Operation
- High-Accuracy Preset Voltage Regulation:
  - 4.20V  $\pm$ 0.75%
- Programmable Charge Current:
  - MCP73830L: 20 mA-200 mA
  - MCP73830: 100 mA-1000 mA
- Soft Start to Avoid Inrush Current
- Preconditioning:
  - 10% and no preconditioning
- Fixed Elapsed Timer: 4 Hours
- Fixed Preconditioning Timer: 1 Hour
- Automatic Recharge: No Auto-Recharge is also Available with Selected Options
- Automatic End-of-Charge (EOC) Control Termination:
  - 7.5% and 10%
- Automatic Power-Down when Input Power Removed
- Undervoltage Lockout (UVLO)
- Chip/Charge Enable Pin ( $\overline{\text{CE}}$ )
- Packaging:
  - TDFN-6 (2x2 mm)
- Temperature Range: -40°C to +85°C

### Applications:

- Bluetooth Headsets
- Portable Media Players
- Rechargeable 3D Glasses
- Toy and Gaming Controllers

### Description:

The MCP73830/L are highly integrated, Li-Ion battery charge management controllers for use in space-limited applications. The MCP73830/L devices provide specific charge algorithms for single-cell Li-Ion/Li-Polymer batteries to achieve optimal capacity and safety in the shortest charging time possible. Along with its small physical size, the low number of external components makes the MCP73830/L ideally suitable for portable applications.

The MCP73830L employs a constant-current/constant voltage charge algorithm. The minimum 20 mA regulated constant, fast charge current enables the design in small Li-Ion batteries and low supply current applications. The fast charge, constant-current value is set with one external resistor, from 20 mA to 200 mA. The MCP73830 allows up to 1000 mA charge current for applications that require faster constant current.

The MCP73830/L devices provide a thermal foldback function that limits the charge current, based on die temperature during high-power or high-ambient conditions. This thermal regulation optimizes the charge cycle time while maintaining device reliability.

The MCP73830/L devices are fully specified over the ambient temperature range of -40°C to +85°C. The MCP73830/L is available in a 6 lead, TDFN package.

### Package Types (Top View)

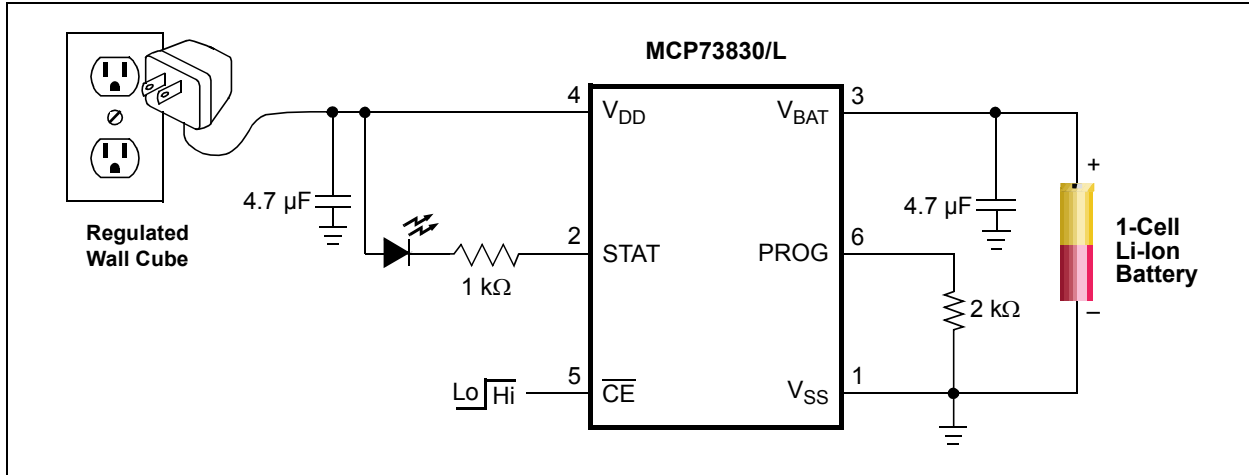

**TABLE 1: AVAILABLE FACTORY PRESET OPTIONS**

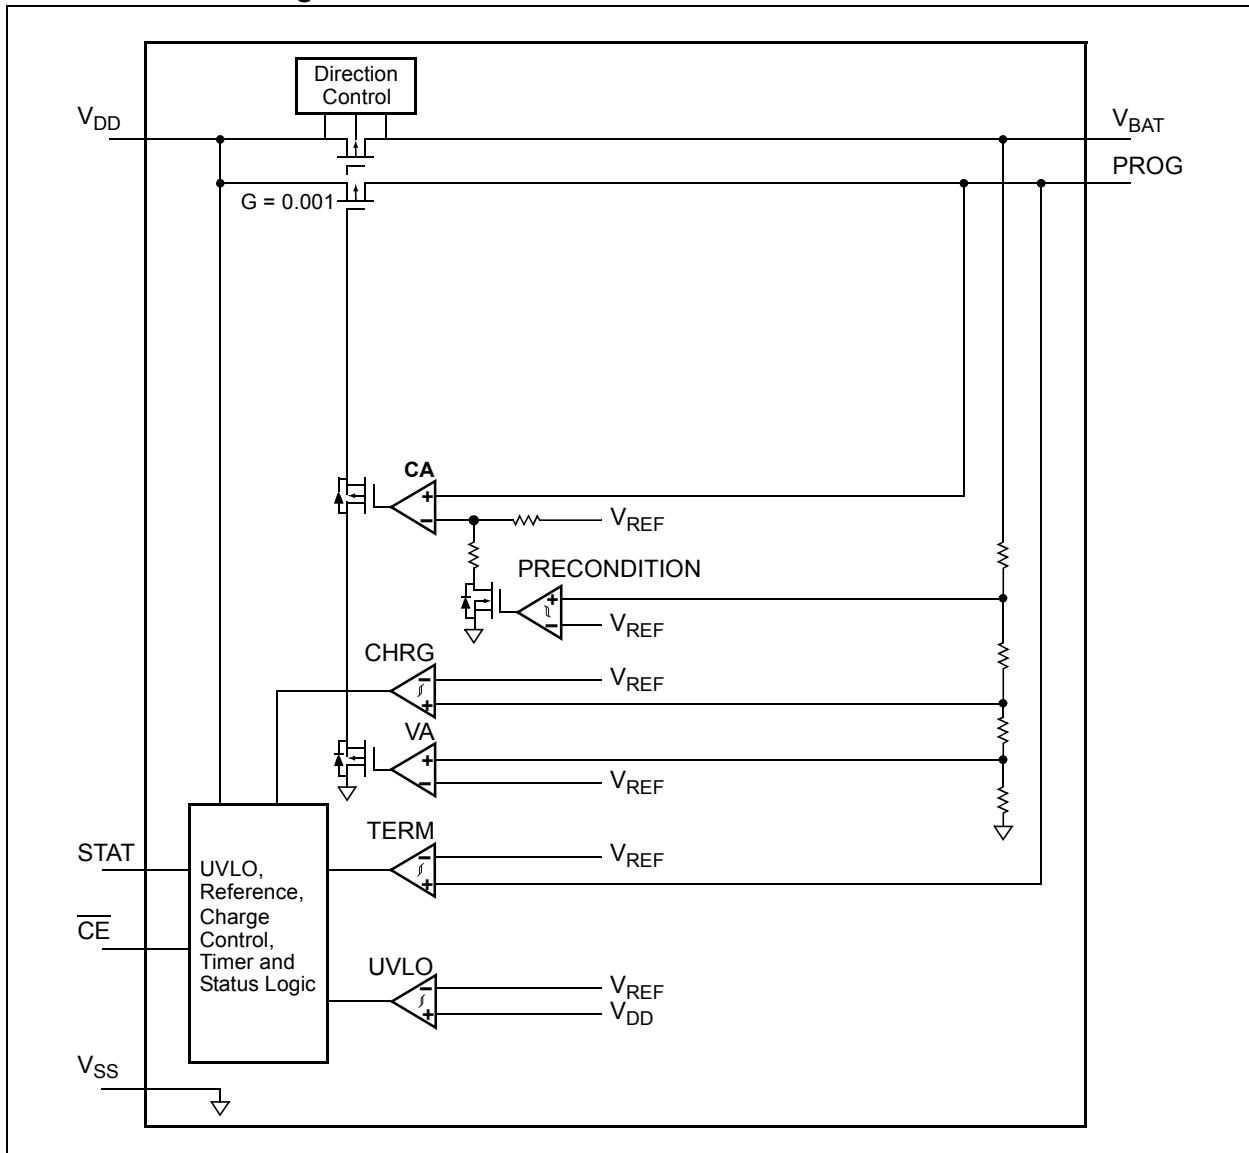

Charge Voltage	Preconditioning Charge Current	End-of-Charge Control	Auto-Recharge
4.2V	10%/Disabled	7.5%/10%	Yes/No

## Typical Application

## Functional Block Diagram

## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings†

$V_{DD}, V_{BAT}$  ..... 7.0V  
 All Inputs and Outputs w.r.t.  $V_{SS}$  ..... -0.3 to ( $V_{DD} + 0.3$ )V  
 Maximum Junction Temperature,  $T_J$  ..... Internally Limited  
 Storage temperature ..... -65°C to +150°C  
 ESD protection on all pins  
 Human Body Model (1.5 k $\Omega$  in Series with 100 pF) .....  $\geq 2$  kV  
 Machine Model (200 pF, No Series Resistance) ..... 300V

† **Notice:** Stresses above those listed under “Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

### DC CHARACTERISTICS

**Electrical Specifications:** Unless otherwise indicated, all limits apply for  $V_{DD} = [V_{REG}(\text{Typical}) + 0.3V]$  to 6V,  $T_A = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ . Typical values are at  $+25^\circ\text{C}$ ,  $V_{DD} = [V_{REG}(\text{Typical}) + 1.0V]$ .

Parameters	Sym.	Min.	Typ.	Max.	Units	Conditions
<b>Supply Input</b>						
Input Voltage Range	$V_{DD}$	3.75	—	6	V	
Supply Current	$I_{SS}$	—	0.6	2	$\mu\text{A}$	Shutdown; $V_{DD} \leq V_{STOP} - 300 \text{ mV}$

# MCP73830/L

## 3.0 PIN DESCRIPTION

The descriptions of the pins are listed in [Table 3-1](#).

TABLE 3-1: PIN FUNCTION TABLE

MCP73830/L	Symbol	I/O	Function
TDFN			
1	$V_{SS}$	—	Battery management 0V reference.
2	STAT	O	Battery charge status output.
3	$V_{BAT}$	I/O	Charge control output. Regulates the charge current and battery voltage. The pin is disconnected during Shutdown mode.
4	$V_{DD}$	I	Input power supply.
5	$\overline{CE}$	I	Charge enable pin. Pull the pin high to disable the device; it is internally pulled down. Leave the pin floating if not used.
6	PROG	I/O	Battery charge current regulation program.
7	EP	—	Exposed pad.

### 3.1 Battery Management 0V Reference ( $V_{SS}$ )

Connect to the negative terminal of the battery and input supply.

### 3.2 Status Output (STAT)

STAT is an open-drain logic output for connection to an LED for charge status indication in stand-alone applications. Alternatively, a pull-up resistor can be applied for interfacing to a host microcontroller. Refer to [Table 5-1](#) for a summary of the status output during a charge cycle.

### 3.3 Battery Charge Control Output ( $V_{BAT}$ )

Connect to the positive terminal of the battery. Bypass to  $V_{SS}$  with a minimum of 1  $\mu$ F to ensure loop stability when the battery is disconnected.

### 3.4 Battery Management Input Supply ( $V_{DD}$ )

A supply voltage of [ $V_{REG}$  (Typical) + 0.3V] to 6.0V is recommended. Bypass to  $V_{SS}$  with a minimum of 1  $\mu$ F.

### 3.5 Charge Enable ( $\overline{CE}$ )

The MCP73830/L devices are always enabled with an internal pull-down resistor. Pulling the CE pin high will enter Standby mode.

### 3.6 Current Regulation Set (PROG)

The fast charge current is set by placing a resistor from PROG to  $V_{SS}$  during Constant-Current (CC) mode.

Refer to [Section 5.4 “Constant-Current Mode – Fast Charge”](#) for details.

### 3.7 Exposed Pad (EP)

The Exposed Thermal Pad (EP) should be connected to the exposed copper area on the Printed Circuit Board (PCB) for thermal enhancement purposes. Additional vias on the copper area under the MCP73830/L devices can improve the performance of heat dissipation and simplify the assembly process.

# MCP73830/L

## 5.0 DETAILED DESCRIPTION

### 5.1 Undervoltage Lockout (UVLO)

An internal Undervoltage Lockout (UVLO) circuit monitors the input voltage and keeps the charger in Shutdown mode until the input supply rises above the UVLO threshold. In the event a battery is present when the input power is applied, the input supply must rise approximately 150 mV above the battery voltage before the MCP73830/L devices become operational.

The UVLO circuit places the device in Shutdown mode if the input supply falls to approximately +50 mV above the battery voltage. The UVLO circuit is always active. If the input supply is below the UVLO threshold, or approximately 150 mV of the voltage at the  $V_{BAT}$  pin, the MCP73830/L devices are placed in Shutdown mode.

### 5.2 Charge Qualification

When the input power is applied, the input supply must rise 150 mV above the battery voltage before the MCP73830/L devices become operational.

The automatic power-down circuit places the device in Shutdown mode if the input supply falls to within +50 mV of the battery voltage.

The automatic circuit is always active. Any time the input supply is within +50 mV of the voltage at the  $V_{BAT}$  pin, the MCP73830/L are placed in Shutdown mode.

For a charge cycle to begin, the automatic power-down exit conditions must be met ( $V_{DD} \geq 3.6V$  and  $V_{DD} \geq V_{BAT} + 150mV$ ) and the charge enable input must be above the input high threshold. The battery voltage should be less than 96.5% of  $V_{REG}$ .

#### 5.2.1 BATTERY MANAGEMENT INPUT SUPPLY ( $V_{DD}$ )

The  $V_{DD}$  input is the input supply to the MCP73830/L. The MCP73830/L devices automatically enter Power-Down mode if the voltage on the  $V_{DD}$  input falls to within +50 mV of the battery voltage. This feature prevents draining the battery pack when the  $V_{DD}$  supply is not present.

#### 5.2.2 BATTERY CHARGE CONTROL OUTPUT ( $V_{BAT}$ )

The battery charge control output is the drain terminal of an internal P-channel MOSFET. The MCP73830/L devices provide constant current and voltage regulation to the battery pack by controlling this MOSFET in the linear region. The battery charge control output should be connected to the positive terminal of the battery pack.

#### 5.2.3 BATTERY DETECTION

The MCP73830/L devices detect the battery presence by monitoring the voltage at  $V_{BAT}$ . The charge flow will initiate when the voltage on  $V_{BAT}$  is pulled below the  $V_{RECHARGE}$  threshold. Refer to [Section 1.0 “Electrical Characteristics”](#) for  $V_{RECHARGE}$  values. The value will be the same for non-automatic recharge devices.

When  $V_{BAT} > V_{REG} + \text{Hysteresis}$ , the charge will be suspended or not started, depending on the condition, to prevent the overcharge that may occur.

### 5.3 Preconditioning

If the voltage at the  $V_{BAT}$  pin is less than the preconditioning threshold, the MCP73830/L devices enter Preconditioning mode. The preconditioning threshold is factory set. Refer to [Section 1.0 “Electrical Characteristics”](#) for preconditioning threshold options.

In this mode, the MCP73830/L devices supply 10% of the fast charge current (established with the value of the resistor connected to the PROG pin) to the battery.

When the voltage at the  $V_{BAT}$  pin rises above the preconditioning threshold, the MCP73830/L devices enter the Constant-Current (Fast Charge) mode.

**Note:** The MCP73830/L devices also offer options with no preconditioning.

#### 5.3.1 TIMER EXPIRED DURING PRECONDITIONING MODE

If the internal timer expires before the voltage threshold is reached for Fast Charge mode, a timer Fault is indicated, and the charge cycle terminates. The MCP73830/L devices remain in this condition until the battery is removed, the input power is cycled or CE is toggled. If the battery is removed, the MCP73830/L devices enter Standby mode, where they remain until a battery is reinserted.

**Note:** The typical preconditioning timers for the MCP73830/L are 60 minutes.

## 5.4 Constant-Current Mode – Fast Charge

During Constant-Current mode, the programmed charge current is supplied to the battery or load.

The charge current is established using a single resistor from PROG to V<sub>SS</sub>. The program resistor and the charge current are calculated using the following equation:

### EQUATION 5-1: MCP73830L

$$I_{REG} = \frac{200}{R_{PROG}}$$

Where:

R<sub>PROG</sub> = kilohms (kΩ)  
 I<sub>REG</sub> = milliamperes (mA)

### EQUATION 5-2: MCP73830

$$I_{REG} = \frac{1000}{R_{PROG}}$$

Where:

R<sub>PROG</sub> = kilohms (kΩ)  
 I<sub>REG</sub> = milliamperes (mA)

Constant-Current mode is maintained until the voltage at the V<sub>BAT</sub> pin reaches the regulation voltage, V<sub>REG</sub>. When Constant-Current mode is invoked, the internal timer is reset.

### 5.4.1 TIMER EXPIRED DURING CONSTANT-CURRENT/FAST CHARGE MODE

If the internal 4-hour timer expires before the recharge voltage threshold is reached, a timer Fault is indicated and the charge cycle terminates. The MCP73830/L devices remain in this condition until the battery is reinserted, or the input power or  $\overline{CE}$  is cycled.

## 5.5 Constant Voltage Mode

When voltage at the V<sub>BAT</sub> pin reaches the regulation voltage, V<sub>REG</sub>, the constant voltage regulation begins. The regulation voltage is factory set to 4.2V with a tolerance of ±0.75%.

## 5.6 Charge Termination

The charge cycle is terminated when, during Constant Voltage mode, the average charge current diminishes below a threshold established with the value of 7.5%, 10% of fast charge current or the internal timer has expired. A 1 ms filter time on the termination comparator ensures that transient load conditions do not result in premature charge cycle termination. The timer period is factory set. Refer to [Section 1.0 “Electrical Characteristics”](#) for the timer period value.

## 5.7 Automatic Recharge

MCP73830/L devices with automatic recharge options continuously monitor the voltage at the V<sub>BAT</sub> pin during the Charge Complete mode. If the voltage drops below the recharge threshold, another charge cycle begins and current is once again supplied to the battery or load. The recharge threshold is factory set. Refer to [Section 1.0 “Electrical Characteristics”](#) for recharge threshold options.

**Note:** The MCP73830/L also offer options with no automatic recharge.

For the MCP73830/L with no recharge option, the devices will go into Standby mode when a termination condition is met. The charge will not restart until the battery voltage is below the automatic recharge threshold and one of the following conditions is met:

- Battery is removed from the system and inserted again.
- V<sub>DD</sub> is removed and plugged in again.
- $\overline{CE}$  is cycled.

The automatic recharge voltage threshold is always active, regardless of whether the automatic recharge option is selected or not.

## 5.8 Thermal Regulation

The MCP73830/L should limit the charge currents based on the die temperature. The thermal regulation optimizes the charge cycle time while maintaining device reliability. [Figure 5-1](#) depicts the thermal regulation for the MCP73830/L devices. Refer to [Section 1.0 “Electrical Characteristics”](#) for thermal package resistances and [Section 6.1.1.3 “Thermal Considerations”](#) for calculating power dissipation.

**FIGURE 5-1:** Thermal Regulation.

# MCP73830/L

---

## 5.9 Thermal Shutdown

The MCP73830/L devices suspend charging if the die temperature exceeds +150°C. Charging will resume when the die temperature has cooled by approximately +10°C. The thermal shutdown is a secondary safety feature in the event that there is a failure within the thermal regulation circuitry.

## 5.10 Status Indicator

The charge status output of the MCP73830/L is open-drain, and as such, has two different states: Low (L) and High-Impedance (High-Z). The charge status outputs can be used to illuminate the LEDs. Optionally, the charge status output can be used as an interface to a host microcontroller. The faulty indication of a preconditioning timer also indicates defective batteries when it fails to pass the preconditioning threshold during the given time.

[Table 5-1](#) summarizes the state of the status outputs during a charge cycle.

**TABLE 5-1: STATUS OUTPUTS**

Charge Cycle State	STAT
Shutdown	High-Z
No Battery Present	High-Z
Preconditioning	L
Constant-Current Fast Charge	L
Constant Voltage	L
Charge Complete	High-Z
Timer Fault	High-Z
Preconditioning Timer Fault	Flashing (2 Hz)

## 6.0 APPLICATIONS

The MCP73830/L devices are designed to operate in conjunction with a host microcontroller or in stand-alone applications. The MCP73830/L provide

the preferred charge algorithm for dual Lithium-Ion or Lithium-Polymer cell's constant current, followed by constant voltage. [Figure 6-1](#) depicts a typical stand-alone application circuit, while [Figure 6-2](#) depicts the accompanying charge profile.

**FIGURE 6-1:** Typical Application Circuit.

**FIGURE 6-2:** Typical Charge Profile (Li-Ion Battery).

### 6.1 Application Circuit Design

Due to the low efficiency of linear charging, the most important factors are thermal design and cost, which are a direct function of the input voltage, output current and thermal impedance between the battery charger and the ambient cooling air. The worst-case situation is when the device has transitioned from Preconditioning mode to Constant-Current mode. In this situation, the battery charger has to dissipate the maximum power. A trade-off must be made between the charge current, cost and thermal requirements of the charger.

#### 6.1.1 COMPONENT SELECTION

Selection of the external components in [Figure 6-1](#) is crucial to the integrity and reliability of the charging system. The following discussion is intended as a guide for the component selection process.

##### 6.1.1.1 Charge Current

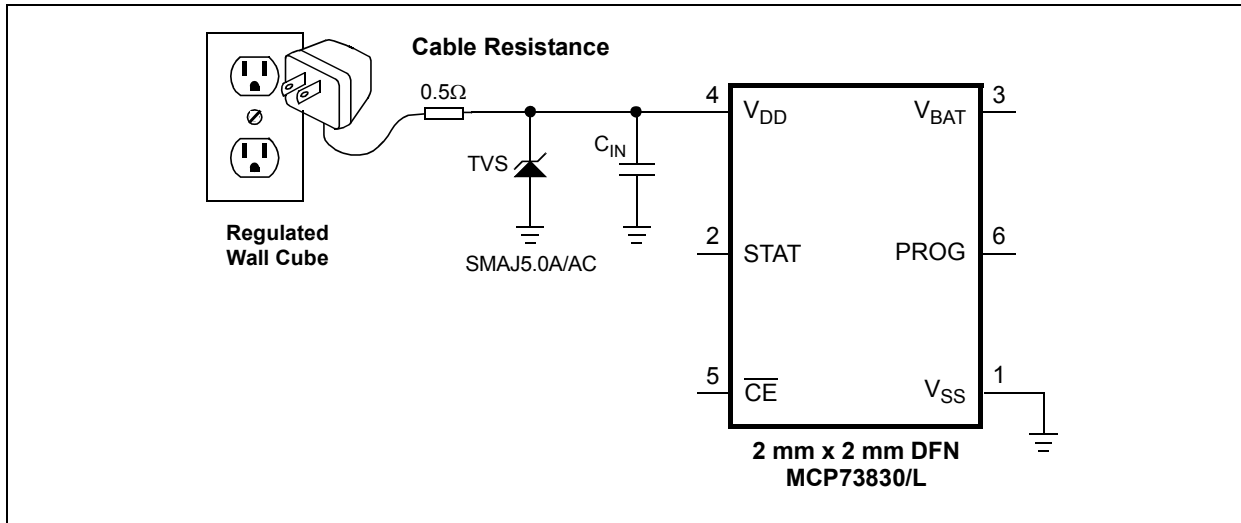

The preferred fast charge current for Li-Ion/Li-Poly cells is below the 1C rate, with an absolute maximum current at the 2C rate. **The recommended fast charge current should be obtained from the battery manufacturer.** For example, a 500 mAh battery pack with 0.7C preferred fast charge current has a charge current of 350 mA. Charging at this rate provides the shortest charge cycle times without degradation to the battery pack performance or life.

**Note:** Please consult with your battery supplier, or refer to the battery data sheet, for the preferred charge rate.

##### 6.1.1.2 Input Overvoltage Protection (IOVP)

Input overvoltage protection must be used when the input power source is hot-pluggable; this includes USB cables and wall-type power supplies. The cabling of these supplies acts as an inductor. When the supplies are connected/disconnected from the system, large voltage transients are created which may damage the system circuitry. These transients should be snubbed out. A transzorb, unidirectional or bidirectional, connected from the V+ input supply connector to the 0V ground reference will snub the transients. An example of this can be seen in [Figure 6-3](#).

# MCP73830/L

**FIGURE 6-3:** Input Overvoltage Protection Example.

### 6.1.1.3 Thermal Considerations

The worst-case power dissipation in the battery charger occurs when the input voltage is at the maximum and the device has transitioned from Preconditioning mode to Constant-Current mode. In this case, the power dissipation is:

**EQUATION 6-1:**

$$PowerDissipation = (V_{DDMAX} - V_{PTHMIN}) \times I_{REGMAX}$$

Where:

- $V_{DDMAX}$  = The maximum input voltage
- $I_{REGMAX}$  = The maximum fast charge current
- $V_{PTHMIN}$  = The minimum transition threshold voltage

Power dissipation with a 5V, ±10% input voltage source, 200 mA, ±10%, and preconditioning threshold voltage at 3.0V is:

**EQUATION 6-2:**

$$PowerDissipation = (5.5V - 3.0V) \times 220 mA = 0.55W$$

This power dissipation with the battery charger in the 2x2 TDFN-6 package will result in a temperature of approximately +10.45°C (PCB mounted, infinite heat sink) above room temperature.

In the worst case (minimum PCB copper, natural convection), the temperature will increase by +50.1°C above the room temperature.

The actual junction temperature is described in equation 6-3:

**EQUATION 6-3:**

$$T_J = T_A + 10.45^\circ C + 0.55W \times \theta_{HA}$$

Where:

- $T_J$  = Junction Temperature
- $T_A$  = Ambient Temperature
- +10.45°C = Temperature Increase due to  $\theta_{JC}$
- $\theta_{HA}$  = Heat Sink to Ambient Thermal Resistance

The MCP73830/L devices are stable with or without a battery load. In order to maintain good AC stability in Constant Voltage mode, a minimum capacitance of 1 µF is recommended to bypass the V<sub>BAT</sub> pin to V<sub>SS</sub>. This capacitance provides compensation when there is no battery load. In addition, the battery and interconnections appear inductive at high frequencies. These elements are in the control feedback loop during Constant Voltage mode. Therefore, the bypass capacitance may be necessary to compensate for the inductive nature of the battery pack.

A minimum of 16V rated 1 µF is recommended to apply for the output capacitor and a minimum of 25V rated 1 µF is recommended to apply for the input capacitor for typical applications.

**TABLE 6-1: MLCC CAPACITOR EXAMPLE**

MLCC Capacitors	Temperature Range	Tolerance
X7R	-55°C to +125°C	±15%
X5R	-55°C to +85°C	±15%

Virtually any good quality output filter capacitor can be used independent of the capacitor's minimum Effective Series Resistance (ESR) value. The actual value of the capacitor (and its associated ESR) depends on the output load current. A 1  $\mu\text{F}$  ceramic, tantalum or aluminum electrolytic capacitor at the output is usually sufficient to ensure stability.

## 6.1.1.4 Reverse-Blocking Protection

The MCP73830/L devices provide protection from a faulted or shorted input. Without the protection, a faulted or shorted input would discharge the battery pack through the body diode of the internal pass transistor.

## 6.2 PCB Layout Issues

For optimum voltage regulation, place the battery pack as close as possible to the device's  $V_{\text{BAT}}$  and  $V_{\text{SS}}$  pins, which is recommended to minimize voltage drops along the high current carrying PCB traces.

If the PCB layout is used as a heat sink, adding many vias in the heat sink pad can help conduct more heat to the backplane of the PCB, thus reducing the maximum junction temperature. Figure 6-5 and Figure 6-6 depict a typical layout with PCB heat sinking.

**FIGURE 6-4:** Typical Layout (Top).

**FIGURE 6-5:** Typical Layout (Top Metal).

**FIGURE 6-6:** Typical Layout (Bottom).

## 7.0 PACKAGING INFORMATION

### 7.1 Package Marking Information

6-Lead TDFN (2x2 mm)

Part Number	Code
MCP73830T-2AAI/MYY	2AA
MCP73830LT-0AAI/MYY	0AA
MCP73830LT-0BCI/MYY	0BC

Example

<b>Legend:</b>	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC® designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.
<b>Note:</b>	In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.	

## 6-Lead Plastic Thin Dual Flat, No Lead Package (MY) – 2x2x0.8 mm Body [TDFN]

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

Microchip Technology Drawing C04-078A Sheet 1 of 2

# MCP73830/L

## 6-Lead Plastic Thin Dual Flat, No Lead Package (MY) – 2x2x0.8 mm Body [TDFN]

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

Dimension Limits	Units	MILLIMETERS		
		MIN	NOM	MAX
Number of Pins	N	6		
Pitch	e	0.50 BSC		
Overall Height	A	0.70	0.75	0.80
Standoff	A1	0.00	0.02	0.05
Contact Thickness	A3	0.20 REF		
Overall Width	E	2.00 BSC		
Exposed Pad Width	E2	0.55	0.60	0.65
Overall Length	D	2.00 BSC		
Exposed Pad Length	D2	1.55	1.60	1.65
Contact Width	b	0.25	0.30	0.35
Contact Length	L	0.20	0.25	0.30
Contact-to-Exposed Pad	K	0.20	-	-

**Notes:**

1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. Package may have one or more exposed tie bars at ends.
3. Package is saw singulated.
4. Dimensioning and tolerancing per ASME Y14.5M.  
BSC: Basic Dimension. Theoretically exact value shown without tolerances.  
REF: Reference Dimension, usually without tolerance, for information purposes only.

## APPENDIX A: REVISION HISTORY

### Revision E (August 2019)

The following is the list of modifications:

1. Updated [Section 1.0, "Electrical Characteristics"](#).
2. Updated [Section 5.0, "Detailed Description"](#).
3. Added label to [Figure 5-1](#).
4. Corrected charge current unit in [Figure 6-2](#).
5. Added clarifying information to [Figure 6-3](#).
6. Changed temperature value in power dissipation with the battery charger in the 2x2 TDFN-6 package.
7. Updated the ["Product Identification System"](#) page with information regarding additional factory options.

### Revision D (July 2014)

The following is the list of modifications:

1. Added the ["Available Factory Preset Options"](#) table.
2. Removed any mention of Fixed Elapse Timer having a disabled option.
3. Removed any mention of an option with no precondition timer.
4. Corrected the flow-chart in [Figure 4-1](#), specifying STAT = High Z in the Charge Complete Mode text box.
5. Updated [Table 5-1.lab](#)
6. Added the [Section 6.1.1.2, "Input Overvoltage Protection \(IOVP\)"](#).
7. Added [Figure 6-3](#).

### Revision C (August 2013)

The following is the list of modifications:

1. Updated the ["Temperature Specifications"](#) table.
2. Updated [Section 6.1.1.3, "Thermal Considerations"](#).

### Revision B (December 2011)

The following is the list of modifications:

1. Updated [Figure 4-1](#).
2. Removed the MCP73830 and MCP73830L options from the ["Product Identification System"](#) section.

### Revision A (September 2011)

- Original release of this document.

# MCP73830/L

---

NOTES:

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

<u>PART NO.</u>	<u>-XXX</u>	<u>X</u>	<u>XX</u>				
Device	Standard Options	Temperature Range	Package				
<p><b>Device:</b> MCP73830T: Single-Cell Li-Ion/Li-Polymer Battery Device, Tape and Reel  MCP73830/LT: Single-Cell Li-Ion/Li-Polymer Battery Device, Tape and Reel</p>							
<b>Standard Options:</b>		$I_{REG}$ (mA)	$V_{REG}$ (V)	$I_{PRECONDITION}$ (%)	$V_{PRECONDITION}$ (%)	$I_{TERM}$ (%)	$R_{TH}$ (%)
MCP73830LT	0AA	200	4.2	10	71.5	7.5	96.5
MCP73830LT	0BC	200	4.2	100	71.5	10	96.5
MCP73830T	2AA	1000	4.2	10	71.5	7.5	96.5
<b>Temperature Range:</b>	I = -40°C to +85°C (Industrial)						
<b>Package:</b>	MY = Plastic Thin Dual Flat, No Lead Package, 2x2x0.8 mm Body (TDFN), 6-Lead *Y = Nickel gold manufacturing designator. Only available on the TDFN package.						

### Examples:

- a) MCP73830T-2AAI/MYY: Tape and Reel, Single-Cell Li-Ion/Li-Polymer Battery Device
- b) MCP73830T-0AAI/MYY: Tape and Reel, Single-Cell Li-Ion/Li-Polymer Battery Device
- c) MCP73830LT-0BCI/MYY: Tape and Reel, Single-Cell Li-Ion/Li-Polymer Battery Device

Contact sales for additional factory options.

NOTES:

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
