

# MIC2786/7/8/9 Evaluation Board

## Push-Button Reset IC

### General Description

The MIC2786/7/8/9 are low-current, ultra-small, push-button reset supervisors with long set-up delays. All the devices feature two manual reset inputs and two reset outputs. The devices initiate a reset for the reset timeout period when the /MR0 and /MR1 inputs are asserted low for a period longer than the set-up delay.

In addition, the MIC2786 and MIC2787 feature an integrated supply voltage monitor. Reset will be asserted for the reset timeout delay once the supply voltage increases above the rising threshold voltage.

The MIC2786 and MIC2788 feature integrated pull-up resistors on the /MR0 and /MR1 inputs, while the MIC2787 and MIC2789 require external pull-up resistors. The PDY input pin selects between a 2s, 4s, or 6s set-up period. Factory-programmed reset timeout periods of 140ms (minimum) and 240ms (minimum) are available.

The MIC2788-XYMT EV Evaluation Board comes with the MIC2788-XYMT ( $t_{\text{RESET}} = 140\text{ms}$ ) installed, but it can also be used to evaluate the MIC2786, MIC2787 and MIC2789. Contact Micrel or an authorized distributor for samples and simply replace the chip on board, as these devices are all pin-to-pin compatible.

For the MIC2787 and MIC2789, positions R1 and R2 will need to be populated with 100k $\Omega$  resistors.

Datasheets and support documentation can be found on Micrel's web site at: [www.micrel.com](http://www.micrel.com).

### Requirements

The MIC2788 Evaluation Board requires only a single power supply that is capable of delivering greater than 1mA at a voltage range of 1.5V to 5.5V. An oscilloscope can be used to view and measure the inputs and outputs.

### Precautions

There is no reverse input protection on this board. While connecting supplies and signals ensure that correct polarities are observed. The maximum operating VIN is rated at 5.5V.

### Getting Started

#### 1. VIN Supplies

Connect a supply to the VIN and GND terminals, paying careful attention to the polarity and the supply range ( $1.5\text{V} \leq \text{VIN} \leq 5.5\text{V}$ ). An ammeter may be placed between the input supply and the VIN terminal to the evaluation board. Ensure that the supply voltage is monitored at the VIN terminal. The ammeter can reduce the voltage supplied to the input.

#### 2. Connect PDY Pin (J5)

Connect the programmable delay input (PDY) pin according to desired set-up delay. Leave PDY pin open for setup-delay of 2s, connect to GND for set-up delay of 4s or connect to VIN for set-up delay of 6s.

#### 3. Monitor Inputs and Outputs

Monitor the inputs (/MR0 and /MR1) and outputs (/RST and RSTP) with an oscilloscope.

#### 4. Turn on the Power

Turn on the power supply. Observe that /MR0, /MR1 and /RST are pulled up to VIN while RSTP remains at 0V.

#### 5. Press Push-Buttons

Press push-button inputs /MR0 and /MR1 and observe /RST and RSTP outputs. Keeping the push-button inputs asserted low for the programmed setup delay time initiates one reset output pulse for the reset timeout delay period.

### Ordering Information

Part Number	Description
MIC2788-XYMT EV	MIC2788 Evaluation Board

## Evaluation Board Features

See the MIC2788/MIC2789 datasheet for detailed explanations of these functions. For detailed operation of the MIC2786/MIC2787 see the MIC2786/MIC2787 datasheet.

### Programmable Delay Pin (PDY)

Use Table 1 to program the PDY pin for desired set-up delay time.

PDY Configuration (J5)	$t_{SETUP}$
OPEN	2s
GND	4s
$V_{IN}$	6s

Table 1. PDY Configuration for Desired Set-Up Delay

Figures 1, 2 and 3 illustrate manual reset function for set-up delays as per PDY pin connection.

Figure 1. Manual Reset Function for 2.0s Set-Up Delay (PDY = OPEN)

Figure 2. Manual Reset Function for 4.0s Set-Up Delay (PDY = GND)

Figure 3. Manual Reset Function for 6.0s Set-Up Delay (PDY = VIN)

### Dual Manual Reset Inputs (/MR0, /MR1)

The manual reset inputs can be operated manually using the push-buttons provided or by connecting a function generator. Test points J1 – J4 are provided on the manual reset inputs for connecting to a function generator and monitoring on an oscilloscope simultaneously.

### Reset Outputs (/RST, RSTP)

The /RST output has a 100kΩ pull-up resistor to  $V_{IN}$ . Test-point J7 is provided for monitoring the /RST signal on an oscilloscope. The RSTP output can be monitored directly by an oscilloscope connected to the test-point J6.

### Evaluation Board Schematic

\*RESISTORS R1 AND R2 ARE REQUIRED FOR MIC2787 AND MIC2789. R1 AND R2 ARE NOT REQUIRED FOR MIC2786 AND MIC2788.
