PIC32MZ Graphics (DA) Family

32-bit Graphics Applications MCUs (up to 2 MB Live Update Flash, 640 KB SRAM, and 32 MB DDR2 SDRAM) with XLP Technology

Operating Conditions
- -40ºC to +85ºC, DC to 200 MHz
  - VDDIO = 2.2V to 3.6V
  - VDDCORE = 1.7V to 1.9V

Core: 200 MHz / 330 DMIPS MIPS32® microAptiv™
- 32 KB I-Cache, 32 KB D-Cache
- MMU for optimum embedded OS execution
- microMIPS™ mode for up to 35% smaller code size
- DSP-enhanced core:
  - Four 64-bit accumulators
  - Single-cycle MAC, saturating and fractional math
- Code-efficient (C and Assembly) architecture

Clock Management
- Programmable PLLs and oscillator clock sources
- Dedicated PLL for DDR2
- Fail-Safe Clock Monitor
- Independent Watchdog and Deadman Timers
- Fast wake-up and start-up

Power Management
- Various power management options for extreme power reduction (V_{BAT}, Deep Sleep, Sleep and Idle)
- Deep Sleep current: < 1 µA (typical)
- Integrated POR and BOR
- Programmable High/Low-Voltage Detect (HLVD) on V_{DDIO} and High-Voltage Detect (HVD) on V_{DDR1V8}

Memory Interfaces
- DDR2 SDRAM interface (up to DDR2-400)
- SD/SDIO/eMMC bus interface (up to 50 MHz)
- Serial Quad Interface (up to 80 MHz)
- External Bus Interface (up to 50 MHz)

Graphics Features
- 3-layer Graphics Controller with up to 24-bit color support
- High-performance 2D Graphics Processing Unit (GPU)

Audio Interfaces
- Audio data communication: I^2S, LJ, and RJ
- Audio control interfaces: SPI and I^2C
- Audio host clock: Fractional clock frequencies with USB synchronization

High-Speed Communication Interfaces (with Dedicated DMA)
- USB 2.0-compliant High-Speed On-The-Go (OTG) controller
- 10/100 Mbps Ethernet MAC with MII and RMII interface

Security Features
- Crypto Engine with a RNG for data encryption/decryption and authentication (AES, 3DES, SHA, MD5, and HMAC)
- Advanced memory protection:
  - Peripheral and memory region access control

Direct Memory Access (DMA)
- Eight channels with automatic data size detection
- Programmable Cyclic Redundancy Check (CRC)

Advanced Analog Features
- 12-bit ADC modules:
  - 18 Msps with up to six ADC circuits (five dedicated and one shared)
  - Up to 45 analog input
  - Can operate during Sleep and Idle modes
  - Multiple trigger sources
  - Six Digital Comparators and six Digital Filters
- Two Comparators with 32 programmable voltage references
- Temperature sensor with ±2ºC accuracy
- Charge Time Measurement Unit (CTMU)

Communication Interfaces
- Two CAN modules (with dedicated DMA channels):
  - 2.0B Active with DeviceNet™ addressing support
- Six UART modules (25 Mbps):
  - Supports up to LIN 2.1 and IrDA® protocols
- Six 4-wire SPI modules (up to 50 MHz)
- SQI configurable as additional SPI module (up to 80 MHz)
- Five I^2C modules (up to 1 Mbaud) with SMBus support
- Parallel Host Port (PMP)
- Peripheral Pin Select (PPS) to enable function remap

Timers/Output Compare/Input Capture
- Nine 16-bit and up to four 32-bit timers/counters
- Nine Output Compare (OC) modules
- Nine Input Capture (IC) modules
- Real-Time Clock and Calendar (RTCC) module

Input/Output
- 5V-tolerant pins with up to 32 mA source/sink
- Selectable open drain, pull-ups, and pull-downs
- Selectable slew rate control
- External interrupts on all I/O pins
- PPS to enable function remap

Qualification and Class B Support
- Class B Safety Library, IEC 60730
- Back-up internal oscillator

Debugger Development Support
- In-circuit and in-application programming
- 4-wire MIPS® Enhanced JTAG interface
- Unlimited software and 12 complex breakpoints
- IEEE 1149.2-compatible (JTAG) boundary scan
- Non-intrusive hardware-based instruction trace

Integrated Software Libraries and Tools
- C/C++ compiler with native DSP/fractional support
- MPLAB® Harmony Integrated Software Framework
- TCP/IP, USB, Graphics, and mTouch™ middleware
- MFi, Android™, and Bluetooth® audio frameworks
- RTOS Kernels: Express Logic ThreadX, FreeRTOS™, OPENRTOS®, Micriμm® µC/OS™, and SEGGER embOS®

Packages

Type	LFBGA		LQFP
Pin Count	169	288	176
I/O Pins (up to)	120	120	120
Contact/Lead Pitch	0.8 mm	0.8 mm	0.4 mm
Dimensions	11x11 mm	15x15 mm	20x20 mm

TABLE 1: PIC32MZ DA FEATURES COMMON TO ALL DEVICES

Boot Flash Memory (KB)	Remappable Peripherals						12-bit ADC Channels	Analog Comparators	CTMU	USB 2.0 HS OTG	I²C	GLCD	GPU	EBI	PMP	SQI	SDHC	RTCC	Ethernet	I/O Pins	JTAG	Trace

TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at **docerrors@microchip.com**. We welcome your feedback.

Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

http://www.microchip.com

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; **http://www.microchip.com**
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

Customer Notification System

Register on our web site at **www.microchip.com** to receive the most current information on all of our products.

Referenced Sources

This device data sheet is based on the following individual sections of the *"PIC32 Family Reference Manual"*. These documents should be considered as the general reference for the operation of a particular module or device feature.

Note: To access the following documents, refer to the *Documentation > Reference Manuals* section of the Microchip PIC32 website: http://www.microchip.com/pic32.

1.0 DEVICE OVERVIEW

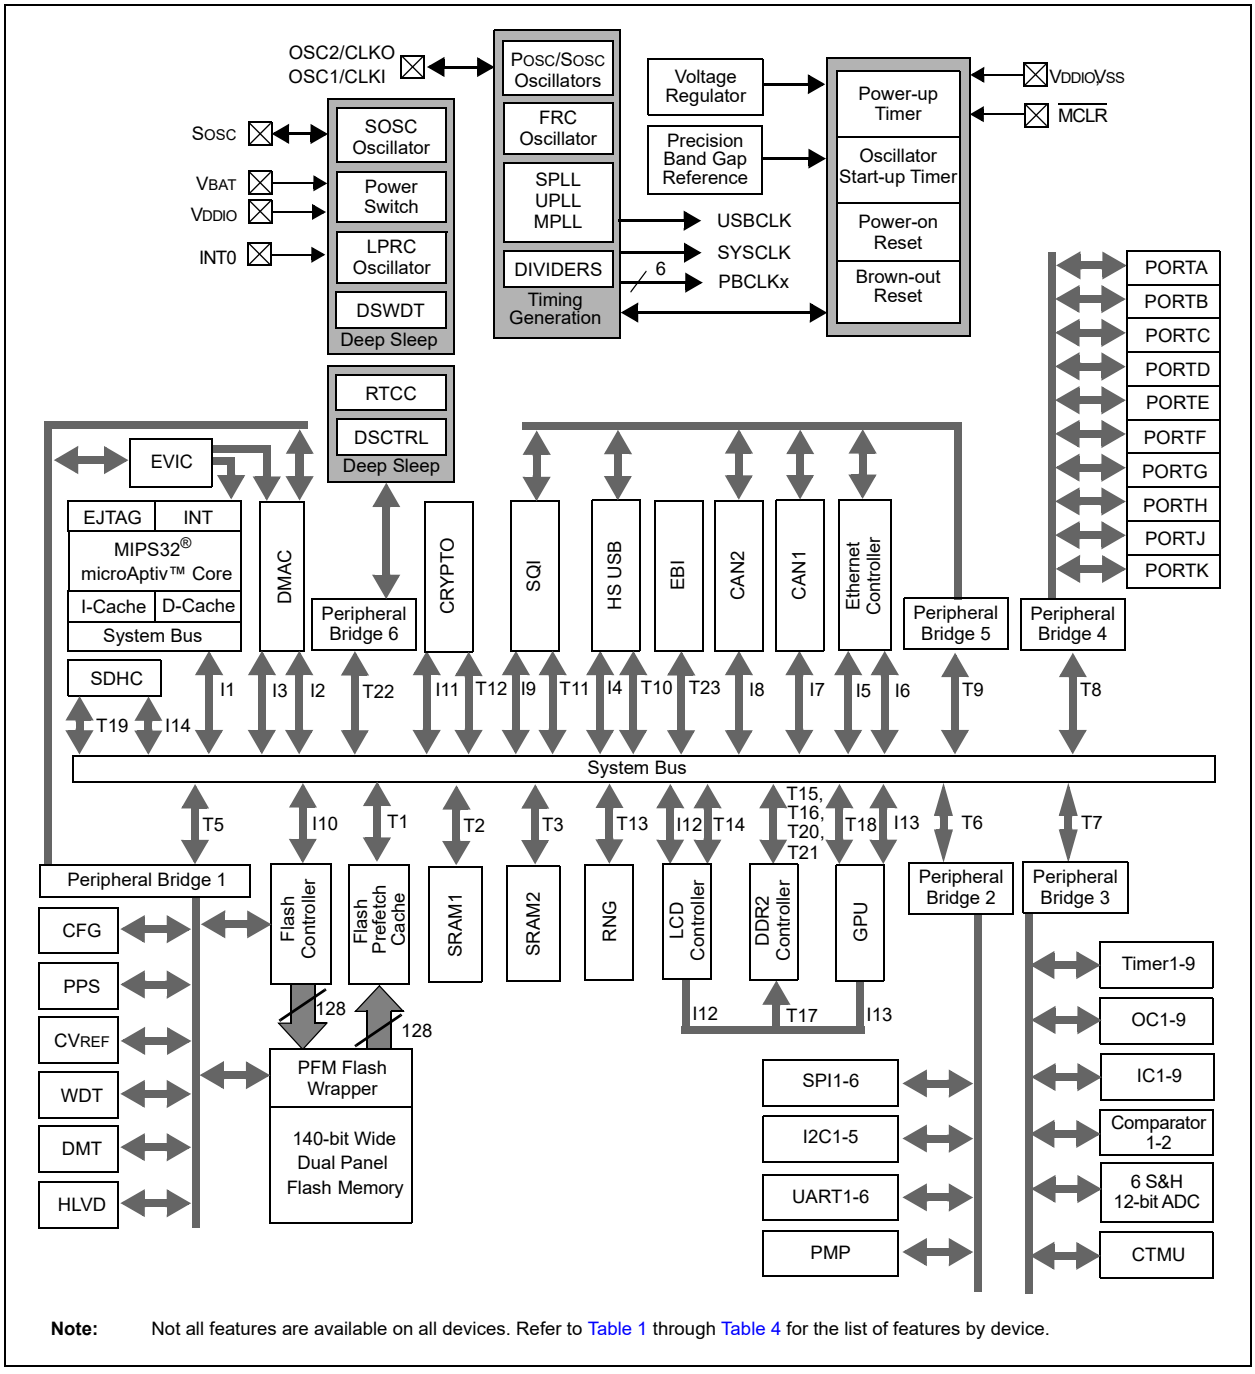
Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the documents listed in the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

This data sheet contains device-specific information for the PIC32MZ DA family of devices.

Figure 1-1 illustrates a general block diagram of the core and peripheral modules in the PIC32MZ DA family of devices.

Table 1-1 through Table 1-24 list the pinout I/O descriptions for the pins shown in the device pin tables (see Table 5 through Table 7).

FIGURE 1-1: PIC32MZ DA FAMILY BLOCK DIAGRAM



Note: Not all features are available on all devices. Refer to Table 1 through Table 4 for the list of features by device.

TABLE 1-1: ADC PINOUT I/O DESCRIPTIONS

Pin Name	Pin Number			Pin Type	Buffer Type	Description
	169-pin LFBGA	176-pin LQFP	288-pin LFBGA			
Analog-to-Digital Converter						
AN0	C12	169	D18	I	Analog	Analog Input Channels
AN1	A13	172	C17	I	Analog

ST = Schmitt Trigger input with CMOS levels; O = Output; I = Input
TTL = Transistor-transistor Logic input buffer; PPS = Peripheral Pin Select

TABLE 1-2: OSCILLATOR PINOUT I/O DESCRIPTIONS

Pin Name	Pin Number			Pin Type	Buffer Type	Description
	169-pin LFBGA	176-pin LQFP	288-pin LFBGA			
Oscillators						
CLKI	E12	164	G17	I	ST/CMOS	External clock source input. Always associated with OSC1 pin function.
CLKO	E13	163	G18	O		Oscillator crystal output. Connects to crystal or resonator in Crystal Oscillator mode. Optionally functions as CLKO in RC and EC modes. Always associated with OSC2 pin function.
OSC1	E12	164	G17	I	ST/CMOS	Oscillator crystal input. ST buffer when configured in RC mode; CMOS otherwise.
OSC2	E13	163	G18	O		Oscillator crystal output. Connects to crystal or resonator in Crystal Oscillator mode. Optionally functions as CLKO in RC and EC modes.
SOSCI	C13	162	H17	I	ST/CMOS	32.768 kHz low-power oscillator crystal input; CMOS otherwise.
SOSCO	D13	161	H18	O	ST/CMOS	32.768 low-power oscillator crystal output. In external clock mode, SOSCO is the input. The secondary oscillator must be disabled in order to use the SOSCO as an input.
REFCLKI1	PPS	PPS	PPS	I	—	Reference Clock Generator Inputs 1-4
REFCLKI3	PPS	PPS	PPS	I	—	
REFCLKI4	PPS	PPS	PPS	I	—	
REFCLKO1	PPS	PPS	PPS	O	—	Reference Clock Generator Outputs 1-4
REFCLKO3	PPS	PPS	PPS	O	—	
REFCLKO4	PPS	PPS	PPS	O	—	

Legend: CMOS = CMOS-compatible input or output; Analog = Analog input; P = Power
ST = Schmitt Trigger input with CMOS levels; O = Output; I = Input
TTL = Transistor-transistor Logic input buffer; PPS = Peripheral Pin Select

TABLE 1-3: IC1 THROUGH IC9 PINOUT I/O DESCRIPTIONS

Pin Name	Pin Number			Pin Type	Buffer Type	Description
	169-pin LFBGA	176-pin LQFP	288-pin LFBGA			
Input Capture						
IC1	PPS	PPS	PPS	I	ST	Input Capture Inputs 1-9
IC2	PPS	PPS	PPS	I	ST	
IC3	PPS	PPS	PPS	I	ST

2.0 GUIDELINES FOR GETTING STARTED WITH 32-BIT MICROCONTROLLERS

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the documents listed in the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

2.1 Basic Connection Requirements

Getting started with the PIC32MZ DA family of 32-bit Microcontrollers (MCUs) requires attention to a minimal set of device pin connections before proceeding with development. The following is a list of pin names, which must always be connected:

- All VDDIO, VDDCORE, and VSS pins (see **2.2 "Decoupling Capacitors"**)
- All AVDD and AVSS pins, even if the ADC module is not used (see **2.2 "Decoupling Capacitors"**)
- VBAT pin (see **2.2 "Decoupling Capacitors"**)
- All VDDR1V8 and VSS1V8 pins (see **2.2 "Decoupling Capacitors"**)
- $\overline{\text{MCLR}}$ pin (see **2.3 "Master Clear (MCLR) Pin"**)
- PGECx/PGEDx pins, used for In-Circuit Serial Programming (ICSP™) and debugging purposes (see **2.4 "ICSP Pins"**)
- OSC1 and OSC2 pins, when external oscillator source is used (see **2.7 "External Oscillator Pins"**)

The following pin(s) may be required as well:

VREF+/VREF- pins, used when external voltage reference for the ADC module is implemented.

Note: The AVDD and AVSS pins must be connected, regardless of ADC use and the ADC voltage reference source.

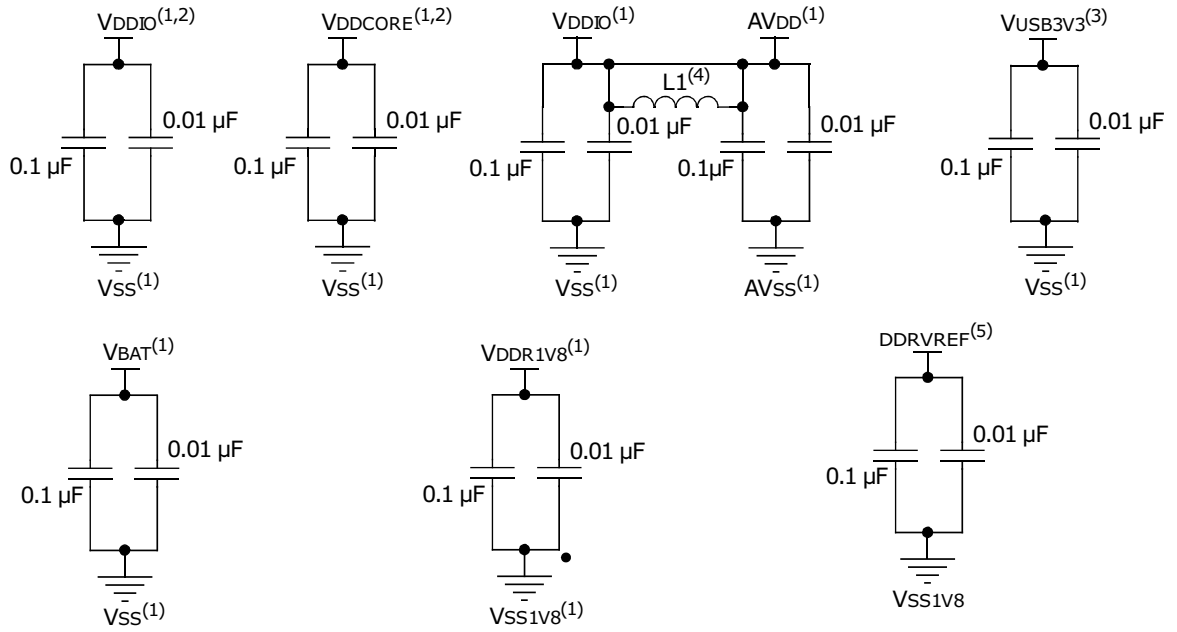
2.2 Decoupling Capacitors

The use of decoupling capacitors on power supply pins, such as VDDIO, VSS, AVDD and AVSS is required. See Figure 2-1.

Consider the following criteria when using decoupling capacitors:

- **Value and type of capacitor:** It is recommended that two parallel capacitors with a value of 0.1 µF (100 nF, 10-20V) and a value of 0.01 µF be used. The 0.1 µF capacitor should be a low Equivalent Series Resistance (low-ESR) capacitor and have resonance frequency in the range of 20 MHz and higher. Place both capacitors in close proximity and consider implementing the pair of capacitances as close to the power and ground pins as possible. It is further recommended that ceramic capacitors be used.
- **Placement on the printed circuit board:** The decoupling capacitors should be placed as close to the pins as possible. It is recommended that the capacitors be placed on the same side of the board as the device. If space is constricted, the capacitor can be placed on another layer on the PCB using a via; however, ensure that the trace length from the pin to the capacitor is within one-quarter inch (6 mm) in length.
- **Maximizing performance:** On the board layout from the power supply circuit, run the power and return traces to the decoupling capacitors first, and then to the device pins. This ensures that the decoupling capacitors are first in the power chain. Equally important is to keep the trace length between the capacitor and the power pins to a minimum thereby reducing PCB track inductance.

FIGURE 2-1: RECOMMENDED MINIMUM CONNECTION



Note 1: There are multiple power and ground pairs and minimum connection rules which apply for each power pin (i.e., VDDIO, VDDCORE, AVDD, VUSB3V3, VBAT, VDDR1V8) and each ground pin (VSS, AVSS, VSS1V8).

2: Voltage on VDDIO must always be greater than or equal to VDDCORE during power-up.

3: If the USB module is not used, this pin must be connected to VSS.

4: As an option, instead of a hard-wired connection, an inductor (L1) can be substituted between VDDIO and AVDD to improve ADC noise rejection. The inductor impedance should be less than 1Ω and the inductor capacity greater than 10 mA.

5: This pin is a no connect in devices without DDR.

Where:

$$f = \frac{FCNV}{2}$$ (i.e., ADC conversion rate/2)

$$f = \frac{1}{(2\pi\sqrt{LC})}$$

$$L = \left(\frac{1}{(2\pi f\sqrt{C})}\right)^2$$

2.2.1 BULK CAPACITORS

The use of a bulk capacitor on VDDIO and VDDCORE is recommended to improve power supply stability. Typical values range from 4.7 µF to 47 µF. This capacitor should be located as close to the device as possible.

2.3 Master Clear (MCLR) Pin

The MCLR pin provides for two specific device functions:

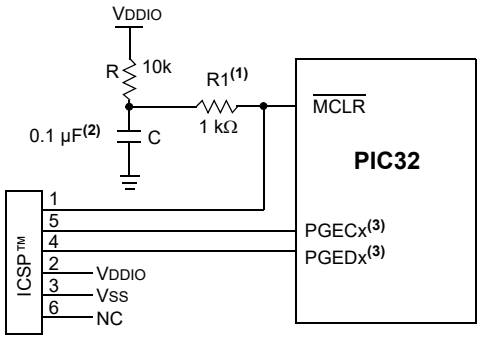
- Device Reset
- Device programming and debugging

Pulling The MCLR pin low generates a device Reset. Figure 2-2 illustrates a typical MCLR circuit. During device programming and debugging, the resistance and capacitance that can be added to the pin must be considered. Device programmers and debuggers drive the MCLR pin. Consequently, specific voltage levels (VIH and VIL) and fast signal transitions must not be adversely affected. Therefore, specific values of R and C will need to be adjusted based on the application and PCB requirements.

For example, as illustrated in Figure 2-2, it is recommended that the capacitor C be isolated from the MCLR pin during programming and debugging operations.

Place the components illustrated in Figure 2-2 within one-quarter inch (6 mm) from the MCLR pin.

FIGURE 2-2: EXAMPLE OF MCLR PIN CONNECTIONS



Note 1: 470W ≤ R1 ≤ 1KΩ will limit any current flowing into MCLR from the external capacitor C, in the event of MCLR pin breakdown, due to Electrostatic Discharge (ESD) or Electrical Overstress (EOS). Ensure that the MCLR pin VIH and VIL specifications are met without interfering with the Debug/Programmer tools.

2: The capacitor can be sized to prevent unintentional Resets from brief glitches or to extend the device Reset period during POR.

3: No pull-ups or bypass capacitors are allowed on active debug/program PGECx/PGEDx pins.

2.4 ICSP Pins

The PGECx and PGEDx pins are used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes. It is recommended to keep the trace length between the ICSP connector and the ICSP pins on the device as short as possible. If the ICSP connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of Ohms, not to exceed 100 Ohms.

Pull-up resistors, series diodes and capacitors on the PGECx and PGEDx pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin input voltage high (VIH) and input low (VIL) requirements.

Ensure that the "Communication Channel Select" (i.e., PGECx/PGEDx pins) programmed into the device matches the physical connections for the ICSP to MPLAB® ICD 3 or MPLAB REAL ICE™.

For additional information on ICD 3 and REAL ICE connection requirements, refer to the following documents that are available for download from the Microchip web site, www.microchip.com:

- *"Using MPLAB® ICD 3"* (poster) (DS50001765)
- *"MPLAB® ICD 3 Design Advisory"* (DS50001764)
- *"MPLAB® REAL ICE™ In-Circuit Debugger User's Guide" (*DS50001616)
- *"Using MPLAB® REAL ICE™ Emulator"* (poster) (DS50001749)

2.5 JTAG

The TMS, TDO, TDI and TCK pins are used for testing and debugging according to the Joint Test Action Group (JTAG) standard. It is recommended to keep the trace length between the JTAG connector and the JTAG pins on the device as short as possible. If the JTAG connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of Ohms, not to exceed 100 Ohms.

Pull-up resistors, series diodes and capacitors on the TMS, TDO, TDI and TCK pins are not recommended as they will interfere with the programmer or debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin input voltage high (VIH) and input low (VIL) requirements.

2.6 Trace

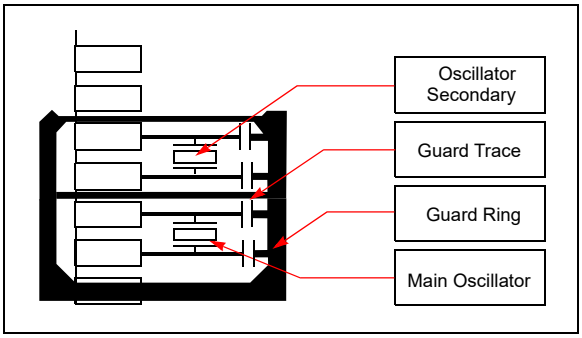
The trace pins can be connected to a hardware trace-enabled programmer to provide a compressed real-time instruction trace. When used for trace, the TRD3, TRD2, TRD1, TRD0 and TRCLK pins should be dedicated for this use. The trace hardware requires a 22 Ohm series resistor between the trace pins and the trace connector.

2.7 External Oscillator Pins

Many MCUs have options for at least two oscillators: a high-frequency primary oscillator and a low-frequency secondary oscillator (refer to **Section 8.0 "Oscillator Configuration"** for details).

The oscillator circuit should be placed on the same side of the board as the device. Also, place the oscillator circuit close to the respective oscillator pins, not exceeding one-half inch (12 mm) distance between them. The load capacitors should be placed next to the oscillator itself, on the same side of the board. Use a grounded copper pour around the oscillator circuit to isolate them from surrounding circuits. The grounded copper pour should be routed directly to the MCU ground. Do not run any signal traces or power traces inside the ground pour. Also, if using a two-sided board, avoid any traces on the other side of the board where the crystal is placed. A suggested layout is illustrated in Figure 2-3.

FIGURE 2-3: SUGGESTED OSCILLATOR CIRCUIT PLACEMENT



2.7.1 CRYSTAL OSCILLATOR DESIGN CONSIDERATION

The following example assumptions are used to calculate the Primary Oscillator loading capacitor values:

- CIN = PIC32_OSC2_pin capacitance = 4 pF
- COUT = PIC32_OSC1_pin capacitance = 4 pF
- PCB stray capacitance (i.e., 12 mm length) = 2.5 pF
- C1 and C2 are the loading capacitors to use on your Crystal circuit design to guarantee that the effective capacitance as seen by the crystal in circuit meets the crystal manufacturer specification.

From the Crystal manufacturer CLOAD spec:

CLOAD = {([Cin + C1] * [COUT + C2]) / [Cin + C1 + C2 + COUT] } + oscillator PCB stray capacitance

EXAMPLE 2-1: CRYSTAL LOAD CAPACITOR CALCULATION

Crystal manufacturer data sheet spec example: CLOAD = 15 pF

Therefore:

MFG CLOAD = {([CIN + C1] * [COUT + C2]) / [CIN + C1 + C2 + COUT] }
+ estimated oscillator PCB stray capacitance

Assuming C1 = C2 and PIC32 Cin = Cout, the formula can be further simplified and restated to solve for C1 and C2 by:

C1 = C2 = ((2 * MFG Cload spec) - Cin - (2 * PCB capacitance))
= ((2 * 15) - 4 - (2 * 2.5 pF))
= (30 - 4 - 5)
= 21 pF

Therefore:

C1 = C2 = 21 pF is the correct loading capacitors to use on your crystal circuit design to guarantee that the effective capacitance as seen by the crystal in circuit in this example is 15 pF to meet the crystal.

Note: Do not add excessive gain such that the oscillator signal is clipped flat on top of the sine wave. If your oscillator signal is clipped, reduce the gain or add a series resistor (RS) as shown in the "Circuit A" of the Figure 2-4. Failure to do so will stress and reduce the lifetime of the crystal, which might result in a premature failure. When measuring the oscillator signal, the user must use an active-powered scope probe with ≤ 1 pF or the scope probe itself will unduly change the gain and Peak-to-Peak oscillator signal levels.

Note: For recommended resistor values versus crystal/frequency, Refer to the *"PIC32MK GP/MC Family Silicon Errata and Data Sheet Clarification"* (DS80000737), which is available for download from the Microchip web site (www.microchip.com).

2.8 Unused I/Os

Unused I/O pins should not be allowed to float as inputs. They can be configured as outputs and driven to a logic-low state.

Alternatively, inputs can be reserved by connecting the pin to Vss through a 1k to 10k resistor and configuring the pin as an input.

2.9 Considerations When Interfacing to Remotely Powered Circuits

2.9.1 NON-5V TOLERANT INPUT PINS

A quick review of the absolute maximum rating section in **44.0 "Electrical Characteristics"** indicates that the voltage on any non-5v tolerant pin should not exceed VDD + 0.3V, unless the input current is limited to meet the respective injection current specifications defined by the parameters DI60a, DI60b, and DI60c as shown in Table 44-12.

Figure 2-5 illustrates a remote circuit using an independent power source, which is powered while connected to a PIC32 non-5V tolerant circuit that is not powered.

Without a proper signal isolation on non-5V tolerant pins, the remote signal can power the PIC32 device through the high side ESD protection diodes. Besides violating the absolute maximum rating specification when VDD of the PIC32 device is restored and ramping up or ramping down, it can also negatively affect the internal Power-on Reset (POR) and Brown-out Reset (BOR) circuits, which can lead to improper initialization of internal PIC32 logic circuits. In these cases, it is recommended to implement digital or analog signal isolation as shown in Figure 2-6. This is indicative of all industry microcontrollers and not just Microchip products.

FIGURE 2-5: PIC32 NON-5V TOLERANT CIRCUIT EXAMPLE

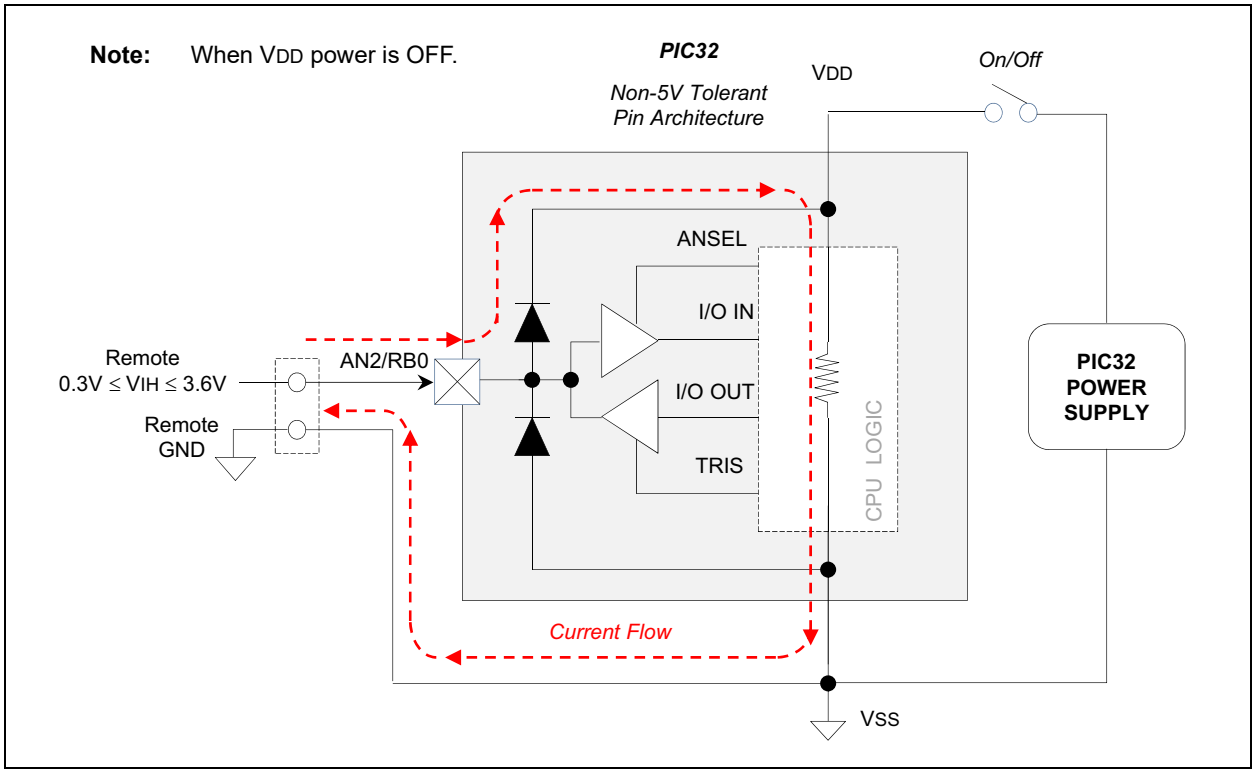

TABLE 2-1: EXAMPLES OF DIGITAL/ ANALOG ISOLATORS WITH OPTIONAL LEVEL TRANSLATION

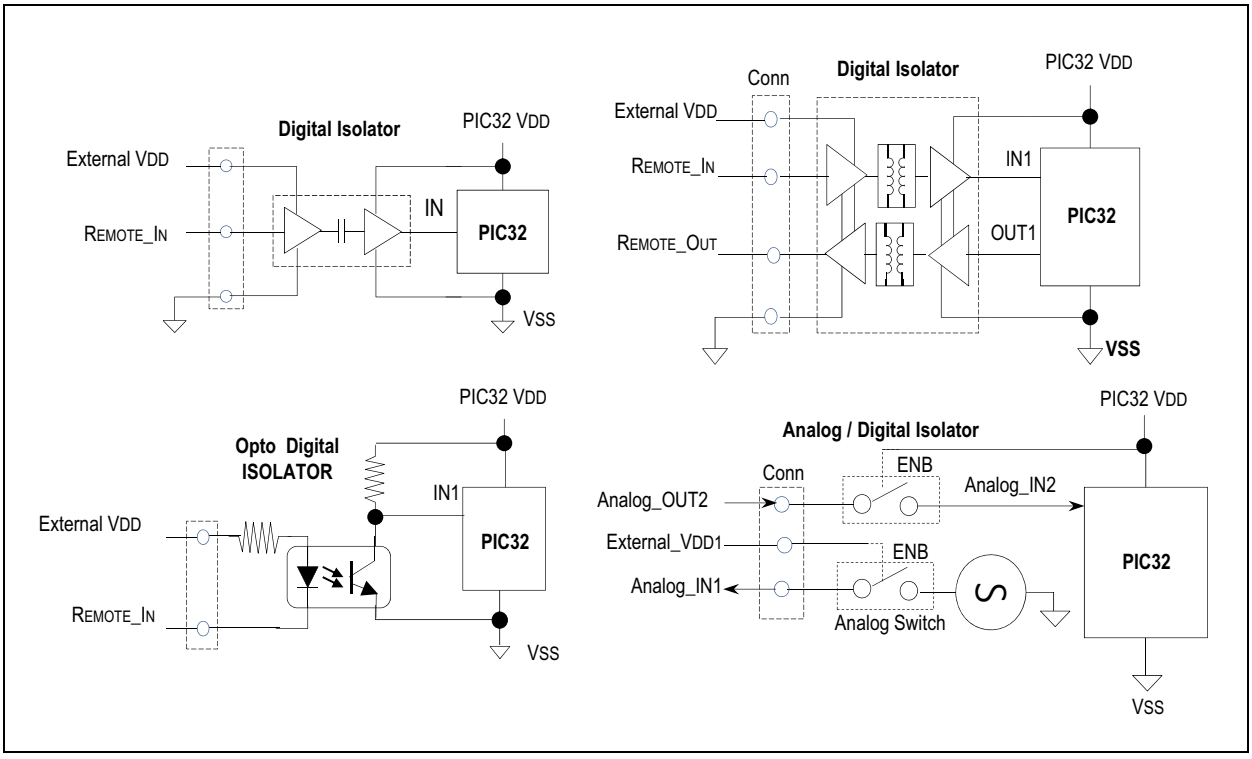
FSA266 / NC7WB66	—	—	—	X

FIGURE 2-6: EXAMPLE DIGITAL/ANALOG SIGNAL ISOLATION CIRCUITS

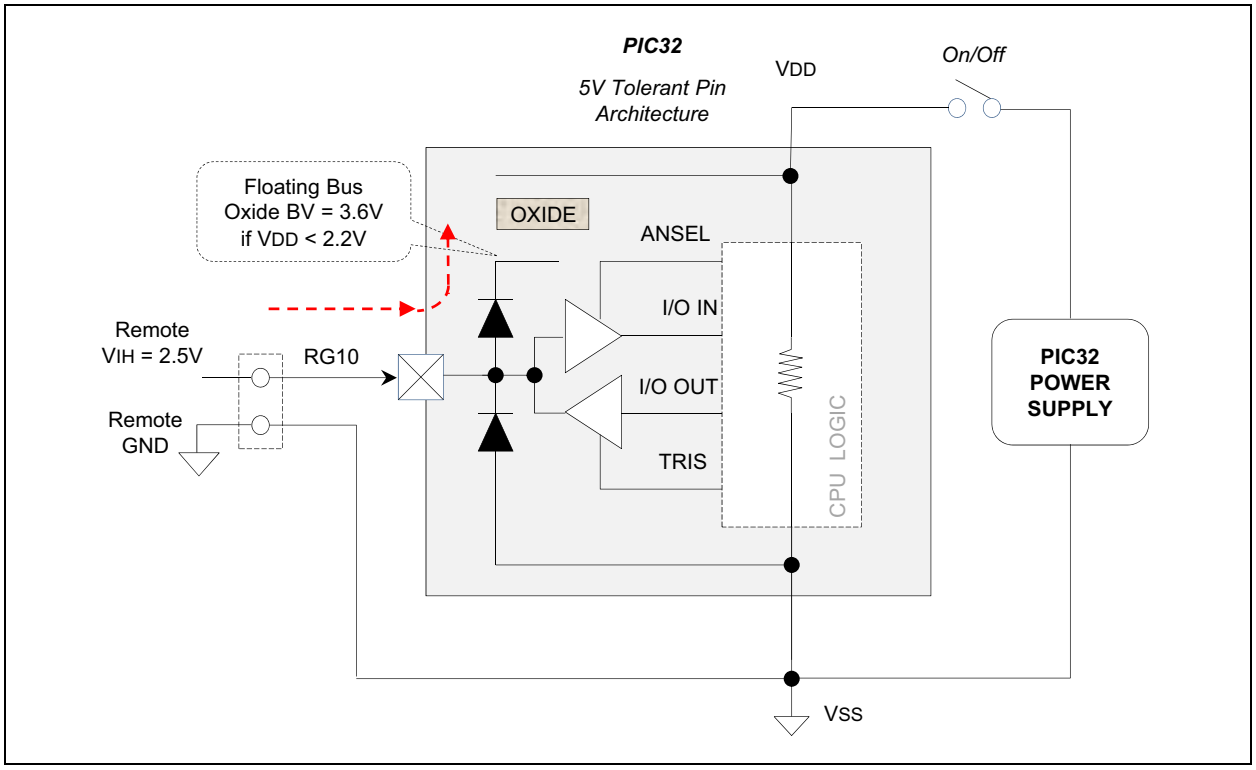


2.9.2 5V TOLERANT INPUT PINS

The internal high side diode on 5V tolerant pins are bussed to an internal floating node, rather than being connected to VDDIO, as shown in Figure 2-7. The voltage on these pins, if VDDIO < 2.2V (usually during power up or power down), should not exceed 3.2V relative to VSS of the PIC32 device. The voltage of 3.6V or higher will (when VDDIO < 2.2V) violate the absolute maximum specification and will stress the oxide layer separating the high side floating node, which impacts device reliability.

If a remotely powered "digital-only" signal can be guaranteed to be ≤ 3.2V relative to Vss on the PIC32 device side, a 5V tolerant pin can be used without the need for a digital isolator. This is assuming there is no ground loop issue, that is, the logic ground of the two circuits are not at the same absolute level, and remote logic low input is not less than VSS - 0.3V. Once VDDIO is >2.2V, the pin can be operated up to 5.5V.

FIGURE 2-7: PIC32 5V TOLERANT PIN ARCHITECTURE EXAMPLE



2.10 Designing for High-Speed Peripherals

The PIC32MZ DA family devices have peripherals that operate at frequencies much higher than typical for an embedded environment. Table 2-2 lists the peripherals that produce high-speed signals on their external pins:

TABLE 2-2: PERIPHERALS THAT PRODUCE HS SIGNALS ON EXTERNAL PINS

Peripheral	High-Speed Signal Pins	Maximum Speed on Signal Pin
DDR2 SDRAM Controller	$\overline{\text{DDRCLK}}$, DDRCLK, $\overline{\text{DDRUDQS}}$, DDRUDQS, $\overline{\text{DDRLDQS}}$, DDRLDQS, DDRAx	200 MHz
	DDRDx	400 MHz
EBI	EBIAx, EBIDx	50 MHz
HS USB	D+, D-	480 MHz
SDHC	SDCK, DATAx	50 MHz
SQI	SQICLK, SQIDx	80 MHz

Due to these high-speed signals, it is important to consider several factors when designing a product that uses these peripherals, as well as the PCB on which these components will be placed. Adhering to these recommendations will help achieve the following goals:

- Minimize the effects of electromagnetic interference to the proper operation of the product
- Ensure signals arrive at their intended destination at the same time
- Minimize crosstalk
- Maintain signal integrity
- Reduce system noise
- Minimize ground bounce and power sag

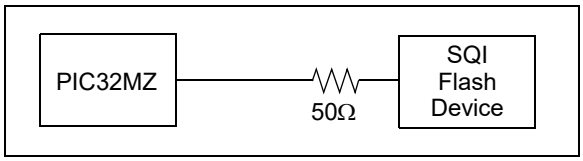
2.10.1 SYSTEM DESIGN

2.10.1.1 Impedance Matching

When selecting parts to place on high-speed buses, particularly the SQI bus, if the impedance of the peripheral device does not match the impedance of the pins on the PIC32MZ DA device to which it is connected, signal reflections could result, thereby degrading the quality of the signal.

If it is not possible to select a product that matches impedance, place a series resistor at the load to create the matching impedance, see Figure 2-8 for an example.

FIGURE 2-8: SERIES RESISTOR



2.10.1.2 PCB Layout Recommendations

The following list contains recommendations that will help ensure the PCB layout will promote the goals previously listed.

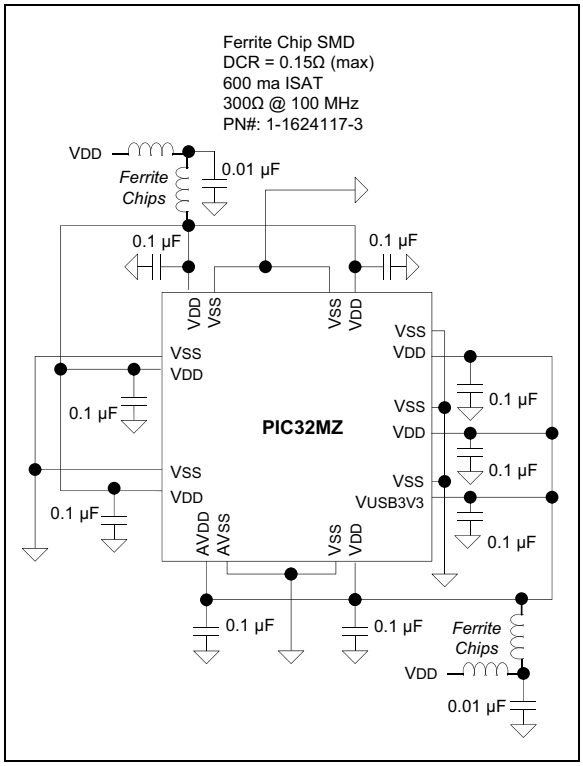
- **Component Placement**
  - Place bypass capacitors as close to their component power and ground pins as possible, and place them on the same side of the PCB
  - Devices on the same bus that have larger setup times should be placed closer to the PIC32MZ DA device
- **Power and Ground**
  - Multi-layer PCBs will allow separate power and ground planes
  - Each ground pin should be connected to the ground plane individually
  - Place bypass capacitor vias as close to the pad as possible (preferably inside the pad)
  - If power and ground planes are not used, maximize width for power and ground traces
  - Use low-ESR, surface-mount bypass capacitors
- **Clocks and Oscillators**
  - Place crystals as close as possible to the PIC32MZ DA device OSC/SOSC pins
  - Do not route high-speed signals near the clock or oscillator
  - Avoid via usage and branches in clock lines (SQICLK)
  - Place termination resistors at the end of clock lines
- **Traces**
  - Higher-priority signals should have the shortest traces
  - Follow vendor-recommended layout guidelines for the DDR2 interface
  - Match trace lengths for parallel buses (EBIAx, EBIDx, SQIDx)
  - Avoid long run lengths on parallel traces to reduce coupling
  - Make the clock traces as straight as possible
  - Use rounded turns rather than right-angle turns
  - Have traces on different layers intersect on right angles to minimize crosstalk
  - Maximize the distance between traces, preferably no less than three times the trace width
  - Power traces should be as short and as wide as possible
  - High-speed traces should be placed close to the ground plane

2.10.1.3 EMI/EMC/EFT (IEC 61000-4-4 and IEC 61000-4-2) Suppression Considerations

The use of LDO regulators is preferred to reduce overall system noise and provide a cleaner power source. However, when utilizing switching Buck/Boost regulators as the local power source for PIC32MZ DA devices, as well as in electrically noisy environments or test conditions required for IEC 61000-4-4 and IEC 61000-4-2, users should evaluate the use of T-Filters (i.e., L-C-L) on the power pins, as shown in Figure 2-9. In addition to a more stable power source, using T-Filters can greatly reduce susceptibility to EMI sources and events.

Note:	The EMI/EMC/EFT Suppression Circuit represents only a few supply/ground pairs. However, the number of pairs on a given package may vary. The number of T-Filters in the system depends on the ferrite chip current limitation and the number of supply/ground pairs. For example, with 600 mA current limitation per T-Filter for the 288-LFBGA package, the system should use three T-Filters.

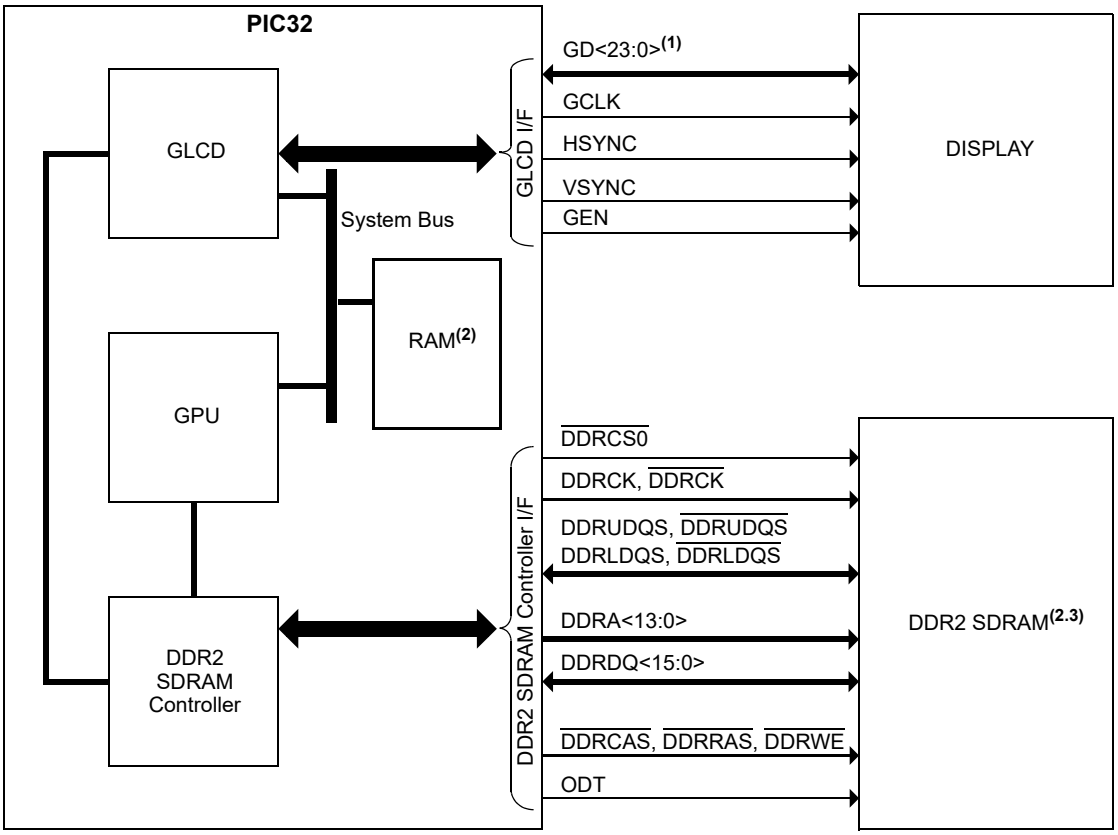
FIGURE 2-9: EMI/EMC/EFT SUPPRESSION CIRCUIT



2.11 Typical Application Connection Example

An example of a typical application connection is shown in Figure 2-10.

FIGURE 2-10: GRAPHICS APPLICATION



Note 1: R<7:0> = GD<7:0>; G<7:0> = GD<15:8>; B<7:0> = GD<23:16>.

2: Frame buffers are either in system RAM or in the DDR2 SDRAM (maximum resolution supported depends on the memory size).

3: Stacked die version (169-pin LFBGA and 176-pin LQFP) supports 32 MB DDR2 SDRAM devices.

NOTES:

3.0 CPU

Note 1: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 50. "CPU for Devices with MIPS32® microAptiv™ and M-Class Cores"** (DS60001192), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

2: MIPS32® microAptiv™ Microprocessor Core resources are available at: http://www.imgtec.com.

The MIPS32 microAptiv Microprocessor Core is the heart of the PIC32MZ DA family device processor. The CPU fetches instructions, decodes each instruction, fetches source operands, executes each instruction and writes the results of instruction execution to the proper destinations.

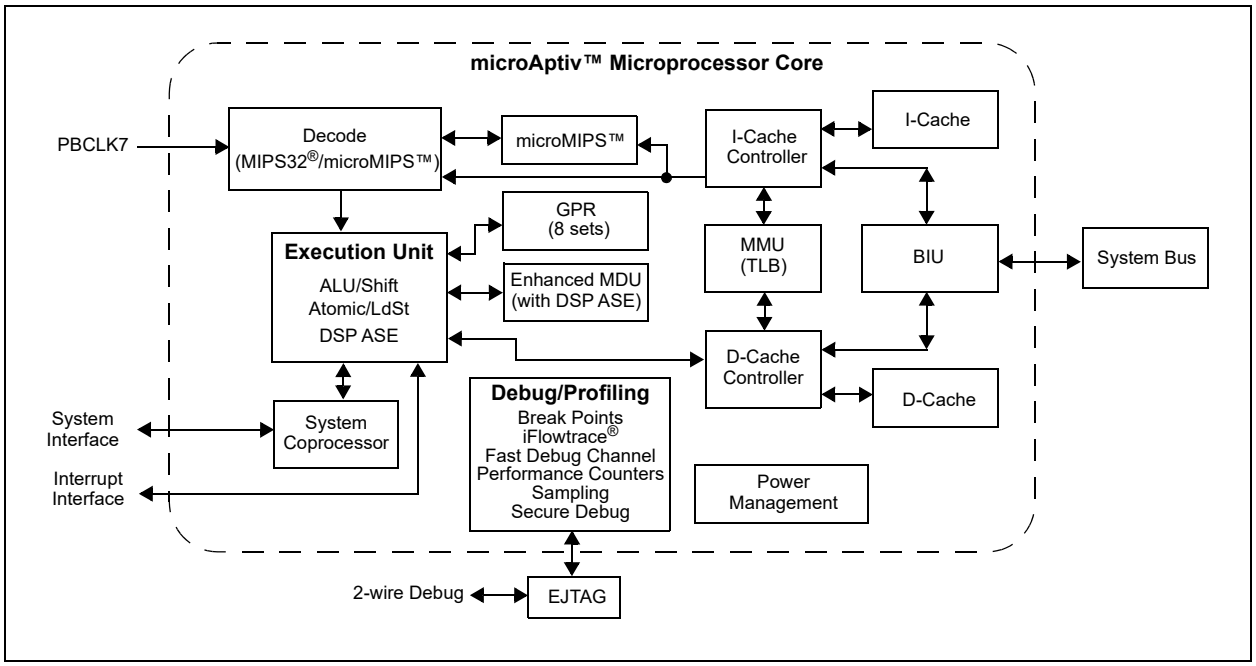
3.1 Features

PIC32MZ DA family processor core key features:

- 5-stage pipeline
- 32-bit address and data paths
- MIPS32 Enhanced Architecture (Release 2):
  - Multiply-accumulate and multiply-subtract instructions
  - Targeted multiply instruction
  - Zero/One detect instructions
  - `WAIT` instruction
  - Conditional move instructions (`MOVN`, `MOVZ`)
  - Vectored interrupts
  - Programmable exception vector base
  - Atomic interrupt enable/disable
  - GPR shadow registers to minimize latency for interrupt handlers
  - Bit field manipulation instructions
  - Virtual memory support
- microMIPS compatible instruction set:
  - Improves code size density over MIPS32, while maintaining MIPS32 performance.
  - Supports all MIPS32 instructions (except branch-likely instructions)
  - Fifteen additional 32-bit instructions and 39 16-bit instructions corresponding to commonly-used MIPS32 instructions
  - Stack pointer implicit in instruction
  - MIPS32 assembly and ABI compatible
- MMU with Translation Lookaside Buffer (TLB) mechanism:
  - 32 dual-entry fully associative Joint TLB
  - 4-entry fully associative Instruction TLB
  - 4-entry fully associative Data TLB
  - 4 KB pages
- Separate L1 data and instruction caches:
  - 32 KB 4-way Instruction Cache (I-Cache)
  - 32 KB 4-way Data Cache (D-Cache)
- Autonomous Multiply/Divide Unit (MDU):
  - Maximum issue rate of one 32x32 multiply per clock
  - Early-in iterative divide. Minimum 12 and maximum 38 clock latency (dividend (*rs*) sign extension-dependent)
- Power Control:
  - Minimum frequency: 0 MHz
  - Low-Power mode (triggered by `WAIT` instruction)
  - Extensive use of local gated clocks
- EJTAG Debug and Instruction Trace:
  - Support for single stepping
  - Virtual instruction and data address/value breakpoints
  - Hardware breakpoint supports both address match and address range triggering.
  - Eight instruction and four data complex breakpoints
- iFlowtrace® version 2.0 support:
  - Real-time instruction program counter
  - Special events trace capability
  - Two performance counters with 34 user-selectable countable events
  - Disabled if the processor enters Debug mode
- Four Watch registers:
  - Instruction, Data Read, Data Write options
  - Address match masking options
- DSP ASE Extension:
  - Native fractional format data type operations
  - Register Single Instruction Multiple Data (SIMD) operations (add, subtract, multiply, shift)
  - GPR-based shift
  - Bit manipulation
  - Compare-Pick
  - DSP Control Access
  - Indexed-Load
  - Branch
  - Multiplication of complex operands
  - Variable bit insertion and extraction
  - Virtual circular buffers
  - Arithmetic saturation and overflow handling
  - Zero-cycle overhead saturation and rounding operations

A block diagram of the PIC32MZ DA family processor core is shown in Figure 3-1.

FIGURE 3-1: PIC32MZ DA FAMILY MICROPROCESSOR CORE BLOCK DIAGRAM



3.2 Architecture Overview

The MIPS32 microAptiv Microprocessor core in PIC32MZ DA family devices contains several logic blocks working together in parallel, providing an efficient high-performance computing engine. The following blocks are included with the core:

- Execution unit
- General Purpose Register (GPR)
- Multiply/Divide Unit (MDU)
- System control coprocessor (CP0)
- Memory Management Unit (MMU)
- Instruction/Data cache controllers
- Power Management
- Instructions and data caches
- microMIPS support
- Enhanced JTAG (EJTAG) controller

3.2.1 EXECUTION UNIT

The processor core execution unit implements a load/store architecture with single-cycle ALU operations (logical, shift, add, subtract) and an autonomous multiply/divide unit. The core contains thirty-two 32-bit General Purpose Registers (GPRs) used for integer operations and address calculation. Seven additional register file shadow sets (containing thirty-two registers) are added to minimize context switching overhead during interrupt/exception processing. The register file consists of two read ports and one write port and is fully bypassed to minimize operation latency in the pipeline.

The execution unit includes:

- 32-bit adder used for calculating the data address
- Address unit for calculating the next instruction address
- Logic for branch determination and branch target address calculation
- Load aligner
- Trap condition comparator
- Bypass multiplexers used to avoid stalls when executing instruction streams where data producing instructions are followed closely by consumers of their results
- Leading Zero/One detect unit for implementing the `CLZ` and `CLO` instructions
- Arithmetic Logic Unit (ALU) for performing arithmetic and bitwise logical operations
- Shifter and store aligner
- DSP ALU and logic block for performing DSP instructions, such as arithmetic/shift/compare operations

3.2.2 MULTIPLY/DIVIDE UNIT (MDU)

The processor core includes a Multiply/Divide Unit (MDU) that contains a separate pipeline for multiply and divide operations, and DSP ASE multiply instructions. This pipeline operates in parallel with the Integer Unit (IU) pipeline and does not stall when the IU pipeline stalls. This allows MDU operations to be partially masked by system stalls and/or other integer unit instructions.

The high-performance MDU consists of a 32x32 booth recoded multiplier, four pairs of result/accumulation registers (HI and LO), a divide state machine, and the necessary multiplexers and control logic. The first number shown ('32' of 32x32) represents the *rs* operand. The second number ('32' of 32x32) represents the *rt* operand.

The MDU supports execution of one multiply or multiply-accumulate operation every clock cycle.

Divide operations are implemented with a simple 1-bit-per-clock iterative algorithm. An early-in detection checks the sign extension of the dividend (*rs*) operand. If *rs* is 8 bits wide, 23 iterations are skipped. For a 16-bit wide *rs*, 15 iterations are skipped and for a 24-bit wide *rs*, 7 iterations are skipped. Any attempt to issue a subsequent `MDU` instruction while a divide is still active causes an IU pipeline stall until the divide operation has completed.

Table 3-1 lists the repeat rate (peak issue rate of cycles until the operation can be reissued) and latency (number of cycles until a result is available) for the processor core multiply and divide instructions. The approximate latency and repeat rates are listed in terms of pipeline clocks.

TABLE 3-1: MIPS32 microAptiv MICROPROCESSOR CORE HIGH-PERFORMANCE INTEGER MULTIPLY/DIVIDE UNIT LATENCIES AND REPEAT RATES

Opcode	Operand Size (mul *rt*) (div *rs*)	Latency	Repeat Rate
`MULT/MULTU, MADD/MADDU, MSUB/MSUBU` (HI/LO destination)	16 bits	5	1
	32 bits	5	1
`MUL` (GPR destination)	16 bits	5	1
	32 bits	5	1
`DIV/DIVU`	8 bits	12/14	12/14
	16 bits	20/22	20/22
	24 bits	28/30	28/30
	32 bits	36/38	36/38

The MIPS architecture defines that the result of a multiply or divide operation be placed in one of four pairs of HI and LO registers. Using the Move-From-HI (MFHI) and Move-From-LO (MFLO) instructions, these values can be transferred to the General Purpose Register file.

In addition to the HI/LO targeted operations, the MIPS32 architecture also defines a multiply instruction, MUL, which places the least significant results in the primary register file instead of the HI/LO register pair. By avoiding the explicit MFLO instruction required when using the LO register, and by supporting multiple destination registers, the throughput of multiply-intensive operations is increased.

Two other instructions, Multiply-Add (MADD) and Multiply-Subtract (MSUB), are used to perform the multiply-accumulate and multiply-subtract operations. The MADD instruction multiplies two numbers and then adds the product to the current contents of the HI and LO registers. Similarly, the MSUB instruction multiplies two operands and then subtracts the product from the HI and LO registers. The MADD and MSUB operations are commonly used in DSP algorithms.

The MDU also implements various shift instructions operating on the HI/LO register and multiply instructions as defined in the DSP ASE. The MDU supports all of the data types required for this purpose and includes three extra HI/LO registers as defined by the ASE.

Table 3-2 lists the latencies and repeat rates for the DSP multiply and dot-product operations. The approximate latencies and repeat rates are listed in terms of pipeline clocks.

TABLE 3-2: DSP-RELATED LATENCIES AND REPEAT RATES

Op code	Latency	Repeat Rate
Multiply and dot-product without saturation after accumulation	5	1
Multiply and dot-product with saturation after accumulation	5	1
Multiply without accumulation	5	1

3.2.3 SYSTEM CONTROL COPROCESSOR (CP0)

In the MIPS architecture, CP0 is responsible for the virtual-to-physical address translation and cache protocols, the exception control system, the processor's diagnostics capability, the operating modes (Kernel, User and Debug) and whether interrupts are enabled or disabled. Configuration information, such as cache size and set associativity, and the presence of options like microMIPS, is also available by accessing the CP0 registers, listed in Table 3-3.

TABLE 3-3: COPROCESSOR 0 REGISTERS

Register Number	Register Name	Function
0	Index	Index into the TLB array (microAptiv MPU only).
1	Random	Randomly generated index into the TLB array (microAptiv MPU only).
2	EntryLo0	Low-order portion of the TLB entry for even-numbered virtual pages (microAptiv MPU only).
3	EntryLo1	Low-order portion of the TLB entry for odd-numbered virtual pages (microAptiv MPU only).
4	Context/ UserLocal	Pointer to the page table entry in memory (microAptiv MPU only). User information that can be written by privileged software and read via the RDHWR instruction.
5	PageMask/ PageGrain	PageMask controls the variable page sizes in TLB entries. PageGrain enables support of 1 KB pages in the TLB (microAptiv MPU only).
6	Wired	Controls the number of fixed (i.e., wired) TLB entries (microAptiv MPU only).
7	HWREna	Enables access via the RDHWR instruction to selected hardware registers in Non-privileged mode.
8	BadVAddr	Reports the address for the most recent address-related exception.
9	Count	Processor cycle count.
10	EntryHi	High-order portion of the TLB entry (microAptiv MPU only).
11	Compare	Core timer interrupt control.

TABLE 3-3: COPROCESSOR 0 REGISTERS (CONTINUED)

Register Number	Register Name	Function
12	Status	Processor status and control.
	IntCtl	Interrupt control of vector spacing.
	SRSCtl	Shadow register set control.
	SRSMap	Shadow register mapping control.
	View_IPL	Allows the Priority Level to be read/written without extracting or inserting that bit from/to the Status register.
	SRSMAP2	Contains two 4-bit fields that provide the mapping from a vector number to the shadow set number to use when servicing such an interrupt.
13	Cause	Describes the cause of the last exception.
	NestedExc	Contains the error and exception level status bit values that existed prior to the current exception.
	View_RIPL	Enables read access to the RIPL bit that is available in the Cause register.
14	EPC	Program counter at last exception.
	NestedEPC	Contains the exception program counter that existed prior to the current exception.
15	PRID	Processor identification and revision
	Ebase	Exception base address of exception vectors.
	CDMMBase	Common device memory map base.
16	Config	Configuration register.
	Config1	Configuration register 1.
	Config2	Configuration register 2.
	Config3	Configuration register 3.
	Config4	Configuration register 4.
	Config5	Configuration register 5.
	Config7	Configuration register 7.
17	LLAddr	Load link address (microAptiv MPU only).
18	WatchLo	Low-order watchpoint address (microAptiv MPU only).
19	WatchHi	High-order watchpoint address (microAptiv MPU only).
20-22	Reserved	Reserved in the PIC32 core.
23	Debug	EJTAG debug register.
	TraceControl	EJTAG trace control.
	TraceControl2	EJTAG trace control 2.
	UserTraceData1	EJTAG user trace data 1 register.
	TraceBPC	EJTAG trace breakpoint register.
	Debug2	Debug control/exception status 1.
24	DEPC	Program counter at last debug exception.
	UserTraceData2	EJTAG user trace data 2 register.
25	PerfCtl0	Performance counter 0 control.
	PerfCnt0	Performance counter 0.
	PerfCtl1	Performance counter 1 control.
	PerfCnt1	Performance counter 1.
26	ErrCtl	Software test enable of way-select and data RAM arrays for I-Cache and D-Cache (microAptiv MPU only).
27	Reserved	Reserved in the PIC32 core.
28	TagLo/DataLo	Low-order portion of cache tag interface (microAptiv MPU only).

3.3 Power Management

The processor core offers a number of power management features, including low-power design, active power management and power-down modes of operation. The core is a static design that supports slowing or halting the clocks, which reduces system power consumption during Idle periods.

3.3.1 INSTRUCTION-CONTROLLED POWER MANAGEMENT

The mechanism for invoking Power-Down mode is through execution of the WAIT instruction. For more information on power management, see **Section 40.0 "Power-Saving Features"**.

3.3.2 LOCAL CLOCK GATING

The majority of the power consumed by the processor core is in the clock tree and clocking registers. The PIC32MZ family makes extensive use of local gated-clocks to reduce this dynamic power consumption.

3.4 L1 Instruction and Data Caches

3.4.1 INSTRUCTION CACHE (I-CACHE)

The I-Cache is an on-core memory block of 32 Kbytes. Because the I-Cache is virtually indexed, the virtual-to-physical address translation occurs in parallel with the cache access rather than having to wait for the physical address translation. The tag holds 23 bits of physical address, a valid bit, and a lock bit. The LRU replacement bits are stored in a separate array.

The I-Cache block also contains and manages the instruction line fill buffer. Besides accumulating data to be written to the cache, instruction fetches that reference data in the line fill buffer are serviced either by a bypass of that data, or data coming from the external interface. The I-Cache control logic controls the bypass function.

The processor core supports I-Cache locking. Cache locking allows critical code or data segments to be locked into the cache on a per-line basis, enabling the system programmer to maximize the efficiency of the system cache.

The cache locking function is always available on all I-Cache entries. Entries can then be marked as locked or unlocked on a per entry basis using the CACHE instruction.

3.4.2 DATA CACHE (D-CACHE)

The D-Cache is an on-core memory block of 32 Kbytes. This virtually indexed, physically tagged cache is protected. Because the D-Cache is virtually indexed, the virtual-to-physical address translation occurs in parallel with the cache access. The tag holds 23 bits of physical address, a valid bit, and a lock bit. There is an additional array holding dirty bits and LRU replacement algorithm bits for each set of the cache.

In addition to I-Cache locking, the processor core also supports a D-Cache locking mechanism identical to the I-Cache. Critical data segments are locked into the cache on a per-line basis. The locked contents can be updated on a store hit, but cannot be selected for replacement on a cache miss.

The D-Cache locking function is always available on all D-Cache entries. Entries can then be marked as locked or unlocked on a per-entry basis using the CACHE instruction.

3.4.3 ATTRIBUTES

The processor core I-Cache and D-Cache attributes are listed in the Configuration registers (see Register 3-1 through Register 3-4).

3.5 EJTAG Debug Support

The processor core provides for an Enhanced JTAG (EJTAG) interface for use in the software debug of application and kernel code. In addition to standard User mode and Kernel modes of operation, the processor core provides a Debug mode that is entered after a debug exception (derived from a hardware breakpoint, single-step exception, etc.) is taken and continues until a Debug Exception Return (DERET) instruction is executed. During this time, the processor executes the debug exception handler routine.

The EJTAG interface operates through the Test Access Port (TAP), a serial communication port used for transferring test data in and out of the core. In addition to the standard JTAG instructions, special instructions defined in the EJTAG specification specify which registers are selected and how they are used.

3.6 MIPS® DSP ASE Extension

The MIPS DSP Application-Specific Extension Revision 2 is an extension to the MIPS32 architecture. This extension comprises new integer instructions and states that include new HI/LO accumulator register pairs and a DSP control register. This extension is crucial in a wide range of DSP, multimedia, and DSP-like algorithms covering Audio and Video processing applications. The extension supports native fractional format data type operations, register Single Instruction Multiple Data (SIMD) operations, such as add, subtract, multiply, and shift. In addition, the extension includes the following features that are essential in making DSP algorithms computationally efficient:

- Support for multiplication of complex operands
- Variable bit insertion and extraction
- Implementation and use of virtual circular buffers
- Arithmetic saturation and overflow handling support
- Zero cycle overhead saturation and rounding operations

3.7 microAptiv Core Configuration

Register 3-1 through Register 3-4 show the default configuration of the microAptiv core, which is included on PIC32MZ DA family devices.

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31 **WII:** Wait IE Ignore bit

1 = Indicates that this processor will allow an interrupt to unblock a WAIT instruction

bit 30-0 **Unimplemented:** Read as '0'

4.0 MEMORY ORGANIZATION

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. For detailed information, refer to **Section 48. "Memory Organization and Permissions"** (DS60001214), which is available from the *Documentation* > *Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

PIC32MZ DA microcontrollers provide 4 GB of unified virtual memory address space. All memory regions, including program, data memory, SFRs and Configuration registers, reside in this address space at their respective unique addresses. The program and data memories can be optionally partitioned into user and kernel memories. In addition, PIC32MZ DA devices allow execution from data memory.

Key features include:

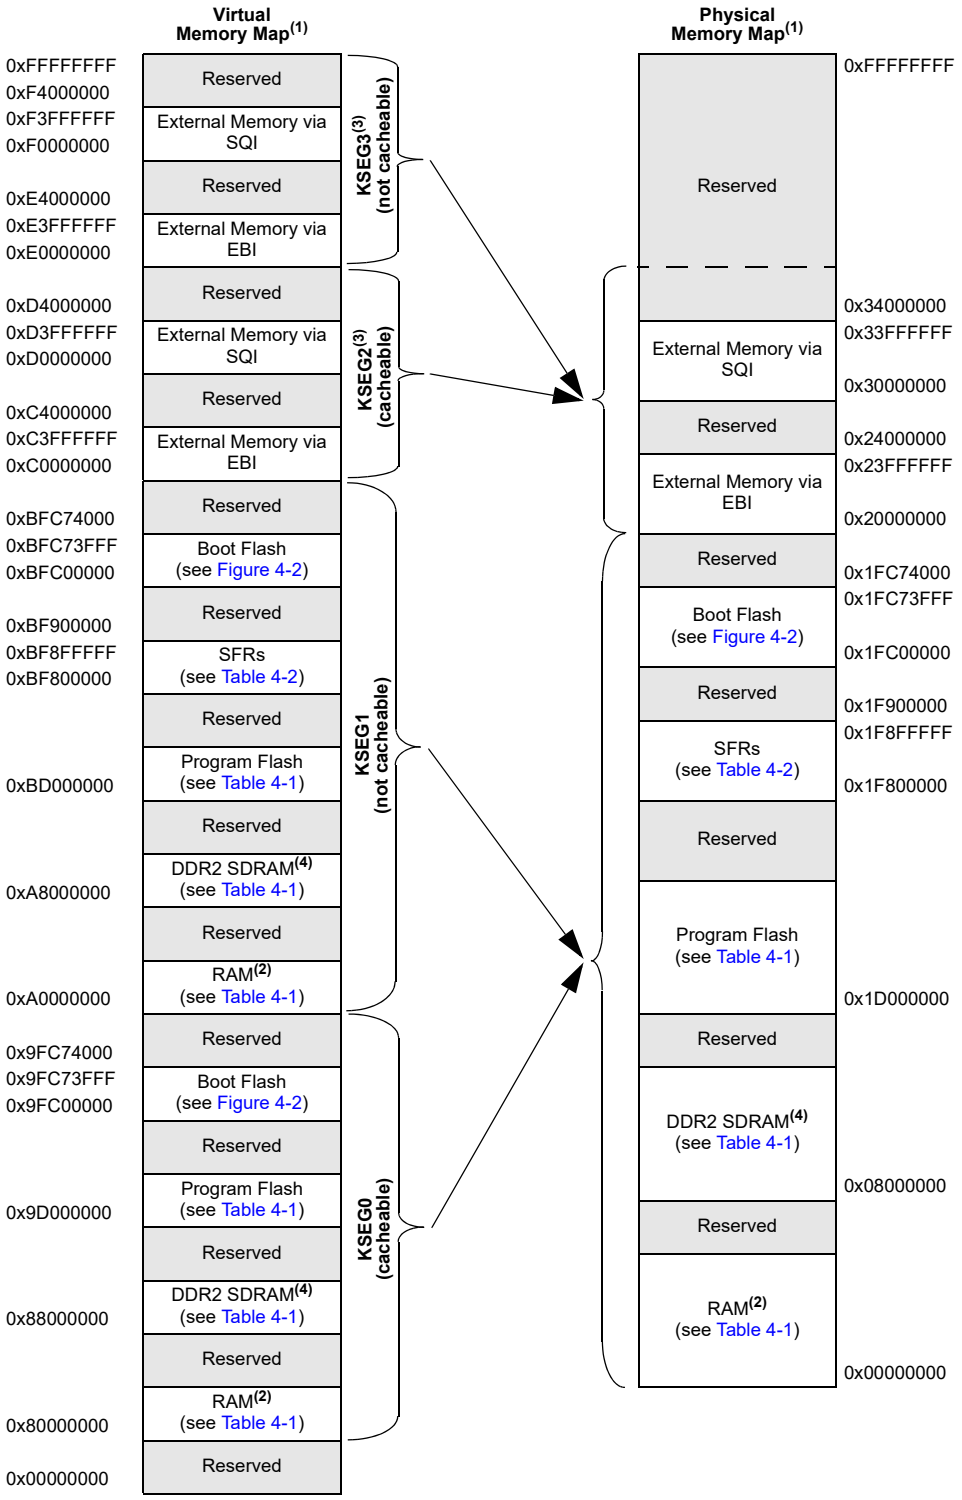
- 32-bit native data width
- Separate User (KUSEG) and Kernel (KSEG0/KSEG1/KSEG2/KSEG3) mode address space
- Separate Boot Flash memory for protected code
- Robust bus exception handling to intercept runaway code
- Cacheable (KSEG0/KSEG2) and non-cacheable (KSEG1/KSEG3) address regions
- Read-Write permission access to predefined memory regions

4.1 Memory Layout

PIC32MZ DA microcontrollers implement two address schemes: virtual and physical. All hardware resources, such as program memory, data memory and peripherals, are located at their respective physical addresses. Virtual addresses are exclusively used by the CPU to fetch and execute instructions as well as access peripherals. Physical addresses are used by bus host peripherals, such as DMA and the Flash controller, that access memory independently of the CPU.

The main memory maps for the PIC32MZ DA devices are illustrated in Figure 4-1. Figure 4-2 provides memory map information for Boot Flash and boot alias. Table 4-1 provides memory map information for Program Flash, RAM, and DDR2 SDRAM. Table 4-2 provides memory map information for Special Function Registers (SFRs).

FIGURE 4-1: PIC32MZ DA FAMILY MEMORY MAP



Note 1: Memory areas are not shown to scale.
2: RAM memory is divided into two banks. Refer to Table 4-1 for additional information.
3: The MMU must be enabled and the TLB must be set up to access this segment.
4: This region is Reserved in devices without the DDR2 option.

TABLE 4-1: ADDRESS MAPPING TABLE

Memory	Size	Region End Address (KSEG1)	Region End Address (KSEG0)	Region End Address (Physical)
Program Flash	2 MB	0xBD1FFFFF	0x9D1FFFFF	0x1D1FFFFF
	1 MB	0xBD0FFFFF	0x9D0FFFFF	0x1D0FFFFF
DDR2 SDRAM	EXT(1)	0xAFFFFFFF	0x8FFFFFFF	0x0FFFFFFF
	32 MB(5)	0xA9FFFFFF	0x89FFFFFF	0x09FFFFFF
	—(2)	Reserved	Reserved	Reserved
RAM	640 KB(3)	0xA009FFFF	0x8009FFFF	0x0009FFFF
	256 KB(4)	0xA003FFFF	0x8003FFFF	0x0003FFFF

Note 1: External DDR2 SDRAM can be up to 128 MB, EXTDDRSIZE<3:0> bits (DEVCFG3<19:16>) should be set, and the region end address should be scaled accordingly.

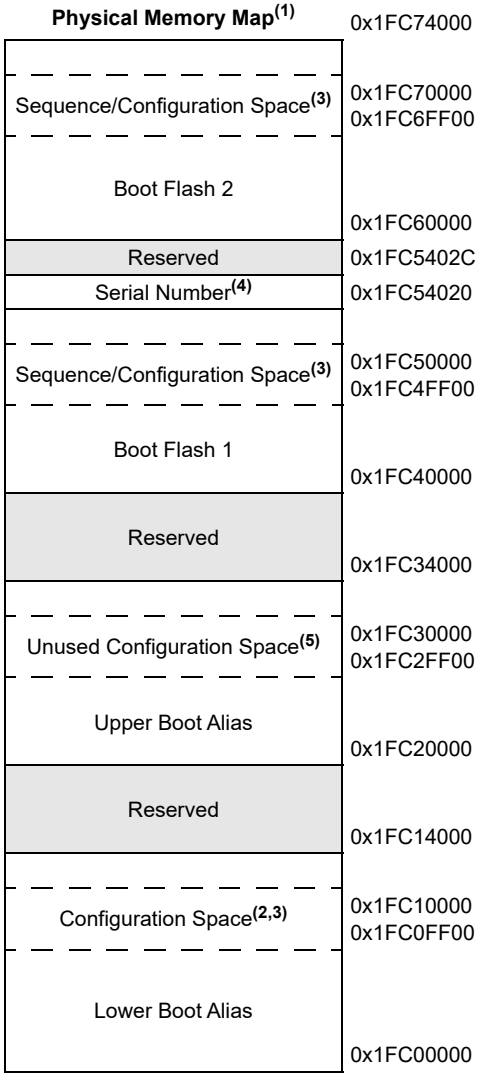
2: Devices without the DDR2 option.

3: Devices with 640 KB RAM contain SRAM Bank 1 (256 KB) and SRAM Bank 2 (384 KB).

4: Devices with 256 KB RAM contain SRAM Bank 1 (128 KB) and SRAM Bank 2 (128 KB).

5: Refer to **4.2 "DDR2 SDRAM"** for DDR2 SDRAM features, which are applicable to devices with internal DDR2 SDRAM.

FIGURE 4-2: BOOT AND ALIAS MEMORY MAP



Note 1: Memory areas are not shown to scale.

2: Memory locations 0x1FC0FF40 through 0x1FC0FFFC are used to initialize Configuration registers (see **Section 41.0 "Special Features"**).

3: Refer to **Section 4.1.1 "Boot Flash Sequence and Configuration Spaces"** for more information.

4: Memory location 0x1FC54020 contains a 128-bit unique device serial number (see **Section 41.0 "Special Features"**).

5: This configuration space cannot be used for executing code in the upper boot alias.

Note 1: Refer to **4.4 "System Bus Arbitration"** for important legal information.

4.1.1 BOOT FLASH SEQUENCE AND CONFIGURATION SPACES

Sequence space is used to identify which Boot Flash is aliased by aliased regions. If the value programmed into the TSEQ<15:0> bits of the BF1SEQ3 word is equal to or greater than the value programmed into the TSEQ<15:0> bits of the BF2SEQ3 word, Boot Flash 1 is aliased by the lower boot alias region, and Boot Flash 2 is aliased by the upper boot alias region. If the TSEQ<15:0> bits of the BF2SEQ3 word are greater than the TSEQ<15:0> bits of the BF1SEQ3 word, the opposite is true (see Table 4-3 and Table 4-4 for BFxSEQ3 word memory locations).

The CSEQ<15:0> bits must contain the complement value of the TSEQ<15:0> bits; otherwise, the value of the TSEQ<15:0> bits are considered invalid, and an alternate sequence is used, see **Section 4.1.2 "Alternate Sequence and Configuration Words"** for more information.

Once Boot Flash memories are aliased, configuration space located in the lower boot alias region is used as the basis for the Configuration words, DEVSIGN0, DEVCP0, and DEVCFGx (and the associated alternate configuration registers). This means that the Boot Flash region to be aliased by lower boot alias region memory must contain configuration values in the appropriate memory locations.

Note:	Do not use word program operation (NVMOP<3:0> = 0001) when programming data into the sequence and configuration spaces.

4.1.2 ALTERNATE SEQUENCE AND CONFIGURATION WORDS

Every word in the configuration space and sequence space has an associated alternate word (designated by the letter A as the first letter in the name of the word). During device start-up, primary words are read and if uncorrectable ECC errors are found, the BCFGERR (RCON<27>) flag is set and alternate words are used. If uncorrectable ECC errors are found in primary and alternate words, the BCFGFAIL (RCON<26>) flag is set and the default configuration is used.

4.2 DDR2 SDRAM

Stacked DDR2 SDRAM memory devices support 32 MB of DDR2 SDRAM. Memory in these devices is organized as 4,194,304 x 4 banks x 16 bits. Refer to Figure 4-1 and Table 4-1 for the DDR2 SDRAM address ranges.

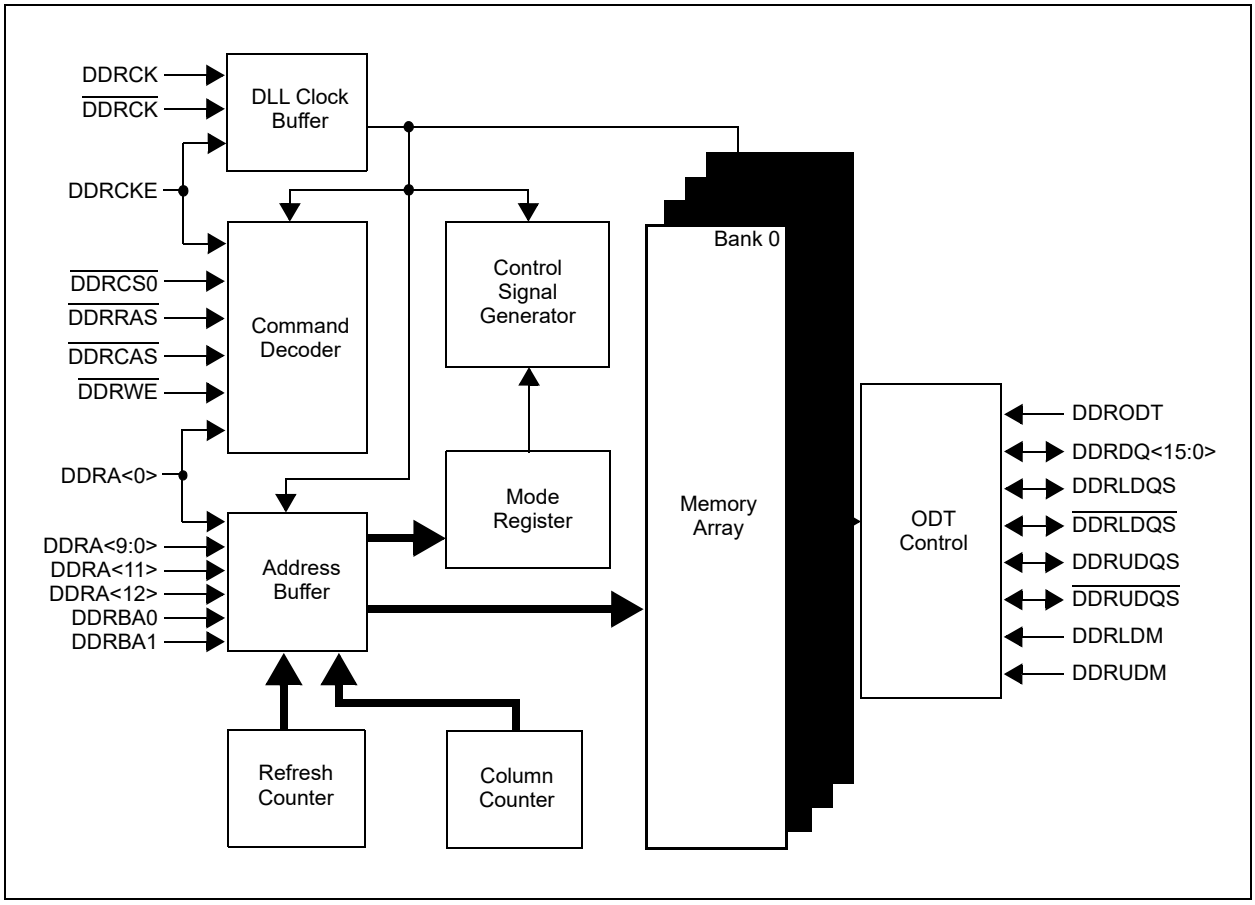
4.2.1 FEATURES

The DDR2 SDRAM includes the following features:

- Double Data Rate architecture: two data transfers per clock cycle
- CAS Latency: 3 and 4
- Burst Length: 8
- Bi-directional, differential data strobes (DDRUDQS, DDRLDQS and DDRUDQS, DDRLDQS) are transmitted / received with data
- Edge-aligned with Read data and center-aligned with Write data
- DLL aligns Data (DDRDQx) and Data Qualifier Strobe (DDRxDQS, DDRxDQS) transitions with clock
- Differential clock inputs (DDRCK and /DDRCK)
- Data masks (DDRUDM, DDRLDM) for write data
- Commands entered on each positive DDRCK edge, data and data mask are referenced to both edges of DDRxDQS
- Posted CAS programmable additive latency supported to make command and data bus efficiency
- Read Latency = Additive Latency plus CAS Latency (RL = AL + CL)
- Off-Chip-Driver impedance adjustment (OCD) and On-Die-Termination (ODT) for better signal quality
- Auto-precharge operation for read and write bursts
- Auto Refresh and Self Refresh modes
- Precharged Power Down and Active Power Down
- Write Latency = Read Latency - 1 (WL = RL - 1)

Figure 4-3 provides a block diagram of the DDR2 SDRAM.

FIGURE 4-3: DDR2 SDRAM BLOCK DIAGRAM



4.3 Timing Parameters

Table 4-5 only applies to device variants with internal 32 MB DDR2 SDRAM. For device variants supporting external DDR2 SDRAM memory, refer to the vendor data sheet for timing parameters.

TABLE 4-5: TIMING PARAMETERS

Parameter	Description	Value	Units
tRFC	Auto-refresh Cycle Time	75	ns
tWR	Write Recovery Time	15	ns
tRP	Precharge-to-Active Command Delay Time	20	ns
tRCD	Active to Read/Write Command Delay Time	20	ns
tRRD	Row-to-Row (RAS to RAS) Command Delay Time	7.5	ns
tWTR	Write-to-Read Command Delay Time	10	ns
tRTP	Read-to-Precharge Command Delay Time	10	ns
tDLLK	DLL Lock Delay Time	200	Clock cycles
tRAS	Active to Precharge Minimum Command Delay Time	40	ns
tRC	Row Cycle Time	65	ns
tFAW	Four Bank Activation Window	35	ns
tMRD	Mode Register Set Command Cycle Delay	2	Clock cycles
tXP	Power Down Exit Delay	2	Clock cycles
tCKE	Power Down Minimum Delay	3	Clock cycles
RL	CAS Latency	4	Clock cycles
tRFI	Average Periodic Refresh Interval	7.8	µs
WL	Write Latency	3	Clock cycles
BL	Burst Length (in cycles)	8	Clock cycles

4.4 System Bus Arbitration

Note: The System Bus interconnect implements one or more instantiations of the SonicsSX® interconnect from Sonics, Inc. This document contains materials that are (c) 2003-2015 Sonics, Inc., and that constitute proprietary information of Sonics, Inc. SonicsSX is a registered trademark of Sonics, Inc. All such materials and trademarks are used under license from Sonics, Inc.

As shown in the PIC32MZ DA Family Block Diagram (see Figure 1-1), there are multiple initiator modules (I1 through I14) in the system that can access various target modules (T1 through T23). Table 4-6 illustrates which initiator can access which target. The System Bus supports simultaneous access to targets by initiators, so long as the initiators are accessing different targets. The System Bus will perform arbitration if multiple initiators attempt to access the same target.

TABLE 4-6: INITIATORS TO TARGETS ACCESS ASSOCIATION

Target Number	Initiator ID	1	2	3	4	5	6	7	8	9	10	11
	Name	CPU	DMA Read	DMA Write	USB	Ethernet Read	Ethernet Write	CAN1	CAN2	SQI1	Flash Controller	Cry

17	External Memory via DDR2 and DDR2 Targets 3 and 4											

Note 1: The GLCD and GPU are directly connected to the DDR2 SDRAM Controller to use DDR2 SDRAM for frame buffers. Arbitration control is done through the DDR2 SD
Refer to **Section 55. "DDR2 SDRAM Controller"** (DS60001321) in the "PIC32 Family Reference Manual" for additional information.

TABLE 4-6: INITIATORS TO TARGETS ACCESS ASSOCIATION (CONTINUED)

Target Number	Initiator ID	1	2	3	4	5	6	7	8	9	10	1
	Name	CPU	DMA Read	DMA Write	USB	Ethernet Read	Ethernet Write	CAN1	CAN2	SQI1	Flash Controller	Cry
18	2D Graphics Processing Unit	X										
19	Secure Digital Host Controller	X										
20	DDR2 PHY Control Register Interface	X										
21	DDR2 Control Register Interface	X										
22	**Peripheral Set 6:** RTCC DSCTRL	X										
23	External Memory via EBI and EBI Module	X	X	X	X	X	X	X	X	X		X

Note 1: The GLCD and GPU are directly connected to the DDR2 SDRAM Controller to use DDR2 SDRAM for frame buffers. Arbitration control is done through the DDR2 SD
Refer to **Section 55. "DDR2 SDRAM Controller"** (DS60001321) in the "PIC32 Family Reference Manual" for additional information.

The System Bus arbitration scheme implements a non-programmable, Least Recently Serviced (LRS).

The arbitration scheme for the available initiators is shown in Table 4-7.

TABLE 4-7: INITIATOR ID AND ARBITRATION

ID	Name	Arbitration
1	CPU	LRS
2	DMA Read	LRS
3	DMA Write	LRS
4	USB	LRS
5	Ethernet Read	LRS
6	Ethernet Write	LRS
7	CAN1	LRS
8	CAN2	LRS
9	SQI1	LRS
10	Flash Controller	LRS
11	Crypto	LRS
12	GLCD(1)	LRS
13	GPU(1)	LRS
14	SDHC	LRS

Note 1: The GLCD and GPU are directly connected to DDR2 SDRAM Controller to use DDR2 SDRAM for frame buffers. Arbitration control is done through the DDR2 SDRAM Controller arbitration engine.

4.5 Permission Access and System Bus Registers

The System Bus on PIC32MZ DA family of microcontrollers provides access control capabilities for the transaction initiators on the System Bus.

The System Bus divides the entire memory space into 17 regions and permits access to each target by initiators via permission groups. Four Permission Groups (0 through 3) can be assigned to each initiator. Each permission group is independent of the others and can have exclusive or shared access to a region.

Using the CFGPG register (see Register 41-12 in **Section 41.0 "Special Features"**), Boot firmware can assign a permission group to each initiator, which can make requests on the System Bus.

The available targets and their regions, as well as the associated control registers to assign protection, are described and listed in Table 4-8.

Register 4-2 through Register 4-13 are used for setting and controlling access permission groups and regions.

To change these registers, they must be unlocked in hardware. The register lock is controlled by the PGLOCK Configuration bit (CFGCON<11>). Setting the PGLOCK bit prevents writes to the control registers and clearing the PGLOCK bit allows writes.

To set or clear the PGLOCK bit, an unlock sequence must be executed. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

TABLE 4-8: SYSTEM BUS TARGETS AND ASSOCIATED PROTECTION REGISTERS

Target Protection Number	Target Description (see Note 5)	SBTxREGy Register (see Note 7)							SBTxRDy Register	
		Name	Region Base (BASE<21:0>) (see Note 2)	Physical Start Address	Region Size (SIZE<4:0>) (see Note 3)	Region Size	Priority (PRI)	Priority Level	Name	Read Permissi (GROUP GROUP GROUP GROUP
0	System Bus	SBT0REG0	R	0x1F8F0000	R	64 KB	—	0	SBT0RD0	0,1,1,1
		SBT0REG1	R	0x1F8F8000	R	32 KB	—	3	SBT0RD1	0,0,0,1

		SBT2REG2	R/W	R/W	R/W	R/W	0	1	SBT2RD2	R/W(1)
3	RAM Bank 2 Memory	SBT3REG0	R(4)	R(4)	R(4)	R(4)	—	0	SBT3RD0	R/W(1)
		SBT3REG1	R/W	R/W	R/W	R/W	—	3	SBT3RD1	R/W(1)
		SBT3REG2	R/W	R/W	R/W	R/W	0	1	SBT3RD2	R/W(1)
4	External Memory via DDR2 and DDR2 Target 0	SBT4REG0	R	0x08000000	R	R(4)	—	0	SBT4RD0	R/W(1)
		SBT4REG1	R/W	R/W	R/W	R/W	—	3	SBT4RD1	R/W(1)
		SBT4REG2	R/W	R/W	R/W	R/W	1	2	SBT4RD2	R/W(1)
		SBT4REG3	R/W	R/W	R/W	R/W	1	2	SBT4RD3	R/W(1)
		SBT4REG4	R/W	R/W	R/W	R/W	1	2	SBT4RD4	R/W(1)
5	External Memory via DDR2 and DDR2 Targets 1 and 2	SBT5REG0	R	0x08000000	R	R(4)	—	0	SBT5RD0	R/W(1)
		SBT5REG1	R/W	R/W	R/W	R/W	—	3	SBT5RD1	R/W(1)
		SBT5REG2	R/W	R/W	R/W	R/W	1	2	SBT5RD2	R/W(1)
		SBT5REG3	R/W	R/W	R/W	R/W	1	2	SBT5RD3	R/W(1)
		SBT5REG4	R/W	R/W	R/W	R/W	1	2	SBT5RD4	R/W(1)

Legend: R = Read; R/W = Read/Write; 'x' in a register name = 0-13; 'y' in a register name = 0-8.

Note 1: Reset values for these bits are '0', '1', '1', '1', respectively.

2: The BASE<21:0> bits must be set to the corresponding Physical Address and right shifted by 10 bits. For Read-only bits, this value is set by hardware on Reset.

3: The SIZE<4:0> bits must be set to the corresponding Region Size, based on the following formula: Region Size = $2^{(SIZE-1)}$ x 1024 bytes. For read-only bits, this val

4: Refer to the Device Memory Map (Figure 4-1) for specific device memory sizes and start addresses.

5: See Table 4-2 for information on specific target memory size and start addresses.

6: The SBTxREG1 SFRs are reserved, and therefore, are not listed in this table for this target.

7: The 'x' in the SBTxREGy, SBTxRDy, and SBTxWRy registers represents the target protection number and not the actual target number (e.g., for SQI 'x' = 13 and n target number).

TABLE 4-8: SYSTEM BUS TARGETS AND ASSOCIATED PROTECTION REGISTERS (CONTINUED)

bit 0 **CLEAR:** Clear Multiple Errors on Read bit
Multiple errors as reported via SBTxELOG1 and SBTxELOG2 is cleared by a read of this register.

Note: Refer to Table 4-8 for the list of available targets and their descriptions.

REGISTER 4-11: SBTxREGy: SYSTEM BUS TARGET 'x' REGION 'y' REGISTER ('x' = 0-13; 'y' = 0-8)

2: For some target regions, certain bits in this register are read-only with preset values. See Table 4-8 for more information.

NOTES:

5.0 FLASH PROGRAM MEMORY

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 52. "Flash Program Memory with Support for Live Update"** (DS60001193), which is available from the *Documentation* > *Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

PIC32MZ DA devices contain an internal Flash program memory for executing user code, which includes the following features:

- Two Flash banks for live update support
- Dual boot support
- Write protection for program and Boot Flash
- ECC support

There are three methods by which the user can program this memory:

- Run-Time Self-Programming (RTSP)
- EJTAG Programming
- In-Circuit Serial Programming™ (ICSP™)

RTSP is performed by software executing from either Flash or RAM memory. Information about RTSP techniques is available in **Section 52. "Flash Program Memory with Support for Live Update"** (DS60001193) in the *"PIC32 Family Reference Manual"*.

EJTAG is performed using the EJTAG port of the device and an EJTAG capable programmer.

ICSP is performed using a serial data connection to the device and allows much faster programming times than RTSP.

The EJTAG and ICSP methods are described in the *"PIC32 Flash Programming Specification"* (DS60001145), which is available for download from the Microchip website.

Note: In PIC32MZ DA devices, the Flash page size is 16 KB (4K IW) and the row size is 2 KB (512 IW).

5.1 Flash Control Registers

TABLE 5-1: FLASH CONTROLLER REGISTER MAP

Legend: x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

Note 1: This register has corresponding CLR, SET and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See **Section 12.2 "CLR, SET,** information.

REGISTER 5-1: NVMCON: PROGRAMMING CONTROL REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31:24	U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
	—	—	—	—	—	—	—	—
23:16	U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
	—	—	—	—	—	—	—	—
15:8	R/W-0, HC	R/W-0	R-0, HS, HC	R-0, HS, HC	U-0	U-0	U-0	U-0
	WR(1)	WREN(1)	WRERR(1)	LVDERR(1)	—	—	—	—
7:0	R/W-0	R/W-0	U-0	U-0	R/W-0	R/W-0	R/W-0	R/W-0
	PFSWAP(3)	BFSWAP(3,4)	—	—	NVMOP<3:0>			

Legend:	HS = Hardware Set	HC = Cleared by Hardware	
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **WR:** Write Control bit(1)

This bit cannot be cleared and can be set only when WREN = 1 and the unlock sequence has been performed.
1 = Initiate a Flash operation
0 = Flash operation is complete or inactive

bit 14 **WREN:** Write Enable bit(1)

1 = Enable writes to the WR bit and the SWAP bit and disables writes to the NVMOP<3:0> bits
0 = Disable writes to WR bit and the SWAP bit and enables writes to the NVMOP<3:0> bits

bit 13 **WRERR:** Write Error bit(1)

This bit can be cleared only by setting the NVMOP<3:0> bits = 0000 and initiating a Flash operation.
1 = Program or erase sequence did not complete successfully
0 = Program or erase sequence completed normally

bit 12 **LVDERR:** Low-Voltage Detect Error bit(1)

This bit can be cleared only by setting the NVMOP<3:0> bits = 0000 and initiating a Flash operation.
1 = Low-voltage detected (possible data corruption, if WRERR is set)
0 = Voltage level is acceptable for programming

bit 11-8 **Unimplemented:** Read as '0'

bit 7 **PFSWAP:** Program Flash Bank Swap Control bit(3)

1 = Program Flash Bank 2 is mapped to the lower mapped region and program Flash Bank 1 is mapped to the upper mapped region
0 = Program Flash Bank 1 is mapped to the lower mapped region and program Flash Bank 2 is mapped to the upper mapped region

Note 1: These bits are only reset by a Power-on Reset (POR) and are not affected by other reset sources.

2: This operation results in a "no operation" (NOP) when the Dynamic Flash ECC Configuration bits = 00 (FECCCON<1:0> (DVCFG0<9:8>)), which enables ECC at all times. For all other FECCCON<1:0> bit settings, this command will execute, but will not write the ECC bits for the word and can cause DED errors if dynamic Flash ECC is enabled (FECCCON<1:0> = 01). Refer to **Section 52. "Flash Program Memory with Support for Live Update"** (DS60001193) for information regarding ECC and Flash programming.

3: This bit can only be modified when the WREN bit = 0, the NVMKEY unlock sequence is satisfied, and the SWAPLOCK<1:0> bits (NVMCON2<7:6>) are cleared to '0'.

4: The BFSWAP value is determined by the values the user programmed Sequence Numbers in each boot panel.

REGISTER 5-1: NVMCON: PROGRAMMING CONTROL REGISTER (CONTINUED)

bit 6 **BFSWAP:** Boot Flash Bank Swap Control bit(3,4)
- 1 = Boot Flash Bank 2 is mapped to the lower boot region and Boot Flash Bank 1 is mapped to the upper mapped region
- 0 = Boot Flash Bank 1 is mapped to the lower boot region and Boot Flash Bank 2 is mapped to the upper mapped region

bit 5-4 **Unimplemented:** Read as '0'

bit 3-0 **NVMOP<3:0>:** NVM Operation bits

These bits are only writable when WREN = 0.
- 1111 = Reserved
- •
- •
- •
- 1000 = Reserved
- 0111 = Program erase operation: erase all of program Flash memory (all pages must be unprotected, PWP<23:0> = 0x000000)
- 0110 = Upper program Flash memory erase operation: erases only the upper mapped region of program Flash (all pages in that region must be unprotected)
- 0101 = Lower program Flash memory erase operation: erases only the lower mapped region of program Flash (all pages in that region must be unprotected)
- 0100 = Page erase operation: erases page selected by NVMADDR, if it is not write-protected
- 0011 = Row program operation: programs row selected by NVMADDR, if it is not write-protected
- 0010 = Quad Word (128-bit) program operation: programs the 128-bit Flash word selected by NVMADDR, if it is not write-protected
- 0001 = Word program operation: programs word selected by NVMADDR, if it is not write-protected(2)
- 0000 = No operation

Note 1: These bits are only reset by a Power-on Reset (POR) and are not affected by other reset sources.

2: This operation results in a "no operation" (NOP) when the Dynamic Flash ECC Configuration bits = 00 (FECCCON<1:0> (DVCFG0<9:8>)), which enables ECC at all times. For all other FECCCON<1:0> bit settings, this command will execute, but will not write the ECC bits for the word and can cause DED errors if dynamic Flash ECC is enabled (FECCCON<1:0> = 01). Refer to **Section 52. "Flash Program Memory with Support for Live Update"** (DS60001193) for information regarding ECC and Flash programming.

3: This bit can only be modified when the WREN bit = 0, the NVMKEY unlock sequence is satisfied, and the SWAPLOCK<1:0> bits (NVMCON2<7:6>) are cleared to '0'.

4: The BFSWAP value is determined by the values the user programmed Sequence Numbers in each boot panel.

REGISTER 5-2: NVMKEY: PROGRAMMING UNLOCK REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-0 **NVMSRCADDR<31:0>:** Source Data Address bits
The system physical address of the data to be programmed into the Flash when the NVMOP<3:0> bits (NVMCON<3:0>) are set to perform row programming.

Note: The bits in this register are only reset by a Power-on Reset (POR) and are not affected by other reset sources.

REGISTER 5-6: NVMPWP: PROGRAM FLASH WRITE-PROTECT REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31:24	R/W-1	U-0	U-0	U-0	U-0	U-0	U-0	U-0
	PWPULOCK	—	—	—	—	—	—	—
23:16	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	PWP<23:16>							
15:8	R/W-0	R/W-0	R-0	R-0	R-0	R-0	R-0	R-0
	PWP<15:8>							
7:0	R-0	R-0	R-0	R-0	R-0	R-0	R-0	R-0
	PWP<7:0>							

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31 **PWPULOCK:** Program Flash Memory Page Write-protect Unlock bit
1 = Register is not locked and can be modified
0 = Register is locked and cannot be modified
This bit is only clearable and cannot be set except by any reset.

bit 30-24 **Unimplemented:** Read as '0'

bit 23-0 **PWP<23:0>:** Flash Program Write-protect (Page) Address bits
Physical memory below address 0x1Dxxxxxx is write protected, where 'xxxxxx' is specified by PWP<23:0>. When PWP<23:0> has a value of '0', write protection is disabled for the entire program Flash. If the specified address falls within the page, the entire page and all pages below the current page will be protected.

Note: The bits in this register are only writable when the NVMKEY unlock sequence is followed.

REGISTER 5-7: NVMBWP: FLASH BOOT (PAGE) WRITE-PROTECT REGISTER

	UBWPULOCK	—	—	UBWP4(1)	UBWP3(1)	UBWP2(1)	UBWP1(1)	UBWP0(1)

Legend:		r = Reserved	
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **LBWPULOCK:** Lower Boot Alias Write-protect Unlock bit
1 = LBWPx bits are not locked and can be modified
0 = LBWPx bits are locked and cannot be modified
This bit is only clearable and cannot be set except by any reset.

bit 14-13 **Unimplemented:** Read as '0'

bit 12 **LBWP4:** Lower Boot Alias Page 4 Write-protect bit(1)
1 = Write protection for physical address 0x01FC10000 through 0x1FC13FFF enabled
0 = Write protection for physical address 0x01FC10000 through 0x1FC13FFF disabled

bit 11 **LBWP3:** Lower Boot Alias Page 3 Write-protect bit(1)
1 = Write protection for physical address 0x01FC0C000 through 0x1FC0FFFF enabled
0 = Write protection for physical address 0x01FC0C000 through 0x1FC0FFFF disabled

bit 10 **LBWP2:** Lower Boot Alias Page 2 Write-protect bit(1)
1 = Write protection for physical address 0x01FC08000 through 0x1FC0BFFF enabled
0 = Write protection for physical address 0x01FC08000 through 0x1FC0BFFF disabled

bit 9 **LBWP1:** Lower Boot Alias Page 1 Write-protect bit(1)
1 = Write protection for physical address 0x01FC04000 through 0x1FC07FFF enabled
0 = Write protection for physical address 0x01FC04000 through 0x1FC07FFF disabled

bit 8 **LBWP0:** Lower Boot Alias Page 0 Write-protect bit(1)
1 = Write protection for physical address 0x01FC00000 through 0x1FC03FFF enabled
0 = Write protection for physical address 0x01FC00000 through 0x1FC03FFF disabled

bit 7 **UBWPULOCK:** Upper Boot Alias Write-protect Unlock bit
1 = UBWPx bits are not locked and can be modified
0 = UBWPx bits are locked and cannot be modified
This bit is only user-clearable and cannot be set except by any reset.

bit 6 **Reserved:** This bit is reserved for use by development tools

bit 5 **Unimplemented:** Read as '0'

Note 1: These bits are only available when the NVMKEY unlock sequence is performed and the associated Lock bit (LBWPULOCK or UBWPULOCK) is set.

Note: The bits in this register are only writable when the NVMKEY unlock sequence is followed.

REGISTER 5-7: NVMBWP: FLASH BOOT (PAGE) WRITE-PROTECT REGISTER

bit 4 **UBWP4:** Upper Boot Alias Page 4 Write-protect bit(1)
1 = Write protection for physical address 0x01FC30000 through 0x1FC33FFF enabled
0 = Write protection for physical address 0x01FC30000 through 0x1FC33FFF disabled

bit 3 **UBWP3:** Upper Boot Alias Page 3 Write-protect bit(1)
1 = Write protection for physical address 0x01FC2C000 through 0x1FC2FFFF enabled
0 = Write protection for physical address 0x01FC2C000 through 0x1FC2FFFF disabled

bit 2 **UBWP2:** Upper Boot Alias Page 2 Write-protect bit(1)
1 = Write protection for physical address 0x01FC28000 through 0x1FC2BFFF enabled
0 = Write protection for physical address 0x01FC28000 through 0x1FC2BFFF disabled

bit 1 **UBWP1:** Upper Boot Alias Page 1 Write-protect bit(1)
1 = Write protection for physical address 0x01FC24000 through 0x1FC27FFF enabled
0 = Write protection for physical address 0x01FC24000 through 0x1FC27FFF disabled

bit 0 **UBWP0:** Upper Boot Alias Page 0 Write-protect bit(1)
1 = Write protection for physical address 0x01FC20000 through 0x1FC23FFF enabled
0 = Write protection for physical address 0x01FC20000 through 0x1FC23FFF disabled

Note 1: These bits are only available when the NVMKEY unlock sequence is performed and the associated Lock bit (LBWPULOCK or UBWPULOCK) is set.

Note: The bits in this register are only writable when the NVMKEY unlock sequence is followed.

REGISTER 5-8: NVMCON2: PROGRAMMING CONTROL REGISTER 2

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

	—	—	—	—	—	—	—	—
7:0	R/W-0	R/W-0	U-0	U-0	U-0	U-0	U-0	U-0
	SWAPLOCK<1:0>(1)		—	—	—	—	—	—

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-8 **Unimplemented:** Read as '0'

bit 7-6 **SWAPLOCK<1:0>:** Program Flash Memory Page Write-protect Unlock bits(1)

11 = PFSWAP and BFSWP in the NVMCON register are Not Writable and SWAPLOCK<1:0> is Not Writable
10 = PFSWAP and BFSWP in the NVMCON register are Not Writable and SWAPLOCK<1:0> is Writable
01 = PFSWAP and BFSWP in the NVMCON register are Not Writable and SWAPLOCK<1:0> is Writable
00 = PFSWAP and BFSWP in the NVMCON register are Writable and SWAPLOCK<1:0> is Writable

bit 5-0 **Unimplemented:** Read as '0'

Note 1: These bits can only be modified when the NVMKEY unlock sequence is satisfied and the SWAPLOCK<1:0> bits ≠ 11. If the SWAPLOCK<1:0> bits == 11, only a Reset can clear these bits.

6.0 RESETS

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 7. "Resets"** (DS60001118), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

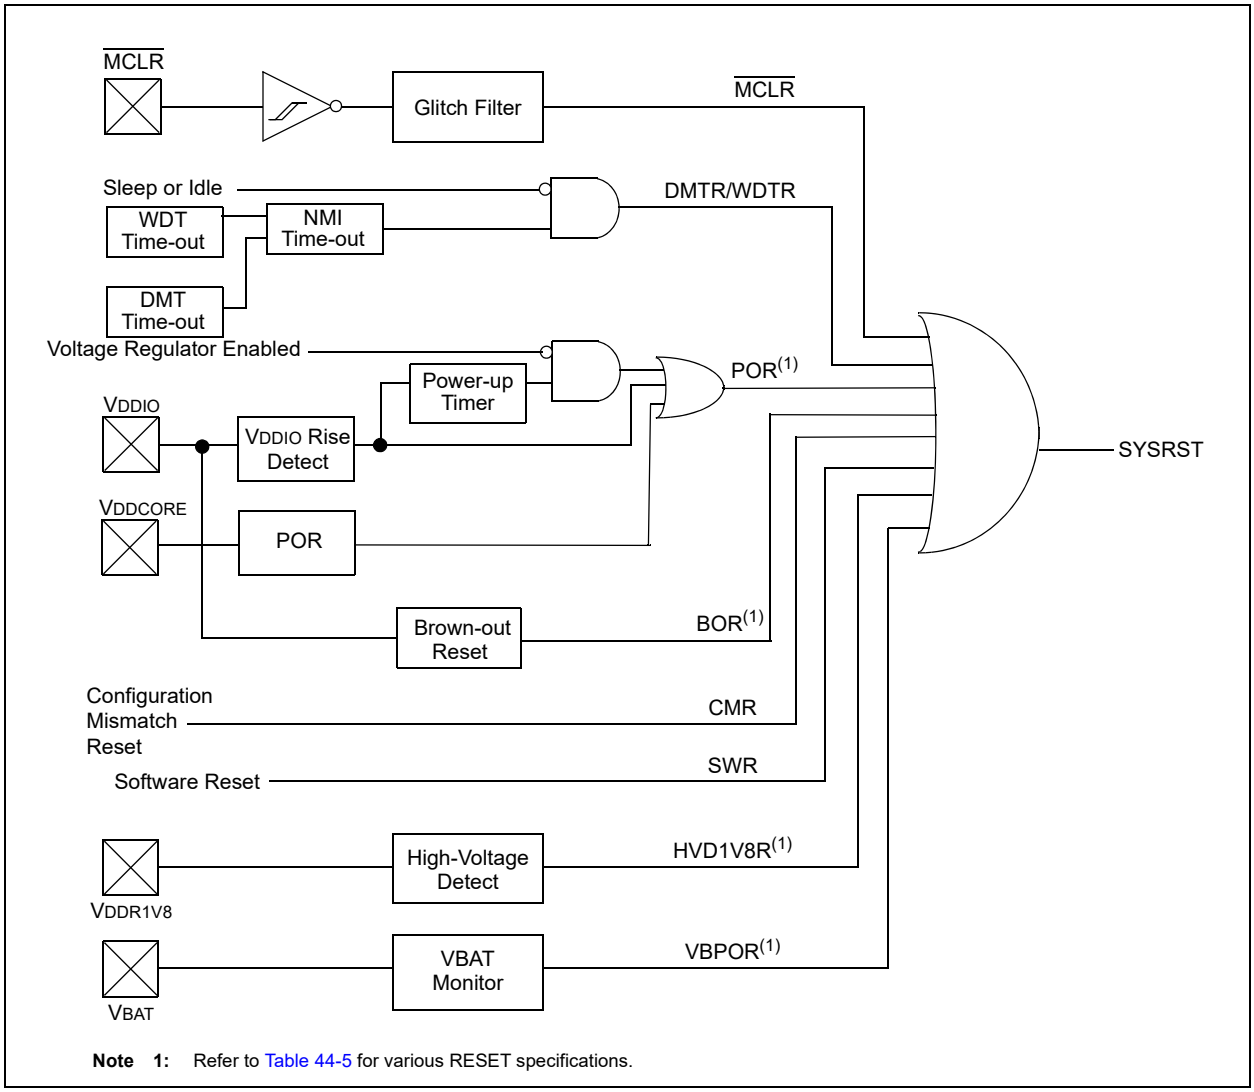
The Reset module combines all Reset sources and controls the device System Reset signal, SYSRST. The device Reset sources are as follows:

- Power-on Reset (POR)
- Brown-out Reset (BOR)
- VBAT Power-on Reset (VBPOR)
- High Voltage Detect Reset (HVD1V8R) on VDDR1V8
- Master Clear Reset pin ($\overline{MCLR}$)
- Software Reset (SWR)
- Watchdog Timer Reset (WDTR)
- Configuration Mismatch Reset (CMR)
- Deadman Timer Reset (DMTR)

All types of device Reset will set a corresponding Status bit in the RCON register (see Register 6-1) to indicate the type of reset.

A simplified block diagram of the Reset module is illustrated in Figure 6-1.

FIGURE 6-1: SYSTEM RESET BLOCK DIAGRAM



Note 1: Refer to Table 44-5 for various RESET specifications.

6.1 Reset Control Registers

Legend:	HS = Hardware Set	HC = Hardware Cleared	
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-30 **Reserved:** Read as '11'

bit 29 **HVD1V8R:** V_{DDR1V8} (DDR2) High Voltage Detect Flag bit
1 = A high voltage condition on the V_{DDR1V8} voltage has occurred
0 = A high voltage condition on the V_{DDR1V8} voltage has not occurred

bit **Unimplemented:** Read as '0'

bit 27 **BCFGERR:** Primary Configuration Registers Error Flag bit
1 = An error occurred during a read of the primary configuration registers
0 = No error occurred during a read of the primary configuration registers

bit 26 **BCFGFAIL:** Primary/Secondary Configuration Registers Error Flag bit
1 = An error occurred during a read of the primary and alternate configuration registers
0 = No error occurred during a read of the primary and alternate configuration registers

bit 25-18 **Unimplemented:** Read as '0'

bit 17 **VBPOR:** VBPOR Mode Flag bit
1 = A V_{BAT} domain POR has occurred
0 = A V_{BAT} domain POR has not occurred

bit 16 **VBAT:** VBAT Mode Flag bit
1 = A POR exit from V_{BAT} has occurred (a true POR must be established with the valid V_{BAT} voltage on the V_{BAT} pin)
0 = A POR exit from V_{BAT} has not occurred

bit 15-11 **Unimplemented:** Read as '0'

bit 10 **DPSLP:** Deep Sleep Mode Flag bit(1)
1 = Deep Sleep mode has occurred
0 = Deep Sleep mode has not occurred

bit 9 **CMR:** Configuration Mismatch Reset Flag bit
1 = A Configuration Mismatch Reset has occurred
0 = A Configuration Mismatch Reset has not occurred

bit 8 **Unimplemented:** Read as '0'

bit 7 **EXTR:** External Reset ($\overline{MCLR}$) Pin Flag bit
1 = Master Clear (pin) Reset has occurred
0 = Master Clear (pin) Reset has not occurred

bit 6 **SWR:** Software Reset Flag bit
1 = Software Reset was executed
0 = Software Reset was not executed

bit 5 **DMTO:** Deadman Timer Time-out Flag bit
1 = A DMT time-out has occurred
0 = A DMT time-out has not occurred

Note 1: User software must clear this bit to view the next detection.

REGISTER 6-1: RCON: RESET CONTROL REGISTER

bit 4 **WDTO:** Watchdog Timer Time-out Flag bit
1 = WDT Time-out has occurred
0 = WDT Time-out has not occurred

bit 3 **SLEEP:** Wake From Sleep Flag bit
1 = Device was in Sleep mode
0 = Device was not in Sleep mode

bit 2 **IDLE:** Wake From Idle Flag bit
1 = Device was in Idle mode
0 = Device was not in Idle mode

bit 1 **BOR:** Brown-out Reset Flag bit(1)
1 = Brown-out Reset has occurred
0 = Brown-out Reset has not occurred

bit 0 **POR:** Power-on Reset Flag bit(1)
1 = Power-on Reset has occurred
0 = Power-on Reset has not occurred

Note 1: User software must clear this bit to view the next detection.

REGISTER 6-2: RSWRST: SOFTWARE RESET REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

7:0	U-0	U-0	U-0	U-0	U-0	U-0	U-0	W-0, HC
	—	—	—	—	—	—	—	SWRST(1,2)

Legend:	HC = Hardware Cleared		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-1 **Unimplemented:** Read as '0'

bit 0 **SWRST:** Software Reset Trigger bit(1,2)
- 1 = Enable software Reset event
- 0 = No effect

Note 1: The system unlock sequence must be performed before the SWRST bit can be written. Refer to the **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

2: Once this bit is set, any read of the RSWRST register will cause a reset to occur.

REGISTER 6-3: RNMICON: NON-MASKABLE INTERRUPT (NMI) CONTROL REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31:24	U-0	U-0	U-0	U-0	U-0	U-0	R/W-0	R/W-0
	—	—	—	—	—	—	DMTO	WDTO
23:16	R/W-0	U-0	U-0	U-0	R/W-0	HS,R/W-0	R/W-0	R/W-0
	SWNMI	—	—	—	GNMI	HLVD	CF	WDTS
15:8	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	NMICNT<15:8>							
7:0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	NMICNT<7:0>							

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-26 **Unimplemented:** Read as '0'

bit 25 **DMTO:** Deadman Timer Time-out Flag bit
1 = DMT time-out has occurred and caused a NMI
0 = DMT time-out has not occurred
Setting this bit will cause a DMT NMI event, and NMICNT will begin counting.

bit 24 **WDTO:** Watchdog Timer Time-Out Flag bit
1 = WDT time-out has occurred and caused a NMI
0 = WDT time-out has not occurred
Setting this bit will cause a WDT NMI event, and MNICNT will begin counting.

bit 23 **SWNMI:** Software NMI Trigger.
1 = An NMI will be generated
0 = An NMI will not be generated

bit 22-20 **Unimplemented:** Read as '0'

bit 19 **GNMI:** General NMI bit
1 = A general NMI event has been detected or a user-initiated NMI event has occurred
0 = A general NMI event has not been detected

Setting GNMI to a '1' causes a user-initiated NMI event. This bit is also set by writing 0x4E to the NMIKEY<7:0> (INTCON<31:24>) bits.

bit 18 **HLVD:** High/Low-Voltage Detect bit
1 = HLVD has detected a low-voltage condition and caused an NMI
0 = HLVD has not detected a low-voltage condition
Note: When this bit is cleared inside NMI before exiting ISR the low voltage condition may still present. This low voltage condition can be checked by monitoring HLVDCON<HLEVT> inside or outside of ISR.

Note 1: If a Watchdog Timer NMI event (when not in Sleep mode) or a Deadman Timer NMI event is cleared before this counter reaches '0', no device Reset is asserted. This NMI reset counter is only applicable to these two specific NMI events.

Note: The system unlock sequence must be performed before the SWRST bit is written. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

REGISTER 6-3: RNMICON: NON-MASKABLE INTERRUPT (NMI) CONTROL REGISTER

bit 17 **CF:** Clock Fail Detect bit
1 = FSCM has detected clock failure and caused an NMI
0 = FSCM has not detected clock failure

Setting this bit will cause a a CF NMI event, but will not cause a clock switch to the BFRC.

Note: On a clock fail event, if enabled by the FCKSM<1:0> bits (DEVCFG1<15:14>) = '0b11, this bit and the OSCCON<CF> bit will be set. The user software must clear both the bits inside the CF NMI handler before exiting the ISR. Software or hardware settings of the CF bit (OSCCON<3>) will cause a CF NMI event and an automatic clock switch to the Backup FRC (BFRC) provided the FCKSM<1:0> = 0b11. Unlike the CF bit (OSCCON<3>), software or hardware settings of the CF bit (RNMICON<17>) will cause a CF NMI event but will not cause a clock switch to the BFRC. After a Clock Fail event, a successful user software clock switch if implemented, hardware will automatically clear the CF bit (RNMICON<17>) but not the CF bit (OSCCON<3>). The CF bit (OSCCON<3>) must be cleared by software using the OSCCON register unlock procedure.

bit 16 **WDTS:** Watchdog Timer Time-out in Sleep Mode Flag bit
1 = WDT time-out has occurred during Sleep mode and caused a wake-up from sleep
0 = WDT time-out has not occurred during Sleep mode
Setting this bit will cause a WDT NMI.

bit 15-0 **NMICNT<15:0>:** NMI Reset Counter Value bits
These bits specify the reload value used by the NMI reset counter.
1111111111111111-0000000000000001 = Number of SYSCLK cycles before a device Reset occurs(1)
0000000000000000 = No delay between NMI assertion and device Reset event

Note 1: If a Watchdog Timer NMI event (when not in Sleep mode) or a Deadman Timer NMI event is cleared before this counter reaches '0', no device Reset is asserted. This NMI reset counter is only applicable to these two specific NMI events.

Note:	The system unlock sequence must be performed before the SWRST bit is written. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

bit 0 **VREGS:** Voltage Regulator Stand-by Enable bit
1 = Voltage regulator will remain active during Sleep
0 = Voltage regulator will go to Stand-by mode during Sleep

7.0 CPU EXCEPTIONS AND INTERRUPT CONTROLLER

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 8. "Interrupt Controller"** (DS60001108) and **Section 50. "CPU for Devices with MIPS32® microAptiv™ and M-Class Cores"** (DS60001192), which are available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

PIC32MZ DA devices generate interrupt requests in response to interrupt events from peripheral modules. The Interrupt Controller module exists outside of the CPU and prioritizes the interrupt events before presenting them to the CPU.

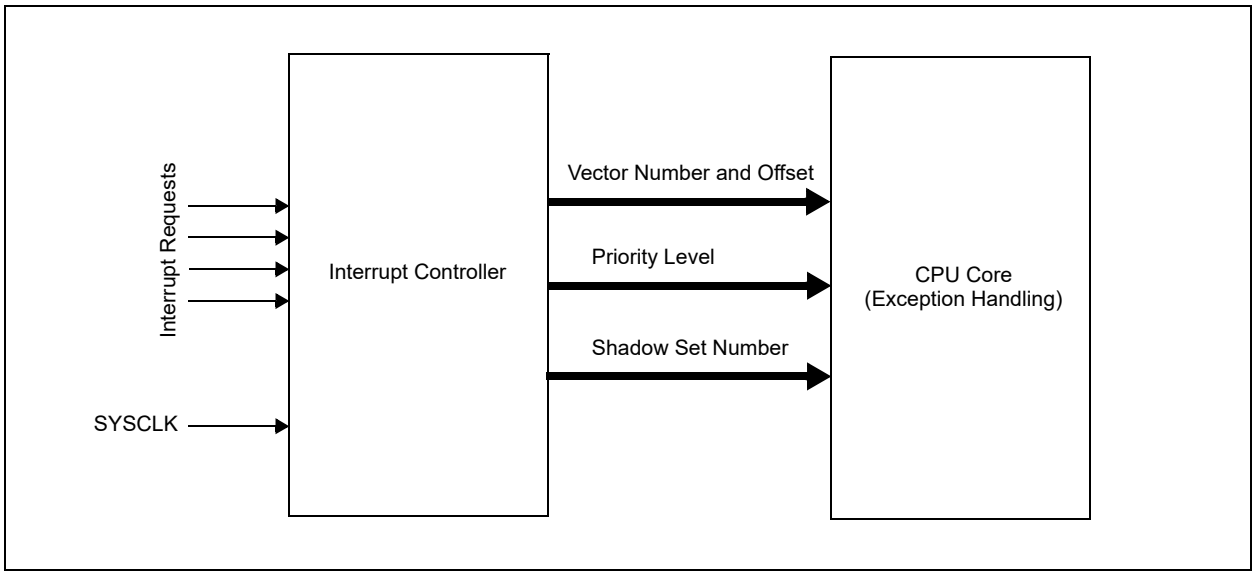
The CPU handles interrupt events as part of the exception handling mechanism, which is described in **Section 7.1 "CPU Exceptions"**.

The Interrupt Controller module includes the following features:

- Up to 210 interrupt sources and vectors with dedicated programmable offsets, eliminating the need for redirection
- Single and multi-vector mode operations
- Five external interrupts with edge polarity control
- Interrupt proximity timer
- Seven user-selectable priority levels for each vector
- Four user-selectable sub-priority levels within each priority
- Seven shadow register sets that can be used for any priority level, eliminating software context switch and reducing interrupt latency
- Software can generate any interrupt

Figure 7-1 shows the block diagram for the Interrupt Controller and CPU exceptions.

FIGURE 7-1: CPU EXCEPTIONS AND INTERRUPT CONTROLLER MODULE BLOCK DIAGRAM



7.1 CPU Exceptions

CPU coprocessor 0 contains the logic for identifying and managing exceptions. Exceptions can be caused by a variety of sources, including boundary cases in data, external events or program errors. Table 7-1 lists the exception types in order of priority.

TABLE 7-1: MIPS32® microAptiv™ MICROPROCESSOR CORE EXCEPTION TYPES

Exception Type (In Order of Priority)	Description	Branches to	Status Bits Set	Debug Bits Set	EXCCODE	X
Highest Priority						
Reset	Assertion $\overline{\text{MCLR}}$ or a Power-on Reset (POR).	0xBFC0_0000	BEV, ERL	—	—	_on_re
Soft Reset	Assertion of a software Reset.	0xBFC0_0000	BEV, SR, ERL	—	—	_on_re
DSS	EJTAG debug single step.	0xBFC0_0480	—	DSS	—	
DINT	EJTAG debug interrupt. Caused by the assertion of the external EJ_DINT input or by setting the EjtagBrk bit in the ECR register.	0xBFC0_0480	—	DINT	—	
NMI	Assertion of NMI signal.	0xBFC0_0000	BEV, NMI, ERL	—	—	_nmi_l
Machine Check	TLB write that conflicts with an existing entry.	EBASE+0x180	MCHECK, EXL	—	0x18	_genei
Interrupt	Assertion of unmasked hardware or software interrupt signal.	See Table 7-2.	IPL<2:0>	—	0x00	See Ta
Deferred Watch	Deferred watch (unmasked by K|DM=>!(K|DM) transition).	EBASE+0x180	WP, EXL	—	0x17	_genei
DIB	EJTAG debug hardware instruction break matched.	0xBFC0_0480	—	DIB	—	
WATCH	A reference to an address that is in one of the Watch registers (fetch).	EBASE+0x180	EXL	—	0x17	_genei
AdEL	Fetch address alignment error. Fetch reference to protected address.	EBASE+0x180	EXL	—	0x04	_genei
TLBL	Fetch TLB miss or fetch TLB hit to page with V = 0.	EBASE if Status.EXL = 0	—	—	0x02	
		EBASE+0x180 if Status.EXL == 1	—	—	0x02	_genei
TLBL Execute-Inhibit	An instruction fetch matched a valid TLB entry that had the XI bit set.	EBASE+0x180	EXL	—	0x14	_genei
IBE	Instruction fetch bus error.	EBASE+0x180	EXL	—	0x06	_genei

TABLE 7-1: MIPS32® microAptiv™ MICROPROCESSOR CORE EXCEPTION TYPES (CONTINUED)

Exception Type (In Order of Priority)	Description	Branches to	Status Bits Set	Debug Bits Set	EXCCODE	X
Instruction Validity Exceptions	An instruction could not be completed because it was not allowed to access the required resources (Coprocessor Unusable) or was illegal (Reserved Instruction). If both exceptions occur on the same instruction, the Coprocessor Unusable Exception takes priority over the Reserved Instruction Exception.	EBASE+0x180	EXL	—	0x0A or 0x0B	_gene
Execute Exception	An instruction-based exception occurred: Integer overflow, trap, system call, breakpoint, floating point, or DSP ASE state disabled exception.	EBASE+0x180	EXL	—	0x08-0x0C	_gene
Tr	Execution of a trap (when trap condition is true).	EBASE+0x180	EXL	—	0x0D	_gene
DDBL/DDBS	EJTAG Data Address Break (address only) or EJTAG data value break on store (address + value).	0xBFC0_0480	—	DDBL or DDBS	—	
WATCH	A reference to an address that is in one of the Watch registers (data).	EBASE+0x180	EXL	—	0x17	_gene
AdEL	Load address alignment error. User mode load reference to kernel address.	EBASE+0x180	EXL	—	0x04	_gene
AdES	Store address alignment error. User mode store to kernel address.	EBASE+0x180	EXL	—	0x05	_gene
TLBL	Load TLB miss or load TLB hit to page with V = 0.	EBASE+0x180	EXL	—	0x02	_gene
TLBS	Store TLB miss or store TLB hit to page with V = 0.	EBASE+0x180	EXL	—	0x03	_gene
DBE	Load or store bus error.	EBASE+0x180	EXL	—	0x07	_gene
DDBL	EJTAG data hardware breakpoint matched in load data compare.	0xBFC0_0480	—	DDBL	—	
CBrk	EJTAG complex breakpoint.	0xBFC0_0480	—	DIBIMPR, DDBLIMPR, and/or DDBSIMPR	—	
Lowest Priority						

7.2 Interrupts

The PIC32MZ DA family uses variable offsets for vector spacing. This allows the interrupt vector spacing to be configured according to application needs. A unique interrupt vector offset can be set for each vector using its associated OFFx register.

For details on the Variable Offset feature, refer to **Section 8. "Interrupt Controller"** (DS6000110 *Reference Manual"*.

Table 7-2 provides the Interrupt IRQ, vector and bit

TABLE 7-2: INTERRUPT IRQ, VECTOR AND BIT LOCATION

Interrupt Source(1)	XC32 Vector Name	IRQ #	Vector #	Interrupt Bit Location		
				Flag	Enable	Priority
Highest Natural Order Priority						
Core Timer Interrupt	_CORE_TIMER_VECTOR	0	OFF000<17:1>	IFS0<0>	IEC0<0>	IPC0<4:2>
Core Software Interrupt 0	_CORE_SOFTWARE_0_VECTOR	1	OFF001<17:1>	IFS0<1>	IEC0<1>	IPC0<12:10>
Core Software Interrupt 1	_CORE_SOFTWARE_1_VECTOR	2	OFF002<17:1>	IFS0<2>	IEC0<2>	IPC0<20:18>
External Interrupt 0	_EXTERNAL_0_VECTOR	3	OFF003<17:1>	IFS0<3>	IEC0<3>	IPC0<28:26>
Timer1	_TIMER_1_VECTOR	4	OFF004<17:1>	IFS0<4>	IEC0<4>	IPC1<4:2>
Input Capture 1 Error	_INPUT_CAPTURE_1_ERROR_VECTOR	5	OFF005<17:1>	IFS0<5>	IEC0<5>	IPC1<12:10>
Input Capture 1	_INPUT_CAPTURE_1_VECTOR	6	OFF006<17:1>	IFS0<6>	IEC0<6>	IPC1<20:18>

	—	—	—	INT4EP	INT3EP	INT2EP	INT1EP	INT0EP

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-24 **NMIKEY<7:0>:** Non-Maskable Interrupt Key bits
When the correct key (0x4E) is written, a software NMI will be generated. The status is indicated by the GNMI bit (RNMICON<19>).

bit 23-13 **Unimplemented:** Read as '0'

bit 12 **MVEC:** Multi Vector Configuration bit
1 = Interrupt controller configured for multi-vectored mode
0 = Interrupt controller configured for single vectored mode

bit 11 **Unimplemented:** Read as '0'

bit 10-8 **TPC<2:0>:** Interrupt Proximity Timer Control bits
111 = Interrupts of group priority 7 or lower start the Interrupt Proximity timer
110 = Interrupts of group priority 6 or lower start the Interrupt Proximity timer
101 = Interrupts of group priority 5 or lower start the Interrupt Proximity timer
100 = Interrupts of group priority 4 or lower start the Interrupt Proximity timer
011 = Interrupts of group priority 3 or lower start the Interrupt Proximity timer
010 = Interrupts of group priority 2 or lower start the Interrupt Proximity timer
001 = Interrupts of group priority 1 start the Interrupt Proximity timer
000 = Disables Interrupt Proximity timer

bit 7-5 **Unimplemented:** Read as '0'

bit 4 **INT4EP:** External Interrupt 4 Edge Polarity Control bit
1 = Rising edge
0 = Falling edge

bit 3 **INT3EP:** External Interrupt 3 Edge Polarity Control bit
1 = Rising edge
0 = Falling edge

bit 2 **INT2EP:** External Interrupt 2 Edge Polarity Control bit
1 = Rising edge
0 = Falling edge

bit 1 **INT1EP:** External Interrupt 1 Edge Polarity Control bit
1 = Rising edge
0 = Falling edge

bit 0 **INT0EP:** External Interrupt 0 Edge Polarity Control bit
1 = Rising edge
0 = Falling edge

bit 0 **Unimplemented:** Read as '0'

8.0 OSCILLATOR CONFIGURATION

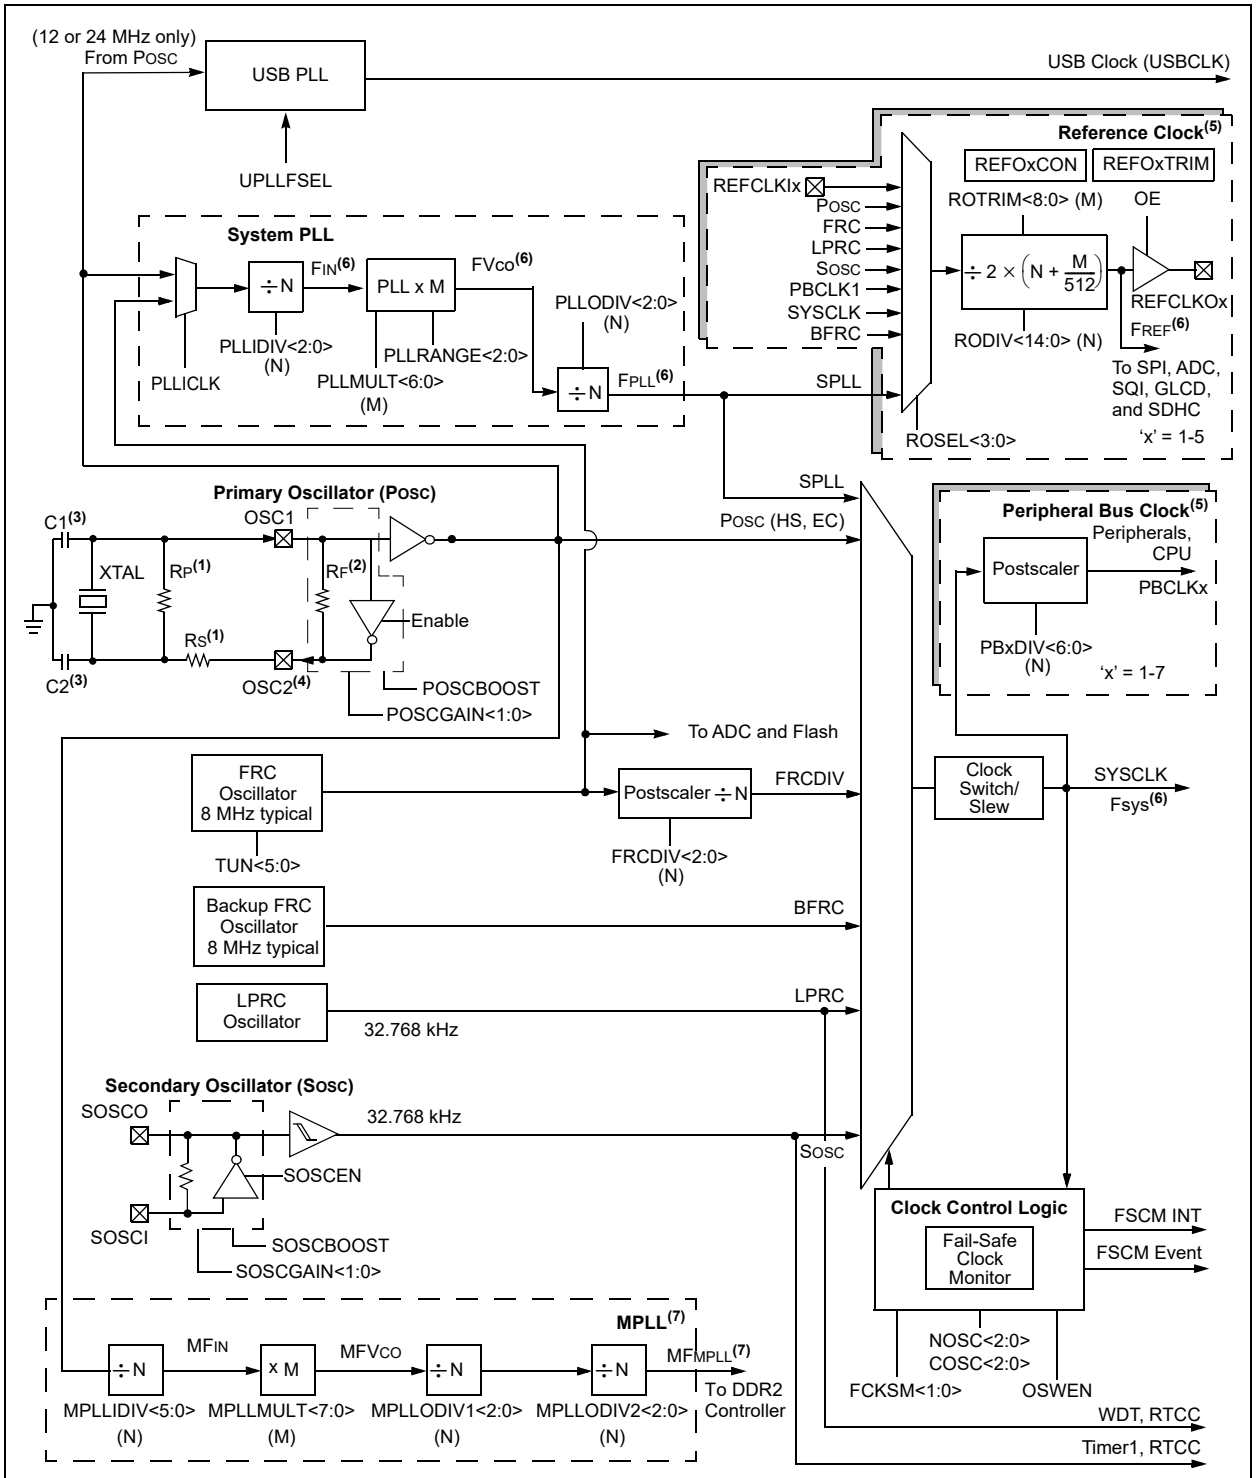
Note: This data sheet summarizes the features of the PIC32MZ DA family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The PIC32MZ DA oscillator system has the following modules and features:

- Five external and internal oscillator options as clock sources
- On-Chip PLL with user-selectable input divider, multiplier and output divider to boost operating frequency on select internal and external oscillator sources
- On-Chip user-selectable divisor postscaler on select oscillator sources
- Software-controllable switching between various clock sources
- A Fail-Safe Clock Monitor (FSCM) that detects clock failure and permits safe application recovery or shutdown with dedicated Back-up FRC (BFRC)
- Dedicated On-Chip PLL for DDR2 and USB modules
- Flexible reference clock output
- Multiple clock branches for peripherals for better performance flexibility

A block diagram of the oscillator system is provided in Figure 8-1. The clock distribution is shown in Table 8-1.

FIGURE 8-1: PIC32MZ DA FAMILY OSCILLATOR DIAGRAM



Notes:
1. A series resistor, RS, may be required for AT strip cut crystals, or to eliminate clipping. Alternately, to increase oscillator circuit gain, add a parallel resistor, RP, with a value of 1 MΩ.
2. The internal feedback resistor, RF, is typically in the range of 2 to 10 MΩ.
3. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the "*PIC32 Family Reference Manual*" for help in determining the best oscillator components.
4. PBCLK1 divided by 2 is available on the OSC2 pin in certain clock modes.
5. Shaded regions indicate multiple instantiations of a peripheral or feature.
6. Refer to Table 44-25 in **Section 44.0 "Electrical Characteristics"** for frequency limitations.
7. Memory Phase-Locked Loop (MPLL) is controlled through the CFGMPLL register (see **41.0 "Special Features"** for details). MFMPLL drives the DDR2 PHY and is the source clock (DDRCK, $\overline{\text{DDRCK}}$) for DDR2 SDRAM.

TABLE 8-1: SYSTEM AND PERIPHERAL CLOCK DISTRIBUTION

Peripheral		Clock Source																
	FRC	LPRC	SOSC	SYSCLK	USBCLK	MPLL	PBCLK1(1)	PBCLK2	PBCLK3	PBCLK4	PBCLK5	PBCLK6	PBCLK7	REFCLKO1	REFCLKO2	REFCLKO3	REFCLKO4	REFOCLK5

Prefetch				X														
OSC2 Pin							X(5)											
DSCTRL(8)				X								X						
HLVD							X(3)											

Note 1: PBCLK1 is used by system modules and cannot be turned off.

2: SYSCLK/PBCLK5 is used to fetch data from/to the Flash Controller, while the FRC clock is used for programming.

3: Special Function Register (SFR) access only.

4: Timer1 only.

5: PBCLK1 divided by 2 is available on the OSC2 pin in certain clock modes.

6: REFCLKO5 is used for the Pixel Clock .

7: USBCR is the Clock/Reset Control block for the USB.

8: DSCTRL is the Deep Sleep Control Block.

8.1 Fail-Safe Clock Monitor (FSCM)

The PIC32MZ DA oscillator system includes a Fail-safe Clock Monitor (FSCM). The FSCM monitors the SYSCLK for continuous operation. If it detects that the SYSCLK has failed, it switches the SYSCLK over to the BFRC oscillator and triggers a NMI. The BFRC is an untuned 8 MHz oscillator that will drive the SYSCLK during FSCM event. When the NMI is executed, software can attempt to restart the main oscillator or shut down the system.

In Sleep mode both the SYSCLK and the FSCM halt, which prevents FSCM detection.

8.2 Oscillator Control Registers

TABLE 8-2: OSCILLATOR CONFIGURATION REGISTER MAP

bit 26-24 **FRCDIV<2:0>:** Internal Fast RC (FRC) Oscillator Clock Divider bits
- 111 = FRC divided by 256
- 110 = FRC divided by 64
- 101 = FRC divided by 32
- 100 = FRC divided by 16
- 011 = FRC divided by 8
- 010 = FRC divided by 4
- 001 = FRC divided by 2
- 000 = FRC divided by 1 (default setting)

bit 23 **DRMEN:** Dream Mode Enable bit
- 1 = Dream mode is enabled
- 0 = Dream mode is disabled

bit 22 **Unimplemented:** Read as '0'

bit 21 **SLP2SPD:** Sleep Two-speed Start-up Control bit
- 1 = Use FRC as SYSCLK until the selected clock is ready
- 0 = Use the selected clock directly

bit 20-15 **Unimplemented:** Read as '0'

bit 14-12 **COSC<2:0>:** Current Oscillator Selection bits
- 111 = System PLL (SPLL)
- 110 = Back-up Fast RC (BFRC) Oscillator
- 101 = Internal Low-Power RC (LPRC) Oscillator
- 100 = Secondary Oscillator (SOSC)
- 011 = Reserved
- 010 = Primary Oscillator (POSC) (HS or EC)
- 001 = System PLL (SPLL)
- 000 = Internal Fast RC (FRC) Oscillator divided by FRCDIV<2:0> bits (FRCDIV)

bit 11 **Unimplemented:** Read as '0'

Note 1: The reset value for this bit depends on the setting of the IESO bit (DEVCFG1<7>). When IESO = 1, the reset value is '1'. When IESO = 0, the reset value is '0'.

Note: Writes to this register require an unlock sequence. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

REGISTER 8-1: OSCCON: OSCILLATOR CONTROL REGISTER

bit 10-8 **NOSC<2:0>:** New Oscillator Selection bits
- 111 = System PLL (SPLL)
- 110 = Reserved
- 101 = Internal Low-Power RC (LPRC) Oscillator
- 100 = Secondary Oscillator (SOSC)
- 011 = Reserved
- 010 = Primary Oscillator (POSC) (HS or EC)
- 001 = System PLL (SPLL)
- 000 = Internal Fast RC (FRC) Oscillator divided by FRCDIV<2:0> bits (FRCDIV)

On Reset, these bits are set to the value of the FNOSC<2:0> Configuration bits (DEVCFG1<2:0>).

bit 7 **CLKLOCK:** Clock Selection Lock Enable bit
- 1 = Clock and PLL selections are locked
- 0 = Clock and PLL selections are not locked and may be modified

bit 6-5 **Unimplemented:** Read as '0'

bit 4 **SLPEN:** Sleep Mode Enable bit
- 1 = Device will enter Sleep mode when a WAIT instruction is executed
- 0 = Device will enter Idle mode when a WAIT instruction is executed

bit 3 **CF:** Clock Fail Detect bit
- 1 = FSCM has detected a clock failure
- 0 = No clock failure has been detected

bit 2 **Unimplemented:** Read as '0'

bit 1 **SOSCEN:** Secondary Oscillator (SOSC) Enable bit
- 1 = Enable Secondary Oscillator
- 0 = Disable Secondary Oscillator

bit 0 **OSWEN:** Oscillator Switch Enable bit(1)
- 1 = Initiate an oscillator switch to selection specified by NOSC<2:0> bits
- 0 = Oscillator switch is complete

Note 1: The reset value for this bit depends on the setting of the IESO bit (DEVCFG1<7>). When IESO = 1, the reset value is '1'. When IESO = 0, the reset value is '0'.

Note:	Writes to this register require an unlock sequence. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

REGISTER 8-2: OSCTUN: FRC TUNING REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

	PLLICLK	—	—	—	—	PLLRANGE<2:0>		

Legend:	y = Value set from Configuration bits on POR		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-27 **Unimplemented:** Read as '0'

bit 26-24 **PLLODIV<2:0>:** System PLL Output Clock Divider bits

111 = Reserved
110 = Reserved
101 = PLL Divide by 32
100 = PLL Divide by 16
011 = PLL Divide by 8
010 = PLL Divide by 4
001 = PLL Divide by 2
000 = Reserved

The default setting is specified by the FPLLODIV<2:0> Configuration bits in the DEVCFG2 register. Refer to Register 34-5 in **Section 34.0 "Special Features"** for information.

bit 23 **Unimplemented:** Read as '0'

bit 22-16 **PLLMULT<6:0>:** System PLL Multiplier bits

1111111 = Multiply by 128
1111110 = Multiply by 127
1111101 = Multiply by 126
1111100 = Multiply by 125
•
•
•
0000000 = Multiply by 1

The default setting is specified by the FPLLMULT<6:0> Configuration bits in the DEVCFG2 register. Refer to Register 34-5 in **Section 34.0 "Special Features"** for information.

bit 15-11 **Unimplemented:** Read as '0'

Note 1: Writes to this register require an unlock sequence. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

2: Writes to this register are not allowed if the SPLL is selected as a clock source (COSC<2:0> = 001).

REGISTER 8-3: SPLLCON: SYSTEM PLL CONTROL REGISTER

bit 10-8 **PLLIDIV<2:0>:** System PLL Input Clock Divider bits

111 = Divide by 8
110 = Divide by 7
101 = Divide by 6
100 = Divide by 5
011 = Divide by 4
010 = Divide by 3
001 = Divide by 2
000 = Divide by 1

The default setting is specified by the FPLLIDIV<2:0> Configuration bits in the DEVCFG2 register. Refer to Register 34-5 in **Section 34.0 "Special Features"** for information. If the PLLICLK is set for FRC, this setting is ignored by the PLL and the divider is set to Divide-by-1.

bit 7 **PLLICLK:** System PLL Input Clock Source bit

1 = FRC is selected as the input to the System PLL
0 = POSC is selected as the input to the System PLL
The POR default is specified by the FPLLICLK Configuration bit in the DEVCFG2 register. Refer to Register 34-5 in **Section 34.0 "Special Features"** for information.

bit 6-3 **Unimplemented:** Read as '0'

bit 2-0 **PLLRANGE<2:0>:** System PLL Frequency Range Selection bits

111 = Reserved
110 = Reserved
101 = 34-64 MHz
100 = 21-42 MHz
011 = 13-26 MHz
010 = 8-16 MHz
001 = 5-10 MHz
000 = Bypass

The default setting is specified by the FPLLRNG<2:0> Configuration bits in the DEVCFG2 register. Refer to Register 34-5 in **Section 34.0 "Special Features"** for information.

Note 1: Writes to this register require an unlock sequence. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

2: Writes to this register are not allowed if the SPLL is selected as a clock source (COSC<2:0> = 001).

REGISTER 8-4: REFOxCON: REFERENCE OSCILLATOR CONTROL REGISTER ('x' = 1-5)

bit 31 **Unimplemented:** Read as '0'

bit 30-16 **RODIV<14:0>** Reference Clock Divider bits

This value specifies 1/2 period of the reference clock in the source clocks.

111111111111111 = REFO clock is Base clock frequency divided by 65,534 (32,767*2)

111111111111110 = REFO clock is Base clock frequency divided by 65,532 (32,766*2)

•

•

•

000000000000011 = REFO clock is Base clock frequency divided by 6 (3*2)

000000000000010 = REFO clock is Base clock frequency divided by 4 (2*2)

000000000000001 = REFO clock is Base clock frequency divided by 2 (1*2)

000000000000000 = REFO is the same frequency as Base Clock (no divider)

bit 15 **ON:** Output Enable bit(1)

1 = Reference Oscillator Module enabled

0 = Reference Oscillator Module disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Peripheral Stop in Idle Mode bit

1 = Discontinue module operation when the device enters Idle mode

0 = Continue module operation in Idle mode

bit 12 **OE:** Reference Clock Output Enable bit

1 = Reference clock is driven out on REFCLKOx pin

0 = Reference clock is not driven out on REFCLKOx pin

bit 11 **RSLP:** Reference Oscillator Module Run in Sleep bit(2)

1 = Reference Oscillator Module output continues to run in Sleep

0 = Reference Oscillator Module output is disabled in Sleep

bit 10 **Unimplemented:** Read as '0'

bit 9 **DIVSWEN:** Divider Switch Enable bit

1 = Divider switch is in progress

0 = Divider switch is complete

bit 8 **ACTIVE:** Reference Clock Request Status bit(1)

1 = Reference clock request is active

0 = Reference clock request is not active

bit 7-4 **Unimplemented:** Read as '0'

Note 1: Do not write to this register when the ON bit is not equal to the ACTIVE bit.

2: This bit is ignored when the ROSEL<3:0> bits = 0000 or 0001.

3: The ROSEL<3:0> bits should not be written while the ACTIVE bit is '1', as undefined behavior may result.

4: REFCLKI2 and REFCLKI5 do not exist and are therefore not selectable.

REGISTER 8-4: REFOxCON: REFERENCE OSCILLATOR CONTROL REGISTER ('x' = 1-5)

bit 3-0 **ROSEL**<3:0>: Reference Clock Source Select bits(3)
1111 = Reserved
•
•
•
1001 = BFRC
1000 = REFCLKIx(4)
0111 = System PLL output
0110 = Reserved
0101 = Sosc
0100 = LPRC
0011 = FRC
0010 = Posc
0001 = PBCLK1
0000 = SYSCLK

Note 1: Do not write to this register when the ON bit is not equal to the ACTIVE bit.
2: This bit is ignored when the ROSEL<3:0> bits = 0000 or 0001.
3: The ROSEL<3:0> bits should not be written while the ACTIVE bit is '1', as undefined behavior may result.
4: REFCLKI2 and REFCLKI5 do not exist and are therefore not selectable.

REGISTER 8-5: REFOxTRIM: REFERENCE OSCILLATOR TRIM REGISTER ('x' = 1-4)

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-20 **Unimplemented:** Read as '0'

bit 19-16 **SYSDIV<3:0>:** System Clock Divide Control bits(1)

1111 = SYSCLK is divided by 16
1110 = SYSCLK is divided by 15
•
•
•
0010 = SYSCLK is divided by 3
0001 = SYSCLK is divided by 2
0000 = SYSCLK is not divided

bit 15-11 **Unimplemented:** Read as '0'

bit 10-8 **SLWDIV<2:0>:** Slew Divisor Steps Control bits

These bits control the maximum division steps used when slewing during a frequency change.
111 = Steps are divide by 128, 64, 32, 16, 8, 4, 2, and then no divisor
110 = Steps are divide by 64, 32, 16, 8, 4, 2, and then no divisor
101 = Steps are divide by 32, 16, 8, 4, 2, and then no divisor
100 = Steps are divide by 16, 8, 4, 2, and then no divisor
011 = Steps are divide by 8, 4, 2, and then no divisor
010 = Steps are divide by 4, 2, and then no divisor
001 = Steps are divide by 2, and then no divisor
000 = No divisor is used during slewing
The steps apply in reverse order (i.e., 2, 4, 8, etc.) during a downward frequency change.

bit 7-3 **Unimplemented:** Read as '0'

bit 2 **UPEN:** Upward Slew Enable bit

1 = Slewing enabled for switching to a higher frequency
0 = Slewing disabled for switching to a higher frequency

bit 1 **DNEN:** Downward Slew Enable bit

1 = Slewing enabled for switching to a lower frequency
0 = Slewing disabled for switching to a lower frequency

bit 0 **BUSY:** Clock Switching Slewing Active Status bit

1 = Clock frequency is being actively slewed to the new frequency
0 = Clock switch has reached its final value

Note 1: The SYSDIV<3:0> bit settings are ignored if both UPEN and DNEN = 0, and SYSCLK will be divided by 1.

CLKSTAT: OSCILLATOR CLOCK STATUS REGISTER

bit 4 **SOSCRDY:** Secondary Oscillator (SOSC) Ready Status bit
- 1 = SOSC is stable and ready
- 0 = SOSC is disabled or not operating

bit 3 **Unimplemented:** Read as '0'

bit 2 **POSCRDY:** Primary Oscillator (POSC) Ready Status bit
- 1 = POSC is stable and ready
- 0 = POSC is disabled or not operating

bit 1 **Unimplemented:** Read as '0'

bit 0 **FRCRDY:** Fast RC (FRC) Oscillator Ready Status bit
- 1 = FRC is stable and ready
- 0 = FRC is disabled for not operating

9.0 PREFETCH MODULE

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 41. "Prefetch Module for Devices with L1 CPU Cache"** (DS60001183), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The Prefetch module is a performance enhancing module that is included in PIC32MZ DA family devices. When running at high-clock rates, Wait states must be inserted into Program Flash Memory (PFM) read transactions to meet the access time of the PFM. Wait states can be hidden to the core by prefetching and storing instructions in a temporary holding area that the CPU can access quickly. Although the data path to the CPU is 32 bits wide, the data path to the PFM is 128 bits wide. This wide data path provides the same bandwidth to the CPU as a 32-bit path running at four times the frequency.

The Prefetch module holds a subset of PFM in temporary holding spaces known as lines. Each line contains a tag and data field. Normally, the lines hold a copy of what is currently in memory to make instructions or data available to the CPU without Flash Wait states.

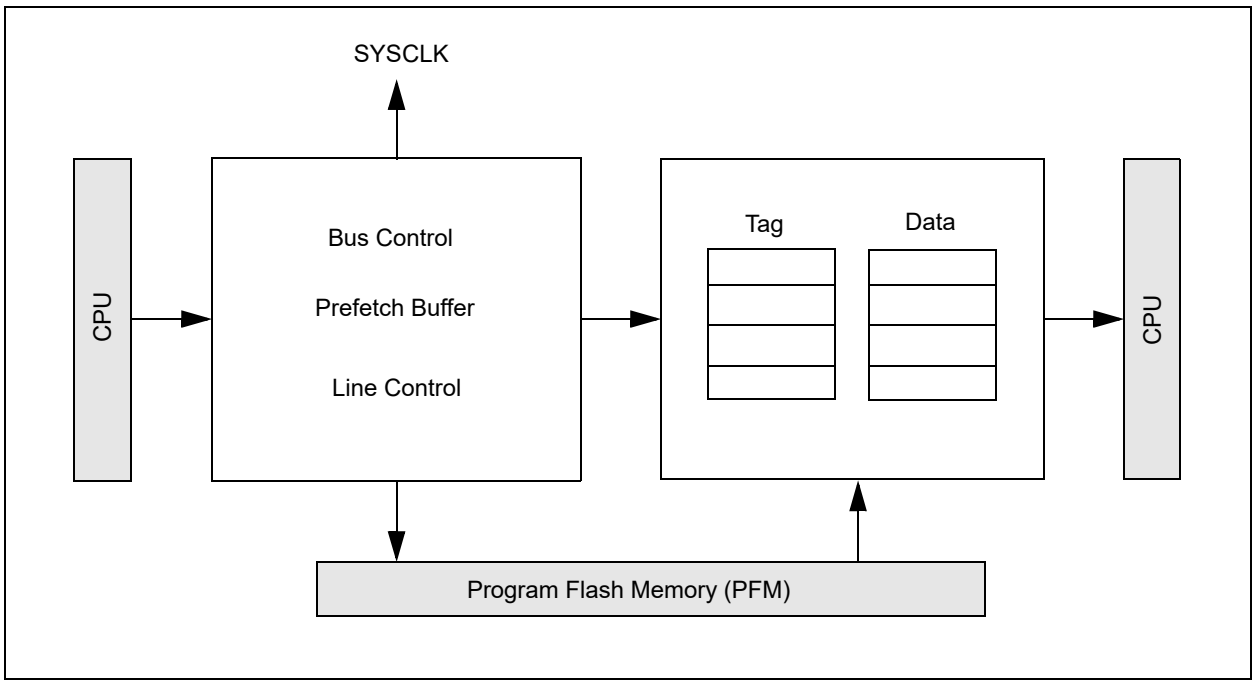
9.1 Features

The Prefetch module includes the following key features:

- 4x16 byte fully-associative lines
- One line for CPU instructions
- One line for CPU data
- Two lines for peripheral data
- 16-byte parallel memory fetch
- Configurable predictive prefetch
- Error detection and correction

A simplified block diagram of the Prefetch module is shown in Figure 9-1.

FIGURE 9-1: PREFETCH MODULE BLOCK DIAGRAM



9.2 Prefetch Control Registers

10.0 DIRECT MEMORY ACCESS (DMA) CONTROLLER

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 31. "Direct Memory Access (DMA) Controller"** (DS60001117), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The Direct Memory Access (DMA) Controller is a bus host module useful for data transfers between different devices without CPU intervention. The source and destination of a DMA transfer can be any of the memory mapped modules existent in the device such as SPI, UART, PMP, etc., or memory itself.

Following are key features of the DMA Controller module:

- Eight identical channels, each featuring:
  - Auto-increment source and destination address registers
  - Source and destination pointers
  - Memory to memory and memory to peripheral transfers
- Automatic word-size detection:
  - Transfer granularity, down to byte level
  - Bytes need not be word-aligned at source and destination
- Fixed priority channel arbitration
- Flexible DMA channel operating modes:
  - Manual (software) or automatic (interrupt) DMA requests
  - One-Shot or Auto-Repeat Block Transfer modes
  - Channel-to-channel chaining
- Flexible DMA requests:
  - A DMA request can be selected from any of the peripheral interrupt sources
  - Each channel can select any (appropriate) observable interrupt as its DMA request source
  - A DMA transfer abort can be selected from any of the peripheral interrupt sources
  - Up to 2-byte Pattern (data) match transfer termination
- Multiple DMA channel status interrupts:
  - DMA channel block transfer complete
  - Source empty or half empty
  - Destination full or half full
  - DMA transfer aborted due to an external event
  - Invalid DMA address generated
- DMA debug support features:
  - Most recent error address accessed by a DMA channel
  - Most recent DMA channel to transfer data
- CRC Generation module:
  - CRC module can be assigned to any of the available channels
  - CRC module is highly configurable

	—	—	—	PLEN<4:0>(1)				
7:0	R/W-0	R/W-0	R/W-0	U-0	U-0	R/W-0	R/W-0	R/W-0
	CRCEN	CRCAPP(1)	CRCTYP	—	—	CRCCH<2:0>		

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-30 **Unimplemented:** Read as '0'

bit 29-28 **BYTO<1:0>:** CRC Byte Order Selection bits
- 11 = Endian byte swap on half-word boundaries (i.e., source half-word order with reverse source byte order per half-word)
- 10 = Swap half-words on word boundaries (i.e., reverse source half-word order with source byte order per half-word)
- 01 = Endian byte swap on word boundaries (i.e., reverse source byte order)
- 00 = No swapping (i.e., source byte order)

bit 27 **WBO:** CRC Write Byte Order Selection bit(1)
- 1 = Source data is written to the destination re-ordered as defined by BYTO<1:0>
- 0 = Source data is written to the destination unaltered

bit 26-25 **Unimplemented:** Read as '0'

bit 24 **BITO:** CRC Bit Order Selection bit

When CRCTYP (DCRCCON<5>) = 1 (CRC module is in IP Header mode):
- 1 = The IP header checksum is calculated Least Significant bit (LSb) first (i.e., reflected)
- 0 = The IP header checksum is calculated Most Significant bit (MSb) first (i.e., not reflected)

When CRCTYP (DCRCCON<5>) = 0 (CRC module is in LFSR mode):
- 1 = The LFSR CRC is calculated Least Significant bit first (i.e., reflected)
- 0 = The LFSR CRC is calculated Most Significant bit first (i.e., not reflected)

bit 23-13 **Unimplemented:** Read as '0'

bit 12-8 **PLEN<4:0>:** Polynomial Length bits(1)

When CRCTYP (DCRCCON<5>) = 1 (CRC module is in IP Header mode):
These bits are unused.

When CRCTYP (DCRCCON<5>) = 0 (CRC module is in LFSR mode):
Denotes the length of the polynomial – 1.

bit 7 **CRCEN:** CRC Enable bit
- 1 = CRC module is enabled and channel transfers are routed through the CRC module
- 0 = CRC module is disabled and channel transfers proceed normally

Note 1: When WBO = 1, unaligned transfers are not supported and the CRCAPP bit cannot be set.

REGISTER 10-4: DCRCCON: DMA CRC CONTROL REGISTER (CONTINUED)

bit 6 **CRCAPP:** CRC Append Mode bit(1)
- 1 = The DMA transfers data from the source into the CRC but NOT to the destination. When a block transfer completes the DMA writes the calculated CRC value to the location given by CHxDSA
- 0 = The DMA transfers data from the source through the CRC obeying WBO as it writes the data to the destination

bit 5 **CRCTYP:** CRC Type Selection bit
- 1 = The CRC module will calculate an IP header checksum
- 0 = The CRC module will calculate a LFSR CRC

bit 4-3 **Unimplemented:** Read as '0'

bit 2-0 **CRCCH<2:0>:** CRC Channel Select bits
- 111 = CRC is assigned to Channel 7
- 110 = CRC is assigned to Channel 6
- 101 = CRC is assigned to Channel 5
- 100 = CRC is assigned to Channel 4
- 011 = CRC is assigned to Channel 3
- 010 = CRC is assigned to Channel 2
- 001 = CRC is assigned to Channel 1
- 000 = CRC is assigned to Channel 0

Note 1: When WBO = 1, unaligned transfers are not supported and the CRCAPP bit cannot be set.

REGISTER 10-5: DCRCDATA: DMA CRC DATA REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-0 **DCRCDATA<31:0>:** CRC Data Register bits
Writing to this register will seed the CRC generator. Reading from this register will return the current value of the CRC. Bits greater than PLEN will return '0' on any read.

When CRCTYP (DCRCCON<5>) = 1 (CRC module is in IP Header mode):
Only the lower 16 bits contain IP header checksum information. The upper 16 bits are always '0'. Data written to this register is converted and read back in 1's complement form (i.e., current IP header checksum value).

When CRCTYP (DCRCCON<5>) = 0 (CRC module is in LFSR mode):
Bits greater than PLEN will return '0' on any read.

REGISTER 10-6: DCRCXOR: DMA CRCXOR ENABLE REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

	CHEN(2)	CHAED	CHCHN	CHAEN	—	CHEDET	CHPRI<1:0>	

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-24 **CHPIGN<7:0>:** Channel Register Data bits
Pattern Terminate mode:
Any byte matching these bits during a pattern match may be ignored during the pattern match determination when the CHPIGNEN bit is set. If a byte is read that is identical to this data byte, the pattern match logic will treat it as a "don't care" when the pattern matching logic is enabled and the CHPIGEN bit is set.

bit 23-16 **Unimplemented:** Read as '0'

bit 15 **CHBUSY:** Channel Busy bit
1 = Channel is active or has been enabled
0 = Channel is inactive or has been disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **CHPIGNEN:** Enable Pattern Ignore Byte bit
1 = Treat any byte that matches the CHPIGN<7:0> bits as a "don't care" when pattern matching is enabled
0 = Disable this feature

bit 12 **Unimplemented:** Read as '0'

bit 11 **CHPATLEN:** Pattern Length bit
1 = 2 byte length
0 = 1 byte length

bit 10-9 **Unimplemented:** Read as '0'

bit 8 **CHCHNS:** Chain Channel Selection bit(1)
1 = Chain to channel lower in natural priority (CH1 will be enabled by CH2 transfer complete)
0 = Chain to channel higher in natural priority (CH1 will be enabled by CH0 transfer complete)

bit 7 **CHEN:** Channel Enable bit(2)
1 = Channel is enabled
0 = Channel is disabled

bit 6 **CHAED:** Channel Allow Events If Disabled bit
1 = Channel start/abort events will be registered, even if the channel is disabled
0 = Channel start/abort events will be ignored if the channel is disabled

bit 5 **CHCHN:** Channel Chain Enable bit
1 = Allow channel to be chained
0 = Do not allow channel to be chained

Note 1: The chain selection bit takes effect when chaining is enabled (i.e., CHCHN = 1).

2: When the channel is suspended by clearing this bit, the user application should poll the CHBUSY bit (if available on the device variant) to see when the channel is suspended, as it may take some clock cycles to complete a current transaction before the channel is suspended.

REGISTER 10-7: DCHxCON: DMA CHANNEL x CONTROL REGISTER (CONTINUED)

bit 4 **CHAEN:** Channel Automatic Enable bit
1 = Channel is continuously enabled, and not automatically disabled after a block transfer is complete
0 = Channel is disabled on block transfer complete

bit 3 **Unimplemented:** Read as '0'

bit 2 **CHEDET:** Channel Event Detected bit
1 = An event has been detected
0 = No events have been detected

bit 1-0 **CHPRI<1:0>:** Channel Priority bits
11 = Channel has priority 3 (highest)
10 = Channel has priority 2
01 = Channel has priority 1
00 = Channel has priority 0

Note 1: The chain selection bit takes effect when chaining is enabled (i.e., CHCHN = 1).

2: When the channel is suspended by clearing this bit, the user application should poll the CHBUSY bit (if available on the device variant) to see when the channel is suspended, as it may take some clock cycles to complete a current transaction before the channel is suspended.

NOTES:

11.0 HI-SPEED USB WITH ON-THE-GO (OTG)

Note: This data sheet summarizes the features of the PIC32MZ DA family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 51. "Hi-Speed USB with On-The-Go (OTG)"** (DS60001326) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Universal Serial Bus (USB) module contains analog and digital components to provide a USB 2.0 embedded host, device, or OTG implementation with a minimum of external components.

The module supports Hi-Speed, Full-Speed, or Low-Speed in any of the operating modes. This module in Host mode is intended for use as an embedded host and therefore does not implement a UHCI or OHCI controller.

The USB module consists of the RAM controller, packet encode/decode, UTM synchronization, endpoint control, a dedicated USB DMA controller, pull-up and pull-down resistors, and the register interface. A block diagram of the PIC32 USB OTG module is illustrated in Figure 11-1.

The USB module includes the following features:

- USB Hi-Speed, Full-Speed, and Low-Speed support for host and device
- USB OTG support with one or more Hi-Speed, Full-Speed, or Low-Speed device
- Integrated signaling resistors
- Integrated analog comparators for VBUS monitoring
- Integrated USB transceiver
- Transaction handshaking performed by hardware
- Integrated 8-channel DMA to access system RAM and Flash
- Seven transmit endpoints and seven receive endpoints, in addition to Endpoint 0
- Session Request Protocol (SRP) and Host Negotiation Protocol (HNP) support
- Suspend and resume signaling support
- Dynamic FIFO sizing
- Integrated RAM for the FIFOs, eliminating the need for system RAM for the FIFOs
- Link power management support

Note 1: The implementation and use of the USB specifications, as well as other third party specifications or technologies, may require licensing; including, but not limited to, USB Implementers Forum, Inc. (also referred to as USB-IF). The user is fully responsible for investigating and satisfying any applicable licensing obligations.

2: If the USB module is used, the Primary Oscillator (POSC) is limited to either 12 MHz or 24 MHz.

		—	—	—	—	—	—	—

Legend:	HS = Hardware Set	HC = Hardware Cleared	
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-24 **Unimplemented:** Read as '0'

bit 23-17 **EP7TXIF:EP1TXIF:** Endpoint 'n' TX Interrupt Flag bit
1 = Endpoint has a transmit interrupt to be serviced
0 = No interrupt event

bit 16 **EP0IF:** Endpoint 0 Interrupt bit
1 = Endpoint 0 has an interrupt to be serviced
0 = No interrupt event

All EPxTX and EP0 bits are cleared when the byte is read. Therefore, these bits must be read independently from the remaining bits in this register to avoid accidental clearing.

bit 15 **ISOUPD:** ISO Update bit (*Device mode only; unimplemented in Host mode*)
1 = USB module will wait for a SOF token from the time TXPKTRDY is set before sending the packet
0 = No change in behavior

This bit only affects endpoints performing isochronous transfers when in *Device mode*. This bit is unimplemented in *Host mode*.

bit 14 **SOFTCONN:** Soft Connect/Disconnect Feature Selection bit
1 = The USB D+/D- lines are enabled and active
0 = The USB D+/D- lines are disabled and are tri-stated

This bit is only available in *Device mode*.

bit 13 **HSEN:** Hi-Speed Enable bit
1 = The USB module will negotiate for Hi-Speed mode when the device is reset by the hub
0 = Module only operates in Full-Speed mode

bit 12 **HSMODE:** Hi-Speed Mode Status bit
1 = Hi-Speed mode successfully negotiated during USB reset
0 = Module is not in Hi-Speed mode

In *Device mode*, this bit becomes valid when a USB reset completes. In *Host mode*, it becomes valid when the RESET bit is cleared.

bit 11 **RESET:** Module Reset Status bit
1 = Reset signaling is present on the bus
0 = Normal module operation

In *Device mode*, this bit is read-only. In *Host mode*, this bit is read/write.

REGISTER 11-1: USBCSR0: USB CONTROL STATUS REGISTER 0 (CONTINUED)

bit 10 **RESUME:** Resume from Suspend control bit
1 = Generate Resume signaling when the device is in Suspend mode
0 = Stop Resume signaling

In *Device mode*, the software should clear this bit after 10 ms (a maximum of 15 ms) to end Resume signaling. In *Host mode*, the software should clear this bit after 20 ms.

bit 9 **SUSPMODE:** Suspend Mode status bit
1 = The USB module is in Suspend mode
0 = The USB module is in Normal operations

This bit is read-only in Device mode. In Host mode, it can be set by software, and is cleared by hardware.

bit 8 **SUSPEN:** Suspend Mode Enable bit
1 = Suspend mode is enabled
0 = Suspend mode is not enabled

bit 7 **Unimplemented:** Read as '0'

bit 6-0 **FUNC<6:0>:** Device Function Address bits

These bits are only available in *Device mode*. This field is written with the address received through a SET_ADDRESS command, which will then be used for decoding the function address in subsequent token packets.

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31 **FORCEHST:** Test Mode Force Host Select bit
1 = Forces USB module into *Host mode*, regardless of whether it is connected to any peripheral
0 = Normal operation

bit 30 **FIFOACC:** Test Mode Endpoint 0 FIFO Transfer Force bit
1 = Transfers the packet in the Endpoint 0 TX FIFO to the Endpoint 0 RX FIFO
0 = No transfer

bit 29 **FORCEFS:** Test mode Force Full-Speed Mode Select bit
This bit is only active if FORCEHST = 1.
1 = Forces USB module into Full-Speed mode. Undefined behavior if FORCEHS = 1.
0 = If FORCEHS = 0, places USB module into Low-Speed mode.

bit 28 **FORCEHS:** Test mode Force Hi-Speed Mode Select bit
This bit is only active if FORCEHST = 1.
1 = Forces USB module into Hi-Speed mode. Undefined behavior if FORCEFS = 1.
0 = If FORCEFS = 0, places USB module into Low-Speed mode.

bit 27 **PACKET:** Test_Packet Test Mode Select bit
This bit is only active if module is in Hi-Speed mode.
1 = The USB module repetitively transmits on the bus a 53-byte test packet. Test packet must be loaded into the Endpoint 0 FIFO before the test mode is entered.
0 = Normal operation

bit 26 **TESTK:** Test_K Test Mode Select bit
1 = Enters Test_K test mode. The USB module transmits a continuous K on the bus.
0 = Normal operation
This bit is only active if the USB module is in Hi-Speed mode.

bit 25 **TESTJ:** Test_J Test Mode Select bit
1 = Enters Test_J test mode. The USB module transmits a continuous J on the bus.
0 = Normal operation
This bit is only active if the USB module is in Hi-Speed mode.

bit 24 **NAK:** Test_SE0_NAK Test Mode Select bit
1 = Enter Test_SE0_NAK test mode. The USB module remains in Hi-Speed mode but responds to any valid IN token with a NAK
0 = Normal operation
This mode is only active if module is in Hi-Speed mode.

bit 23-20 **Unimplemented:** Read as '0'

REGISTER 11-4: USBCSR3: USB CONTROL STATUS REGISTER 3 (CONTINUED)

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-28 **Unimplemented:** Read as '0'

bit 27 **DISPING:** Disable Ping tokens control bit (*Host mode*)
1 = USB Module will not issue PING tokens in data and status phases of a Hi-Speed Control transfer
0 = Ping tokens are issued

bit 26 **DTWREN:** Data Toggle Write Enable bit (*Host mode*)
1 = Enable the current state of the Endpoint 0 data toggle to be written. Automatically cleared.
0 = Disable data toggle write

bit 25 **DATATGGL:** Data Toggle bit (*Host mode*)
When read, this bit indicates the current state of the Endpoint 0 data toggle.
If DTWREN = 1, this bit is writable with the desired setting.
If DTWREN = 0, this bit is read-only.

bit 24 **FLSHFIFO:** Flush FIFO Control bit
1 = Flush the next packet to be transmitted/read from the Endpoint 0 FIFO. The FIFO pointer is reset and the TXPKTRDY/RXPKTRDY bit is cleared. Automatically cleared when the operation completes. Should only be used when TXPKTRDY/RXPKTRDY = 1.
0 = No Flush operation

bit 23 **SVCSETEND:** Clear SETUPEND Control bit (*Device mode*)
1 = Clear the SETUPEND bit in this register. This bit is automatically cleared.
0 = Do not clear

NAKTMOUT: NAK Time-out Control bit (*Host mode*)
1 = Endpoint 0 is halted following the receipt of NAK responses for longer than the time set by the NAKLIM<4:0> bits (USBICSR<28:24>)
0 = Allow the endpoint to continue

bit 22 **SVCRPR:** Serviced RXPKTRDY Clear Control bit (*Device mode*)
1 = Clear the RXPKTRDY bit in this register. This bit is automatically cleared.
0 = Do not clear

STATPKT: Status Stage Transaction Control bit (*Host mode*)
1 = When set at the same time as the TXPKTRDY or REQPKT bit is set, performs a status stage transaction
0 = Do not perform a status stage transaction

REGISTER 11-5: USBIE0CSR0: USB INDEXED ENDPOINT CONTROL STATUS REGISTER 0 (ENDPOINT 0) (CONTINUED)

bit 21 **SENDSTALL:** Send Stall Control bit (*Device mode*)
1 = Terminate the current transaction and transmit a STALL handshake. This bit is automatically cleared.
0 = Do not send STALL handshake.

REQPKT: IN transaction Request Control bit (*Host mode*)
1 = Request an IN transaction. This bit is cleared when the RXPKTRDY bit is set.
0 = Do not request an IN transaction

bit 20 **SETUPEND:** Early Control Transaction End Status bit (*Device mode*)
1 = A control transaction ended before the DATAEND bit has been set. An interrupt will be generated and the FIFO flushed at this time.
0 = Normal operation

This bit is cleared by writing a '1' to the SVCSETEND bit in this register.

ERROR: No Response Error Status bit (*Host mode*)
1 = Three attempts have been made to perform a transaction with no response from the peripheral. An interrupt is generated.
0 = Clear this flag. Software must write a '0' to this bit to clear it.

bit 19 **DATAEND:** End of Data Control bit (*Device mode*)
The software sets this bit when:
- Setting TXPKTRDY for the last data packet
- Clearing RXPKTRDY after unloading the last data packet
- Setting TXPKTRDY for a zero length data packet

Hardware clears this bit.

SETUPPKT: Send a SETUP token Control bit (*Host mode*)
1 = When set at the same time as the TXPKTRDY bit is set, the module sends a SETUP token instead of an OUT token for the transaction
0 = Normal OUT token operation

Setting this bit also clears the Data Toggle.

bit 18 **SENTSTALL:** STALL sent status bit (*Device mode*)
1 = STALL handshake has been transmitted
0 = Software clear of bit

RXSTALL: STALL handshake received Status bit (*Host mode*)
1 = STALL handshake was received
0 = Software clear of bit

bit 17 **TXPKTRDY:** TX Packet Ready Control bit
1 = Data packet has been loaded into the FIFO. It is cleared automatically.
0 = No data packet is ready for transmit

bit 16 **RXPKTRDY:** RX Packet Ready Status bit
1 = Data packet has been received. Interrupt is generated (when enabled) when this bit is set.
0 = No data packet has been received

This bit is cleared by setting the SVCRPR bit.

bit 15-0 **Unimplemented:** Read as '0'

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31 **AUTOSET:** Auto Set Control bit

1 = TXPKTRDY will be automatically set when data of the maximum packet size (value in TXMAXP) is loaded into the TX FIFO. If a packet of less than the maximum packet size is loaded, then TXPKTRDY will have to be set manually.

0 = TXPKTRDY must be set manually for all packet sizes

bit 30 **ISO:** Isochronous TX Endpoint Enable bit (Device mode)

1 = Enables the endpoint for Isochronous transfers

0 = Disables the endpoint for Isochronous transfers and enables it for Bulk or Interrupt transfers.

This bit only has an effect in Device mode. In Host mode, it always returns zero.

bit 29 **MODE:** Endpoint Direction Control bit

1 = Endpoint is TX

0 = Endpoint is RX

This bit only has any effect where the same endpoint FIFO is used for both TX and RX transactions.

bit 28 **DMAREQEN:** Endpoint DMA Request Enable bit

1 = DMA requests are enabled for this endpoint

0 = DMA requests are disabled for this endpoint

bit 27 **FRCDATTG:** Force Endpoint Data Toggle Control bit

1 = Forces the endpoint data toggle to switch and the data packet to be cleared from the FIFO, regardless of whether an ACK was received.

0 = No forced behavior

bit 26 **DMAREQMD:** Endpoint DMA Request Mode Control bit

1 = DMA Request Mode 1

0 = DMA Request Mode 0

This bit must not be cleared either before or in the same cycle as the DMAREQEN bit is cleared.

bit 25 **DATAWEN:** Data Toggle Write Enable bit (Host mode)

1 = Enable the current state of the TX Endpoint data toggle (DATATGGL) to be written

0 = Disables writing the DATATGGL bit

bit 24 **DATATGGL:** Data Toggle Control bit (Host mode)

When read, this bit indicates the current state of the TX Endpoint data toggle. If DATAWEN = 1, this bit may be written with the required setting of the data toggle. If DATAWEN = 0, any value written to this bit is ignored.

REGISTER 11-8: USBIENCSR0: USB INDEXED ENDPOINT CONTROL STATUS REGISTER 0 (ENDPOINT 1-7) (CONTINUED)

bit 23 **INCOMPTX:** Incomplete TX Status bit (Device mode)

1 = For high-bandwidth Isochronous endpoint, a large packet has been split into 2 or 3 packets for transmission but insufficient IN tokens have been received to send all the parts

0 = Normal operation

In anything other than isochronous transfers, this bit will always return 0.

NAKTMOUT: NAK Time-out status bit (Host mode)

1 = TX endpoint is halted following the receipt of NAK responses for longer than the NAKLIM setting

0 = Written by software to clear this bit

bit 22 **CLRDT:** Clear Data Toggle Control bit

1 = Resets the endpoint data toggle to 0

0 = Do not clear the data toggle

bit 21 **SENTSTALL:** STALL handshake transmission status bit (Device mode)

1 = STALL handshake is transmitted. The FIFO is flushed and the TXPKTRDY bit is cleared.

0 = Written by software to clear this bit

RXSTALL: STALL receipt bit (Host mode)

1 = STALL handshake is received. Any DMA request in progress is stopped, the FIFO is completely flushed and the TXPKTRDY bit is cleared.

0 = Written by software to clear this bit

bit 20 **SENDSTALL:** STALL handshake transmission control bit (Device mode)

1 = Issue a STALL handshake to an IN token

0 = Terminate stall condition

This bit has no effect when the endpoint is being used for Isochronous transfers.

SETUPPKT: Definition bit (Host mode)

1 = When set at the same time as the TXPKTRDY bit is set, send a SETUP token instead of an OUT token for the transaction. This also clears the Data Toggle.

0 = Normal OUT token for the transaction

bit 19 **FLUSH:** FIFO Flush control bit

1 = Flush the latest packet from the endpoint TX FIFO. The FIFO pointer is reset, the TXPKTRDY bit is cleared and an interrupt is generated.

0 = Do not flush the FIFO

bit 18 **UNDERRUN:** Underrun status bit (Device mode)

1 = An IN token has been received when the TXPKTRDY bit is not set.

0 = Written by software to clear this bit.

ERROR: Handshake failure status bit (Host mode)

1 = Three attempts have been made to send a packet and no handshake packet has been received

0 = Written by software to clear this bit.

bit 17 **FIFONE:** FIFO Not Empty status bit

1 = There is at least 1 packet in the TX FIFO

0 = TX FIFO is empty

bit 16 **TXPKTRDY:** TX Packet Ready Control bit

The software sets this bit after loading a data packet into the FIFO. It is cleared automatically when a data packet has been transmitted. This bit is also automatically cleared prior to loading a second packet into a double-buffered FIFO.

REGISTER 11-8: USBIENCSR0: USB INDEXED ENDPOINT CONTROL STATUS REGISTER 0 (ENDPOINT 1-7) (CONTINUED)

bit 15-11 **MULT<4:0>:** Multiplier Control bits

For Isochronous/Interrupt endpoints or of packet splitting on Bulk endpoints, multiplies TXMAXP by MULT+1 for the payload size.

For Bulk endpoints, MULT can be up to 32 and defines the number of “USB” packets of the specified payload into which a single data packet placed in the FIFO should be split, prior to transfer. The data packet is required to be an exact multiple of the payload specified by TXMAXP.

For Isochronous/Interrupts endpoints operating in Hi-Speed mode, MULT may be either 2 or 3 and specifies the maximum number of such transactions that can take place in a single microframe.

bit 10-0 **TXMAXP<10:0>:** Maximum TX Payload per transaction Control bits

This field sets the maximum payload (in bytes) transmitted in a single transaction. The value is subject to the constraints placed by the USB Specification on packet sizes for Bulk, Interrupt and Isochronous transfers in Full-Speed and Hi-Speed operations.

TXMAXP must be set to an even number of bytes for proper interrupt generation in DMA Mode 1.

REGISTER 11-9: USBIENCSR1: USB INDEXED ENDPOINT CONTROL STATUS REGISTER 1 (ENDPOINT 1-7)

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31 **AUTOCLR:** RXPKTRDY Automatic Clear Control bit

1 = RXPKTRDY will be automatically cleared when a packet of RXMAXP bytes has been unloaded from the RX FIFO. When packets of less than the maximum packet size are unloaded, RXPKTRDY will have to be cleared manually. When using a DMA to unload the RX FIFO, data is read from the RX FIFO in 4-byte chunks regardless of the RXMAXP.

0 = No automatic clearing of RXPKTRDY

This bit should not be set for high-bandwidth Isochronous endpoints.

bit 30 **ISO:** Isochronous Endpoint Control bit (*Device mode*)

1 = Enable the RX endpoint for Isochronous transfers

0 = Enable the RX endpoint for Bulk/Interrupt transfers

AUTORQ: Automatic Packet Request Control bit (*Host mode*)

1 = REQPKT will be automatically set when RXPKTRDY bit is cleared.

0 = No automatic packet request

This bit is automatically cleared when a short packet is received.

bit 29 **DMAREQEN:** DMA Request Enable Control bit

1 = Enable DMA requests for the RX endpoint.

0 = Disable DMA requests for the RX endpoint.

bit 28 **DISNYET:** Disable NYET Handshakes Control/PID Error Status bit (*Device mode*)

1 = In Bulk/Interrupt transactions, disables the sending of NYET handshakes. All successfully received RX packets are ACKed including at the point at which the FIFO becomes full.

0 = Normal operation.

In Bulk/Interrupt transactions, this bit only has any effect in Hi-Speed mode, in which mode it should be set for all Interrupt endpoints.

PIDERR: PID Error Status bit (*Host mode*)

1 = In ISO transactions, this indicates a PID error in the received packet.

0 = No error

bit 27 **DMAREQMD:** DMA Request Mode Selection bit

1 = DMA Request Mode 1

0 = DMA Request Mode 0

REGISTER 11-9: USBIENCSR1: USB INDEXED ENDPOINT CONTROL STATUS REGISTER 1 (ENDPOINT 1-7) (CONTINUED)

bit 26 **DATATWEN:** Data Toggle Write Enable Control bit (*Host mode*)
1 = DATATGGL can be written
0 = DATATGGL is not writable

bit 25 **DATATGGL:** Data Toggle bit (*Host mode*)
When read, this bit indicates the current state of the endpoint data toggle.
If DATATWEN = 1, this bit may be written with the required setting of the data toggle.
If DATATWEN = 0, any value written to this bit is ignored.

bit 24 **INCOMPRX:** Incomplete Packet Status bit
1 = The packet in the RX FIFO during a high-bandwidth Isochronous/Interrupt transfer is incomplete because parts of the data were not received
0 = Written by then software to clear this bit
In anything other than Isochronous transfer, this bit will always return 0.

bit 23 **CLRDT:** Clear Data Toggle Control bit
1 = Reset the endpoint data toggle to 0
0 = Leave endpoint data toggle alone

bit 22 **SENTSTALL:** STALL Handshake Status bit (*Device mode*)
1 = STALL handshake is transmitted
0 = Written by the software to clear this bit

RXSTALL: STALL Handshake Receive Status bit (*Host mode*)
1 = A STALL handshake has been received. An interrupt is generated.
0 = Written by the software to clear this bit

bit 21 **SENDSTALL:** STALL Handshake Control bit (*Device mode*)
1 = Issue a STALL handshake
0 = Terminate stall condition

REQPKT: IN Transaction Request Control bit (*Host mode*)
1 = Request an IN transaction.
0 = No request
This bit is cleared when RXPKTRDY is set.

bit 20 **FLUSH:** Flush FIFO Control bit
1 = Flush the next packet to be read from the endpoint RX FIFO. The FIFO pointer is reset and the RXPKTRDY bit is cleared. This should only be used when RXPKTRDY is set. If the FIFO is double-buffered, FLUSH may need to be set twice to completely clear the FIFO.
0 = Normal FIFO operation
This bit is automatically cleared.

bit 19 **DATAERR:** Data Packet Error Status bit (*Device mode*)
1 = The data packet has a CRC or bit-stuff error.
0 = No data error
This bit is cleared when RXPKTRDY is cleared. This bit is only valid when the endpoint is operating in ISO mode. In Bulk mode, it always returns zero.

DERRNAKT: Data Error/NAK Time-out Status bit (*Host mode*)
1 = The data packet has a CRC or bit-stuff error. In Bulk mode, the RX endpoint is halted following the receipt of NAK responses for longer than the time set as the NAK limit.
0 = No data or NAK time-out error

REGISTER 11-9: USBIENCSR1: USB INDEXED ENDPOINT CONTROL STATUS REGISTER 1 (ENDPOINT 1-7) (CONTINUED)

bit 18 **OVERRUN:** Data Overrun Status bit (*Device mode*)

1 = An OUT packet cannot be loaded into the RX FIFO.
0 = Written by software to clear this bit

This bit is only valid when the endpoint is operating in ISO mode. In Bulk mode, it always returns zero.

ERROR: No Data Packet Received Status bit (*Host mode*)

1 = Three attempts have been made to receive a packet and no data packet has been received. An interrupt is generated.

0 = Written by the software to clear this bit.

This bit is only valid when the RX endpoint is operating in Bulk or Interrupt mode. In ISO mode, it always returns zero.

bit 17 **FIFOFULL:** FIFO Full Status bit

1 = No more packets can be loaded into the RX FIFO
0 = The RX FIFO has at least one free space

bit 16 **RXPKTRDY:** Data Packet Reception Status bit

1 = A data packet has been received. An interrupt is generated.
0 = Written by software to clear this bit when the packet has been unloaded from the RX FIFO.

bit 15-11 **MULT<4:0>:** Multiplier Control bits

For Isochronous/Interrupt endpoints or of packet splitting on Bulk endpoints, multiplies RXMAXP by MULT+1 for the payload size.

For Bulk endpoints, MULT can be up to 32 and defines the number of “USB” packets of the specified payload into which a single data packet placed in the FIFO should be split, prior to transfer. The data packet is required to be an exact multiple of the payload specified by RXMAXP.

For Isochronous/Interrupts endpoints operating in Hi-Speed mode, MULT may be either 2 or 3 and specifies the maximum number of such transactions that can take place in a single microframe.

bit 10-0 **RXMAXP<10:0>:** Maximum RX Payload Per Transaction Control bits

This field sets the maximum payload (in bytes) transmitted in a single transaction. The value is subject to the constraints placed by the USB Specification on packet sizes for Bulk, Interrupt and Isochronous transfers in Full-Speed and Hi-Speed operations.

RXMAXP must be set to an even number of bytes for proper interrupt generation in DMA Mode 1.

Note: Transfer size greater than RxMaxP is handled by DMA Mode 1 only.

REGISTER 11-10: USBIENCSR2: USB INDEXED ENDPOINT CONTROL STATUS REGISTER 2 (ENDPOINT 1-7)

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

bit 31-24 **TXINTERV<7:0>:** Endpoint TX Polling Interval/NAK Limit bits (*Host mode*)

For Interrupt and Isochronous transfers, this field defines the polling interval for the endpoint. For Bulk endpoints, this field sets the number of frames/microframes after which the endpoint should time out on receiving a stream of NAK responses.

The following table describes the valid values and interpretation for these bits:

Transfer Type	Speed	Valid Values (m)	Interpretation
Interrupt	Low/Full	0x01 to 0xFF	Polling interval is 'm' frames.
	High	0x01 to 0x10	Polling interval is $2^{(m-1)}$ frames.
Isochronous	Full or High	0x01 to 0x10	Polling interval is $2^{(m-1)}$ frames/microframes.
Bulk	Full or High	0x02 to 0x10	NAK limit is $2^{(m-1)}$ frames/microframes. A value of '0' or '1' disables the NAK time-out function.

bit 31-0 **DATA<31:0>:** USB Transmit/Receive FIFO Data bits

Writes to this register loads data into the TxFIFO for the corresponding endpoint. Reading from this register unloads data from the RxFIFO for the corresponding endpoint.

Transfers may be 8-bit, 16-bit or 32-bit as required, and any combination of access is allowed provided the data accessed is contiguous. However, all transfers associated with one packet must be of the same width so that data is consistently byte-, word- or double-word aligned. The last transfer may contain fewer bytes than the previous transfers in order to complete an odd-byte or odd-word transfer.

0000 = 8 bytes

bit 23-21 **Unimplemented:** Read as '0'

bit 20 **TXDPB:** TX Endpoint Double-packet Buffering Control bit
1 = Double-packet buffer is supported. This doubles the size set in TXFIFOSZ.
0 = Double-packet buffer is not supported

REGISTER 11-13: USBOTG: USB OTG CONTROL/STATUS REGISTER (CONTINUED)

bit 19-16 **TXFIFOSZ<3:0>:** TX Endpoint FIFO packet size bits

The maximum packet size to allowed for (before any splitting within the FIFO of Bulk/High-Bandwidth packets prior to transmission)

1111 = Reserved
•
•
•
1010 = Reserved
1001 = 4096 bytes
1000 = 2048 bytes
0111 = 1024 bytes
0110 = 512 bytes
0101 = 256 bytes
0100 = 128 bytes
0011 = 64 bytes
0010 = 32 bytes
0001 = 16 bytes
0000 = 8 bytes

bit 15-10 **Unimplemented:** Read as '0'

bit 9 **TXEDMA:** TX Endpoint DMA Assertion Control bit
1 = DMA_REQ signal for all IN endpoints will be deasserted when MAXP-8 bytes have been written to an endpoint. This is Early mode.
0 = DMA_REQ signal for all IN endpoints will be deasserted when MAXP bytes have been written to an endpoint. This is Late mode.

bit 8 **RXEDMA:** RX Endpoint DMA Assertion Control bit
1 = DMA_REQ signal for all OUT endpoints will be deasserted when MAXP-8 bytes have been written to an endpoint. This is Early mode.
0 = DMA_REQ signal for all OUT endpoints will be deasserted when MAXP bytes have been written to an endpoint. This is Late mode.

bit 7 **BDEV:** USB Device Type bit
1 = USB is operating as a 'B' device
0 = USB is operating as an 'A' device

bit 6 **FSDEV:** Full-Speed/Hi-Speed device detection bit (*Host mode*)
1 = A Full-Speed or Hi-Speed device has been detected being connected to the port
0 = No Full-Speed or Hi-Speed device detected

bit 5 **LSDEV:** Low-Speed Device Detection bit (*Host mode*)
1 = A Low-Speed device has been detected being connected to the port
0 = No Low-Speed device detected

bit 4-3 **VBUS<1:0>:** VBUS Level Detection bits
11 = Above VBUS Valid
10 = Above AValid, below VBUS Valid
01 = Above Session End, below AValid
00 = Below Session End

bit 2 **HOSTMODE:** Host Mode bit
1 = USB module is acting as a Host
0 = USB module is not acting as a Host

bit 1 **HOSTREQ:** Host Request Control bit
'B' device only:
1 = USB module initiates the Host Negotiation when Suspend mode is entered. This bit is cleared when Host Negotiation is completed.
0 = Host Negotiation is not taking place

REGISTER 11-13: USBOTG: USB OTG CONTROL/STATUS REGISTER (CONTINUED)

bit 0 **SESSION:** Active Session Control/Status bit

'A' device:

1 = Start a session

0 = End a session

'B' device:

1 = (Read) Session has started or is in progress, (Write) Initiate the Session Request Protocol

0 = When USB module is in Suspend mode, clearing this bit will cause a software disconnect

Clearing this bit when the USB module is not suspended will result in undefined behavior.

bit 31-24 **VPLEN<7:0>:** VBUS pulsing charge length bits

Sets the duration of the VBUS pulsing charge in units of 546.1 µs. (The default setting corresponds to 32.77 ms.)

bit 23-20 **WTCON<3:0>:** Connect/Disconnect filter control bits

Sets the wait to be applied to allow for the connect/disconnect filter in units of 533.3 ns. The default setting corresponds to 2.667 µs.

bit 19-6 **WTID<3:0>:** ID delay valid control bits

Sets the delay to be applied from IDPULLUP being asserted to IDDIG being considered valid in units of 4.369ms. The default setting corresponds to 52.43ms.

bit 15-12 **DMACHANS<3:0>:** DMA Channels bits

These read-only bits provide the number of DMA channels in the USB module. For the PIC32MZ DA family, this number is 8.

bit 11-8 **RAMBITS<3:0>:** RAM address bus width bits

These read-only bits provide the width of the RAM address bus. For the PIC32MZ DA family, this number is 12.

bit 7-4 **RXENDPTS<3:0>:** Included RX Endpoints bits

This read-only register gives the number of RX endpoints in the design. For the PIC32MZ DA family, this number is 7.

bit 3-0 **TXENDPTS<3:0>:** Included TX Endpoints bits

These read-only bits provide the number of TX endpoints in the design. For the PIC32MZ DA family, this number is 7.

0 = Disable the LPMNYET Interrupt

bit 25 **LPMSTIE:** LPM STALL Interrupt Enable bit
1 = Enable the LPMST Interrupt
0 = Disable the LPMST Interrupt

bit 24 **LPMTOIE:** LPM Time-out Interrupt Enable bit
1 = Enable the LPMTO Interrupt
0 = Disable the LPMTO Interrupt

bit 23-21 **Unimplemented:** Read as '0'

bit 20 **LPMNAK:** LPM-only Transaction Setting bit
1 = All endpoints will respond to all transactions other than a LPM transaction with a NAK
0 = Normal transaction operation
Setting this bit to '1' will only take effect after the USB module as been LPM suspended.

bit 19-18 **LPMEN<1:0>:** LPM Enable bits (*Device mode*)
11 = LPM Extended transactions are supported
10 = LPM and Extended transactions are not supported
01 = LPM mode is not supported but Extended transactions are supported
00 = LPM Extended transactions are supported

bit 17 **LPMRES:** LPM Resume bit
1 = Initiate resume (remote wake-up). Resume signaling is asserted for 50 µs.
0 = No resume operation
This bit is self-clearing.

REGISTER 11-28: USBLPMR1: USB LINK POWER MANAGEMENT CONTROL REGISTER 1 (CONTINUED)

bit 16 **LPMXMT:** LPM Transition to the L1 State bit

When in *Device mode*:

1 = USB module will transition to the L1 state upon the receipt of the next LPM transaction. LPMEN must be set to '0b11. Both LPMXMT and LPMEN must be set in the same cycle.

0 = Maintain current state

When LPMXMT and LPMEN are set, the USB module can respond in the following ways:

- If no data is pending (all TX FIFOs are empty), the USB module will respond with an ACK. The bit will self clear and a software interrupt will be generated.
- If data is pending (data resides in at least one TX FIFO), the USB module will respond with a NYET. In this case, the bit will not self clear however a software interrupt will be generated.

When in *Host mode*:

1 = USB module will transmit an LPM transaction. This bit is self clearing, and will be immediately cleared upon receipt of any Token or three time-outs have occurred.

0 = Maintain current state

bit 15-12 **ENDPOINT<3:0>:** LPM Token Packet Endpoint bits

This is the endpoint in the token packet of the LPM transaction.

bit 11-9 **Unimplemented:** Read as '0'

bit 8 **RMTWAK:** Remote Wake-up Enable bit

This bit is applied on a temporary basis only and is only applied to the current suspend state.

1 = Remote wake-up is enabled

0 = Remote wake-up is disabled

bit 7-4 **HIRD<3:0>:** Host Initiated Resume Duration bits

The minimum time the host will drive resume on the bus. The value in this register corresponds to an actual resume time of:

Resume Time = 50 µs + HIRD * 75 µs. The resulting range is 50 µs to 1200 µs.

bit 3-0 **LNKSTATE<3:0>:** Link State bits

This value is provided by the host to the peripheral to indicate what state the peripheral must transition to after the receipt and acceptance of a LPM transaction. The only valid value for this register is '1' for Sleep State (L1). All other values are reserved.

0 = Disable interrupt for detection of activity on USB bus in Sleep mode

12.0 I/O PORTS

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 12. "I/O Ports"** (DS60001120), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

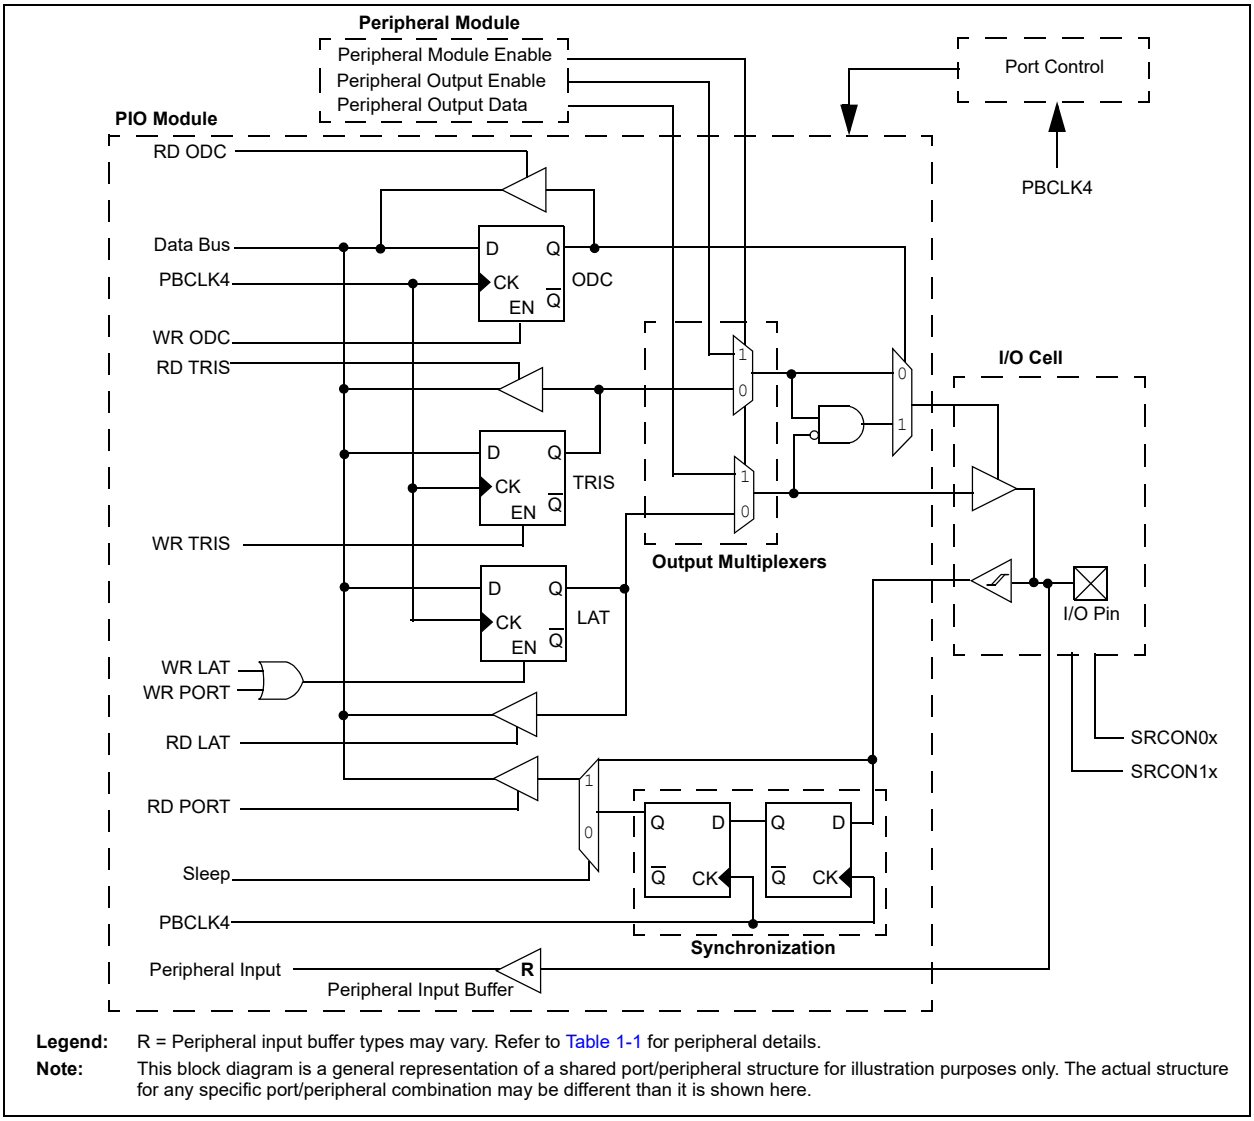
General purpose I/O pins are the simplest of peripherals. They allow the PIC32MZ DA family device to monitor and control other devices. To add flexibility and functionality, some pins are multiplexed with alternate function(s). These functions depend on which peripheral features are on the device. In general, when a peripheral is functioning, that pin may not be used as a general purpose I/O pin.

Some of the key features of the I/O ports are as follows:

- Individual output pin open-drain enable/disable
- Individual input pin weak pull-up and pull-down
- Monitor selective inputs and generate interrupt when change in pin state is detected
- Operation during Sleep and Idle modes
- Fast bit manipulation using CLR, SET, and INV registers

Figure 12-1 illustrates a block diagram of a typical multiplexed I/O port.

FIGURE 12-1: BLOCK DIAGRAM OF A TYPICAL MULTIPLEXED PORT STRUCTURE



Legend: R = Peripheral input buffer types may vary. Refer to Table 1-1 for peripheral details.

Note: This block diagram is a general representation of a shared port/peripheral structure for illustration purposes only. The actual structure for any specific port/peripheral combination may be different than it is shown here.

12.1 Parallel I/O (PIO) Ports

All port pins have ten registers directly associated with their operation as digital I/O. The data direction register (TRISx) determines whether the pin is an input or an output. If the data direction bit is a '1', then the pin is an input. All port pins are defined as inputs after a Reset. Reads from the latch (LATx) read the latch. Writes to the latch write the latch. Reads from the port (PORTx) read the port pins, while writes to the port pins write the latch.

12.1.1 OPEN-DRAIN CONFIGURATION

In addition to the PORTx, LATx, and TRISx registers for data control, some port pins can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Control register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The open-drain feature allows the generation of outputs higher than VDDIO (e.g., 5V) on any desired 5V-tolerant pins by using external pull-up resistors. The maximum open-drain voltage allowed is the same as the maximum VIH specification.

Refer to the pin name tables (Table 5 and Table 7) for the available pins and their functionality.

12.1.2 CONFIGURING ANALOG AND DIGITAL PORT PINS

The ANSELx register controls the operation of the analog port pins. The port pins that are to function as analog inputs must have their corresponding ANSEL and TRIS bits set. In order to use port pins for I/O functionality with digital modules, such as Timers, UARTs, etc., the corresponding ANSELx bit must be cleared.

The ANSELx register has a default value of 0xFFFF; therefore, all pins that share analog functions are analog (not digital) by default.

If the TRIS bit is cleared (output) while the ANSELx bit is set, the digital output level (VOH or VOL) is converted by an analog peripheral, such as the ADC module or Comparator module.

When the PORT register is read, all pins configured as analog input channels are read as cleared (a low level).

Pins configured as digital inputs do not convert an analog input. Analog levels on any pin defined as a digital input (including the ANx pins) can cause the input buffer to consume current that exceeds the device specifications.

12.1.3 I/O PORT WRITE/READ TIMING

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically this instruction would be an NOP.

12.1.4 INPUT CHANGE NOTIFICATION

The input change notification function of the I/O ports allows the PIC32MZ DA devices to generate interrupt requests to the processor in response to a change-of-state on selected input pins. This feature can detect input change-of-states even in Sleep mode, when the clocks are disabled. Every I/O port pin can be selected (enabled) for generating an interrupt request on a change-of-state.

Five control registers are associated with the CN functionality of each I/O port. The CNENx/CNNEx registers contain the CN interrupt enable control bits for each of the input pins. Setting any of these bits enables a CN interrupt for the corresponding pins. CNENx enables a mismatch CN interrupt condition when the EDGEDETECT bit (CNCONx<11>) is not set. When the EDGEDETECT bit is set, CNNEx controls the negative edge while CNENx controls the positive.

The CNSTATx/CNFx registers indicate the status of change notice based on the setting of the EDGEDETECT bit. If the EDGEDETECT bit is set to '0', the CNSTATx register indicates whether a change occurred on the corresponding pin since the last read of the PORTx bit. If the EDGEDETECT bit is set to '1', the CNFx register indicates whether a change has occurred and through the CNNEx/CNENx registers the edge type of the change that occurred is also indicated.

Each I/O pin also has a weak pull-up and a weak pull-down connected to it. The pull-ups act as a current source or sink source connected to the pin, and eliminate the need for external resistors when push-button or keypad devices are connected. The pull-ups and pull-downs are enabled separately using the CNPUx and the CNPDx registers, which contain the control bits for each of the pins. Setting any of the control bits enables the weak pull-ups and/or pull-downs for the corresponding pins.

Note:	Pull-ups and pull-downs on change notification pins should always be disabled when the port pin is configured as a digital output.

An additional control register (CNCONx) is shown in Register 12-3.

12.2 CLR, SET, and INV Registers

Every I/O module register has a corresponding CLR (clear), SET (set) and INV (invert) register designed to provide fast atomic bit manipulations. As the name of the register implies, a value written to a SET, CLR or INV register effectively performs the implied operation, but only on the corresponding base register and only bits specified as '1' are modified. Bits specified as '0' are not modified.

Reading SET, CLR and INV registers returns undefined values. To see the affects of a write operation to a SET, CLR or INV register, the base register must be read.

12.3 Slew Rate Registers

Each I/O pin can be configured for various types of slew rate control on its associated port. This is controlled by the Slew Rate Control bits in the SRCON1x and SRCON0x registers that are associated with each I/O port.

12.4 Peripheral Pin Select (PPS)

A major challenge in general purpose devices is providing the largest possible set of peripheral features while minimizing the conflict of features on I/O pins. The challenge is even greater on low pin-count devices. In an application where more than one peripheral needs to be assigned to a single pin, inconvenient workarounds in application code or a complete redesign may be the only option.

PPS configuration provides an alternative to these choices by enabling peripheral set selection and their placement on a wide range of I/O pins. By increasing the pinout options available on a particular device, users can better tailor the device to their entire application, rather than trimming the application to fit the device.

The PPS configuration feature operates over a fixed subset of digital I/O pins. Users may independently map the input and/or output of most digital peripherals to these I/O pins. PPS is performed in software and generally does not require the device to be reprogrammed. Hardware safeguards are included that prevent accidental or spurious changes to the peripheral mapping once it has been established.

12.4.1 AVAILABLE PINS

The number of available pins is dependent on the particular device and its pin count. Pins that support the PPS feature include the designation “RPn” in their full pin designation, where “RP” designates a remappable peripheral and “n” is the remappable port number.

12.4.2 AVAILABLE PERIPHERALS

The peripherals managed by the PPS are all digital-only peripherals. These include general serial communications (UART, SPI, and CAN), general purpose timer clock inputs, timer-related peripherals (input capture and output compare), interrupt-on-change inputs, and reference clocks (input and output).

In comparison, some digital-only peripheral modules are never included in the PPS feature. This is because the peripheral’s function requires special I/O circuitry on a specific port and cannot be easily connected to multiple pins. These modules include I^2C among others. A similar requirement excludes all modules with analog inputs, such as the Analog-to-Digital Converter (ADC).

A key difference between remappable and non-remappable peripherals is that remappable peripherals are not associated with a default I/O pin. The peripheral must always be assigned to a specific I/O pin before it can be used. In contrast, non-remappable peripherals are always available on a default pin, assuming that the peripheral is active and not conflicting with another peripheral.

When a remappable peripheral is active on a given I/O pin, it takes priority over all other digital I/O and digital communication peripherals associated with the pin. Priority is given regardless of the type of peripheral that is mapped. Remappable peripherals never take priority over any analog functions associated with the pin.

12.4.3 CONTROLLING PPS

PPS features are controlled through two sets of SFRs: one to map peripheral inputs, and one to map outputs. Because they are separately controlled, a particular peripheral’s input and output (if the peripheral has both) can be placed on any selectable function pin without constraint.

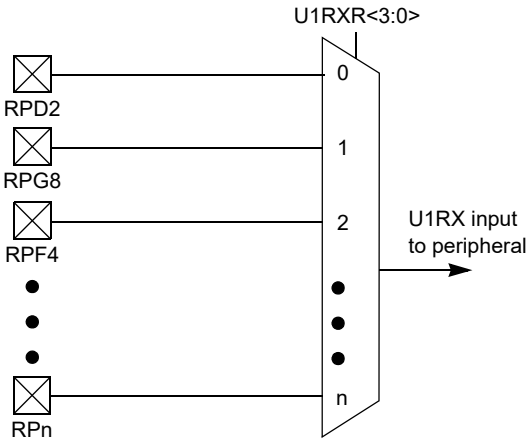
The association of a peripheral to a peripheral-selectable pin is handled in two different ways, depending on whether an input or output is being mapped.

12.4.4 INPUT MAPPING

The inputs of the PPS options are mapped on the basis of the peripheral. That is, a control register associated with a peripheral dictates the pin it will be mapped to. The [*pin name*]R registers, where [*pin name*] refers to the peripheral pins listed in Table 12-1, are used to configure peripheral input mapping (see Register 12-1). Each register contains sets of 4 bit fields. Programming these bit fields with an appropriate value maps the RPn pin with the corresponding value to that peripheral. For any given device, the valid range of values for any bit field is shown in Table 12-1.

For example, Figure 12-2 illustrates the remappable pin selection for the U1RX input.

FIGURE 12-2: REMAPPABLE INPUT EXAMPLE FOR U1RX



Note: For input only, PPS functionality does not have priority over TRISx settings. Therefore, when configuring RPn pin for input, the corresponding bit in the TRISx register must also be configured for input (set to '1').

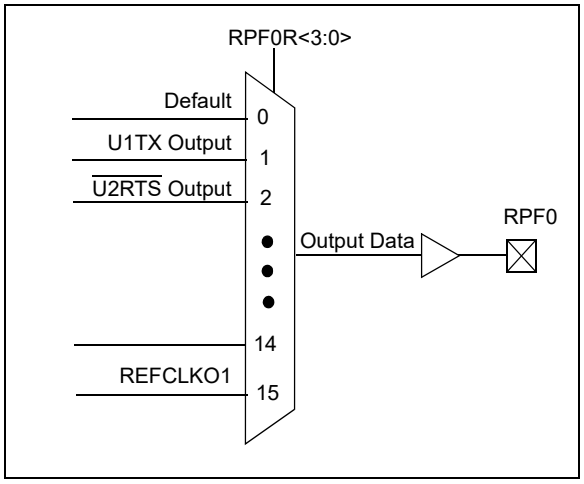
12.4.5 OUTPUT MAPPING

In contrast to inputs, the outputs of the PPS options are mapped on the basis of the pin. In this case, a control register associated with a particular pin dictates the peripheral output to be mapped. The RPnR registers (Register 12-2) are used to control output mapping. Like the [*pin name*]R registers, each register contains sets of 4 bit fields. The value of the bit field corresponds to one of the peripherals, and that peripheral's output is mapped to the pin (see Table 12-2 and Figure 12-3).

A null output is associated with the output register reset value of '0'. This is done to ensure that remappable outputs remain disconnected from all output pins by default.

FIGURE 12-3: EXAMPLE OF MULTIPLEXING OF REMAPPABLE OUTPUT FOR RPF0



12.4.6 CONTROLLING CONFIGURATION CHANGES

Because peripheral remapping can be changed during run time, some restrictions on peripheral remapping are needed to prevent accidental configuration changes. PIC32MZ DA devices include two features to prevent alterations to the peripheral map:

- Control register lock sequence
- Configuration bit select lock

12.4.6.1 Control Register Lock

Under normal operation, writes to the RPnR and [*pin name*]R registers are not allowed. Attempted writes appear to execute normally, but the contents of the registers remain unchanged. To change these registers, they must be unlocked in hardware. The register lock is controlled by the IOLOCK Configuration bit (CFGCON<13>). Setting the IOLOCK bit prevents writes to the control registers and clearing the IOLOCK bit allows writes.

To set or clear the IOLOCK bit, an unlock sequence must be executed. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

12.4.6.2 Configuration Bit Select Lock

As an additional level of safety, the device can be configured to prevent more than one write session to the RPnR and [*pin name*]R registers. The IOL1WAY Configuration bit (DEVCFG3<29>) blocks the IOLOCK bit from being cleared after it has been set once. If IOLOCK remains set, the register unlock procedure does not execute, and the PPS control registers cannot be written to. The only way to clear the bit and re-enable peripheral remapping is to perform a device Reset.

In the default (unprogrammed) state, IOL1WAY is set, restricting users to one write session.

bit 11 **EDGEDETECT:** Edge Detection Type Control bit
- 1 = Detects any edge on the pin (CNFx is used for the CN event)
- 0 = Detects any edge on the pin (CNSTATx is used for the CN event)

bit 10-0 **Unimplemented:** Read as '0'

13.0 TIMER1

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 14. "Timers"** (DS60001105), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

PIC32MZ DA devices feature one synchronous/asynchronous 16-bit timer that can operate as a free-running interval timer for various timing applications and counting external events. This timer can also be used with the low-power Secondary Oscillator (SOSC) for real-time clock applications.

The following modes are supported by Timer1:

- Synchronous Internal Timer
- Synchronous Internal Gated Timer
- Synchronous External Timer
- Asynchronous External Timer

13.1 Additional Supported Features

- Selectable clock prescaler
- Timer operation during Sleep and Idle modes
- Fast bit manipulation using CLR, SET and INV registers
- Asynchronous mode can be used with the SOSC to function as a real-time clock
- ADC event trigger

FIGURE 13-1: TIMER1 BLOCK DIAGRAM

0 = Asynchronous write to TMR1 register complete
In Synchronous Timer mode:
This bit is read as '0'.

bit 10 **Unimplemented:** Read as '0'

bit 9-8 **TECS<1:0>:** Timer1 External Clock Selection bits
11 = Reserved
10 = External clock comes from the LPRC
01 = External clock comes from the T1CK pin
00 = External clock comes from the SOSC

bit 7 **TGATE:** Timer Gated Time Accumulation Enable bit
When TCS = 1:
This bit is ignored.
When TCS = 0:
1 = Gated time accumulation is enabled
0 = Gated time accumulation is disabled

bit 6 **Unimplemented:** Read as '0'

REGISTER 13-1: T1CON: TYPE A TIMER CONTROL REGISTER (CONTINUED)

bit 5-4 **TCKPS<1:0>:** Timer Input Clock Prescale Select bits
11 = 1:256 prescale value
10 = 1:64 prescale value
01 = 1:8 prescale value
00 = 1:1 prescale value

bit 3 **Unimplemented:** Read as '0'

bit 2 **TSYNC:** Timer External Clock Input Synchronization Selection bit
When TCS = 1:
1 = External clock input is synchronized
0 = External clock input is not synchronized
When TCS = 0:
This bit is ignored.

bit 1 **TCS:** Timer Clock Source Select bit
1 = External clock is defined by the TECS<1:0> bits
0 = Internal peripheral clock

bit 0 **Unimplemented:** Read as '0'

14.0 TIMER2/3, TIMER4/5, TIMER6/7, AND TIMER8/9

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 14. "Timers"** (DS60001105), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

This family of devices features eight synchronous 16-bit timers (default) that can operate as a free-running interval timer for various timing applications and counting external events.

The following modes are supported:

- Synchronous internal 16-bit timer
- Synchronous internal 16-bit gated timer
- Synchronous external 16-bit timer

Four 32-bit synchronous timers are available by combining Timer2 with Timer3, Timer4 with Timer5, Timer6 with Timer7, and Timer8 with Timer9.

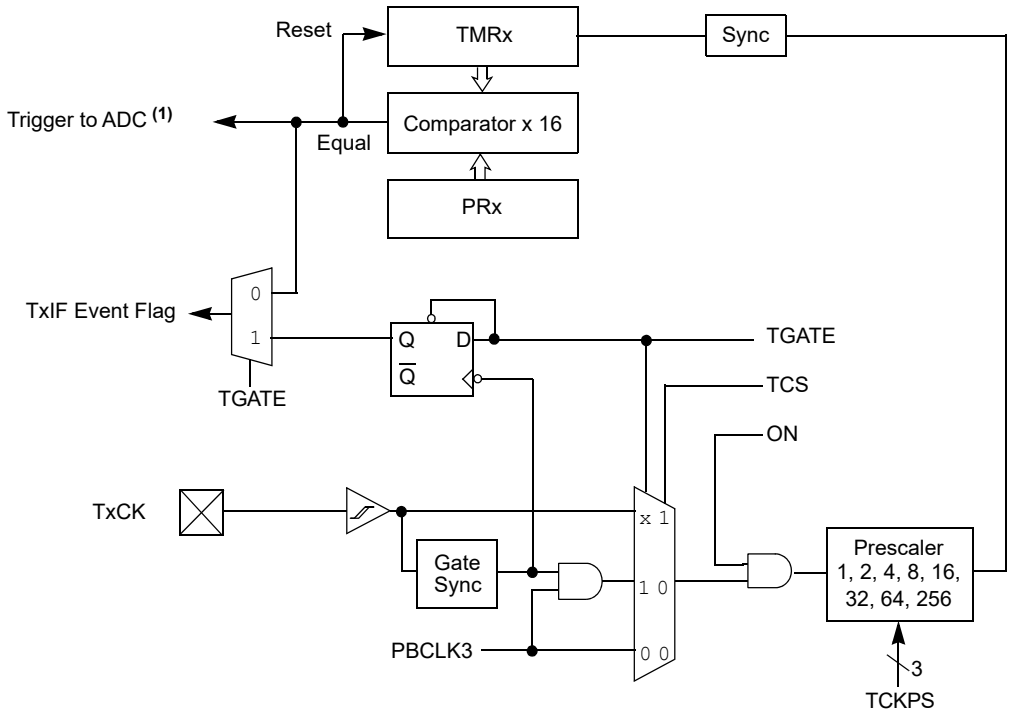
The 32-bit timers can operate in one of three modes:

- Synchronous internal 32-bit timer
- Synchronous internal 32-bit gated timer
- Synchronous external 32-bit timer

14.1 Additional Features

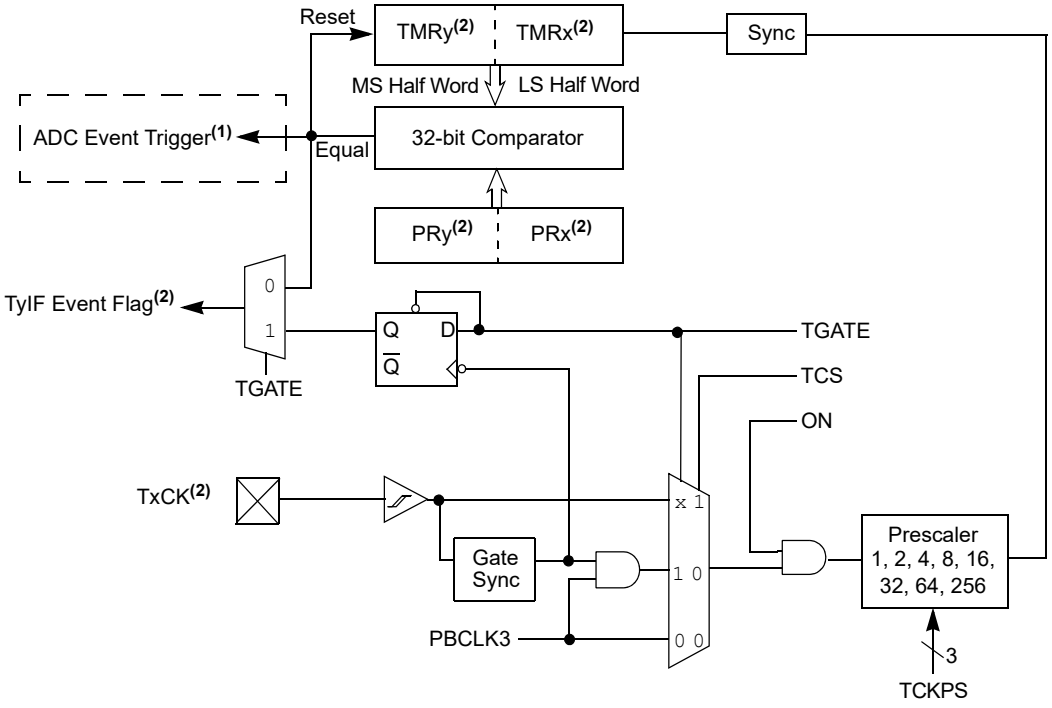
- Selectable clock prescaler
- Timers operational during CPU idle
- Time base for Input Capture and Output Compare modules (Timer2 through Timer7 only)
- ADC event trigger (Timer3 and Timer5 only)
- Fast bit manipulation using CLR, SET and INV registers

FIGURE 14-1: TIMER2 THROUGH TIMER9 BLOCK DIAGRAM (16-BIT)



Note 1: The ADC event trigger is available on Timer3 and Timer5 only.

FIGURE 14-2: TIMER2/3, TIMER4/5, TIMER6/7, AND TIMER8/9 BLOCK DIAGRAM (32-BIT)



Note 1: ADC event trigger is available only on the Timer2/3 and TImer4/5 pairs.
2: In this diagram, 'x' represents Timer2, 4, 6, or 8, and 'y' represents Timer3, 5, 7, or 9.

1 = External clock from TxCK pin
0 = Internal peripheral clock

bit 0 **Unimplemented:** Read as '0'

Note 1: While operating in 32-bit mode, this bit has no effect for odd numbered timers (Timer1, Timer3, Timer5, Timer7, and Timer9). All timer functions are set through the even numbered timers.

2: While operating in 32-bit mode, this bit must be cleared on odd numbered timers to enable the 32-bit timer in Idle mode.

3: This bit is available only on even numbered timers (Timer2, Timer4, Timer6, and Timer8).

15.0 INPUT CAPTURE

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 15. "Input Capture"** (DS60001122), which is available from the *Documentation* > *Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The Input Capture module is useful in applications requiring frequency (period) and pulse measurement.

The Input Capture module captures the 16-bit or 32-bit value of the selected Time Base registers when an event occurs at the ICx pin.

Capture events are caused by the following:

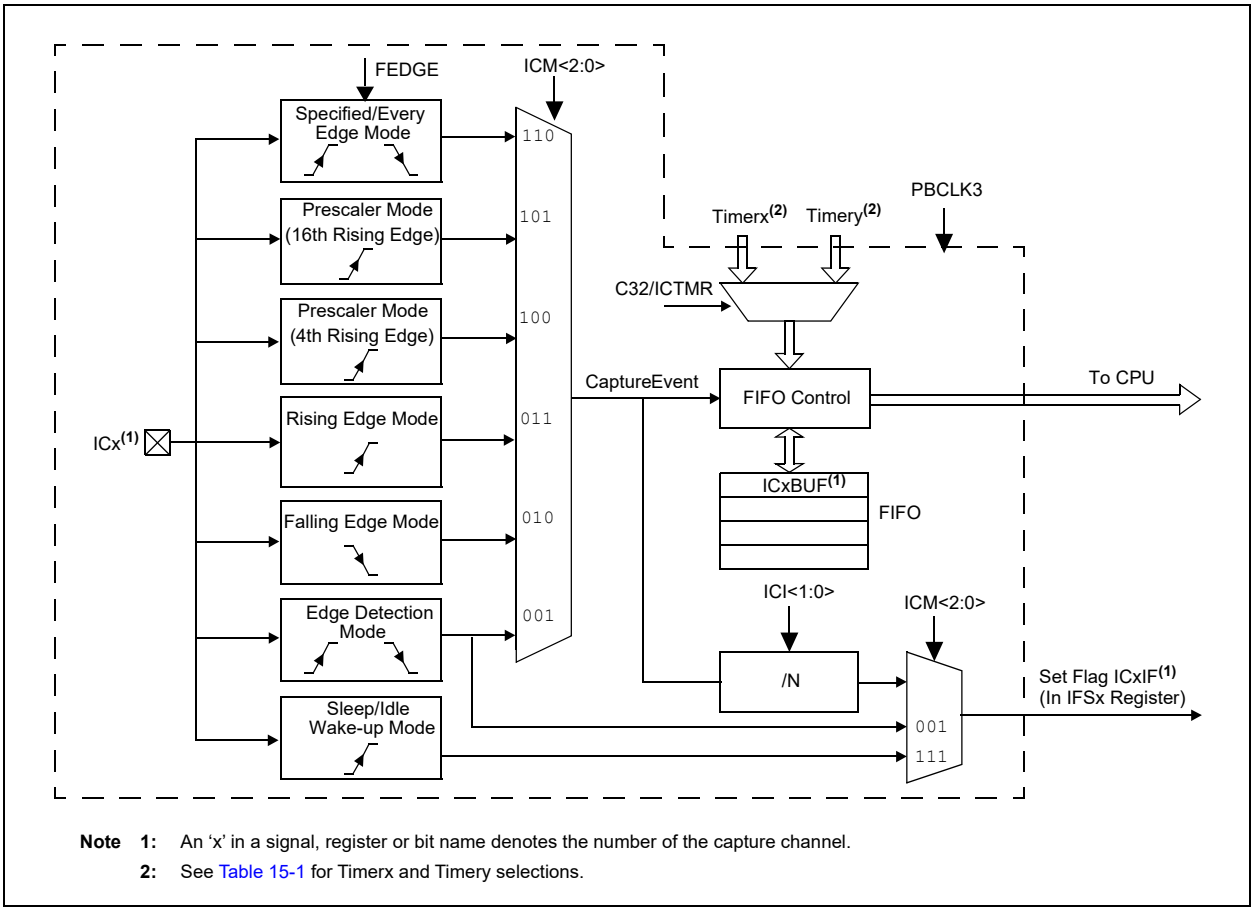
- Capture timer value on every edge (rising and falling), specified edge first
- Prescaler capture event modes:
  - Capture timer value on every 4th rising edge of input at ICx pin
  - Capture timer value on every 16th rising edge of input at ICx pin

Each input capture channel can select between one of six 16-bit timers for the time base, or two of six 16-bit timers together to form a 32-bit timer. The selected timer can use either an internal or external clock.

Other operational features include:

- Device wake-up from capture pin during Sleep and Idle modes
- Interrupt on input capture event
- 4-word FIFO buffer for capture values; Interrupt optionally generated after 1, 2, 3, or 4 buffer locations are filled
- Input capture can also be used to provide additional sources of external interrupts

FIGURE 15-1: INPUT CAPTURE BLOCK DIAGRAM



Note 1: An 'x' in a signal, register or bit name denotes the number of the capture channel.

2: See Table 15-1 for Timerx and Timery selections.

The timer source for each Input Capture module depends on the setting of the ICACLK bit in the CFGCON register. The available configurations are shown in Table 15-1.

TABLE 15-1: TIMER SOURCE CONFIGURATIONS

Input Capture Module	Timerx	Timery

- 0 = Input capture buffer is empty

bit 2-0 **ICM<2:0>:** Input Capture Mode Select bits
- 111 = Interrupt-Only mode (only supported while in Sleep mode or Idle mode)
- 110 = Simple Capture Event mode – every edge, specified edge first and every edge thereafter
- 101 = Prescaled Capture Event mode – every sixteenth rising edge
- 100 = Prescaled Capture Event mode – every fourth rising edge
- 011 = Simple Capture Event mode – every rising edge
- 010 = Simple Capture Event mode – every falling edge
- 001 = Edge Detect mode – every edge (rising and falling)
- 000 = Input Capture module is disabled

Note 1: Refer to Table 15-1 for Timerx and Timery selections.

16.0 OUTPUT COMPARE

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 16. "Output Compare"** (DS60001111), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

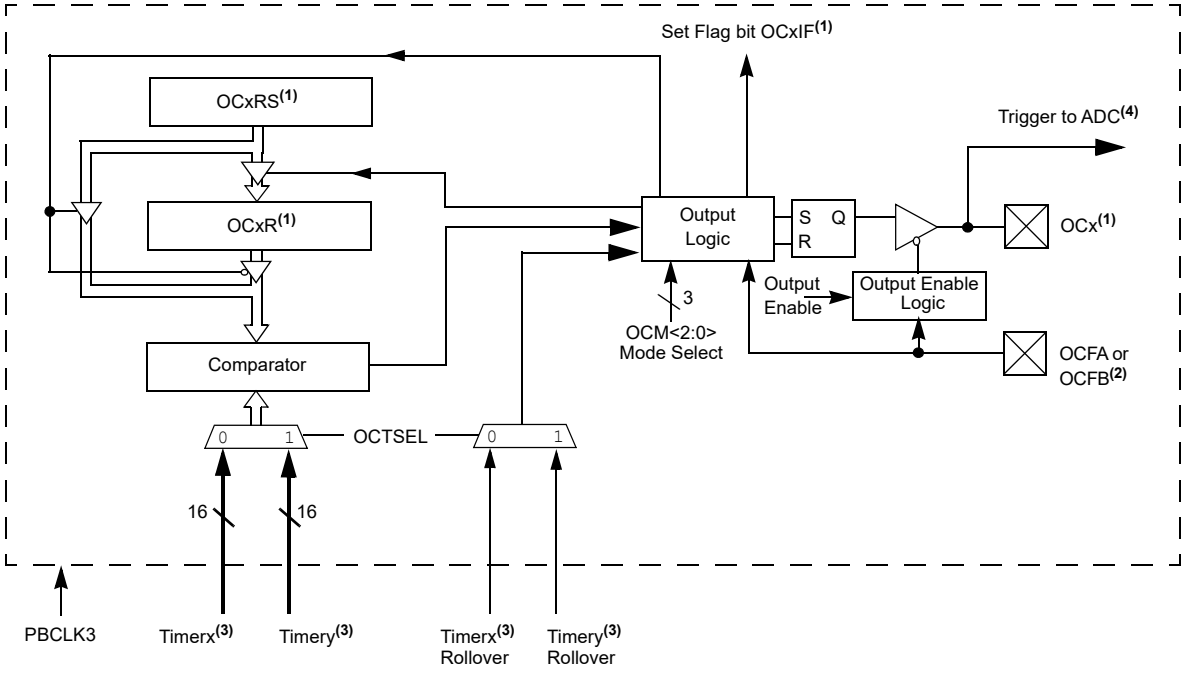
The Output Compare module is used to generate a single pulse or a train of pulses in response to selected time base events.

For all modes of operation, the Output Compare module compares the values stored in the OCxR and/or the OCxRS registers to the value in the selected timer. When a match occurs, the Output Compare module generates an event based on the selected mode of operation.

The following are some of the key features of the Output Compare module:

- Multiple Output Compare modules in a device
- Programmable interrupt generation on compare event
- Single and Dual Compare modes
- Single and continuous output pulse generation
- Pulse-Width Modulation (PWM) mode
- Hardware-based PWM Fault detection and automatic output disable
- Programmable selection of 16-bit or 32-bit time bases
- Can operate from either of two available 16-bit time bases or a single 32-bit time base
- ADC event trigger

FIGURE 16-1: OUTPUT COMPARE MODULE BLOCK DIAGRAM



Note 1: Where 'x' is shown, reference is made to the registers associated with the respective output compare channels, 1 through 9.

2: The OCFA pin controls the OC1, OC3, and OC7-OC9 channels. The OCFB pin controls the OC4-OC6 channels.

3: Refer to Table 16-1 for Timerx and Timery selections.

4: The ADC event trigger is only available on OC1,OC3, and OC 5.

The timer source for each Output Compare module depends on the setting of the OCACLK bit in the CFGCON register. The available configurations are shown in Table 16-1.

TABLE 16-1: TIMER SOURCE CONFIGURATIONS

Output Compare Module	Timerx	Timery

	ON	—	SIDL	—	—	—	—	—
7:0	U-0	U-0	R/W-0	R-0	R/W-0	R/W-0	R/W-0	R/W-0
	—	—	OC32	OCFLT(1)	OCTSEL(2)	OCM<2:0>		

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ON:** Output Compare Peripheral On bit
- 1 = Output Compare peripheral is enabled
- 0 = Output Compare peripheral is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit
- 1 = Discontinue operation when CPU enters Idle mode
- 0 = Continue operation in Idle mode

bit 12-6 **Unimplemented:** Read as '0'

bit 5 **OC32:** 32-bit Compare Mode bit
- 1 = OCxR<31:0> and/or OCxRS<31:0> are used for comparisions to the 32-bit timer source
- 0 = OCxR<15:0> and OCxRS<15:0> are used for comparisons to the 16-bit timer source

bit 4 **OCFLT:** PWM Fault Condition Status bit(1)
- 1 = PWM Fault condition has occurred (cleared in HW only)
- 0 = No PWM Fault condition has occurred

bit 3 **OCTSEL:** Output Compare Timer Select bit(2)
- 1 = Timery is the clock source for this Output Compare module
- 0 = Timerx is the clock source for this Output Compare module

bit 2-0 **OCM<2:0>:** Output Compare Mode Select bits
- 111 = PWM mode on OCx; Fault pin enabled
- 110 = PWM mode on OCx; Fault pin disabled
- 101 = Initialize OCx pin low; generate continuous output pulses on OCx pin
- 100 = Initialize OCx pin low; generate single output pulse on OCx pin
- 011 = Compare event toggles OCx pin
- 010 = Initialize OCx pin high; compare event forces OCx pin low
- 001 = Initialize OCx pin low; compare event forces OCx pin high
- 000 = Output compare peripheral is disabled but continues to draw current

Note 1: This bit is only used when OCM<2:0> = '111'. It is read as '0' in all other modes.

2: Refer to Table 16-1 for Timerx and Timery selections.

NOTES:

17.0 DEADMAN TIMER (DMT)

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 9. "Watchdog, Deadman, and Power-up Timers"** (DS60001114), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

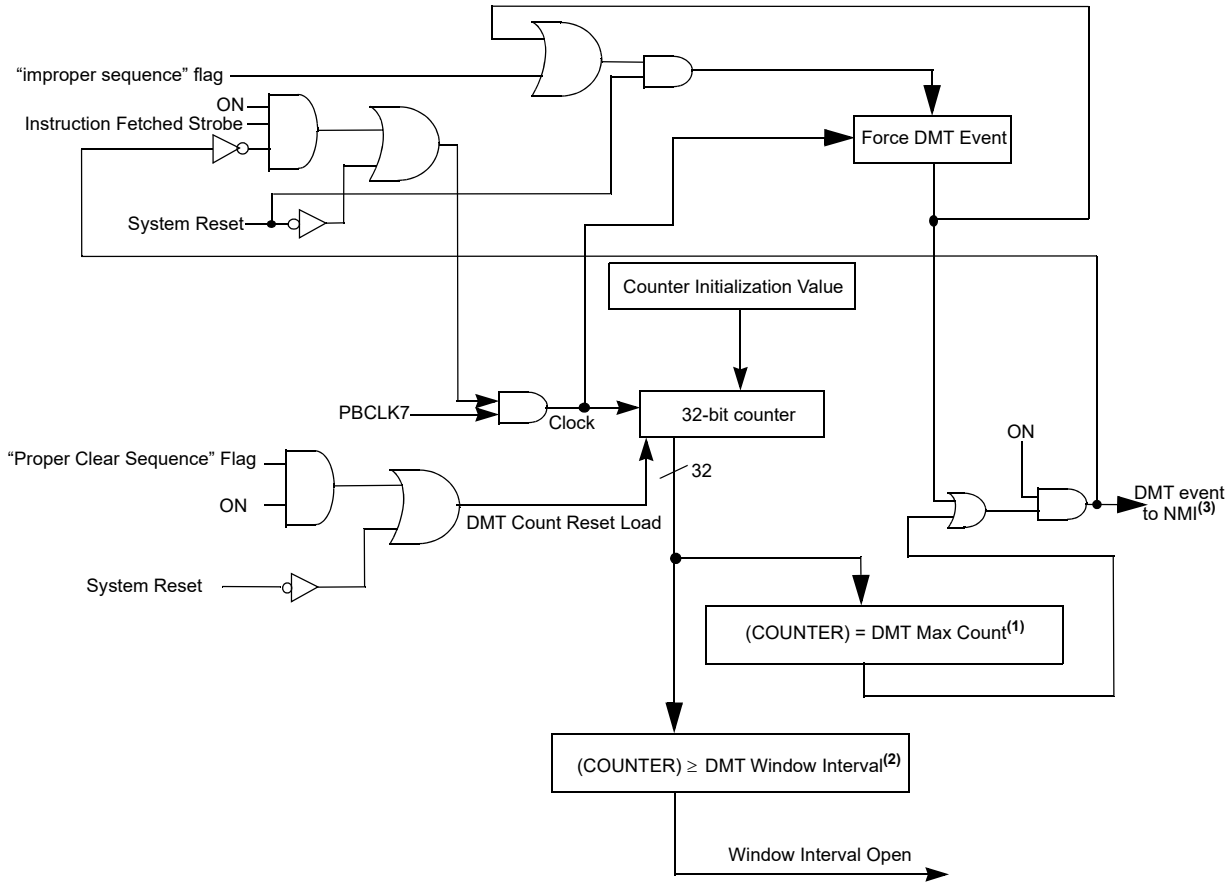
The primary function of the Deadman Timer (DMT) is to reset the processor in the event of a software malfunction. The DMT is a free-running instruction fetch timer, which is clocked whenever an instruction fetch occurs until a count match occurs. Instructions are not fetched when the processor is in Sleep mode.

The DMT consists of a 32-bit counter with a time-out count match value as specified by the DMTCNT<3:0> bits in the DEVCFG1 Configuration register.

A Deadman Timer is typically used in mission critical and safety critical applications, where any single failure of the software functionality and sequencing must be detected.

Figure 17-1 shows a block diagram of the Deadman Timer module.

FIGURE 17-1: DEADMAN TIMER BLOCK DIAGRAM



Note 1: DMT Max Count is controlled by the DMTCNT<3:0> bits in the DEVCFG1 Configuration register.
2: DMT Window Interval is controlled by the DMTINTV<2:0> bits in the DEVCFG1 Configuration register.
3: Refer to **Section 6.0 "Resets"** for more information.

	STEP2<7:0>							

Legend:		
R = Readable bit	W = Writable bit	U = Unimplemented bit
-n = Bit Value at POR: (‘0’, ‘1’, x = unknown)	P = Programmable bit	r = Reserved bit

bit 31-8 **Unimplemented:** Read as ‘0’

bit 7-0 **STEP2<7:0>:** Clear Timer bits

00001000 = Clears STEP1<7:0>, STEP2<7:0> and the Deadman Timer if, and only if, preceded by correct loading of STEP1<7:0> bits in the correct sequence. The write to these bits may be verified by reading the DMTCNT bit and observing the counter being reset.

All other write patterns = Set BAD2 bit, the value of STEP1<7:0> will remain unchanged, and the new value being written STEP2<7:0> will be captured. These bits are also cleared when a DMT reset event occurs.

If the STEP2<7:0> bits are written without preceding with a correct loading of STEP1<7:0> bits, the BAD1 bit is set.

REGISTER 17-4: DMTSTAT: DEADMAN TIMER STATUS REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

This is always the value of the DMTINTV<2:0> bits in the DEVCFG1 Configuration register.

NOTES:

18.0 WATCHDOG TIMER (WDT)

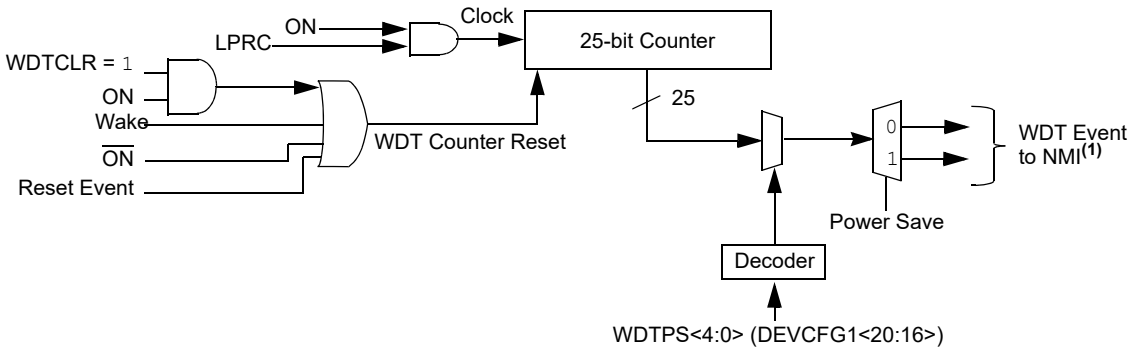
Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 9. "Watchdog, Deadman, and Power-up Timers"** (DS60001114), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

When enabled, the Watchdog Timer (WDT) operates from the internal Low-Power Oscillator (LPRC) clock source and can be used to detect system software malfunctions by resetting the device if the WDT is not cleared periodically in software. Various WDT time-out periods can be selected using the WDT postscaler. The WDT can also be used to wake the device from Sleep or Idle mode.

The following are some of the key features of the WDT module:

- Configuration or software controlled
- User-configurable time-out period
- Can wake the device from Sleep or Idle

FIGURE 18-1: WATCHDOG TIMER BLOCK DIAGRAM



Note 1: Refer to **Section 6.0 "Resets"** for more information.

7:0	U-0	U-0	U-0	U-0	U-0	U-0	U-0	R/W-0
	—	—	SLPDIV<4:0>					WDTWINEN

Legend:	y = Values set from Configuration bits on POR		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **WDTCLRKEY<15:0>:** Watchdog Timer Clear Key bits
To clear the Watchdog Timer to prevent a time-out, software must write the value 0x5743 to these bits using a single 16-bit write.

bit 15 **ON:** Watchdog Timer Enable bit(1)
1 = The Watchdog Timer module is enabled
0 = The Watchdog Timer module is disabled

bit 14-13 **Unimplemented:** Read as '0'

bit 12-8 **RUNDIV<4:0>:** Watchdog Timer Postscaler Value in Run Mode bits
In Run mode, these bits are set to the values of the WDTPS<4:0> Configuration bits in DEVCFG1.

bit 7-6 **Unimplemented:** Read as '0'

bit 5-1 **SLPDIV<4:0>:** Watchdog Timer Postscaler Value in Sleep Mode bits
In Sleep mode, these bits are set to the values of the SWDTPS <4:0> Configuration bits in DEVCFG4.

bit 0 **WDTWINEN:** Watchdog Timer Window Enable bit
1 = Enable windowed Watchdog Timer
0 = Disable windowed Watchdog Timer

Note 1: This bit only has control when FWDTEN (DEVCFG1<23>) = 0.

NOTES:

19.0 DEEP SLEEP WATCHDOG TIMER (DSWDT)

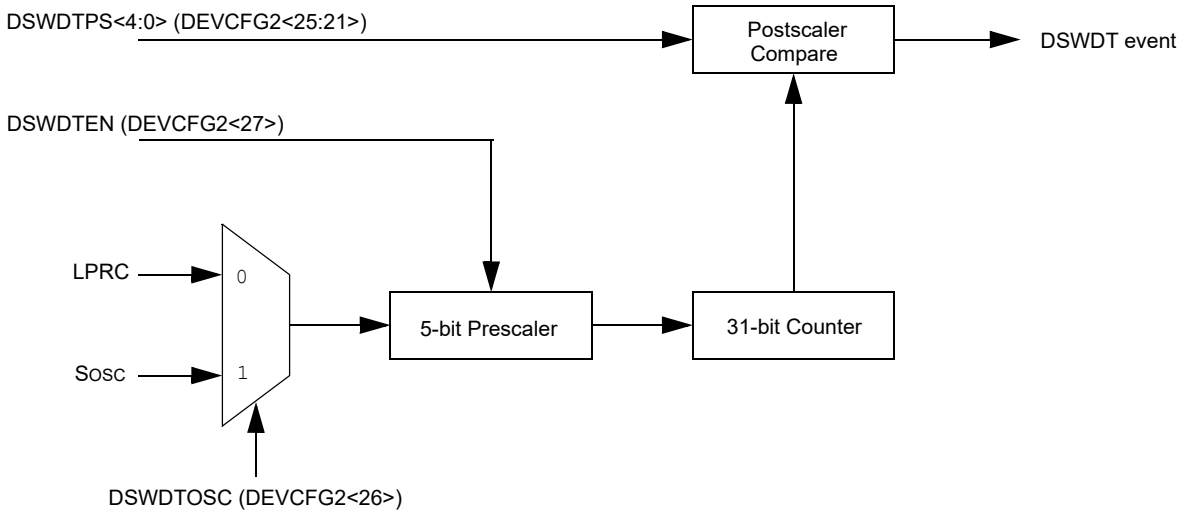
Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 9. "Watchdog, Deadman, and Power-up Timers"** (DS60001114), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The Deep Sleep Watchdog Timer (DSWDT) is a dedicated Watchdog Timer for Deep Sleep mode operations of the device. The DSWDT is very useful in Battery-powered applications and in Low-Power modes of operations.

The primary function of the DSWDT is to automatically exit Deep Sleep mode after a prescribed amount of time has elapsed.

The DSWDT is controlled through the DEVCFG2 Configuration register at boot time (one-time programmable per POR). When enabled through the DSWDTEN bit in DEVCFG2, the DSWDT operates either from the internal Low-Power RC (LPRC) clock or from the Secondary Oscillator (SOSC). The clock selection for the DSWDT is done through the DSWDTOSC bit in the DEVCFG2 register.

FIGURE 19-1: DEEP SLEEP WATCHDOG TIMER BLOCK DIAGRAM



Example: When DSWDTOSC = 1, DSWDTPS<4:0> bits = 00000, and the SOSC is 32 kHz, the Watchdog delay is set to 1 ms.

NOTES:

20.0 REAL-TIME CLOCK AND CALENDAR (RTCC)

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 29. "Real-Time Clock and Calendar (RTCC)"** (DS60001125), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The RTCC module is intended for applications in which accurate time must be maintained for extended periods of time with minimal or no CPU intervention. Low-power optimization provides extended battery lifetime while keeping track of time.

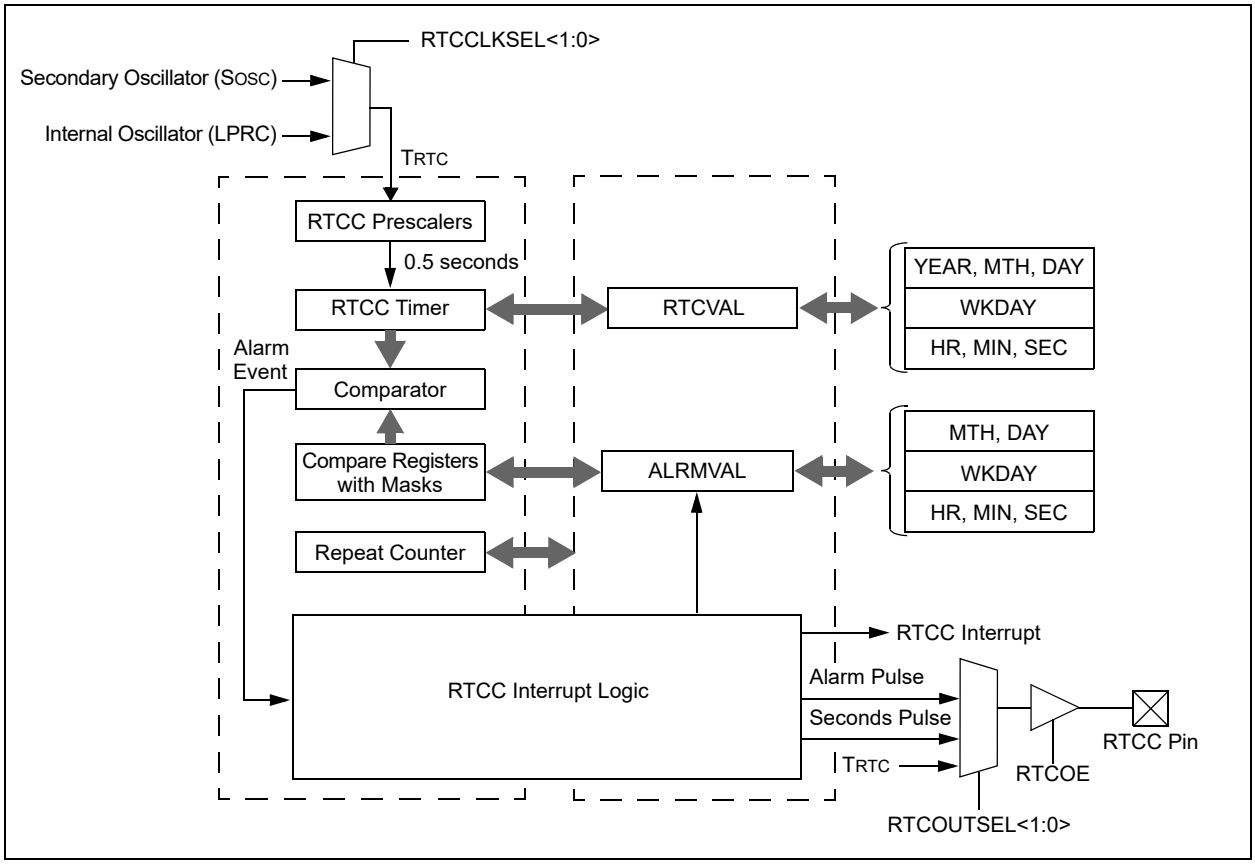
The RTCC module can operate in VBAT mode when there is a power loss on the VDDIO pin. The RTCC will continue to operate if the VBAT pin is powered on (it is usually connected to the battery).

Key features of the RTCC module include:

- Time: hours, minutes and seconds
- 24-hour format (military time)
- Visibility of one-half second period
- Provides calendar: Weekday, date, month and year
- Alarm intervals are configurable for half of a second, one second, 10 seconds, one minute, 10 minutes, one hour, one day, one week, one month, and one year
- Alarm repeat with decrementing counter
- Alarm with indefinite repeat: Chime
- Year range: 2000 to 2099
- Leap year correction
- BCD format for smaller firmware overhead
- Optimized for long-term battery operation
- Fractional second synchronization
- User calibration of the clock crystal frequency with auto-adjust
- Calibration range: ±0.66 seconds error per month
- Calibrates up to 260 ppm of crystal error
- Uses external crystal or internal oscillator
- Alarm pulse, seconds clock, or internal clock output on RTCC pin

Note: RTCC pin function is not available during VBAT operation.

FIGURE 20-1: RTCC BLOCK DIAGRAM



20.1 RTCC Control Registers

TABLE 20-1: RTCC REGISTER MAP

Virtual Address (BF8C_#)	Register Name(1)	Bit Range	Bits

	RTC OUTSEL<0>(2)	RTC CLKON	—	—	RTC WREN(3)	RTC SYNC	HALFSEC(4)	RTCOE

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-26 **Unimplemented:** Read as '0'

bit 25-16 **CAL<9:0>:** Real-Time Clock Drift Calibration bits, which contain a signed 10-bit integer value
0111111111 = Maximum positive adjustment, adds 511 real-time clock pulses every one minute
•
•
•
0000000001 = Minimum positive adjustment, adds 1 real-time clock pulse every one minute
0000000000 = No adjustment
1111111111 = Minimum negative adjustment, subtracts 1 real-time clock pulse every one minute
•
•
•
1000000000 = Minimum negative adjustment, subtracts 512 real-time clock pulses every one minute

bit 15 **ON:** RTCC On bit(1)
1 = RTCC module is enabled
0 = RTCC module is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit
1 = Disables RTCC operation when CPU enters Idle mode
0 = Continue normal operation when CPU enters Idle mode

bit 12-11 **Unimplemented:** Read as '0'

Note 1: The ON bit is only writable when RTCWREN = 1.
2: Requires RTCOE = 1 (RTCCON<0>) for the output to be active.
3: The RTCWREN bit can be set only when the write sequence is enabled.
4: This bit is read-only. It is cleared to '0' on a write to the seconds bit fields (RTCTIME<14:8>).

Note: This register is reset only on a Power-on Reset (POR).

REGISTER 20-1: RTCCON: REAL-TIME CLOCK AND CALENDAR CONTROL REGISTER

bit 10-9 **RTCCLKSEL<1:0>:** RTCC Clock Select bits

When a new value is written to these bits, the Seconds Value register should also be written to properly reset the clock prescalers in the RTCC.

11 = Reserved
10 = Reserved
01 = RTCC uses the external 32.768 kHz Secondary Oscillator (SOSC)
00 = RTCC uses the internal 32 kHz oscillator (LPRC)

bit 8-7 **RTCOUTSEL<1:0>:** RTCC Output Data Select bits(2)

11 = Reserved
10 = RTCC Clock is presented on the RTCC pin
01 = Seconds Clock is presented on the RTCC pin
00 = Alarm Pulse is presented on the RTCC pin when the alarm interrupt is triggered

bit 6 **RTCCLKON:** RTCC Clock Enable Status bit

1 = RTCC Clock is actively running
0 = RTCC Clock is not running

bit 5-4 **Unimplemented:** Read as '0'

bit 3 **RTCWREN:** Real-Time Clock Value Registers Write Enable bit(3)

1 = Real-Time Clock Value registers can be written to by the user
0 = Real-Time Clock Value registers are locked out from being written to by the user

bit 2 **RTCSYNC:** Real-Time Clock Value Registers Read Synchronization bit

1 = Real-time clock value registers can change while reading (due to a rollover ripple that results in an invalid data read). If the register is read twice and results in the same data, the data can be assumed to be valid.
0 = Real-time clock value registers can be read without concern about a rollover ripple

bit 1 **HALFSEC:** Half-Second Status bit(4)

1 = Second half period of a second
0 = First half period of a second

bit 0 **RTCOE:** RTCC Output Enable bit

1 = RTCC output is enabled
0 = RTCC output is not enabled

Note 1: The ON bit is only writable when RTCWREN = 1.
2: Requires RTCOE = 1 (RTCCON<0>) for the output to be active.
3: The RTCWREN bit can be set only when the write sequence is enabled.
4: This bit is read-only. It is cleared to '0' on a write to the seconds bit fields (RTCTIME<14:8>).

Note: This register is reset only on a Power-on Reset (POR).

REGISTER 20-2: RTCALRM: REAL-TIME CLOCK ALARM CONTROL REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31:24	U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
	—	—	—	—	—	—	—	—
23:16	U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
	—	—	—	—	—	—	—	—
15:8	R/W-0	R/W-0	R/W-0	R-0	R/W-0	R/W-0	R/W-0	R/W-0
	ALRMEN(1,2)	CHIME(2)	PIV(2)	ALRMSYNC	AMASK<3:0>(2)			
7:0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	ARPT<7:0>(2)							

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ALRMEN:** Alarm Enable bit(1,2)
- 1 = Alarm is enabled
- 0 = Alarm is disabled

bit 14 **CHIME:** Chime Enable bit(2)
- 1 = Chime is enabled – ARPT<7:0> is allowed to rollover from 0x00 to 0xFF
- 0 = Chime is disabled – ARPT<7:0> stops once it reaches 0x00

bit 13 **PIV:** Alarm Pulse Initial Value bit(2)

When ALRMEN = 0, PIV is writable and determines the initial value of the Alarm Pulse.
When ALRMEN = 1, PIV is read-only and returns the state of the Alarm Pulse.

bit 12 **ALRMSYNC:** Alarm Sync bit
- 1 = ARPT<7:0> and ALRMEN may change as a result of a half second rollover during a read. The ARPT must be read repeatedly until the same value is read twice. This must be done since multiple bits may be changing.
- 0 = ARPT<7:0> and ALRMEN can be read without concerns of rollover because the prescaler is more than 32 real-time clocks away from a half-second rollover

bit 11-8 **AMASK<3:0>:** Alarm Mask Configuration bits(2)
- 0000 = Every half-second
- 0001 = Every second
- 0010 = Every 10 seconds
- 0011 = Every minute
- 0100 = Every 10 minutes
- 0101 = Every hour
- 0110 = Once a day
- 0111 = Once a week
- 1000 = Once a month
- 1001 = Once a year (except when configured for February 29, once every four years)
- 1010 = Reserved
- 1011 = Reserved
- 11xx = Reserved

Note 1: Hardware clears the ALRMEN bit anytime the alarm event occurs, when ARPT<7:0> = 00 and CHIME = 0.

2: This field should not be written when the RTCC ON bit = '1' (RTCCON<15>) and ALRMSYNC = 1.

Note: This register is reset only on a Power-on Reset (POR).

REGISTER 20-2: RTCALRM: REAL-TIME CLOCK ALARM CONTROL REGISTER (CONTINUED)

bit 7-0 **ARPT<7:0>:** Alarm Repeat Counter Value bits(2)

11111111 = Alarm will trigger 256 times

•

•

•

00000000 = Alarm will trigger one time

The counter decrements on any alarm event. The counter only rolls over from 0x00 to 0xFF if CHIME = 1.

Note 1: Hardware clears the ALRMEN bit anytime the alarm event occurs, when ARPT<7:0> = 00 and CHIME = 0.

2: This field should not be written when the RTCC ON bit = '1' (RTCCON<15>) and ALRMSYNC = 1.

Note:	This register is reset only on a Power-on Reset (POR).

bit 11-8 **DAY01<3:0>:** Binary Coded Decimal value of days bits, 1 digit; contains a value from 0 to 9

bit 7-4 **Unimplemented:** Read as '0'

bit 3-0 **WDAY01<3:0>:** Binary Coded Decimal value of weekdays bits, 1 digit; contains a value from 0 to 6

21.0 SERIAL PERIPHERAL INTERFACE (SPI) AND INTER-IC SOUND (I^2S)

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 23. "Serial Peripheral Interface (SPI)"** (DS60001106), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The SPI/I^2S module is a synchronous serial interface that is useful for communicating with external peripherals and other microcontroller devices, as well as digital audio devices. These peripheral devices may be Serial EEPROMs, Shift registers, display drivers, Analog-to-Digital Converters (ADC), etc.

The SPI/I^2S module is compatible with Motorola® SPI and SIOP interfaces.

Some of the key features of the SPI module are:

- Host and Client modes support
- Four different clock formats
- Enhanced Framed SPI protocol support
- User-configurable 8-bit, 16-bit and 32-bit data width
- Separate SPI FIFO buffers for receive and transmit
  - FIFO buffers act as 4/8/16-level deep FIFOs based on 32/16/8-bit data width
- Programmable interrupt event on every 8-bit, 16-bit and 32-bit data transfer
- Operation during Sleep and Idle modes
- Audio Codec Support:
  - I^2S protocol
  - Left-justified
  - Right-justified
  - PCM

FIGURE 21-1: SPI/I^2S MODULE BLOCK DIAGRAM

7:0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	SSEN	CKP(3)	MSTEN	DISSDI(4)	STXISEL<1:0>		SRXISEL<1:0>	

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31 **FRMEN:** Framed SPI Support bit
1 = Framed SPI support is enabled ($\overline{SSx}$ pin used as FSYNC input/output)
0 = Framed SPI support is disabled

bit 30 **FRMSYNC:** Frame Sync Pulse Direction Control on $\overline{SSx}$ pin bit (Framed SPI mode only)
1 = Frame sync pulse input (Client mode)
0 = Frame sync pulse output (Host mode)

bit 29 **FRMPOL:** Frame Sync / SPI Select Polarity bit (Framed SPI or Host Transmit modes only)
1 = Frame pulse or $\overline{SSx}$ pin is active-high
0 = Frame pulse or $\overline{SSx}$ is active-low

bit 28 **MSSEN:** Host Mode SPI Select Enable bit
1 = SPI select support enabled. The $\overline{SS}$ pin is automatically driven during transmission in Host mode. Polarity is determined by the FRMPOL bit.
0 = SPI select support is disabled.

bit 27 **FRMSYPW:** Frame Sync Pulse Width bit
1 = Frame sync pulse is one character wide
0 = Frame sync pulse is one clock wide

bit 26-24 **FRMCNT<2:0>:** Frame Sync Pulse Counter bits. Controls the number of data characters transmitted per pulse. This bit is only valid in Framed mode.
111 = Reserved
110 = Reserved
101 = Generate a frame sync pulse on every 32 data characters
100 = Generate a frame sync pulse on every 16 data characters
011 = Generate a frame sync pulse on every 8 data characters
010 = Generate a frame sync pulse on every 4 data characters
001 = Generate a frame sync pulse on every 2 data characters
000 = Generate a frame sync pulse on every data character

bit 23 **MCLKSEL:** Host Clock Enable bit(1)
1 = REFCLKO1 is used by the Baud Rate Generator
0 = PBCLK2 is used by the Baud Rate Generator

bit 22-18 **Unimplemented:** Read as '0'

Note 1: This bit can only be written when the ON bit = 0. Refer to **Section 44.0 "Electrical Characteristics"** for maximum clock frequency requirements.

2: This bit is not used in the Framed SPI mode. The user should program this bit to '0' for the Framed SPI mode (FRMEN = 1).

3: When AUDEN = 1, the SPI/I^2S module functions as if the CKP bit is equal to '1', regardless of the actual value of the CKP bit.

4: This bit present for legacy compatibility and is superseded by PPS functionality on these devices (see **Section 12.4 "Peripheral Pin Select (PPS)"** for more information).

REGISTER 21-1: SPIxCON: SPI CONTROL REGISTER (CONTINUED)

bit 17 **SPIFE:** Frame Sync Pulse Edge Select bit (Framed SPI mode only)
1 = Frame synchronization pulse coincides with the first bit clock
0 = Frame synchronization pulse precedes the first bit clock

bit 16 **ENHBUF:** Enhanced Buffer Enable bit(1)
1 = Enhanced Buffer mode is enabled
0 = Enhanced Buffer mode is disabled

bit 15 **ON:** SPI/I2S Module On bit
1 = SPI/I2S module is enabled
0 = SPI/I2S module is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit
1 = Discontinue operation when CPU enters in Idle mode
0 = Continue operation in Idle mode

bit 12 **DISSDO:** Disable SDOx pin bit(4)
1 = SDOx pin is not used by the module. Pin is controlled by associated PORT register
0 = SDOx pin is controlled by the module

bit 11-10 **MODE<32,16>:** 32/16-Bit Communication Select bits

When AUDEN = 1:

MODE32	MODE16	Communication
1	1	24-bit Data, 32-bit FIFO, 32-bit Channel/64-bit Frame
1	0	32-bit Data, 32-bit FIFO, 32-bit Channel/64-bit Frame
0	1	16-bit Data, 16-bit FIFO, 32-bit Channel/64-bit Frame
0	0	16-bit Data, 16-bit FIFO, 16-bit Channel/32-bit Frame

When AUDEN = 0:

MODE32	MODE16	Communication
1	x	32-bit
0	1	16-bit
0	0	8-bit

bit 9 **SMP:** SPI Data Input Sample Phase bit
Host mode (MSTEN = 1):
1 = Input data sampled at end of data output time
0 = Input data sampled at middle of data output time
Client mode (MSTEN = 0):
SMP value is ignored when SPI is used in Client mode. The module always uses SMP = 0.

bit 8 **CKE:** SPI Clock Edge Select bit(2)
1 = Serial output data changes on transition from active clock state to Idle clock state (see CKP bit)
0 = Serial output data changes on transition from Idle clock state to active clock state (see CKP bit)

bit 7 **SSEN:** SPI Select Enable (Client mode) bit
1 = SSx pin used for Client mode
0 = SSx pin not used for Client mode, pin controlled by port function.

bit 6 **CKP:** Clock Polarity Select bit(3)
1 = Idle state for clock is a high level; active state is a low level
0 = Idle state for clock is a low level; active state is a high level

Note 1: This bit can only be written when the ON bit = 0. Refer to **Section 44.0 "Electrical Characteristics"** for maximum clock frequency requirements.

2: This bit is not used in the Framed SPI mode. The user should program this bit to '0' for the Framed SPI mode (FRMEN = 1).

3: When AUDEN = 1, the SPI/I2S module functions as if the CKP bit is equal to '1', regardless of the actual value of the CKP bit.

4: This bit present for legacy compatibility and is superseded by PPS functionality on these devices (see **Section 12.4 "Peripheral Pin Select (PPS)"** for more information).

REGISTER 21-1: SPIxCON: SPI CONTROL REGISTER (CONTINUED)

bit 5 **MSTEN:** Host Mode Enable bit
1 = Host mode
0 = Client mode

bit 4 **DISSDI:** Disable SDI bit(4)
1 = SDI pin is not used by the SPI module (pin is controlled by PORT function)
0 = SDI pin is controlled by the SPI module

bit 3-2 **STXISEL<1:0>:** SPI Transmit Buffer Empty Interrupt Mode bits
11 = Interrupt is generated when the buffer is not full (has one or more empty elements)
10 = Interrupt is generated when the buffer is empty by one-half or more
01 = Interrupt is generated when the buffer is completely empty
00 = Interrupt is generated when the last transfer is shifted out of SPISR and transmit operations are complete

bit 1-0 **SRXISEL<1:0>:** SPI Receive Buffer Full Interrupt Mode bits
11 = Interrupt is generated when the buffer is full
10 = Interrupt is generated when the buffer is full by one-half or more
01 = Interrupt is generated when the buffer is not empty
00 = Interrupt is generated when the last word in the receive buffer is read (i.e., buffer is empty)

Note 1: This bit can only be written when the ON bit = 0. Refer to **Section 44.0 "Electrical Characteristics"** for maximum clock frequency requirements.

2: This bit is not used in the Framed SPI mode. The user should program this bit to '0' for the Framed SPI mode (FRMEN = 1).

3: When AUDEN = 1, the SPI/I^2S module functions as if the CKP bit is equal to '1', regardless of the actual value of the CKP bit.

4: This bit present for legacy compatibility and is superseded by PPS functionality on these devices (see **Section 12.4 "Peripheral Pin Select (PPS)"** for more information).

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **SPISGNEXT:** Sign Extend Read Data from the RX FIFO bit
- 1 = Data from RX FIFO is sign extended
- 0 = Data from RX FIFO is not sign extened

bit 14-13 **Unimplemented:** Read as '0'

bit 12 **FRMERREN:** Enable Interrupt Events via FRMERR bit
- 1 = Frame Error overflow generates error events
- 0 = Frame Error does not generate error events

bit 11 **SPIROVEN:** Enable Interrupt Events via SPIROV bit
- 1 = Receive overflow generates error events
- 0 = Receive overflow does not generate error events

bit 10 **SPITUREN:** Enable Interrupt Events via SPITUR bit
- 1 = Transmit Underrun Generates Error Events
- 0 = Transmit Underrun Does Not Generates Error Events

bit 9 **IGNROV:** Ignore Receive Overflow bit (for Audio Data Transmissions)
- 1 = A ROV is not a critical error; during ROV data in the fifo is not overwritten by receive data
- 0 = A ROV is a critical error which stop SPI operation

bit 8 **IGNTUR:** Ignore Transmit Underrun bit (for Audio Data Transmissions)
- 1 = A TUR is not a critical error and zeros are transmitted until the SPIxTXB is not empty
- 0 = A TUR is a critical error which stop SPI operation

bit 7 **AUDEN:** Enable Audio CODEC Support bit(1)
- 1 = Audio protocol enabled
- 0 = Audio protocol disabled

bit 6-5 **Unimplemented:** Read as '0'

bit 3 **AUDMONO:** Transmit Audio Data Format bit(1,2)
- 1 = Audio data is mono (Each data word is transmitted on both left and right channels)
- 0 = Audio data is stereo

bit 2 **Unimplemented:** Read as '0'

bit 1-0 **AUDMOD<1:0>:** Audio Protocol Mode bit(1,2)
- 11 = PCM/DSP mode
- 10 = Right Justified mode
- 01 = Left Justified mode
- 00 = I^2S mode

Note 1: This bit can only be written when the ON bit = 0.

2: This bit is only valid for AUDEN = 1.

REGISTER 21-3: SPIxSTAT: SPI STATUS REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

	SRMT	SPIROV	SPIRBE	—	SPITBE	—	SPITBF	SPIRBF

Legend:	C = Clearable bit	HS = Hardware Set	
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-29 **Unimplemented:** Read as '0'

bit 28-24 **RXBUFELM<4:0>:** Receive Buffer Element Count bits (valid only when ENHBUF = 1)

bit 23-21 **Unimplemented:** Read as '0'

bit 20-16 **TXBUFELM<4:0>:** Transmit Buffer Element Count bits (valid only when ENHBUF = 1)

bit 15-13 **Unimplemented:** Read as '0'

bit 12 **FRMERR:** SPI Frame Error status bit

1 = Frame error detected
0 = No Frame error detected
This bit is only valid when FRMEN = 1.

bit 11 **SPIBUSY:** SPI Activity Status bit

1 = SPI peripheral is currently busy with some transactions
0 = SPI peripheral is currently idle

bit 10-9 **Unimplemented:** Read as '0'

bit 8 **SPITUR:** Transmit Under Run bit

1 = Transmit buffer has encountered an underrun condition

0 = Transmit buffer has no underrun condition

This bit is only valid in Framed Sync mode; the underrun condition must be cleared by disabling/re-enabling the module.

bit 7 **SRMT:** Shift Register Empty bit (valid only when ENHBUF = 1)

1 = When SPI module shift register is empty

0 = When SPI module shift register is not empty

bit 6 **SPIROV:** Receive Overflow Flag bit

1 = A new data is completely received and discarded. The user software has not read the previous data in the SPIxBUF register.
0 = No overflow has occurred

This bit is set in hardware; can only be cleared (= 0) in software.

bit 5 **SPIRBE:** RX FIFO Empty bit (valid only when ENHBUF = 1)

1 = RX FIFO is empty (CRPTR = SWPTR)
0 = RX FIFO is not empty (CRPTR ≠ SWPTR)

bit 4 **Unimplemented:** Read as '0'

REGISTER 21-3: SPIxSTAT: SPI STATUS REGISTER

bit 3 **SPITBE:** SPI Transmit Buffer Empty Status bit

1 = Transmit buffer, SPIxTXB is empty
0 = Transmit buffer, SPIxTXB is not empty

Automatically set in hardware when SPI transfers data from SPIxTXB to SPIxSR.

Automatically cleared in hardware when SPIxBUF is written to, loading SPIxTXB.

bit 2 **Unimplemented:** Read as '0'

bit 1 **SPITBF:** SPI Transmit Buffer Full Status bit

1 = Transmit not yet started, SPITXB is full
0 = Transmit buffer is not full

Standard Buffer Mode:

Automatically set in hardware when the core writes to the SPIBUF location, loading SPITXB.
Automatically cleared in hardware when the SPI module transfers data from SPITXB to SPISR.

Enhanced Buffer Mode:

Set when CWPTR + 1 = SRPTR; cleared otherwise

bit 0 **SPIRBF:** SPI Receive Buffer Full Status bit

1 = Receive buffer, SPIxRXB is full
0 = Receive buffer, SPIxRXB is not full

Standard Buffer Mode:

Automatically set in hardware when the SPI module transfers data from SPIxSR to SPIxRXB.
Automatically cleared in hardware when SPIxBUF is read from, reading SPIxRXB.

Enhanced Buffer Mode:

Set when SWPTR + 1 = CRPTR; cleared otherwise

NOTES:

22.0 SERIAL QUAD INTERFACE (SQI)

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 46. "Serial Quad Interface (SQI)"** (DS60001244), which is available from the *Documentation* > *Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

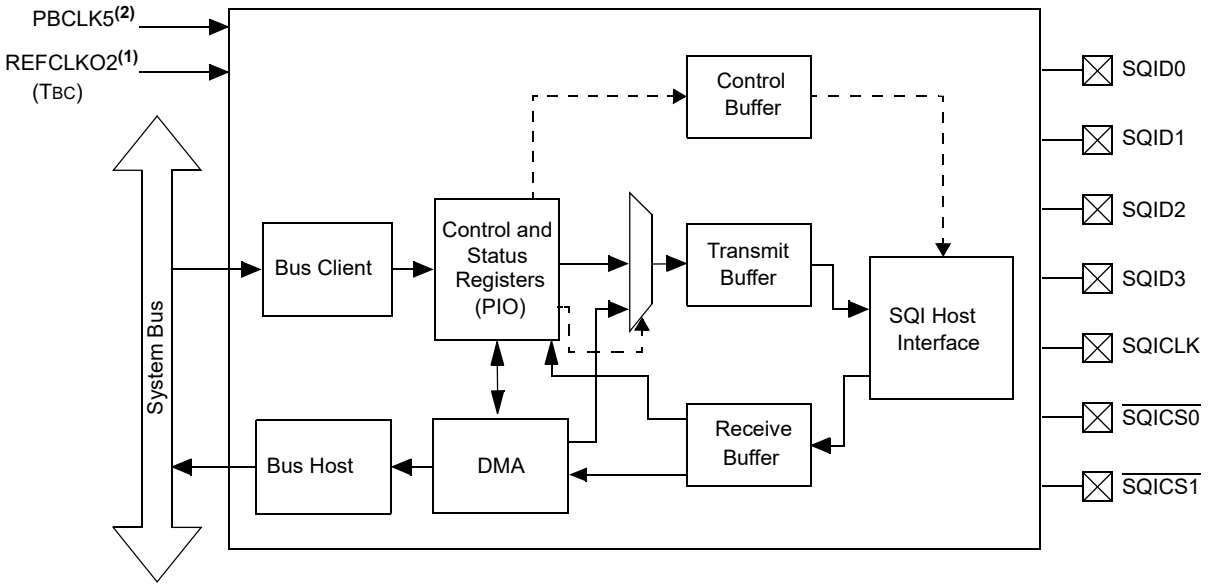
The SQI module is a synchronous serial interface that provides access to serial Flash memories and other serial devices. The SQI module supports Single Lane (identical to SPI), Dual Lane, and Quad Lane modes.

The following are some of the key features of the SQI module:

- Supports Single, Dual, and Quad Lane modes
- Supports Single Data Rate (SDR) and Double Data Rate (DDR) modes
- Programmable command sequence
- eXecute-In-Place (XIP)
- Data transfer:
  - Programmed I/O mode (PIO)
  - Buffer descriptor DMA
- Supports SPI Mode 0 and Mode 3
- Programmable Clock Polarity (CPOL) and Clock Phase (CPHA) bits
- Supports up to two Chip Selects
- Supports up to four bytes of Flash address
- Programmable interrupt thresholds
- 32-byte transmit data buffer
- 32-byte receive data buffer
- 4-word controller buffer

Note: Once the SQI module is configured, external devices are memory mapped into KSEG2 (see Figure 4-1 through Figure 4-2 in **Section 4.0 "Memory Organization"** for more information). The MMU must be enabled and the TLB must be set up to access this memory (see **Section 50. "CPU for Devices with MIPS32® microAptiv™ and M-Class Cores"** (DS60001192) in the *"PIC32 Family Reference Manual"* for more information).

FIGURE 22-1: SQI MODULE BLOCK DIAGRAM



Note 1: When configuring the REFCLKO2 clock source, a value of '0' for the ROTRIM<8:0> bits must be selected. REFCLKO2 must be turned on before SQI Special Function Registers (SFR) access.

2: This clock source is only used for SQI Special Function Register (SFR) access.

22.1 SQI Control Registers

bit 17-10 **READOPCODE<7:0>:** Op code Value for Read Operation bits

These bits contain the 8-bit op code value for read operation.

bit 9-8 **TYPEDATA<1:0>:** SQI Type Data Enable bits

The boot controller will receive the data in Single Lane, Dual Lane, or Quad Lane.
11 = Reserved
10 = Quad Lane mode data is enabled
01 = Dual Lane mode data is enabled
00 = Single Lane mode data is enabled

bit 7-6 **TYPEDUMMY<1:0>:** SQI Type Dummy Enable bits

The boot controller will send the dummy in Single Lane, Dual Lane, or Quad Lane.
11 = Reserved
10 = Quad Lane mode dummy is enabled
01 = Dual Lane mode dummy is enabled
00 = Single Lane mode dummy is enabled

bit 5-4 **TYPEMODE<1:0>:** SQI Type Mode Enable bits

The boot controller will send the mode in Single Lane, Dual Lane, or Quad Lane.
11 = Reserved
10 = Quad Lane mode is enabled
01 = Dual Lane mode is enabled
00 = Single Lane mode is enabled

bit 3-2 **TYPEADDR<1:0>:** SQI Type Address Enable bits

The boot controller will send the address in Single Lane, Dual Lane, or Quad Lane.
11 = Reserved
10 = Quad Lane mode address is enabled
01 = Dual Lane mode address is enabled
00 = Single Lane mode address is enabled

bit 1-0 **TYPECMD<1:0>:** SQI Type Command Enable bits

The boot controller will send the command in Single Lane, Dual Lane, or Quad Lane.
11 = Reserved
10 = Quad Lane mode command is enabled
01 = Dual Lane mode command is enabled
00 = Single Lane mode command is enabled

Note 1: When DDRCMD is set to '0', the SQI module will ignore the value in the SDRCMD bit.

	TXRXCOUNT<7:0>							

Legend:	r = Reserved		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-26 **Unimplemented:** Read as '0'

bit 25 **Reserved:** Must be programmed as '0'

bit 24 **SCHECK:** Flash Status Check bit(1)
- 1 = Check the status of the Flash
- 0 = Do not check the status of the Flash

bit 23 **DDRMODE:** Double Data Rate Mode bit
- 1 = Set the SQI transfers to DDR mode
- 0 = Set the SQI transfers to SDR mode

bit 22 **DASSERT:** Chip Select Assert bit
- 1 = Chip Select is deasserted after transmission or reception of the specified number of bytes
- 0 = Chip Select is not deasserted after transmission or reception of the specified number of bytes

bit 21-20 **DEVSEL<1:0>:** SQI Device Select bits
- 11 = Reserved
- 10 = Reserved
- 01 = Select Device 1
- 00 = Select Device 0

bit 19-18 **LANEMODE<1:0>:** SQI Lane Mode Select bits
- 11 = Reserved
- 10 = Quad Lane mode
- 01 = Dual Lane mode
- 00 = Single Lane mode

bit 17-16 **CMDINIT<1:0>:** Command Initiation Mode Select bits

If it is Transmit, commands are initiated based on a write to the transmit register or the contents of TX buffer. If CMDINIT is Receive, commands are initiated based on reads to the read register or RX buffer availability.
- 11 = Reserved
- 10 = Receive
- 01 = Transmit
- 00 = Idle

bit 15-0 **TXRXCOUNT<15:0>:** Transmit/Receive Count bits

These bits specify the total number of bytes to transmit or received (based on CMDINIT).

Note 1: When this bit is set to '1', the SQI module uses the SQI1MEMSTAT register to control the status check command process.

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-19 **Unimplemented:** Read as '0'

bit 18-8 **CLKDIV<10:0>:** SQI Clock TSQI Frequency Select bit(1)

10000000000 = Base clock TBC is divided by 2048
01000000000 = Base clock TBC is divided by 1024
00100000000 = Base clock TBC is divided by 512
00010000000 = Base clock TBC is divided by 256
00001000000 = Base clock TBC is divided by 128
00000100000 = Base clock TBC is divided by 64
00000010000 = Base clock TBC is divided by 32
00000001000 = Base clock TBC is divided by 16
00000000100 = Base clock TBC is divided by 8
00000000010 = Base clock TBC is divided by 4
00000000001 = Base clock TBC is divided by 2
00000000000 = Base clock TBC

Setting these bits to '00000000' specifies the highest frequency of the SQI clock.

bit 7-2 **Unimplemented:** Read as '0'

bit 1 **STABLE:** TSQI Clock Stable Select bit

This bit is set to '1' when the SQI clock, TSQI, is stable after writing a '1' to the EN bit.
1 = TSQI clock is stable
0 = TSQI clock is not stable

bit 0 **EN:** TSQI Clock Enable Select bit

When clock oscillation is stable, the SQI module will set the STABLE bit to '1'.
1 = Enable the SQI clock (TSQI) (when clock oscillation is stable, the SQI module sets the STABLE bit to '1')
0 = Disable the SQI clock (TSQI) (the SQI module should stop its clock to enter a low power state); SFRs can still be accessed, as they use PBCLK5

Note 1: Refer to Table 44-41 in **44.0 "Electrical Characteristics"** for the maximum clock frequency specifications.

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-14 **Unimplemented:** Read as '0'

bit 13-8 **TXCMDTHR<5:0>:** Transmit Command Threshold bits

In transmit initiation mode, the SQI module performs a transmit operation when transmit command threshold bytes are present in the TX buffer. These bits should usually be set to '1' for normal Flash commands, and set to a higher value for page programming. For 16-bit mode, the value should be a multiple of 2.

bit 7-6 **Unimplemented:** Read as '0'

bit 5-0 **RXCMDTHR<5:0>:** Receive Command Threshold bits(1)

In receive initiation mode, the SQI module attempts to perform receive operations to fetch the receive command threshold number of bytes in the receive buffer. If space for these bytes is not present in the buffer, the SQI will not initiate a transfer. For 16-bit mode, the value should be a multiple of 2.

If software performs any reads, thereby reducing the buffer count, hardware would initiate a receive transfer to make the buffer count equal to the value in these bits. If software would not like any more words latched into the buffer, command initiation mode needs to be changed to Idle before any buffer reads by software.

In the case of Boot/XIP mode, the SQI module will use the System Bus burst size, instead of the receive command threshold value.

Note 1: These bits should only be programmed when a receive is not active (i.e., during Idle mode or a transmit).

	BDCON<7:0>							

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-22 **Unimplemented:** Read as '0'

bit 21-18 **BDSTATE<3:0>:** DMA Buffer Descriptor Processor State Status bits
These bits return the current state of the buffer descriptor processor:
5 = Fetched buffer descriptor is disabled
4 = Descriptor is done
3 = Data phase
2 = Buffer descriptor is loading
1 = Descriptor fetch request is pending
0 = Idle

bit 17 **DMASTART:** DMA Buffer Descriptor Processor Start Status bit
1 = DMA has started
0 = DMA has not started

bit 16 **DMAACTV:** DMA Buffer Descriptor Processor Active Status bit
1 = Buffer Descriptor Processor is active
0 = Buffer Descriptor Processor is idle

bit 15-0 **BDCON<15:0>:** DMA Buffer Descriptor Control Word bits
These bits contain the current buffer descriptor control word.

REGISTER 22-18: SQI1BDPOLLCON: SQI BUFFER DESCRIPTOR POLL CONTROL REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-21 **Unimplemented:** Read as '0'

bit 20 **STATPOS:** Status Bit Position in Flash bit

Indicates the BUSY bit position in the Flash Status register. This bit is added to support all Flash types (with BUSY bit at 0 and at 7).

1 = BUSY bit position is bit 7 in status register

0 = BUSY bit position is bit 0 in status register

bit 19-18 **STATTYPE<1:0>:** Status Command Lane Mode bits

11 = Reserved

10 = Status command and read are executed in Quad Lane mode

01 = Status command and read are executed in Dual Lane mode

00 = Status command and read are executed in Single Lane mode

bit 17-16 **STATBYTES<1:0>:** Number of Status Bytes bits

11 = Reserved

10 = Status command is 2 bytes long

01 = Status command is 1 byte long

00 = Reserved

bit 15-0 **STATCMD<15:0>:** Status Command bits

The status check command is written into these bits

23.0 INTER-INTEGRATED CIRCUIT (I^2C)

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 24. "Inter-Integrated Circuit (I^2C)"** (DS60001116), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The I^2C module provides complete hardware support for both Client and Multi-Host modes of the I^2C serial communication standard.

Each I^2C module has a 2-pin interface:

- SCLx pin is clock
- SDAx pin is data

Each I^2C module offers the following key features:

- I^2C interface supporting both host and client operation
- I^2C Client mode supports 7-bit and 10-bit addressing
- I^2C Host mode supports 7-bit and 10-bit addressing
- I^2C port allows bidirectional transfers between host and clients
- Serial clock synchronization for the I^2C port can be used as a handshake mechanism to suspend and resume serial transfer (SCLREL control)
- I^2C supports multi-host operation; detects bus collision and arbitrates accordingly
- Provides support for address bit masking
- SMBus support

Figure 23-1 illustrates the I^2C module block diagram.

	ON	—	SIDL	SCLREL	STRICT	A10M	DISSLW	SMEN
7:0	R/W-0	R/W-0	R/W-0	R/W-0, HC	R/W-0, HC	R/W-0, HC	R/W-0, HC	R/W-0, HC
	GCEN	STREN	ACKDT	ACKEN	RCEN	PEN	RSEN	SEN

Legend:	HC = Cleared in Hardware		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-23 **Unimplemented:** Read as '0'

bit 22 **PCIE:** Stop Condition Interrupt Enable bit (I²C Client mode only)
- 1 = Enable interrupt on detection of Stop condition
- 0 = Stop detection interrupts are disabled

bit 21 **SCIE:** Start Condition Interrupt Enable bit (I²C Client mode only)
- 1 = Enable interrupt on detection of Start or Restart conditions
- 0 = Start detection interrupts are disabled

bit 20 **BOEN:** Buffer Overwrite Enable bit (I²C Client mode only)
- 1 = I2CxRCV is updated and $\overline{ACK}$ is generated for a received address/data byte, ignoring the state of the I2COV bit (I2CxSTAT<6>)only if the RBF bit (I2CxSTAT<2>) = 0
- 0 = I2CxRCV is only updated when the I2COV bit (I2CxSTAT<6>) is clear

bit 19 **SDAHT:** SDA Hold Time Selection bit
- 1 = Minimum of 300 ns hold time on SDA after the falling edge of SCL
- 0 = Minimum of 100 ns hold time on SDA after the falling edge of SCL

bit 18 **SBCDE:** Client Mode Bus Collision Detect Enable bit (I²C Client mode only)
- 1 = Enable client bus collision interrupts
- 0 = Client bus collision interrupts are disabled

bit 17 **AHEN:** Address Hold Enable bit (Client mode only)
- 1 = Following the 8th falling edge of SCL for a matching received address byte; SCLREL bit will be cleared and the SCL will be held low.
- 0 = Address holding is disabled

bit 16 **DHEN:** Data Hold Enable bit (I²C Client mode only)
- 1 = Following the 8th falling edge of SCL for a received data byte; client hardware clears the SCLREL bit and SCL is held low
- 0 = Data holding is disabled

bit 15 **ON:** I²C Enable bit
- 1 = Enables the I²C module and configures the SDA and SCL pins as serial port pins
- 0 = Disables the I²C module; all I²C pins are controlled by PORT functions

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit
- 1 = Discontinue module operation when device enters Idle mode
- 0 = Continue module operation in Idle mode

REGISTER 23-1: I2CxCON: I²C CONTROL REGISTER (CONTINUED)

bit 12 **SCLREL:** SCLx Release Control bit (when operating as I²C client)
1 = Release SCLx clock
0 = Hold SCLx clock low (clock stretch)
If STREN = 1:
Bit is R/W (i.e., software can write '0' to initiate stretch and write '1' to release clock). Hardware clear at beginning of client transmission. Hardware clear at end of client reception.
If STREN = 0:
Bit is R/S (i.e., software can only write '1' to release clock). Hardware clear at beginning of client transmission.

bit 11 **STRICT:** Strict I²C Reserved Address Rule Enable bit
1 = Strict reserved addressing is enforced. Device does not respond to reserved address space or generate addresses in reserved address space.
0 = Strict I²C Reserved Address Rule not enabled

bit 10 **A10M:** 10-bit Client Address bit
1 = I2CxADD is a 10-bit client address
0 = I2CxADD is a 7-bit client address

bit 9 **DISSLW:** Disable Slew Rate Control bit
1 = Slew rate control disabled
0 = Slew rate control enabled

bit 8 **SMEN:** SMBus Input Levels bit
1 = Enable I/O pin thresholds compliant with SMBus specification
0 = Disable SMBus input thresholds

bit 7 **GCEN:** General Call Enable bit (when operating as I²C client)
1 = Enable interrupt when a general call address is received in the I2CxRSR (module is enabled for reception)
0 = General call address disabled

bit 6 **STREN:** SCLx Clock Stretch Enable bit (when operating as I²C client)
Used in conjunction with the SCLREL bit.
1 = Enable software or receive clock stretching
0 = Disable software or receive clock stretching

bit 5 **ACKDT:** Acknowledge Data bit (when operating as I²C host, applicable during host receive)
Value that is transmitted when the software initiates an Acknowledge sequence.
1 = Send NACK during Acknowledge
0 = Send ACK during Acknowledge

bit 4 **ACKEN:** Acknowledge Sequence Enable bit
(when operating as I²C host, applicable during host receive)
1 = Initiate Acknowledge sequence on SDAx and SCLx pins and transmit ACKDT data bit. Hardware clear at end of host Acknowledge sequence.
0 = Acknowledge sequence not in progress

bit 3 **RCEN:** Receive Enable bit (when operating as I²C host)
1 = Enables Receive mode for I²C. Hardware clear at end of eighth bit of host receive data byte.
0 = Receive sequence not in progress

bit 2 **PEN:** Stop Condition Enable bit (when operating as I²C host)
1 = Initiate Stop condition on SDAx and SCLx pins. Hardware clear at end of host Stop sequence.
0 = Stop condition not in progress

bit 1 **RSEN:** Repeated Start Condition Enable bit (when operating as I²C host)
1 = Initiate Repeated Start condition on SDAx and SCLx pins. Hardware clear at end of host Repeated Start sequence.
0 = Repeated Start condition not in progress

bit 0 **SEN:** Start Condition Enable bit (when operating as I²C host)
1 = Initiate Start condition on SDAx and SCLx pins. Hardware clear at end of host Start sequence.
0 = Start condition not in progress

REGISTER 23-2: I2CxSTAT: I²C STATUS REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

	IWCOL	I2COV	D_A	P	S	R_W	RBF	TBF

Legend:	HS = Hardware Set	HC = Hardware Cleared	SC = Software Cleared
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	C = Clearable bit

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ACKSTAT:** Acknowledge Status bit
(when operating as I²C host, applicable to host transmit operation)
1 = NACK received from client
0 = ACK received from client
Hardware set or clear at end of client Acknowledge.

bit 14 **TRSTAT:** Transmit Status bit (when operating as I²C host, applicable to host transmit operation)
1 = Host transmit is in progress (8 bits + ACK)
0 = Host transmit is not in progress
Hardware set at beginning of host transmission. Hardware clear at end of client Acknowledge.

bit 13 **ACKTIM:** Acknowledge Time Status bit (Valid in I²C Client mode only)
1 = I²C bus is in an Acknowledge sequence, set on 8th falling edge of SCL clock
0 = Not an Acknowledge sequence, cleared on 9th rising edge of SCL clock

bit 12-11 **Unimplemented:** Read as '0'

bit 10 **BCL:** Host Bus Collision Detect bit
1 = A bus collision has been detected during a host operation
0 = No collision
Hardware set at detection of bus collision.

bit 9 **GCSTAT:** General Call Status bit
1 = General call address was received
0 = General call address was not received
Hardware set when address matches general call address. Hardware clear at Stop detection.

bit 8 **ADD10:** 10-bit Address Status bit
1 = 10-bit address was matched
0 = 10-bit address was not matched
Hardware set at match of 2nd byte of matched 10-bit address. Hardware clear at Stop detection.

bit 7 **IWCOL:** Write Collision Detect bit
1 = An attempt to write the I2CxTRN register failed because the I²C module is busy
0 = No collision
Hardware set at occurrence of write to I2CxTRN while busy (cleared by software).

bit 6 **I2COV:** Receive Overflow Flag bit
1 = A byte was received while the I2CxRCV register is still holding the previous byte
0 = No overflow
Hardware set at attempt to transfer I2CxRSR to I2CxRCV (cleared by software).

REGISTER 23-2: I2CxSTAT: I^{2}C STATUS REGISTER (CONTINUED)

bit 5 **D_A:** Data/Address bit (when operating as I^{2}C client)
1 = Indicates that the last byte received was data
0 = Indicates that the last byte received was device address
Hardware clear at device address match. Hardware set by reception of client byte.

bit 4 **P:** Stop bit
1 = Indicates that a Stop bit has been detected last
0 = Stop bit was not detected last
Hardware set or clear when Start, Repeated Start or Stop detected.

bit 3 **S:** Start bit
1 = Indicates that a Start (or Repeated Start) bit has been detected last
0 = Start bit was not detected last
Hardware set or clear when Start, Repeated Start or Stop detected.

bit 2 **R_W:** Read/Write Information bit (when operating as I^{2}C client)
1 = Read – indicates data transfer is output from client
0 = Write – indicates data transfer is input to client
Hardware set or clear after reception of I^{2}C device address byte.

bit 1 **RBF:** Receive Buffer Full Status bit
1 = Receive complete, I2CxRCV is full
0 = Receive not complete, I2CxRCV is empty
Hardware set when I2CxRCV is written with received byte. Hardware clear when software reads I2CxRCV.

bit 0 **TBF:** Transmit Buffer Full Status bit
1 = Transmit in progress, I2CxTRN is full
0 = Transmit complete, I2CxTRN is empty
Hardware set when software writes I2CxTRN. Hardware clear at completion of data transmission.

24.0 UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER (UART)

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 21. "Universal Asynchronous Receiver Transmitter (UART)"** (DS60001107), which is available from the *Documentation* > *Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The UART module is one of the serial I/O modules available in PIC32MZ DA family devices. The UART is a full-duplex, asynchronous communication channel that communicates with peripheral devices and personal computers through protocols, such as RS-232, RS-485, LIN, and IrDA®. The module also supports the hardware flow control option, with UxCTS and UxRTS pins, and also includes an IrDA encoder and decoder.

The primary features of the UART module are:

- Full-duplex, 8-bit or 9-bit data transmission
- Even, Odd or No Parity options (for 8-bit data)
- One or two Stop bits
- Hardware auto-baud feature
- Hardware flow control option
- Fully integrated Baud Rate Generator (BRG) with 16-bit prescaler
- Baud rates ranging from 76 bps to 25 Mbps at 100 MHz (PBCLK2)
- 8-level deep First-In-First-Out (FIFO) transmit data buffer
- 8-level deep FIFO receive data buffer
- Parity, framing and buffer overrun error detection
- Support for interrupt-only on address detect (9th bit = 1)
- Separate transmit and receive interrupts
- Loopback mode for diagnostic support
- LIN Protocol support
- IrDA encoder and decoder with 16x baud clock output for external IrDA encoder/decoder support
- Auto-baud support
- Ability to receive data during Sleep mode

Figure 24-1 illustrates a simplified block diagram of the UART module.

REGISTER 24-1: UxMODE: UARTx MODE REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31:24	U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
	—	—	—	—	—	—	—	—
23:16	R/W-0	R-0, HS, HC	U-0	U-0	U-0	R/W-0	R/W-0	R/W-0
	SLPEN	ACTIVE	—	—	—	CLKSEL<1:0>		RUNOVF
15:8	R/W-0	U-0	R/W-0	R/W-0	R/W-0	U-0	R/W-0	R/W-0
	ON	—	SIDL	IREN	RTSMD	—	UEN<1:0>(1)	
7:0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	WAKE	LPBACK	ABAUD	RXINV	BRGH	PDSEL<1:0>		STSEL

Legend:	HS = Hardware set	HC = Hardware cleared	
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-24 **Unimplemented:** Read as '0'

bit 23 **SLPEN:** Run During Sleep Enable bit
- 1 = UARTx BRG clock runs during Sleep mode
- 0 = UARTx BRG clock is turned off during Sleep mode

Note: SLPEN = 1 only applies if CLKSEL = FRC. All clocks, as well as the UART, are disabled in Deep Sleep mode.

bit 22 **ACTIVE:** UARTx Module Running Status bit
- 1 = UARTx module is active (UxMODE register should not be updated)
- 0 = UARTx module is not active (UxMODE register can be updated)

bit 21-19 **Unimplemented:** Read as '0'

bit 18-17 **CLKSEL<1:0>:** UARTx Module Clock Selection bits
- 11 = BRG clock is PBCLK2
- 10 = BRG clock is FRC
- 01 = BRG clock is SYSCLK (turned off in Sleep mode)
- 00 = BRG clock is PBCLK2 (turned off in Sleep mode)

bit 16 **RUNOVF:** Run During Overflow Condition Mode bit
- 1 = When an Overflow Error (OERR) condition is detected, the shift register continues to run to remain synchronized
- 0 = When an Overflow Error (OERR) condition is detected, the shift register stops accepting new data (Legacy mode)

bit 15 **ON:** UARTx Enable bit
- 1 = UARTx module is enabled. UARTx pins are controlled by UARTx as defined by UEN<1:0> and UTXEN control bits
- 0 = UARTx module is disabled. All UARTx pins are controlled by corresponding bits in the PORTx, TRISx, and LATx registers; UARTx power consumption is minimal

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit
- 1 = Discontinue operation when device enters Idle mode
- 0 = Continue operation in Idle mode

Note 1: These bits are present for legacy compatibility, and are superseded by PPS functionality on these devices (see **Section 12.4 "Peripheral Pin Select (PPS)"** for more information).

REGISTER 24-1: UxMODE: UARTx MODE REGISTER (CONTINUED)

bit 12 **IREN:** IrDA® Encoder and Decoder Enable bit
1 = IrDA is enabled
0 = IrDA is disabled

bit 11 **RTSMD:** Mode Selection for $\overline{\text{UxRTS}}$ Pin bit
1 = $\overline{\text{UxRTS}}$ pin is in Simplex mode
0 = $\overline{\text{UxRTS}}$ pin is in Flow Control mode

bit 10 **Unimplemented:** Read as '0'

bit 9-8 **UEN<1:0>:** UARTx Module Enable bits(1)
11 = UxTX, UxRX and UxBCLK pins are enabled and used; $\overline{\text{UxCTS}}$ pin is controlled by corresponding bits in the PORTx register
10 = UxTX, UxRX, $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ pins are enabled and used
01 = UxTX, UxRX and $\overline{\text{UxRTS}}$ pins are enabled and used; $\overline{\text{UxCTS}}$ pin is controlled by corresponding bits in the PORTx register
00 = UxTX and UxRX pins are enabled and used; $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$/UxBCLK pins are controlled by corresponding bits in the PORTx register

bit 7 **WAKE:** Enable Wake-up on Start bit Detect During Sleep Mode bit
1 = Wake-up enabled
0 = Wake-up disabled

bit 6 **LPBACK:** UARTx Loopback Mode Select bit
1 = Loopback mode is enabled
0 = Loopback mode is disabled

bit 5 **ABAUD:** Auto-Baud Enable bit
1 = Enable baud rate measurement on the next character – requires reception of Sync character (0x55); cleared by hardware upon completion
0 = Baud rate measurement disabled or completed

bit 4 **RXINV:** Receive Polarity Inversion bit
1 = UxRX Idle state is '0'
0 = UxRX Idle state is '1'

bit 3 **BRGH:** High Baud Rate Enable bit
1 = High-Speed mode – 4x baud clock enabled
0 = Standard Speed mode – 16x baud clock enabled

bit 2-1 **PDSEL<1:0>:** Parity and Data Selection bits
11 = 9-bit data, no parity
10 = 8-bit data, odd parity
01 = 8-bit data, even parity
00 = 8-bit data, no parity

bit 0 **STSEL:** Stop Selection bit
1 = 2 Stop bits
0 = 1 Stop bit

Note 1: These bits are present for legacy compatibility, and are superseded by PPS functionality on these devices (see **Section 12.4 "Peripheral Pin Select (PPS)"** for more information).

REGISTER 24-2: UxSTA: UARTx STATUS AND CONTROL REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31:24	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	MASK<7:0>							
23:16	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	ADDR<7:0>							
15:8	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R-0	R-1
	UTXISEL<1:0>		UTXINV	URXEN	UTXBRK	UTXEN	UTXBF	TRMT
7:0	R/W-0	R/W-0	R/W-0	R-1	R-0	R-0	R/W-0	R-0
	URXISEL<1:0>		ADDEN	RIDLE	PERR	FERR	OERR	URXDA

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-25 **MASK<7:0>:** UARTx Address Match Mask bits

These bits are used to mask the ADDR<7:0> bits.

11111111 = Corresponding ADDRx bits are used to detect the address match

Note: This setting allows the user to assign individual address as well as a group broadcast address to a UART.

00000000 = Corresponding ADDRx bits are not used to detect the address match.

bit 23-16 **ADDR<7:0>:** Automatic Address Mask bits

When the ADDEN bit is '1', this value defines the address character to use for automatic address detection.

bit 15-14 **UTXISEL<1:0>:** TX Interrupt Mode Selection bits

11 = Reserved, do not use

10 = Interrupt is generated and asserted while the transmit buffer is empty

01 = Interrupt is generated and asserted when all characters have been transmitted

00 = Interrupt is generated and asserted while the transmit buffer contains at least one empty space

bit 13 **UTXINV:** Transmit Polarity Inversion bit

If IrDA mode is disabled (i.e., IREN (UxMODE<12>) is '0'):

1 = UxTX Idle state is '0'

0 = UxTX Idle state is '1'

If IrDA mode is enabled (i.e., IREN (UxMODE<12>) is '1'):

1 = IrDA encoded UxTX Idle state is '1'

0 = IrDA encoded UxTX Idle state is '0'

bit 12 **URXEN:** Receiver Enable bit

1 = UARTx receiver is enabled. UxRX pin is controlled by UARTx (if ON = 1)

0 = UARTx receiver is disabled. UxRX pin is ignored by the UARTx module

Note: The event of disabling an enabled receiver will release the RX pin to the PORT function; however, the receive buffers *will not* be reset. Disabling the receiver has no effect on the receive status flags.

bit 11 **UTXBRK:** Transmit Break bit

1 = Send Break on next transmission. Start bit followed by twelve '0' bits, followed by Stop bit; cleared by hardware upon completion

0 = Break transmission is disabled or completed

REGISTER 24-2: UxSTA: UARTx STATUS AND CONTROL REGISTER (CONTINUED)

bit 10 **UTXEN:** Transmit Enable bit
1 = UARTx transmitter is enabled. UxTX pin is controlled by UARTx (if ON = 1)
0 = UARTx transmitter is disabled. Any pending transmission is aborted and buffer is reset

Note: The event of disabling an enabled transmitter will release the TX pin to the PORT function and reset the transmit buffers to empty. Any pending transmission is aborted and data characters in the transmit buffers are lost. All transmit status flags are cleared and the TRMT bit is set

bit 9 **UTXBF:** Transmit Buffer Full Status bit (read-only)
1 = Transmit buffer is full
0 = Transmit buffer is not full, at least one more character can be written

bit 8 **TRMT:** Transmit Shift Register is Empty bit (read-only)
1 = Transmit shift register is empty and transmit buffer is empty (the last transmission has completed)
0 = Transmit shift register is not empty, a transmission is in progress or queued in the transmit buffer

bit 7-6 **URXISEL<1:0>:** Receive Interrupt Mode Selection bit
11 = Reserved
10 = Interrupt flag bit is asserted while receive buffer is 3/4 or more full
01 = Interrupt flag bit is asserted while receive buffer is 1/2 or more full
00 = Interrupt flag bit is asserted while receive buffer is not empty (i.e., has at least 1 data character)

bit 5 **ADDEN:** Address Character Detect bit (bit 8 of received data = 1)
1 = Address Detect mode is enabled. If 9-bit mode is not selected, this control bit has no effect
0 = Address Detect mode is disabled

bit 4 **RIDLE:** Receiver Idle bit (read-only)
1 = Receiver is Idle
0 = Data is being received

bit 3 **PERR:** Parity Error Status bit (read-only)
1 = Parity error has been detected for the current character
0 = Parity error has not been detected

bit 2 **FERR:** Framing Error Status bit (read-only)
1 = Framing error has been detected for the current character
0 = Framing error has not been detected

bit 1 **OERR:** Receive Buffer Overrun Error Status bit.
This bit is set in hardware and can only be cleared (= 0) in software. Clearing a previously set OERR bit resets the receiver buffer and RSR to empty state.
1 = Receive buffer has overflowed
0 = Receive buffer has not overflowed

bit 0 **URXDA:** Receive Buffer Data Available bit (read-only)
1 = Receive buffer has data, at least one more character can be read
0 = Receive buffer is empty

Figure 24-2 and Figure 24-3 illustrate typical receive and transmit timing for the UART module.

FIGURE 24-2: UART RECEPTION

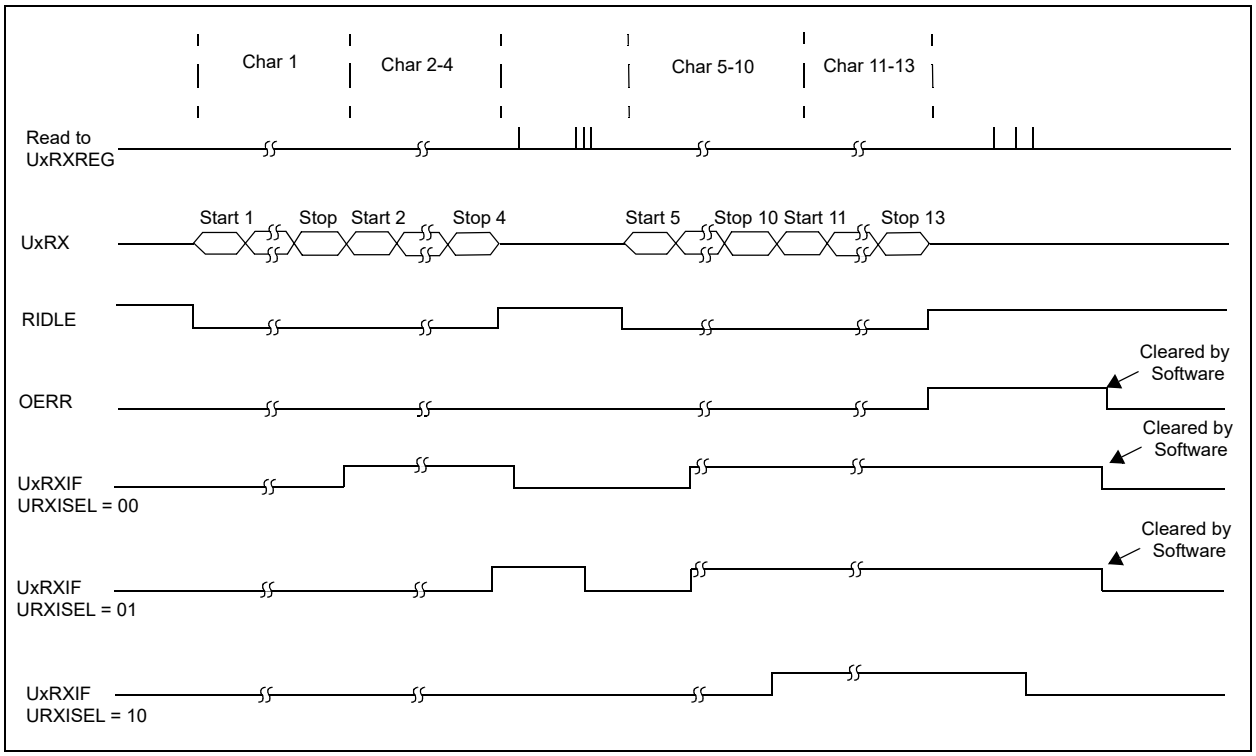

FIGURE 24-3: TRANSMISSION (8-BIT OR 9-BIT DATA)

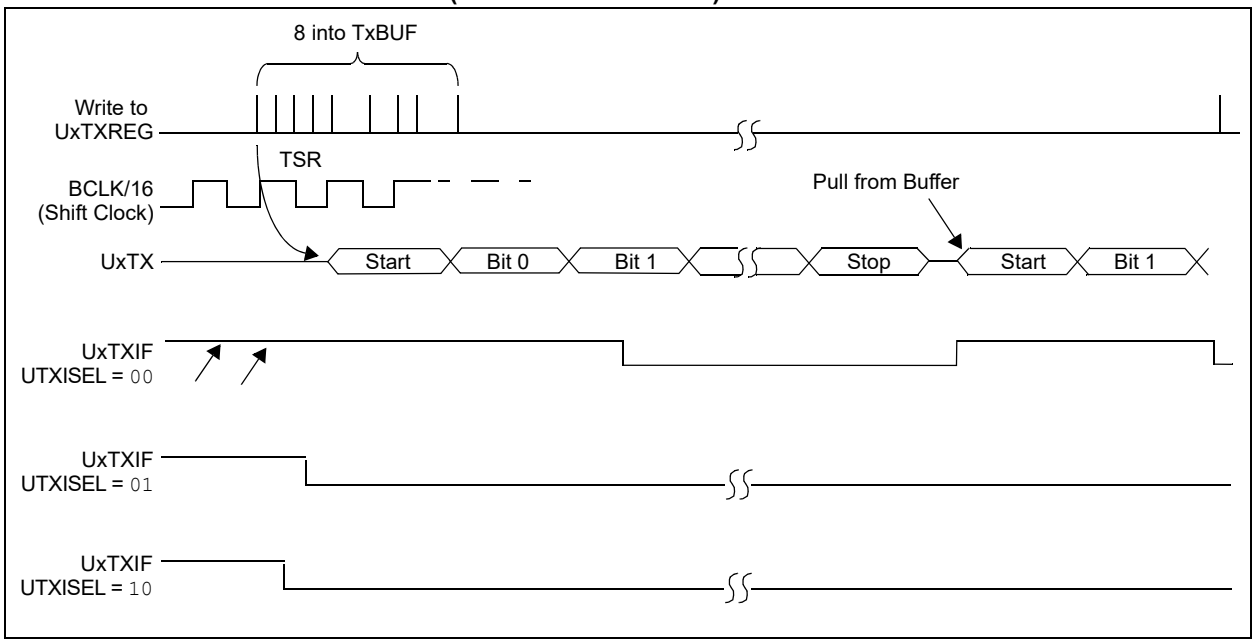

25.0 PARALLEL HOST PORT (PMP)

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 13. "Parallel Master Port (PMP)"** (DS60001128), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The PMP is a parallel 8-bit/16-bit input/output module specifically designed to communicate with a wide variety of parallel devices, such as communications peripherals, LCDs, external memory devices and microcontrollers. Because the interface to parallel peripherals varies significantly, the PMP module is highly configurable.

Key features of the PMP module include:

- 8-bit,16-bit interface
- Up to 16 programmable address lines
- Up to two Chip Select lines
- Programmable strobe options:
  - Individual read and write strobes, or
  - Read/$\overline{\text{write}}$ strobe with enable strobe
- Address auto-increment/auto-decrement
- Programmable address/data multiplexing
- Programmable polarity on control signals
- Parallel Client Port (PSP) support:
  - Legacy addressable
  - Address support
  - 4-byte deep auto-incrementing buffer
- Programmable Wait states
- Operate during Sleep and Idle modes
- Separate configurable read/write registers or dual buffers for Host mode
- Fast bit manipulation using CLR, SET, and INV registers

FIGURE 25-1: PMP MODULE PINOUT AND CONNECTIONS TO EXTERNAL DEVICES

	CSF<1:0>(2)		ALP(2)	CS2P(2)	CS1P(2)	—	WRSP	RDSP

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-24 **Unimplemented:** Read as '0'

bit 23 **RDSTART:** Start Read on PMP Bus bit

This bit is cleared by hardware at the end of the read cycle.

1 = Start a read cycle on the PMP bus
0 = No effect

bit 22-18 **Unimplemented:** Read as '0'

bit 17 **DUALBUF:** PMP Dual Read/Write Buffer Enable bit

This bit is only valid in Host mode.

1 = PMP uses separate registers for reads and writes
Reads: PMRADDR and PMRDIN
Writes: PMRWADDR and PMDOUT
0 = PMP uses legacy registers for reads and writes
Reads/Writes: PMADDR and PMRDIN

bit 16 **Unimplemented:** Read as '0'

bit 15 **ON:** PMP Enable bit(1)

1 = PMP enabled
0 = PMP disabled, no off-chip access performed

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit

1 = Discontinue module operation when device enters Idle mode
0 = Continue module operation in Idle mode

bit 12-11 **ADRMUX<1:0>:** Address/Data Multiplexing Selection bits

11 = All 16 bits of address are multiplexed on PMD<15:0>
10 = All 16 bits of address are multiplexed on PMD<7:0>
01 = Lower 8 bits of address are multiplexed on PMD<7:0> pins, upper 8 bits are on PMA<15:8>
00 = Address and data appear on separate pins

bit 10 **PMPTTL:** PMP Module TTL Input Buffer Select bit

1 = PMP module uses TTL input buffers
0 = PMP module uses Schmitt Trigger input buffer

bit 9 **PTWREN:** Write Enable Strobe Port Enable bit

1 = PMWR/PMENB port is enabled
0 = PMWR/PMENB port is disabled

Note 1: When using 1:1 PBCLK divisor, the user software should not read/write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON control bit.

2: These bits have no effect when their corresponding pins are used as address lines.

REGISTER 25-1: PMCON: PARALLEL PORT CONTROL REGISTER (CONTINUED)

bit 8 **PTRDEN:** Read/Write Strobe Port Enable bit
1 = PMRD/PMWR port is enabled
0 = PMRD/PMWR port is disabled

bit 7-6 **CSF<1:0>:** Chip Select Function bits(2)
11 = Reserved
10 = PMCS1 and PMCS2 function as Chip Select
01 = PMCS1 functions as address bit 14; PMCS2 functions as Chip Select
00 = PMCS1 and PMCS2 function as address bits 14 and 15, respectively

bit 5 **ALP:** Address Latch Polarity bit(2)
1 = Active-high (PMALL and PMALH)
0 = Active-low (PMALL and PMALH)

bit 4 **CS2P:** Chip Select 0 Polarity bit(2)
1 = Active-high (PMCS2)
0 = Active-low (PMCS2)

bit 3 **CS1P:** Chip Select 0 Polarity bit(2)
1 = Active-high (PMCS1)
0 = Active-low (PMCS1)

bit 2 **Unimplemented:** Read as '0'

bit 1 **WRSP:** Write Strobe Polarity bit
For Client Modes and Host mode 2 (MODE<1:0> = 00,01,10):
1 = Write strobe active-high (PMWR)
0 = Write strobe active-low (PMWR)
For Host mode 1 (MODE<1:0> = 11):
1 = Enable strobe active-high (PMENB)
0 = Enable strobe active-low (PMENB)

bit 0 **RDSP:** Read Strobe Polarity bit
For Client modes and Host mode 2 (MODE<1:0> = 00,01,10):
1 = Read Strobe active-high (PMRD)
0 = Read Strobe active-low (PMRD)
For Host mode 1 (MODE<1:0> = 11):
1 = Read/write strobe active-high (PMRD/PMWR)
0 = Read/write strobe active-low (PMRD/PMWR)

Note 1: When using 1:1 PBCLK divisor, the user software should not read/write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON control bit.

2: These bits have no effect when their corresponding pins are used as address lines.

REGISTER 25-2: PMMODE: PARALLEL PORT MODE REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

	BUSY	IRQM<1:0>		INCM<1:0>		MODE16	MODE<1:0>	
7:0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	WAITB<1:0>(1)		WAITM<3:0>(1)				WAITE<1:0>(1)	

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **BUSY:** Busy bit (Host mode only)
- 1 = Port is busy
- 0 = Port is not busy

bit 14-13 **IRQM<1:0>:** Interrupt Request Mode bits
- 11 = Reserved, do not use
- 10 = Interrupt generated when Read Buffer 3 is read or Write Buffer 3 is written (Buffered PSP mode), or on a read or write operation when PMA<1:0> =11 (Addressable Client mode only)
- 01 = Interrupt generated at the end of the read/write cycle
- 00 = No Interrupt generated

Note: These bits only control the generation of the PMP interrupt. The PMP Error (PMPE) is always generated.

bit 12-11 **INCM<1:0>:** Increment Mode bits
- 11 = Client mode read and write buffers auto-increment (MODE<1:0> = 00 only)
- 10 = Decrement ADDR<15:0> by 1 every read/write cycle(2)
- 01 = Increment ADDR<15:0> by 1 every read/write cycle(2)
- 00 = No increment or decrement of address

bit 10 **MODE16:** 8/16-bit Mode bit
- 1 = 16-bit mode: a read or write to the data register invokes a single 16-bit transfer
- 0 = 8-bit mode: a read or write to the data register invokes a single 8-bit transfer

bit 9-8 **MODE<1:0>:** Parallel Port Mode Select bits
- 11 = Host mode 1 (PMCSx, PMRD/PMWR, PMENB, PMA<x:0>, PMD<7:0> and PMD<8:15>(3))
- 10 = Host mode 2 (PMCSx, PMRD, PMWR, PMA<x:0>, PMD<7:0> and PMD<8:15>(3))
- 01 = Enhanced Client mode, control signals (PMRD, PMWR, PMCS, PMD<7:0> and PMA<1:0>)
- 00 = Legacy PSP, control signals (PMRD, PMWR, PMCS and PMD<7:0>)

Note 1: Whenever WAITM<3:0> = 0000, WAITB and WAITE bits are ignored and forced to 1 TPBCLK cycle for a write operation; WAITB = 1 TPBCLK cycle, WAITE = 0 TPBCLK cycles for a read operation.

2: Address bits, A15 and A14, are not subject to automatic increment/decrement if configured as Chip Select CS2 and CS1.

3: These pins are active when MODE16 = 1 (16-bit mode).

REGISTER 25-2: PMMODE: PARALLEL PORT MODE REGISTER (CONTINUED)

bit 7-6 **WAITB<1:0>:** Data Setup to Read/Write Strobe Wait States bits(1)

11 = Data wait of 4 TPB; multiplexed address phase of 4 TPB
10 = Data wait of 3 TPB; multiplexed address phase of 3 TPB
01 = Data wait of 2 TPB; multiplexed address phase of 2 TPB
00 = Data wait of 1 TPB; multiplexed address phase of 1 TPB (default)

bit 5-2 **WAITM<3:0>:** Data Read/Write Strobe Wait States bits(1)

1111 = Wait of 16 TPB
•
•
•
0001 = Wait of 2 TPB
0000 = Wait of 1 TPB (default)

bit 1-0 **WAITE<1:0>:** Data Hold After Read/Write Strobe Wait States bits(1)

11 = Wait of 4 TPB
10 = Wait of 3 TPB
01 = Wait of 2 TPB
00 = Wait of 1 TPB (default)

For Read operations:
11 = Wait of 3 TPB
10 = Wait of 2 TPB
01 = Wait of 1 TPB
00 = Wait of 0 TPB (default)

Note 1: Whenever WAITM<3:0> = 0000, WAITB and WAITE bits are ignored and forced to 1 TPBCLK cycle for a write operation; WAITB = 1 TPBCLK cycle, WAITE = 0 TPBCLK cycles for a read operation.

2: Address bits, A15 and A14, are not subject to automatic increment/decrement if configured as Chip Select CS2 and CS1.

3: These pins are active when MODE16 = 1 (16-bit mode).

bit 31-16 **Unimplemented:** Read as '0'

bit 15-0 **DATAOUT<15:0>:** Port Data Output bits

This register is used for Read operations in the Enhanced Parallel Client mode and Write operations for Dual Buffer Host mode.

In Dual Buffer Host mode, the DUALBUF bit (PMPCON<17>) = 1, a write to the MSB triggers the transaction on the PMP port. When MODE16 = 1, MSB = DATAOUT<15:8>. When MODE16 = 0, MSB = DATAOUT<7:0>.

Note: In Host mode, a read will return the last value written to the register. In Client mode, a read will return indeterminate results.

REGISTER 25-5: PMDIN: PARALLEL PORT INPUT DATA REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

bit 31-16 **Unimplemented:** Read as '0'

bit 15-0 **DATAIN<15:0>:** Port Data Input bits

This register is used for both PMP mode and Enhanced Parallel Client mode.

In Parallel Host mode, a write to the MSB triggers the write transaction on the PMP port. Similarly, a read to the MSB triggers the read transaction on the PMP port.

When MODE16 = 1, MSB = DATAIN<15:8>. When MODE16 = 0, MSB = DATAIN<7:0>.

Note: This register is not used in Dual Buffer Host mode (i.e., DUALBUF bit (PMPCON<17>) = 1).

REGISTER 25-6: PMAEN: PARALLEL PORT PIN ENABLE REGISTER

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **IBF:** Input Buffer Full Status bit
- 1 = All writable input buffer registers are full
- 0 = Some or all of the writable input buffer registers are empty

bit 14 **IBOV:** Input Buffer Overflow Status bit
- 1 = A write attempt to a full input byte buffer has occurred (must be cleared in software)
- 0 = An overflow has not occurred

Note: When this bit is set in Client mode, it will generate a PMP Error (PMPE) interrupt.

bit 13-12 **Unimplemented:** Read as '0'

bit 11-8 **IBxF:** Input Buffer 'x' Status Full bits
- 1 = Input Buffer contains data that has not been read (reading buffer will clear this bit)
- 0 = Input Buffer does not contain any unread data

bit 7 **OBE:** Output Buffer Empty Status bit
- 1 = All readable output buffer registers are empty
- 0 = Some or all of the readable output buffer registers are full

bit 6 **OBUF:** Output Buffer Underflow Status bit
- 1 = A read is occurred from an empty output byte buffer (must be cleared in software)
- 0 = No underflow is occurred

Note: When this bit is set in Client mode, it will generate a PMP Error (PMPE) interrupt.

bit 5-4 **Unimplemented:** Read as '0'

bit 3-0 **OBxE:** Output Buffer 'x' Status Empty bits
- 1 = Output buffer is empty (writing data to the buffer will clear this bit)
- 0 = Output buffer contains data that has not been transmitted

Note: This register is only used when the DUALBUF bit (PMCON<17>) is set to '1' and exclusively for reads. If the DUALBUF bit is '0', the PMDIN register (Register 25-5) is used for reads instead of PMRDIN.

26.0 EXTERNAL BUS INTERFACE (EBI)

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 47. "External Bus Interface (EBI)"**, which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

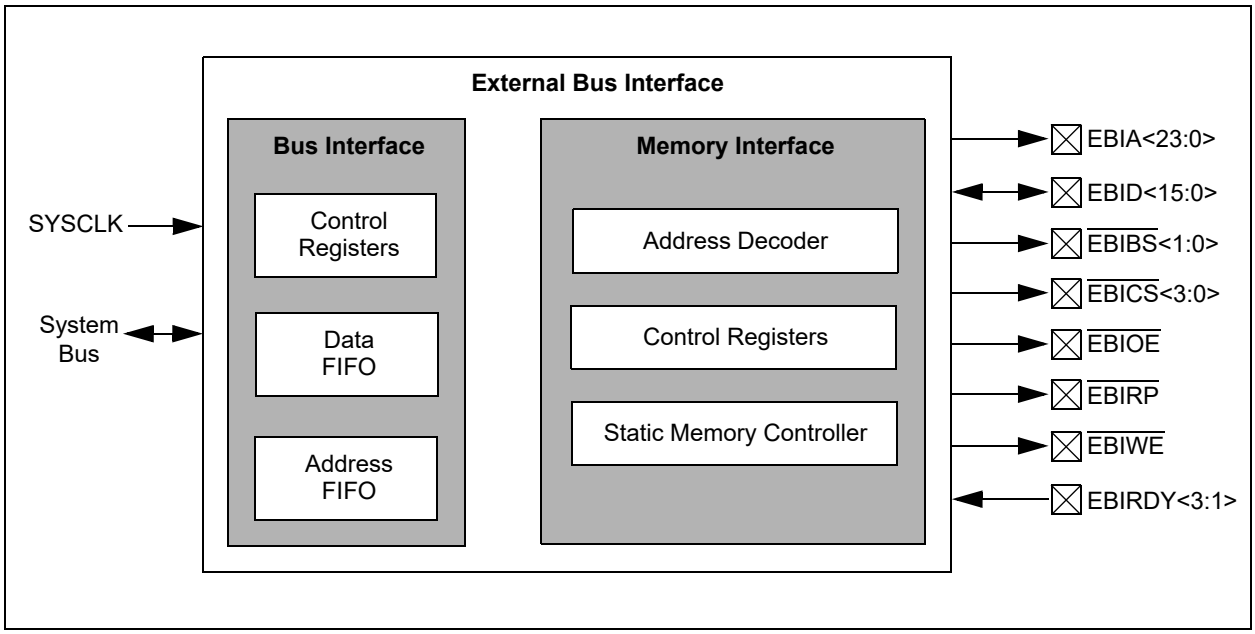
The External Bus Interface (EBI) module provides a high-speed, convenient way to interface external parallel memory devices to the PIC32MZ DA family device.

With the EBI module, it is possible to connect asynchronous SRAM and NOR Flash devices, as well as non-memory devices such as camera sensors and LCDs.

Note 1: Once the EBI module is configured, external devices will be memory mapped and can be access from KSEG2 memory space (see Figure 4-1 through Figure 4-2 in **Section 4.0 "Memory Organization"** for more information). The MMU must be enabled and the TLB must be set up to access this memory (see **Section 50. "CPU for Devices with MIPS32® microAptiv™ and M-Class Cores"** (DS60001192) in the *"PIC32 Family Reference Manual"* for more information).

2: When using the EBI module, Graphics LCD (GLCD) Controller functionality is not available, as most of the I/O between the EBI module and the GLCD is shared.

FIGURE 26-1: EBI SYSTEM BLOCK DIAGRAM



26.1 EBI Control Registers

bit 31-27 **Unimplemented:** Read as '0'

bit 26 **RDYMODE:** Data Ready Device Select bit
The device associated with register set 'x' is a data-ready device, and will use the EBIRDYx pin.
1 = EBIRDYx input is used
0 = EBIRDYx input is not used

bit 25-24 **PAGESIZE<1:0>:** Page Size for Page Mode Device bits
11 = 32-word page
10 = 16-word page
01 = 8-word page
00 = 4-word page

bit 23 **PAGEMODE:** Memory Device Page Mode Support bit
1 = Device supports Page mode
0 = Device does not support Page mode

bit 22-19 **TPRC<3:0>:** Page Mode Read Cycle Time bits(1)
Read cycle time is TPRC + 1 clock cycle.

bit 18-16 **TBTA<2:0>:** Data Bus Turnaround Time bits(1)
Clock cycles (0-7) for static memory between read-to-write, write-to-read, and read-to-read when Chip Select changes.

bit 15-10 **TWP<5:0>:** Write Pulse Width bits(1)
Write pulse width is TWP + 1 clock cycle.

bit 9-8 **TWR<1:0>:** Write Address/Data Hold Time bits(1)
Number of clock cycles to hold address or data on the bus.

bit 7-6 **TAS<1:0>:** Write Address Setup Time bits(1)
Clock cycles for address setup time. A value of '0' is only valid in the case of SSRAM.

bit 5-0 **TRC<5:0>:** Read Cycle Time bits(1)
Read cycle time is TRC + 1 clock cycle.

Note 1: Refer to **Section 47. "External Bus Interface (EBI)"** in the *"PIC32 Family Reference Manual"* for the EBI timing diagrams and additional information.

bit 6-1 **Unimplemented:** Read as '0'

bit 0 **SMRP:** Flash Reset/Power-down mode Select bit

After a Reset, the controller internally performs a power-down for Flash, and then sets this bit to '1'.
- 1 = Flash is taken out of Power-down mode
- 0 = Flash is forced into Power-down mode

NOTES:

27.0 CRYPTO ENGINE

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 49. "Crypto Engine (CE) and Random Number Generator (RNG)"** (DS60001246), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The Crypto Engine is intended to accelerate applications that need cryptographic functions. By executing these functions in the hardware module, software overhead is reduced, and actions such as encryption, decryption, and authentication can execute much more quickly.

The Crypto Engine uses an internal descriptor-based DMA for efficient programming of the security association data and packet pointers (allowing scatter/gather data fetching). An intelligent state machine schedules the crypto engines based on the protocol selection and packet boundaries. The hardware engines can perform the encryption and authentication in sequence or in parallel.

Key features of the Crypto Engine are:

- Bulk ciphers and hash engines
- Integrated DMA to off-load processing:
  - Buffer descriptor-based
  - Secure association per buffer descriptor
- Some functions can execute in parallel

Bulk ciphers that are handled by the Crypto Engine include:

- AES:
  - 128-bit, 192-bit, and 256-bit key sizes
  - CBC, ECB, CTR, CFB, and OFB modes
- DES/TDES:
  - CBC, ECB, CFB, and OFB modes

Authentication engines that are available through the Crypto Engine include:

- SHA-1
- SHA-256
- MD-5
- AES-GCM
- HMAC operation (for all authentication engines)

The rate of data that can be processed by the Crypto Engine depends on a number of factors, including:

- Which engine is in use
- Whether the engines are used in parallel or in series
- The demands on source and destination memories by other parts of the system (i.e., CPU, DMA, etc.)
- The speed of PBCLK5, which drives the Crypto Engine

Table 27-1 provides typical performance for various engines. Figure 27-1 illustrates the Crypto Engine block diagram.

TABLE 27-1: CRYPTO ENGINE PERFORMANCE

Engine/ Algorithm	Performance Factor (Mbps/MHz)	Maximum Mbps (PBCLK5 = 100 MHz)
DES	14.4	1440
TDES	6.6	660
AES-128	9.0	900
AES-192	7.9	790
AES-256	7.2	720
MD5	15.6	1560
SHA-1	13.2	1320
SHA-256	9.3	930

15-8	BD_BUFLEN<15:8>							
7-0	BD_BUFLEN<7:0>							

bit 31 **DESC_EN**: Descriptor Enable
1 = The descriptor is owned by hardware. After processing the BD, hardware resets this bit to '0'.
0 = The descriptor is owned by software

bit 30 **Unimplemented:** Must be written as '0'

bit 29-27 **CRY_MODE<2:0>:** Crypto Mode
111 = Reserved
110 = Reserved
101 = Reserved
100 = Reserved
011 = CEK operation
010 = KEK operation
001 = Preboot authentication
000 = Normal operation

bit 22 **SA_FETCH_EN:** Fetch Security Association From External Memory
1 = Fetch SA from the SA pointer. This bit needs to be set to '1' for every new packet.
0 = Use current fetched SA or the internal SA

bit 21-20 **Unimplemented:** Must be written as '0'

bit 19 **LAST_BD:** Last Buffer Descriptors
1 = Last Buffer Descriptor in the chain
0 = More Buffer Descriptors in the chain
After the last BD, the CEBDADDR goes to the base address in CEBDPADDR.

bit 18 **LIFM:** Last In Frame
In case of Receive Packets (from H/W-> Host), this field is filled by the Hardware to indicate whether the packet goes across multiple buffer descriptors. In case of transmit packets (from Host -> H/W), this field indicates whether this BD is the last in the frame.

bit 17 **PKT_INT_EN:** Packet Interrupt Enable
Generate an interrupt after processing the current buffer descriptor, if it is the end of the packet.

bit 16 **CBD_INT_EN:** CBD Interrupt Enable
Generate an interrupt after processing the current buffer descriptor.

bit 15-0 **BD_BUFLEN<15:0>:** Buffer Descriptor Length
This field contains the length of the buffer and is updated with the actual length filled by the receiver.

23-16	MSG_LENGTH<23:16>							
15-8	MSG_LENGTH<15:8>							
7-0	MSG_LENGTH<7:0>							

bit 31-0 **MSG_LENGTH:** Total Message Length

Total message length for the hash and HMAC algorithms in bytes. Total number of crypto bytes in case of GCM algorithm (LEN-C).

FIGURE 27-10: FORMAT OF BD_ENC_OFF

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31-24	ENCR_OFFSET<31:24>							
23-16	ENCR_OFFSET<23:16>							
15-8	ENCR_OFFSET<15:8>							
7-0	ENCR_OFFSET<7:0>							

bit 31-0 **ENCR_OFFSET:** Encryption Offset

Encryption offset for the multi-task test cases (both encryption and authentication). The number of AAD bytes in the case of GCM algorithm (LEN-A).

27.3 Security Association Structure

Table 27-11 shows the Security Association Structure.

The Crypto Engine uses the Security Association to determine the settings for processing a Buffer Descriptor Processor. The Security Association contains:

- Which algorithm to use
- Whether to use engines in parallel (for both authentication and encryption/decryption)
- The size of the key
- Authentication key
- Encryption/decryption key
- Authentication Initialization Vector (IV)
- Encryption IV

Table 27-12 shows the Security Association control word structure.

The Crypto Engine fetches different structures for different flows and ensures that hardware fetches minimum words from SA required for processing. The structure is ready for hardware optimal data fetches.

FIGURE 27-12: FORMAT OF SA_CTRL

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31-24	—	—	VERIFY	—	NO_RX	OR_EN	ICVONLY	IRFLAG

15-8	ALGO<5:0>						ENC	KEY SIZE<1>
7-0	KEY SIZE<0>	MULTITASK<2:0>			CRYPTOALGO<3:0>			

bit 31-30 **Reserved:** Do not use

bit 29 **VERIFY:** NIST Procedure Verification Setting
1 = NIST procedures are to be used
0 = Do not use NIST procedures

bit 28 **Reserved:** Do not use

bit 27 **NO_RX:** Receive DMA Control Setting
1 = Only calculate ICV for authentication calculations
0 = Normal processing

bit 26 **OR_EN:** OR Register Bits Enable Setting
1 = OR the register bits with the internal value of the CSR register
0 = Normal processing

bit 25 **ICVONLY:** Incomplete Check Value Only Flag
This affects the SHA-1 algorithm only. It has no effect on the AES algorithm.
1 = Only three words of the HMAC result are available
0 = All results from the HMAC result are available

bit 24 **IRFLAG:** Immediate Result of Hash Setting
This bit is set when the immediate result for hashing is requested.
1 = Save the immediate result for hashing
0 = Do not save the immediate result

bit 23 **LNC:** Load New Keys Setting
1 = Load a new set of keys for encryption and authentication
0 = Do not load new keys

bit 22 **LOADIV:** Load IV Setting
1 = Load the IV from this Security Association
0 = Use the next IV

bit 21 **FB:** First Block Setting
This bit indicates that this is the first block of data to feed the IV value.
1 = Indicates this is the first block of data
0 = Indicates this is not the first block of data

bit 20 **FLAGS:** Incoming/Outgoing Flow Setting
1 = Security Association is associated with an outgoing flow
0 = Security Association is associated with an incoming flow

bit 19-17 **Reserved:** Do not use

Figure 27-12: Format of SA_CTRL (Continued)

bit 16-10 **ALGO<6:0>:** Type of Algorithm to Use
1xxxxxx = HMAC 1
x1xxxxx = SHA-256
xx1xxxx = SHA1
xxx1xxx = MD5
xxxx1xx = AES
xxxxx1x = TDES
xxxxxx1 = DES

bit 9 **ENC:** Type of Encryption Setting
1 = Encryption
0 = Decryption

bit 8-7 **KEYSIZE<1:0>:** Size of Keys in SA_AUTHKEYx or SA_ENCKEYx
11 = Reserved; do not use
10 = 256 bits
01 = 192 bits
00 = 128 bits(1)

bit 6-4 **MULTITASK<2:0>:** How to Combine Parallel Operations in the Crypto Engine
111 = Parallel pass (decrypt and authenticate incoming data in parallel)
101 = Pipe pass (encrypt the incoming data, and then perform authentication on the encrypted data)
011 = Reserved
010 = Reserved
001 = Reserved
000 = Encryption or authentication or decryption (no pass)

bit 3-0 **CRYPTOALGO<3:0>:** Mode of operation for the Crypto Algorithm
1111 = Reserved
1110 = AES_GCM (for AES processing)
1101 = RCTR (for AES processing)
1100 = RCBC_MAC (for AES processing)
1011 = ROFB (for AES processing)
1010 = RCFB (for AES processing)
1001 = RCBC (for AES processing)
1000 = REBC (for AES processing)
0111 = TOFB (for Triple-DES processing)
0110 = TCFB (for Triple-DES processing)
0101 = TCBC (for Triple-DES processing)
0100 = TECB (for Triple-DES processing)
0011 = OFB (for DES processing)
0010 = CFB (for DES processing)
0001 = CBC (for DES processing)
0000 = ECB (for DES processing)

Note 1: This setting does not alter the size of SA_AUTHKEYx or SA_ENCKEYx in the Security Association, only the number of bits of SA_AUTHKEYx and SA_ENCKEYx that are used.

NOTES:

28.0 RANDOM NUMBER GENERATOR (RNG)

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 49. "Crypto Engine (CE) and Random Number Generator (RNG)"** (DS60001246), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The Random Number Generator (RNG) core implements a thermal noise-based, True Random Number Generator (TRNG) and a cryptographically secure Pseudo-Random Number Generator (PRNG).

The TRNG uses multiple ring oscillators and the inherent thermal noise of integrated circuits to generate true random numbers that can initialize the PRNG.

The PRNG is a flexible LFSR, which is capable of manifesting a maximal length LFSR of up to 64-bits.

The following are some of the key features of the Random Number Generator:

- TRNG:
  - Up to 25 Mbps of random bits
  - Multi-Ring Oscillator based design
  - Built-in Bias Corrector
- PRNG:
  - LFSR-based
  - Up to 64-bit polynomial length
  - Programmable polynomial
  - TRNG can be seed value

29.0 12-BIT HIGH-SPEED SUCCESSIVE APPROXIMATION REGISTER (SAR) ANALOG-TO-DIGITAL CONVERTER (ADC)

Note: This data sheet summarizes the features of the PIC32MZ DA family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 22. "12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC)"** (DS60001344) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The 12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC) includes the following features:

- 12-bit resolution
- Six ADC modules with dedicated Sample and Hold (S&H) circuits
- Two dedicated ADC modules can be combined in Turbo mode to provide double conversion rate (clock sources for combined ADCs must be synchronous)
- Up to 45 analog input sources, in addition to the internal CTMU, VBAT, internal voltage reference and internal temperature sensor
- Single-ended and/or differential inputs
- Can operate during Sleep mode
- Supports touch sense applications
- Six digital comparators
- Six digital filters supporting two modes:
  - Oversampling mode
  - Averaging mode
- 16-word FIFO on ADC0 through ADC4 for increased throughput
- Early interrupt generation resulting in faster processing of converted data
- Designed for motor control, power conversion, and general purpose applications
- Operation during Sleep and Idle modes

A simplified block diagram of the ADC module is illustrated in Figure 29-1.

The 12-bit HS SAR ADC has up to five dedicated ADC modules (ADC0-ADC4) and one shared ADC module (ADC7). The dedicated ADC modules use a single input (or its alternate) and are intended for high-speed and precise sampling of time-sensitive or transient inputs. The the shared ADC module incorporates a multiplexer on the input to facilitate a larger group of inputs, with slower sampling, and provides flexible automated scanning option through the input scan logic.

For each ADC module, the analog inputs are connected to the S&H capacitor. The clock, sampling time, and output data resolution for each ADC module can be set independently. The ADC module performs the conversion of the input analog signal based on the configurations set in the registers. When conversion is complete, the final result is stored in the result buffer for the specific analog input and is passed to the digital filter and digital comparator if configured to use data from this particular sample. Input to ADCx mapping is illustrated in Figure 29-2.

29.1 Activation Sequence

Step 1: Initialize the ADC calibration values by copying them from the factory programmed DEVADCx Flash locations starting at 0xBFC45000 into the ADCxCFG registers starting at 0xBF887D00. Then, configure the AICPMPEN bit (ADCCON1<12> and the IOANCPEN bit (CFGCON<7>) = 1 if and only if VDD is less than 2.5V. The default is '0', which assumes VDD is greater than or equal to 2.5V.

Step 2: The user writes all the essential ADC configuration SFRs including the ADC control clock and all ADC core clocks setup:

- ADCCON1, keeping the ON bit = 0
- ADCCON2, especially paying attention to ADCDIV<6:0> and SAMC<9:0>
- ADCANCON, keeping all analog enables ANENx bit = 0, WKUPCLKCNT bit = 0xA
- ADCCON3, keeping all DIGEN5x = 0, especially paying attention to ADCSEL<1:0>, CONCLKDIV <5:0>, and VREFSEL<2:0>
- ADCxTIME, ADCDIVx<6:0>, and SAMCx<9:0>
- ADCTRGMODE, ADCIMCONx, ADCTRGSNS, ADCCSSx, ADCGIRQENx, ADCTRGx, ADCBASE
- Comparators, filters, and so on

Step 3: The user sets the ANENx bit to '1' for the ADC SAR Cores needed (which internally in the ADC module enables the control clock to generate by division the core clocks for the desired ADC SAR Cores, which in turn enables the bias circuitry for these ADC SAR Cores).

Step 4: The user sets the ON bit to '1', which enables the ADC control clock. The following ADCx activation sequence is to be followed at all times:

Step 5: The user waits for the interrupt/polls the BGVRRDY bit (ADCCON2<31>) and the WKRDYx bit (ADCANCON<15,13:8>) = 1, which signals that the device analog environment (band gap and VREF) is ready.

Step 6: Set the DIGENx bit (ADCCON3<15,13:8>) to '1', which enables the digital circuitry to immediately begin processing incoming triggers to perform data conversions.

Standard non-interleaved dedicated Class_1 ADCx throughput rate formula is shown in Equation 29-1.

EQUATION 29-1: THROUGHPUT RATE

ADC Throughput Rate = 1/((Sample time + Conversion time)(TAD))
= 1 / ((SAMC+# bit resolution+1)(TAD))

Example:
SAMC = 3 TAD, 12-bit mode, TAD = 20 ns = 50 MHz:
Throughput rate:
= 1 / ((3+13)(20 ns))
= 1/(16 * 20 ns)
= 3.125 msps

TABLE 29-1: PIC32MZXXDAXX INTERLEAVED ADC THROUGHPUT RATES

#No.of Interleaved ADC Possible	ADC TAD(min) = 20ns (50Mhz max)			
	12-bit (max.) msps	10-bit (max.) msps	8-bit (max.) msps	6-bit (max.) msps
1	3.125 msps	3.571 msps	4.167 msps	5.0 msps
2	6.250 msps	7.143 msps	8.333 msps	10.00 msps
3	8.330 msps	10.00 msps	12.50 msps	12.50 msps
4	12.50 msps	12.50 msps	16.667 msps	16.667 msps

Note: Interleaved ADCs in this context means connecting the same analog source signal to multiple dedicated Class_1 ADCs (i.e., ADC0-ADC5), and using independent staggered trigger sources accordingly for each interleaved ADC.

Note 1: Prior to enabling the ADC module, the user application must copy the ADC calibration data (DEVADC0-DEVADC4, DEVADC7; see Register 41-8) from the Configuration memory into the ADC Configuration registers (ADC0CFG-ADC4CFG, ADC7CFG).

2: If VDDIO is greater than 2.5V, set the AICPMPEN bit (ADCCON1<12>) and the IOANCPEN bit (CFGCON<7>) to '0'. If VDDIO is less than 2.5V, set both bits to '1'.

Legend:	HC = Hardware Set	HS = Hardware Cleared	
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31 **TRBEN:** Turbo Channel Enable bit
1 = Enable the Turbo channel
0 = Disable the Turbo channel

bit 30 **TRBERR:** Turbo Channel Error Status bit
1 = An error occurred while setting the Turbo channel and Turbo channel function to be disabled regardless of the TRBEN bit being set to '1'.
0 = Turbo channel error did not occur

Note: The status of this bit is valid only after the TRBEN bit is set.

bit 29-27 **TRBMST<2:0>:** Turbo Host ADCx bits
111 = Reserved
110 = ADC4 is selected as the Turbo Host
•
•
•
000 = ADC0 is selected as the Turbo Host

bit 26-24 **TRBSLV<2:0>:** Turbo Client ADCx bits
111 = Reserved
110 = ADC4 is selected as the Turbo Client
•
•
•
000 = ADC0 is selected as the Turbo Client

bit 23 **FRACT:** Fractional Data Output Format bit
1 = Fractional
0 = Integer

bit 22-21 **SELRES<1:0>:** Shared ADC (ADC7) Resolution bits
11 = 12 bits (default)
10 = 10 bits
01 = 8 bits
00 = 6 bits

Note: Changing the resolution of the ADC does not shift the result in the corresponding ADCDATAx register. The result will still occupy 12 bits, with the corresponding lower unused bits set to '0'. For example, a resolution of 6 bits will result in ADCDATAx<5:0> being set to '0', and ADCDATAx<11:6> holding the result.

Note 1: The rising edge of the module output signal triggers an ADC conversion. See Figure 16-1 in **16.0 "Output Compare"** and Figure 32-1 in **32.0 "Comparator"** for more information.

REGISTER 29-1: ADCCON1: ADC CONTROL REGISTER 1 (CONTINUED)

bit 20-16 **STRGSRC<4:0>:** Scan Trigger Source Select bits

11111 = Reserved
11110 = Reserved
11101 = CTMU Event
11100 = Reserved
.
.
.
01110 = Reserved
01101 = CTMU Event
01100 = Comparator 2 (C2OUT) (1)
01011 = Comparator 1 (C1OUT) (1)
01010 = OCMP5 (1)

00100 = INT0 External interrupt
00011 = Reserved
00010 = Global level software trigger (GLSWTRG)
00001 = Global software edge trigger (GSWTRG)
00000 = No Trigger

bit 15 **ON:** ADC Module Enable bit
1 = ADC module is enabled
0 = ADC module is disabled

Note: The ON bit should be set only after the ADC module has been configured.

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit
1 = Discontinue module operation when device enters Idle mode
0 = Continue module operation in Idle mode

bit 12 **AICPMPEN:** Analog Input Charge Pump Enable bit
1 = Analog input charge pump is enabled
0 = Analog input charge pump is disabled

Note 1: For proper analog operation at VDDIO less than 2.5V, the AICPMPEN bit and the IOANCPEN (CFGCON<7>) bit must be set to `1'. These bits should not be set if VDDIO is greater than 2.5V.

2: ADC throughput rate performance is reduced as defined in the table below if the AICPMPEN (ADCCON1<12>) bit and the IOANCPEN(CFGCON<7>) bit are set to '1'

ADC0	ADC1	ADC2	ADC3	ADC4	ADC7	Maximum combined
ON	OFF	OFF	OFF	OFF	OFF	2 MSPS
ON	ON	OFF	OFF	OFF	OFF	4 MSPS
ON	ON	ON	OFF	OFF	OFF	5 MSPS
OFF	OFF	OFF	ON	OFF	OFF	2 MSPS
OFF	OFF	OFF	ON	ON	OFF	4 MSPS
OFF	OFF	OFF	ON	ON	ON	5 MSPS
ON	ON	ON	ON	OFF	OFF	7 MSPS
ON	ON	ON	ON	ON	OFF	9 MSPS
ON	ON	ON	ON	ON	ON	10 MSPS

bit 11 **CVDEN:** Capacitive Voltage Division Enable bit
1 = CVD operation is enabled
0 = CVD operation is disabled

Note 1: The rising edge of the module output signal triggers an ADC conversion. See Figure 16-1 in **16.0 "Output Compare"** and Figure 32-1 in **32.0 "Comparator"** for more information.

REGISTER 29-1: ADCCON1: ADC CONTROL REGISTER 1 (CONTINUED)

bit 10 **FSSCLKEN:** Fast Synchronous System Clock to ADC Control Clock bit
1 = Fast synchronous system clock to ADC control clock is enabled
0 = Fast synchronous system clock to ADC control clock is disabled

bit 9 **FSPBCLKEN:** Fast Synchronous Peripheral Clock to ADC Control Clock bit
1 = Fast synchronous peripheral clock to ADC control clock is enabled
0 = Fast synchronous peripheral clock to ADC control clock is disabled

bit 8-7 **Unimplemented:** Read as '0'

bit 6-4 **IRQVS<2:0>:** Interrupt Vector Shift bits
To determine interrupt vector address, this bit specifies the amount of left shift done to the ARDYx status bits in the ADCDSTAT1 and ADCDSTAT2 registers, prior to adding with the ADCBASE register.
Interrupt Vector Address = Read Value of ADCBASE and Read Value of ADCBASE = Value written to ADCBASE + x << IRQVS<2:0>, where 'x' is the smallest active input ID from the ADCDSTAT1 or ADCDSTAT2 registers (which has highest priority).
111 = Shift x left 7 bit position
110 = Shift x left 6 bit position
101 = Shift x left 5 bit position
100 = Shift x left 4 bit position
011 = Shift x left 3 bit position
010 = Shift x left 2 bit position
001 = Shift x left 1 bit position
000 = Shift x left 0 bit position

bit 3 **STRGLVL:** Scan Trigger High Level/Positive Edge Sensitivity bit
1 = Scan trigger is high level sensitive. Once STRIG mode is selected (TRGSRCx<4:0> in the ADCTRGx register), the scan trigger will continue for all selected analog inputs, until the STRIG option is removed.
0 = Scan trigger is positive edge sensitive. Once STRIG mode is selected (TRGSRCx<4:0> in the ADCTRGx register), only a single scan trigger will be generated, which will complete the scan of all selected analog inputs.

bit 2-0 **Unimplemented:** Read as '0'

Note 1: The rising edge of the module output signal triggers an ADC conversion. See Figure 16-1 in **16.0 "Output Compare"** and Figure 32-1 in **32.0 "Comparator"** for more information.

REGISTER 29-2: ADCCON2: ADC CONTROL REGISTER 2

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31:24	R-0, HS, HC	R-0, HS, HC	R-0, HS, HC	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

23:16	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	SAMC<7:0>							
15:8	R/W-0	R/W-0	R/W-0	R/W-0	U-0	R/W-0	R/W-0	R/W-0
	BGVRIEN	REFFLTIEN	EOSIEN	ADCEIOVR	—	ADCEIS<2:0>		
7:0	U-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	—	ADCDIV<6:0>						

Legend:	HC = Hardware Set	HS = Hardware Cleared	r = Reserved
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31 **BGVRRDY:** Band Gap Voltage/ADC Reference Voltage Status bit

1 = Both band gap voltage and ADC reference voltages (V_{REF}) are ready
0 = Either or both band gap voltage and ADC reference voltages (V_{REF}) are not ready

Data processing is valid only after BGVRRDY is set by hardware, so the application code must check that the BGVRRDY bit is set to ensure data validity. This bit set to '0' when ON (ADCCON1<15>) = 0.

bit 30 **REFFLT:** Band Gap/V_{REF}/AV_{DD} BOR Fault Status bit

1 = Fault in band gap or the V_{REF} voltage while the ON bit (ADCCON1<15>) was set. Most likely a band gap or V_{REF} fault will be caused by a BOR of the analog V_{DDIO} supply.
0 = Band gap and V_{REF} voltage are working properly

This bit is cleared when the ON bit (ADCCON1<15>) = 0 and the BGVRRDY bit = 1.

bit 29 **EOSRDY:** End of Scan Interrupt Status bit

1 = All analog inputs are considered for scanning through the scan trigger (all analog inputs specified in the ADCCSS1 and ADCCSS2 registers) have completed scanning
0 = Scanning has not completed

This bit is cleared when ADCCON2<31:24> are read in software.

bit 28-26 **CVDCPL<2:0>:** Capacitor Voltage Divider (CVD) Setting bit

111 = 7 * 2.5 pF = 17.5 pF
110 = 6 * 2.5 pF = 15 pF
101 = 5 * 2.5 pF = 12.5 pF
100 = 4 * 2.5 pF = 10 pF
011 = 3 * 2.5 pF = 7.5 pF
010 = 2 * 2.5 pF = 5 pF
001 = 1 * 2.5 pF = 2.5 pF
000 = 0 * 2.5 pF = 0 pF

REGISTER 29-2: ADCCON2: ADC CONTROL REGISTER 2 (CONTINUED)

bit 25-16 **SAMC<9:0>:** Sample Time for the Shared ADC (ADC7) bits

1111111111 = 1025 TAD7
•
•
•
0000000001 = 3 TAD7
0000000000 = 2 TAD7

Where TAD7 = period of the ADC conversion clock for the Shared ADC (ADC7) controlled by the ADCDIV<6:0> bits.

Note: Unlike the high-speed Class 1 ADC modules, the trigger event for the shared Class-3 ADC7 module initiates the SAMC sampling sequence, rather than the convert sequence.

Shared ADC7 Throughput rate:

=((1/((Sample time + Conversion time) (TAD))) / #of ADC inputs used in scan list)

=((1/((SAMC + # bit resolution +1)(TAD))) / #of ADC inputs used in scan list)

For example:

SCAN mode enabled with (2) ANx inputs in scan list (i.e., ADCCSSx<CSSY>), SAMC = 4

TAD, 12-bit mode, TAD = 20ns = 50 MHz

Throughput rate = ((1/ ((4+13)(20ns))) / 2)

= ((1/ (17 * 20ns)) / 2)

= 1,470588 msps

bit 15 **BGVRIEN:** Band Gap/VREF Voltage Ready Interrupt Enable bit

1 = Interrupt will be generated when the BGVRDDY bit is set
0 = No interrupt is generated when the BGVRRDY bit is set

bit 14 **REFFLTIEN:** Band Gap/VREF Voltage Fault Interrupt Enable bit

1 = Interrupt will be generated when the REFFLT bit is set
0 = No interrupt is generated when the REFFLT bit is set

bit 13 **EOSIEN:** End of Scan Interrupt Enable bit

1 = Interrupt will be generated when EOSRDY bit is set
0 = No interrupt is generated when the EOSRDY bit is set

bit 12 **ADCEIOVR:** Early Interrupt Request Override bit

1 = Early interrupt generation is not overridden and interrupt generation is controlled by the ADCEIEN1 and ADCEIEN2 registers
0 = Early interrupt generation is overridden and interrupt generation is controlled by the ADCGIRQEN1 and ADCGIRQEN2 registers

bit 11 **Unimplemented:** Read as '0'

bit 10-8 **ADCEIS<2:0>:** Shared ADC (ADC7) Early Interrupt Select bits

These bits select the number of clocks (TAD7) prior to the arrival of valid data that the associated interrupt is generated.

111 = The data ready interrupt is generated 8 ADC clocks prior to end of conversion
110 = The data ready interrupt is generated 7 ADC clocks prior to end of conversion
•
•
•
001 = The data ready interrupt is generated 2 ADC module clocks prior to end of conversion
000 = The data ready interrupt is generated 1 ADC module clock prior to end of conversion

Note: All options are available when the selected resolution, set by the SELRES<1:0> bits (ADCCON1<22:21>), is 12-bit or 10-bit. For a selected resolution of 8-bit, options from '000' to '101' are valid. For a selected resolution of 6-bit, options from '000' to '011' are valid.

bit 7 **Unimplemented:** Read as '0'

REGISTER 29-2: ADCCON2: ADC CONTROL REGISTER 2 (CONTINUED)

bit 6-0 **ADCDIV<6:0>:** Shared ADC (ADC7) Clock Divider bits

1111111 = 254 * TQ = TAD7
•
•
•
0000011 = 6 * TQ = TAD7
0000010 = 4 * TQ = TAD7
0000001 = 2 * TQ = TAD7
0000000 = Reserved

The ADCDIV<6:0> bits divide the ADC control clock (TQ) to generate the clock for the Shared ADC, ADC7 (TAD7).

REGISTER 29-3: ADCCON3: ADC CONTROL REGISTER 3

	VREFSEL<2:0>			TRGSUSP	UPDIEN	UPDRDY	SAMP(1,2,3,4)	RQCNVRT
7:0	R/W-0	R/W, HC	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	GLSWTRG	GSWTRG	ADINSEL<5:0>					

Legend:	HC = Hardware Set	HS = Hardware Cleared	
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-30 **ADCSEL<1:0>:** Analog-to-Digital Clock Source (TCLK) bits
11 = FRC
10 = REFCLK3
01 = System Clock (Tcy)
00 = PBCLK3

bit 29-24 **CONCLKDIV<5:0>:** Analog-to-Digital Control Clock (TQ) Divider bits
111111 = 64 * TCLK = TQ
•
•
•
000011 = 4 * TCLK = TQ
000010 = 3 * TCLK = TQ
000001 = 2 * TCLK = TQ
000000 = TCLK = TQ

bit 23 **DIGEN7:** Shared ADC (ADC7) Digital Enable bit
1 = ADC7 is digital enabled
0 = ADC7 is digital disabled

bit 22-21 **Unimplemented:** Read as '0'

bit 20 **DIGEN4:** ADC4 Digital Enable bit
1 = ADC4 is digital enabled
0 = ADC4 is digital disabled

bit 19 **DIGEN3:** ADC3 Digital Enable bit
1 = ADC3 is digital enabled
0 = ADC3 is digital disabled

Note 1: The SAMP bit has the highest priority and setting this bit will keep the S&H circuit in Sample mode until the bit is cleared. Also, usage of the SAMP bit will cause settings of SAMC<9:0> bits (ADCCON2<25:16>) to be ignored.

2: The SAMP bit only connects Class 2 and Class 3 analog inputs to the shared ADC, ADC7. All Class 1 analog inputs are not affected by the SAMP bit.

3: The SAMP bit is not a self-clearing bit and it is the responsibility of application software to first clear this bit and only after setting the RQCNVRT bit to start the analog-to-digital conversion.

4: Normally, when the SAMP and RQCNVRT bits are used by software routines, all TRGSRCx<4:0> bits and STRGSRC<4:0> bits should be set to '00000' to disable all external hardware triggers and prevent them from interfering with the software-controlled sampling command signal SAMP and with the software-controlled trigger RQCNVRT.

REGISTER 29-3: ADCCON3: ADC CONTROL REGISTER 3 (CONTINUED)

bit 18 **DIGEN2:** ADC2 Digital Enable bit
1 = ADC2 is digital enabled
0 = ADC2 is digital disabled

bit 17 **DIGEN1:** ADC1 Digital Enable bit
1 = ADC1 is digital enabled
0 = ADC1 is digital disabled

bit 16 **DIGEN0:** ADC0 Digital Enable bit
1 = ADC0 is digital enabled
0 = ADC0 is digital disabled

bit 15-13 **VREFSEL<2:0>:** Voltage Reference (VREF) Input Selection bits

VREFSEL<2:0>	ADREF+	ADREF-
1xx	RESERVED: DO NOT USE	
011	EXTERNAL VREFH	EXTERNAL VREFL
010	AVDD	EXTERNAL VREFL
001	EXTERNAL VREFH	AVSS
000	AVDD	AVSS

bit 12 **TRGSUSP:** Trigger Suspend bit
1 = Triggers are blocked from starting a new analog-to-digital conversion, but the ADC module is not disabled
0 = Triggers are not blocked

bit 11 **UPDIEN:** Update Ready Interrupt Enable bit
1 = Interrupt will be generated when the UPDRDY bit is set by hardware
0 = No interrupt is generated

bit 10 **UPDRDY:** ADC Update Ready Status bit
1 = ADC SFRs can be updated
0 = ADC SFRs cannot be updated

Note: This bit is only active while the TRGSUSP bit is set and there are no more running conversions of any ADC modules.

bit 9 **SAMP:** Class 2 and Class 3 Analog Input Sampling Enable bit**(1,2,3,4)**
1 = The ADC S&H amplifier is sampling
0 = The ADC S&H amplifier is holding

bit 8 **RQCNVRT:** Individual ADC Input Conversion Request bit
This bit and its associated ADINSEL<5:0> bits enable the user to individually request an analog-to-digital conversion of an analog input through software.
1 = Trigger the conversion of the selected ADC input as specified by the ADINSEL<5:0> bits
0 = Do not trigger the conversion

Note: This bit is automatically cleared in the next ADC clock cycle.

Note 1: The SAMP bit has the highest priority and setting this bit will keep the S&H circuit in Sample mode until the bit is cleared. Also, usage of the SAMP bit will cause settings of SAMC<9:0> bits (ADCCON2<25:16>) to be ignored.

2: The SAMP bit only connects Class 2 and Class 3 analog inputs to the shared ADC, ADC7. All Class 1 analog inputs are not affected by the SAMP bit.

3: The SAMP bit is not a self-clearing bit and it is the responsibility of application software to first clear this bit and only after setting the RQCNVRT bit to start the analog-to-digital conversion.

4: Normally, when the SAMP and RQCNVRT bits are used by software routines, all TRGSRCx<4:0> bits and STRGSRC<4:0> bits should be set to '00000' to disable all external hardware triggers and prevent them from interfering with the software-controlled sampling command signal SAMP and with the software-controlled trigger RQCNVRT.

REGISTER 29-3: ADCCON3: ADC CONTROL REGISTER 3 (CONTINUED)

bit 7 **GLSWTRG:** Global Level Software Trigger bit
1 = Trigger conversion for ADC inputs that have selected the GLSWTRG bit as the trigger signal, either through the associated TRGSRC<4:0> bits in the ADCTRGx registers or through the STRGSRC<4:0> bits in the ADCCON1 register
0 = Do not trigger an analog-to-digital conversion

bit 6 **GSWTRG:** Global Software Trigger bit
1 = Trigger conversion for ADC inputs that have selected the GSWTRG bit as the trigger signal, either through the associated TRGSRC<4:0> bits in the ADCTRGx registers or through the STRGSRC<4:0> bits in the ADCCON1 register
0 = Do not trigger an analog-to-digital conversion
Note: This bit is automatically cleared in the next ADC clock cycle.

bit 5-0 **ADINSEL<5:0>:** Analog Input Select bits
These bits select the analog input to be converted when the RQCNVRT bit is set. As a general rule:
111111 = Reserved
•
•
•
101101 = Reserved
101100 = IV_{TEMP}
101011 = IV_{REF}
101010 = V_{BAT}
101000 = CTMU
100111 = AN39
•
•
•
000001 = AN1
000000 = AN0

Note 1: The SAMP bit has the highest priority and setting this bit will keep the S&H circuit in Sample mode until the bit is cleared. Also, usage of the SAMP bit will cause settings of SAMC<9:0> bits (ADCCON2<25:16>) to be ignored.
2: The SAMP bit only connects Class 2 and Class 3 analog inputs to the shared ADC, ADC7. All Class 1 analog inputs are not affected by the SAMP bit.
3: The SAMP bit is not a self-clearing bit and it is the responsibility of application software to first clear this bit and only after setting the RQCNVRT bit to start the analog-to-digital conversion.
4: Normally, when the SAMP and RQCNVRT bits are used by software routines, all TRGSRCx<4:0> bits and STRGSRC<4:0> bits should be set to '00000' to disable all external hardware triggers and prevent them from interfering with the software-controlled sampling command signal SAMP and with the software-controlled trigger RQCNVRT.

bit 31-0 **CSS31:CSS0:** Analog Common Scan Select bits
1 = Select AN*x* for input scan
0 = Skip AN*x* for input scan

Note 1: In addition to setting the appropriate bits in this register, Class 1 and Class 2 analog inputs must select the STRIG input as the trigger source if they are to be scanned through the CSS*x* bits. Refer to the bit descriptions in the ADCTRGx registers for selecting the STRIG option.

2: If a Class 1 or Class 2 input is included in the scan by setting the CSSx bit to '1' and by setting the TRGSRCx<4:0> bits to STRIG mode ('0b11), the user application must ensure that no other triggers are generated for that input using the RQCNVRT bit in the ADCCON3 register or the hardware input or any digital filter. Otherwise, the scan behavior is unpredictable.

	DCMPLO<7:0>(1,2,3)							

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **DCMPHI<15:0>:** Digital Comparator '*x*' High Limit Value bits(1,2,3)

These bits store the high limit value, which is used by digital comparator for comparisons with ADC converted data.

bit 15-0 **DCMPLO<15:0>:** Digital Comparator '*x*' Low Limit Value bits(1,2,3)

These bits store the low limit value, which is used by digital comparator for comparisons with ADC converted data.

Note 1: Changing theses bits while the Digital Comparator is enabled (ENDCMP = 1) can result in unpredictable behavior.

2: The format of the limit values should match the format of the ADC converted value in terms of sign and fractional settings.

3: For Digital Comparator 0 used in CVD mode, the DCMPHI<15:0> and DCMPLO<15:0> bits must always be specified in signed format, as the CVD output data is differential and is always signed.

REGISTER 29-16: ADCFLTRx: ADC DIGITAL FILTER 'x' REGISTER ('x' = 1 THROUGH 6)

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31 **AFEN:** Digital Filter '*x*' Enable bit
1 = Digital filter is enabled
0 = Digital filter is disabled and the AFRDY status bit is cleared

Note: If the ADCFLTRx<AFEN> = 1, then the ADCxTIME<SAMC> minimum must be ≥ to 0x004 or equivalent to ≥ 6 TADx. This will correspondingly reduce the maximum sampling rate possible.

bit 30 **DATA16EN:** Filter Significant Data Length bit
1 = All 16 bits of the filter output data are significant
0 = Only the first 12 bits are significant, followed by four zeros

Note: This bit is significant only if DFMODE = 1 (Averaging mode) and FRACT (ADCCON1<23>) = 1 (Fractional Output mode).

bit **DFMODE:** ADC Filter Mode bit
1 = Filter '*x*' works in Averaging mode
0 = Filter '*x*' works in Oversampling Filter mode (default)

bit 28-26 **OVRSAM<2:0>:** Oversampling Filter Ratio bits
If DFMODE is '0':
111 = 128 samples (shift sum 3 bits to right, output data is in 15.1 format)
110 = 32 samples (shift sum 2 bits to right, output data is in 14.1 format)
101 = 8 samples (shift sum 1 bit to right, output data is in 13.1 format)
100 = 2 samples (shift sum 0 bits to right, output data is in 12.1 format)
011 = 256 samples (shift sum 4 bits to right, output data is 16 bits)
010 = 64 samples (shift sum 3 bits to right, output data is 15 bits)
001 = 16 samples (shift sum 2 bits to right, output data is 14 bits)
000 = 4 samples (shift sum 1 bit to right, output data is 13 bits)

If DFMODE is '1':
111 = 256 samples (256 samples to be averaged)
110 = 128 samples (128 samples to be averaged)
101 = 64 samples (64 samples to be averaged)
100 = 32 samples (32 samples to be averaged)
011 = 16 samples (16 samples to be averaged)
010 = 8 samples (8 samples to be averaged)
001 = 4 samples (4 samples to be averaged)
000 = 2 samples (2 samples to be averaged)

bit 25 **AFGIEN:** Digital Filter '*x*' Interrupt Enable bit
1 = Digital filter interrupt is enabled and is generated by the AFRDY status bit
0 = Digital filter is disabled

REGISTER 29-16: ADCFLTRx: ADC DIGITAL FILTER 'x' REGISTER ('x' = 1 THROUGH 6)

bit 24 **AFRDY:** Digital Filter '*x*' Data Ready Status bit
1 = Data is ready in the FLTRDATA<15:0> bits
0 = Data is not ready

Note: This bit is cleared by reading the FLTRDATA<15:0> bits or by disabling the Digital Filter module (by setting AFEN to '0').

bit 23-21 **Unimplemented:** Read as '0'

bit 20-16 **CHNLID<4:0>:** Digital Filter Analog Input Selection bits
These bits specify the analog input to be used as the oversampling filter data source.
11111 = Reserved
•
•
•
01100 = Reserved
01011 = AN11
•
•
•
00001 = AN1
00000 = AN0

Note: Only the first 12 analog inputs, Class 1 (AN0-AN11) and Class 2 (AN5-AN11), can use a digital filter.

bit 15-0 **FLTRDATA<15:0>:** Digital Filter '*x*' Data Output Value bits
The filter output data is as per the fractional format set in the FRACT bit (ADCCON1<23>). The FRACT bit should not be changed while the filter is enabled. Changing the state of the FRACT bit after the operation of the filter ended will not update the value of the FLTRDATA<15:0> bits to reflect the new format.

bit 31-16 **CVDDATA<15:0>:** CVD Data Status bits

In CVD mode, these bits obtain the CVD differential output data (subtraction of CVD positive and negative measurement), whenever a Digital Comparator interrupt is generated. The value in these bits is compliant with the FRACT bit (ADCCON1<23>) and is always signed.

bit 15-14 **Unimplemented:** Read as '0'

bit 13-8 **AINID<5:0>:** Digital Comparator 0 Analog Input Identification (ID) bits

When a digital comparator event occurs (DCMPED = 1), these bits identify the analog input being monitored by Digital Comparator 0.

Note: In normal ADC mode, only analog inputs <31:0> can be processed by the Digital Comparator 0. The Digital Comparator 0 also supports the CVD mode, in which all Class 2 and Class 3 analog inputs may be stored in the AINID<5:0> bits.

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-29 **Unimplemented:** Read as '0'

bit 28-26 **ADCEIS<2:0>:** ADCx Early Interrupt Select bits

111 = The data ready interrupt is generated 8 ADC clocks prior to the end of conversion
110 = The data ready interrupt is generated 7 ADC clocks prior to the end of conversion
.
.
.
001 = The data ready interrupt is generated 2 ADC clocks prior to the end of conversion
000 = The data ready interrupt is generated 1 ADC clock prior to the end of conversion

Note: All options are available when the selected resolution, specified by the SELRES<1:0> bits (ADCxTIME<25:24>), is 12-bit or 10-bit. For a selected resolution of 8-bit, options from '000' to '101' are valid. For a selected resolution of 6-bit, options from '000' to '011' are valid.

bit 25-24 **SELRES<1:0>:** ADCx Resolution Select bits

11 = 12 bits
10 = 10 bits
01 = 8 bits
00 = 6 bits

Note: Changing the resolution of the ADC does not shift the result in the corresponding ADCDATAx register. The result will still occupy 12 bits, with the corresponding lower unused bits set to '0'. For example, a resolution of 6 bits will result in ADCDATAx<5:0> being set to '0', and ADCDATAx<11:6> holding the result.

bit 23 **Unimplemented:** Read as '0'

bit 22-16 **ADCDIV<6:0>:** ADCx Clock Divisor bits

These bits divide the ADC control clock with period TQ to generate the clock for ADCx (TAD*x*).

1111111 = 254 * TQ = TAD*x*
.
.
.
0000011 = 6 * TQ = TAD*x*
0000010 = 4 * TQ = TAD*x*
0000001 = 2 * TQ = TAD*x*
0000000 = Reserved

bit 15-10 **Unimplemented:** Read as '0'

bit 9-0 **SAMC<9:0>:** ADCx Sample Time bits

Where TAD*x* = period of the ADC conversion clock for the dedicated ADC controlled by the ADCDIV<6:0> bits.

1111111111 = 1025 TAD*x*
.
.
.
0000000001 = 3 TAD*x*
0000000000 = 2 TAD*x*

30.0 CONTROLLER AREA NETWORK (CAN)

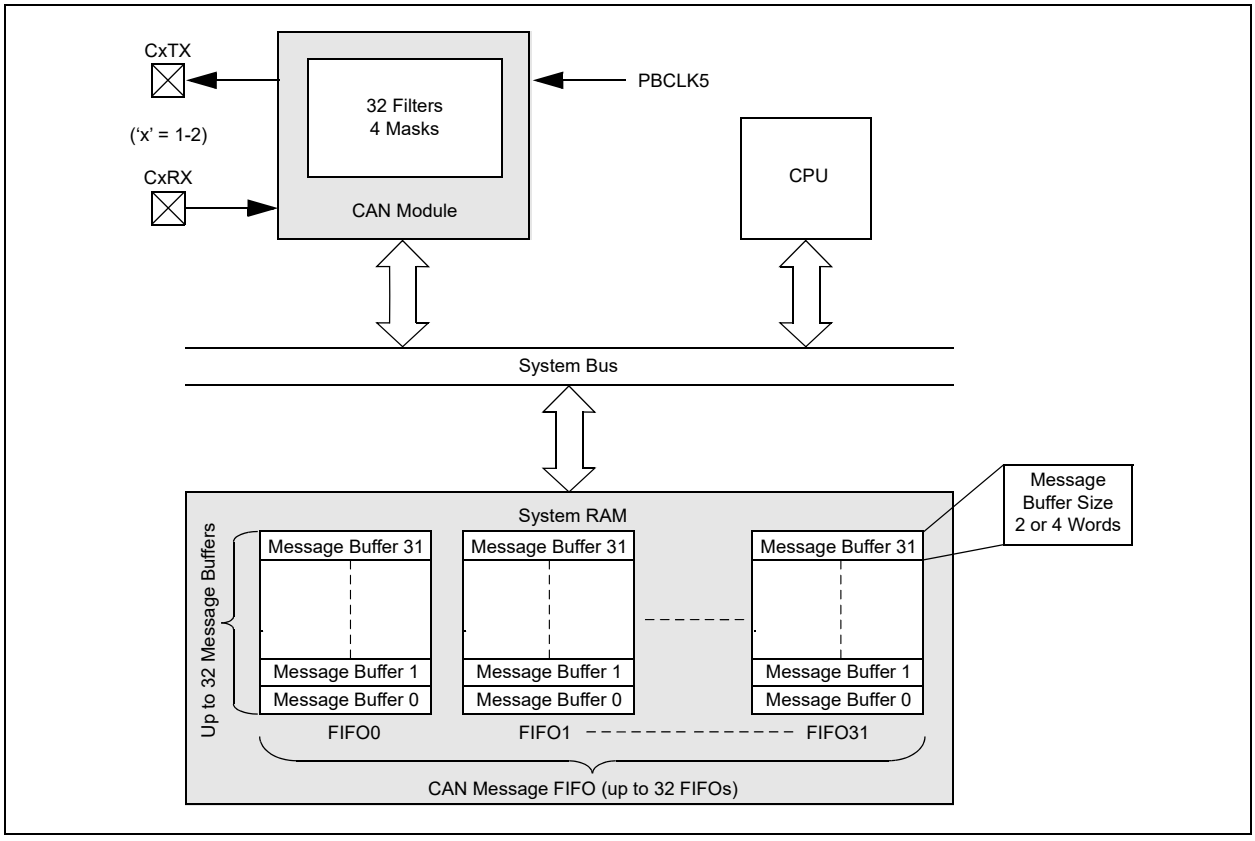
Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 34. "Controller Area Network (CAN)"** (DS60001154), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The Controller Area Network (CAN) module supports the following key features:

- Standards Compliance:
  - Full CAN 2.0B compliance
  - Programmable bit rate up to 1 Mbps
- Message Reception and Transmission:
  - 32 message FIFOs
  - Each FIFO can have up to 32 messages for a total of 1024 messages
  - FIFO can be a transmit message FIFO or a receive message FIFO
  - User-defined priority levels for message FIFOs used for transmission
  - 32 acceptance filters for message filtering
  - Four acceptance filter mask registers for message filtering
  - Automatic response to remote transmit request
  - DeviceNet™ addressing support
- Additional Features:
  - Loopback, Listen All Messages and Listen Only modes for self-test, system diagnostics and bus monitoring
  - Low-power operating modes
  - CAN module is a bus host on the PIC32 System Bus
  - Use of DMA is not required
  - Dedicated time-stamp timer
  - Dedicated DMA channels
  - Data-only Message Reception mode

Figure 30-1 illustrates the general structure of the CAN module.

FIGURE 30-1: PIC32 CAN MODULE BLOCK DIAGRAM



30.1 CAN Control Registers

Note: The 'i' shown in register names denotes CAN1 or CAN2.

	ON(1)	—	SIDLE	—	CANBUSY	—	—	—
7:0	U-0	U-0	U-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	—	—	—	DNCNT<4:0>				

Legend:	HC = Hardware Clear	S = Settable bit	
R = Readable bit	W = Writable bit	P = Programmable bit	r = Reserved bit
U = Unimplemented bit	-n = Bit Value at POR: (‘0’, ‘1’, x = Unknown)		

bit 31-28 **Unimplemented:** Read as ‘0’

bit 27 **ABAT:** Abort All Pending Transmissions bit
- 1 = Signal all transmit buffers to abort transmission
- 0 = Module will clear this bit when all transmissions aborted

bit 26-24 **REQOP<2:0>:** Request Operation Mode bits
- 111 = Set Listen All Messages mode
- 110 = Reserved - Do not use
- 101 = Reserved - Do not use
- 100 = Set Configuration mode
- 011 = Set Listen Only mode
- 010 = Set Loopback mode
- 001 = Set Disable mode
- 000 = Set Normal Operation mode

bit 23-21 **OPMOD<2:0>:** Operation Mode Status bits
- 111 = Module is in Listen All Messages mode
- 110 = Reserved
- 101 = Reserved
- 100 = Module is in Configuration mode
- 011 = Module is in Listen Only mode
- 010 = Module is in Loopback mode
- 001 = Module is in Disable mode
- 000 = Module is in Normal Operation mode

bit 20 **CANCAP:** CAN Message Receive Time Stamp Timer Capture Enable bit
- 1 = CANTMR value is stored on valid message reception and is stored with the message
- 0 = Disable CAN message receive time stamp timer capture and stop CANTMR to conserve power

bit 19-16 **Unimplemented:** Read as ‘0’

bit 15 **ON:** CAN On bit(1)
- 1 = CAN module is enabled
- 0 = CAN module is disabled

bit 14 **Unimplemented:** Read as ‘0’

Note 1: If the user application clears this bit, it may take a number of cycles before the CAN module completes the current transaction and responds to this request. The user application should poll the CANBUSY bit to verify that the request has been honored.

REGISTER 30-1: CiCON: CAN MODULE CONTROL REGISTER (CONTINUED)

bit 13 **SIDLE:** CAN Stop in Idle bit
1 = CAN Stops operation when system enters Idle mode
0 = CAN continues operation when system enters Idle mode

bit 12 **Unimplemented:** Read as '0'

bit 11 **CANBUSY:** CAN Module is Busy bit
1 = The CAN module is active
0 = The CAN module is completely disabled

bit 10-5 **Unimplemented:** Read as '0'

bit 4-0 **DNCNT<4:0>:** Device Net Filter Bit Number bits
10011-11111 = Invalid Selection (compare up to 18-bits of data with EID)
10010 = Compare up to data byte 2 bit 6 with EID17 (CiRXFn<17>)
•
•
•
00001 = Compare up to data byte 0 bit 7 with EID0 (CiRXFn<0>)
00000 = Do not compare data bytes

Note 1: If the user application clears this bit, it may take a number of cycles before the CAN module completes the current transaction and responds to this request. The user application should poll the CANBUSY bit to verify that the request has been honored.

Legend:	HC = Hardware Clear	S = Settable bit	
R = Readable bit	W = Writable bit	P = Programmable bit	r = Reserved bit
U = Unimplemented bit	-n = Bit Value at POR: (‘0’, ‘1’, x = Unknown)		

bit 31-23 **Unimplemented:** Read as ‘0’

bit 22 **WAKFIL:** CAN Bus Line Filter Enable bit
1 = Use CAN bus line filter for wake-up
0 = CAN bus line filter is not used for wake-up

bit 21-19 **Unimplemented:** Read as ‘0’

bit 18-16 **SEG2PH<2:0>:** Phase Buffer Segment 2 bits(1,4)
111 = Length is 8 x TQ
•
•
•
000 = Length is 1 x TQ

bit 15 **SEG2PHTS:** Phase Segment 2 Time Select bit(1)
1 = Freely programmable
0 = Maximum of SEG1PH or Information Processing Time, whichever is greater

bit 14 **SAM:** Sample of the CAN Bus Line bit(2)
1 = Bus line is sampled three times at the sample point
0 = Bus line is sampled once at the sample point

bit 13-11 **SEG1PH<2:0>:** Phase Buffer Segment 1 bits(4)
111 = Length is 8 x TQ
•
•
•
000 = Length is 1 x TQ

Note 1: SEG2PH ≤ SEG1PH. If SEG2PHTS is clear, SEG2PH will be set automatically.
2: 3 Time bit sampling is not allowed for BRP < 2.
3: SJW ≤ SEG2PH.
4: The Time Quanta per bit must be greater than 7 (that is, TQBIT > 7).

Note: This register can only be modified when the CAN module is in Configuration mode (OPMOD<2:0> (CiCON<23:21>) = 100).

REGISTER 30-2: CiCFG: CAN BAUD RATE CONFIGURATION REGISTER (CONTINUED)

bit 10-8 **PRSEG<2:0>:** Propagation Time Segment bits(4)
111 = Length is 8 x TQ
•
•
•
000 = Length is 1 x TQ

bit 7-6 **SJW<1:0>:** Synchronization Jump Width bits(3)
11 = Length is 4 x TQ
10 = Length is 3 x TQ
01 = Length is 2 x TQ
00 = Length is 1 x TQ

bit 5-0 **BRP<5:0>:** Baud Rate Prescaler bits
111111 = TQ = (2 x 64)/TPBCLK5
111110 = TQ = (2 x 63)/TPBCLK5
•
•
•
000001 = TQ = (2 x 2)/TPBCLK5
000000 = TQ = (2 x 1)/TPBCLK5

Note 1: SEG2PH ≤ SEG1PH. If SEG2PHTS is clear, SEG2PH will be set automatically.
2: 3 Time bit sampling is not allowed for BRP < 2.
3: SJW ≤ SEG2PH.
4: The Time Quanta per bit must be greater than 7 (that is, TQBIT > 7).

Note:	This register can only be modified when the CAN module is in Configuration mode (OPMOD<2:0> (CiCON<23:21>) = 100).

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-0 **CiFIFOBA<31:0>:** CAN FIFO Base Address bits

These bits define the base address of all message buffers. Individual message buffers are located based on the size of the previous message buffers. This address is a physical address. Note that bits <1:0> are read-only and read '0', forcing the messages to be 32-bit word-aligned in device RAM.

Note 1: This bit is unimplemented and will always read '0', which forces word-alignment of messages.

Note: This register can only be modified when the CAN module is in Configuration mode (OPMOD<2:0> (CiCON<23:21>) = 100).

REGISTER 30-20: CiFIFOCONn: CAN FIFO CONTROL REGISTER (n = 0 THROUGH 31)

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

	TXEN	TXABAT(2)	TXLARB(3)	TXERR(3)	TXREQ	RTREN	TXPR<1:0>	

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-21 **Unimplemented:** Read as '0'

bit 20-16 **FSIZE<4:0>:** FIFO Size bits(1)

11111 = FIFO is 32 messages deep

•

•

•

00010 = FIFO is 3 messages deep

00001 = FIFO is 2 messages deep

00000 = FIFO is 1 message deep

bit 15 **Unimplemented:** Read as '0'

bit 14 **FRESET:** FIFO Reset bits

1 = FIFO will be reset when bit is set, cleared by hardware when FIFO is reset. After setting, the user should poll if this bit is clear before taking any action

0 = No effect

bit 13 **UINC:** Increment Head/Tail bit

TXEN = 1: (FIFO configured as a Transmit FIFO)

When this bit is set the FIFO head will increment by a single message

TXEN = 0: (FIFO configured as a Receive FIFO)

When this bit is set the FIFO tail will increment by a single message

bit 12 **DONLY:** Store Message Data Only bit(1)

TXEN = 1: (FIFO configured as a Transmit FIFO)

This bit is not used and has no effect.

TXEN = 0: (FIFO configured as a Receive FIFO)

1 = Only data bytes will be stored in the FIFO

0 = Full message is stored, including identifier

bit 11-8 **Unimplemented:** Read as '0'

bit 7 **TXEN:** TX/RX Buffer Selection bit

1 = FIFO is a Transmit FIFO

0 = FIFO is a Receive FIFO

Note 1: These bits can only be modified when the CAN module is in Configuration mode (OPMOD<2:0> bits (CiCON<23:21>) = 100).

2: This bit is updated when a message completes (or aborts) or when the FIFO is reset.

3: This bit is reset on any read of this register or when the FIFO is reset.

REGISTER 30-20: CiFIFOCONn: CAN FIFO CONTROL REGISTER (n = 0 THROUGH 31)

bit 6 **TXABAT:** Message Aborted bit(2)
1 = Message was aborted
0 = Message completed successfully

bit 5 **TXLARB:** Message Lost Arbitration bit(3)
1 = Message lost arbitration while being sent
0 = Message did not loose arbitration while being sent

bit 4 **TXERR:** Error Detected During Transmission bit(3)
1 = A bus error occured while the message was being sent
0 = A bus error did not occur while the message was being sent

bit 3 **TXREQ:** Message Send Request
TXEN = 1: (FIFO configured as a Transmit FIFO)
Setting this bit to '1' requests sending a message.
The bit will automatically clear when all the messages queued in the FIFO are successfully sent
Clearing the bit to '0' while set ('1') will request a message abort.
TXEN = 0: (FIFO configured as a Receive FIFO)
This bit has no effect.

bit 2 **RTREN:** Auto RTR Enable bit
1 = When a remote transmit is received, TXREQ will be set
0 = When a remote transmit is received, TXREQ will be unaffected

bit 1-0 **TXPR<1:0>:** Message Transmit Priority bits
11 = Highest Message Priority
10 = High Intermediate Message Priority
01 = Low Intermediate Message Priority
00 = Lowest Message Priority

Note 1: These bits can only be modified when the CAN module is in Configuration mode (OPMOD<2:0> bits (CiCON<23:21>) = 100).
2: This bit is updated when a message completes (or aborts) or when the FIFO is reset.
3: This bit is reset on any read of this register or when the FIFO is reset.

REGISTER 30-21: CiFIFOINTn: CAN FIFO INTERRUPT REGISTER (n = 0 THROUGH 31)

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

bit 31-27 **Unimplemented:** Read as '0'

bit 26 **TXNFULLIE:** Transmit FIFO Not Full Interrupt Enable bit
1 = Interrupt enabled for FIFO not full
0 = Interrupt disabled for FIFO not full

bit 25 **TXHALFIE:** Transmit FIFO Half Full Interrupt Enable bit
1 = Interrupt enabled for FIFO half full
0 = Interrupt disabled for FIFO half full

bit 24 **TXEMPTYIE:** Transmit FIFO Empty Interrupt Enable bit
1 = Interrupt enabled for FIFO empty
0 = Interrupt disabled for FIFO empty

bit 23-20 **Unimplemented:** Read as '0'

bit 19 **RXOVFLIE:** Overflow Interrupt Enable bit
1 = Interrupt enabled for overflow event
0 = Interrupt disabled for overflow event

bit 18 **RXFULLIE:** Full Interrupt Enable bit
1 = Interrupt enabled for FIFO full
0 = Interrupt disabled for FIFO full

bit 17 **RXHALFIE:** FIFO Half Full Interrupt Enable bit
1 = Interrupt enabled for FIFO half full
0 = Interrupt disabled for FIFO half full

bit 16 **RXNEMPTYIE:** Empty Interrupt Enable bit
1 = Interrupt enabled for FIFO not empty
0 = Interrupt disabled for FIFO not empty

bit 15-11 **Unimplemented:** Read as '0'

bit 10 **TXNFULLIF:** Transmit FIFO Not Full Interrupt Flag bit(1)
TXEN = 1: (FIFO configured as a Transmit Buffer)
1 = FIFO is not full
0 = FIFO is full

TXEN = 0: (FIFO configured as a Receive Buffer)
Unused, reads '0'

Note 1: This bit is read-only and reflects the status of the FIFO.

REGISTER 30-21: CiFIFOINTn: CAN FIFO INTERRUPT REGISTER (n = 0 THROUGH 31)

bit 9 **TXHALFIF:** FIFO Transmit FIFO Half Empty Interrupt Flag bit(1)
TXEN = 1: (FIFO configured as a Transmit Buffer)
1 = FIFO is ≤ half full
0 = FIFO is > half full
TXEN = 0: (FIFO configured as a Receive Buffer)
Unused, reads '0'

bit 8 **TXEMPTYIF:** Transmit FIFO Empty Interrupt Flag bit(1)
TXEN = 1: (FIFO configured as a Transmit Buffer)
1 = FIFO is empty
0 = FIFO is not empty, at least 1 message queued to be transmitted
TXEN = 0: (FIFO configured as a Receive Buffer)
Unused, reads '0'

bit 7-4 **Unimplemented:** Read as '0'

bit 3 **RXOVFLIF:** Receive FIFO Overflow Interrupt Flag bit
TXEN = 1: (FIFO configured as a Transmit Buffer)
Unused, reads '0'
TXEN = 0: (FIFO configured as a Receive Buffer)
1 = Overflow event has occurred
0 = No overflow event occured

bit 2 **RXFULLIF:** Receive FIFO Full Interrupt Flag bit(1)
TXEN = 1: (FIFO configured as a Transmit Buffer)
Unused, reads '0'
TXEN = 0: (FIFO configured as a Receive Buffer)
1 = FIFO is full
0 = FIFO is not full

bit 1 **RXHALFIF:** Receive FIFO Half Full Interrupt Flag bit(1)
TXEN = 1: (FIFO configured as a Transmit Buffer)
Unused, reads '0'
TXEN = 0: (FIFO configured as a Receive Buffer)
1 = FIFO is ≥ half full
0 = FIFO is < half full

bit 0 **RXNEMPTYIF:** Receive Buffer Not Empty Interrupt Flag bit(1)
TXEN = 1: (FIFO configured as a Transmit Buffer)
Unused, reads '0'
TXEN = 0: (FIFO configured as a Receive Buffer)
1 = FIFO is not empty, has at least 1 message
0 = FIFO is empty

Note 1: This bit is read-only and reflects the status of the FIFO.

REGISTER 30-22: CiFIFOUAn: CAN FIFO USER ADDRESS REGISTER (n = 0 THROUGH 31)

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-0 **CiFIFOUAn<31:0>:** CAN FIFO User Address bits

TXEN = 1: (FIFO configured as a Transmit Buffer)

A read of this register will return the address where the next message is to be written (FIFO head).

TXEN = 0: (FIFO configured as a Receive Buffer)

A read of this register will return the address where the next message is to be read (FIFO tail).

Note 1: This bit will always read '0', which forces byte-alignment of messages.

Note:	This register is not guaranteed to read correctly in Configuration mode, and should only be accessed when the module is not in Configuration mode.

REGISTER 30-23: CiFIFOCIN: CAN MODULE MESSAGE INDEX REGISTER (n = 0 THROUGH 31)

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-5 **Unimplemented:** Read as '0'

bit 4-0 **CiFIFOCIn<4:0>:** CAN Side FIFO Message Index bits

TXEN = 1: (FIFO configured as a Transmit Buffer)

A read of this register will return an index to the message that the FIFO will next attempt to transmit.

TXEN = 0: (FIFO configured as a Receive Buffer)

A read of this register will return an index to the message that the FIFO will use to save the next message.

31.0 ETHERNET CONTROLLER

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 35. "Ethernet Controller"** (DS60001155), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The Ethernet controller is a bus host module that interfaces with an off-chip Physical Layer (PHY) to implement a complete Ethernet node in a system.

Key features of the Ethernet Controller include:

- Supports 10/100 Mbps data transfer rates
- Supports full-duplex and half-duplex operation
- Supports RMII and MII PHY interface
- Supports MIIM PHY management interface
- Supports both manual and automatic Flow Control
- RAM descriptor-based DMA operation for both receive and transmit path
- Fully configurable interrupts
- Configurable receive packet filtering
  - CRC check
  - 64-byte pattern match
  - Broadcast, multicast and unicast packets
  - Magic Packet™
  - 64-bit hash table
  - Runt packet
- Supports packet payload checksum calculation
- Supports various hardware statistics counters

Figure 31-1 illustrates a block diagram of the Ethernet controller.

FIGURE 31-1: ETHERNET CONTROLLER BLOCK DIAGRAM

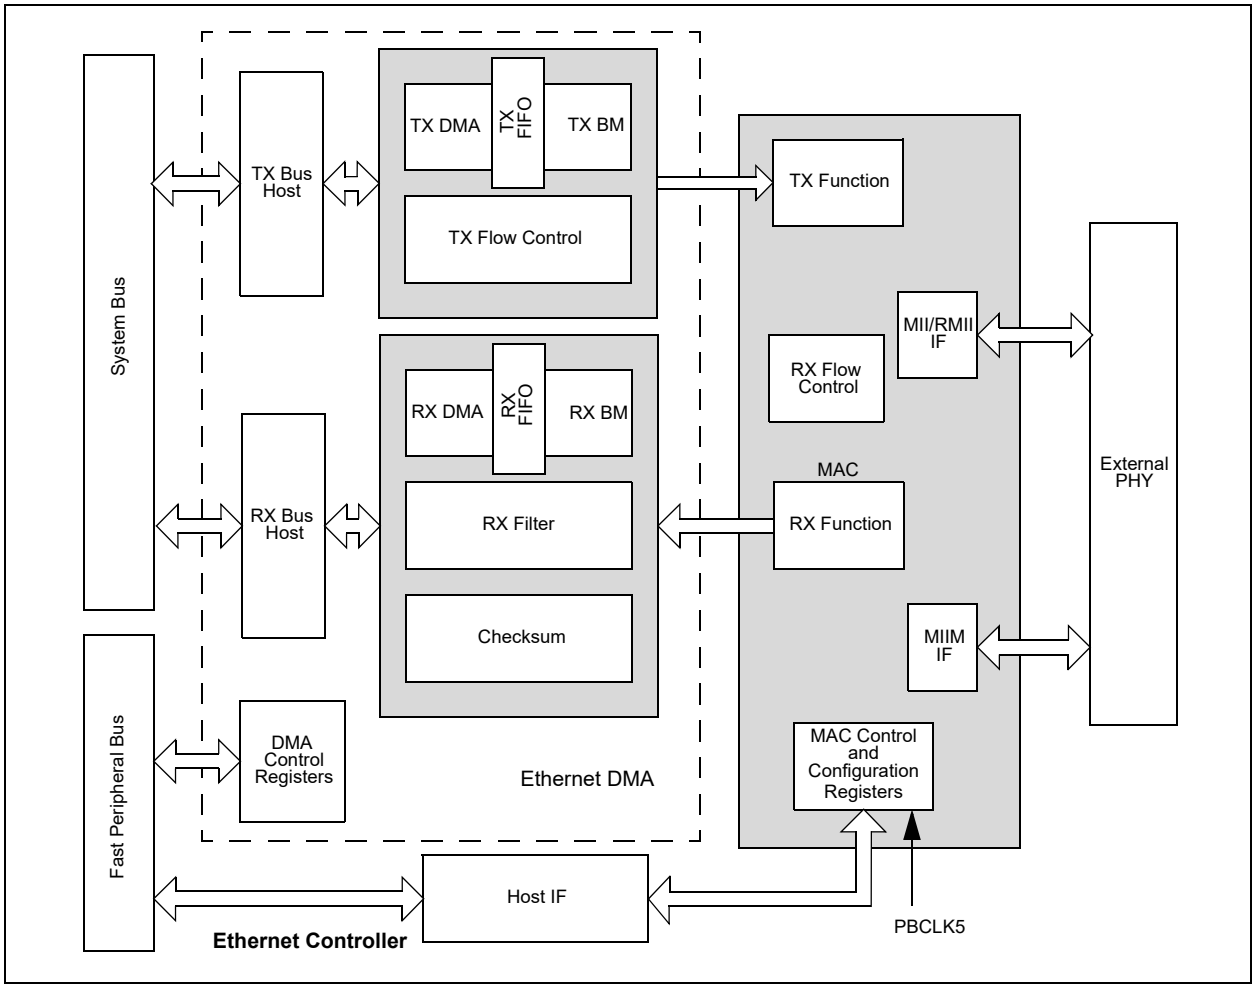

Table 31-1 and Table 31-2 show two interfaces and the associated pins that can be used with the Ethernet Controller.

TABLE 31-1: MII MODE DEFAULT INTERFACE SIGNALS (FMIIEN = 1, FETHIO = 1)

Pin Name	Description
EMDC	Management Clock
EMDIO	Management I/O
ETXCLK	Transmit Clock
ETXEN	Transmit Enable
ETXD0	Transmit Data
ETXD1	Transmit Data
ETXD2	Transmit Data
ETXD3	Transmit Data
ETXERR	Transmit Error
ERXCLK	Receive Clock
ERXDV	Receive Data Valid
ERXD0	Receive Data
ERXD1	Receive Data
ERXD2	Receive Data
ERXD3	Receive Data
ERXERR	Receive Error
ECRS	Carrier Sense
ECOL	Collision Indication

TABLE 31-2: RMII MODE DEFAULT INTERFACE SIGNALS (FMIIEN = 0, FETHIO = 1)

Pin Name	Description
EMDC	Management Clock
EMDIO	Management I/O
ETXEN	Transmit Enable
ETXD0	Transmit Data
ETXD1	Transmit Data
EREFCLK	Reference Clock
ECRSDV	Carrier Sense – Receive Data Valid
ERXD0	Receive Data
ERXD1	Receive Data
ERXERR	Receive Error

Note: Ethernet controller pins that are not used by selected interface can be used by other peripherals.

	ON	—	SIDL	—	—	—	TXRTS	RXEN(1)
7:0	R/W-0	U-0	U-0	R/W-0	U-0	U-0	U-0	R/W-0
	AUTOFC	—	—	MANFC	—	—	—	BUFCDEC

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **PTV<15:0>:** PAUSE Timer Value bits

PAUSE Timer Value used for Flow Control.
This register should only be written when RXEN (ETHCON1<8>) is not set.

These bits are only used for Flow Control operations.

bit 15 **ON:** Ethernet ON bit

1 = Ethernet module is enabled
0 = Ethernet module is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Ethernet Stop in Idle Mode bit

1 = Ethernet module transfers are paused during Idle mode
0 = Ethernet module transfers continue during Idle mode

bit 12-10 **Unimplemented:** Read as '0'

bit 9 **TXRTS:** Transmit Request to Send bit

1 = Activate the TX logic and send the packet(s) defined in the TX EDT
0 = Stop transmit (when cleared by software) or transmit done (when cleared by hardware)

After the bit is written with a '1', it will clear to a '0' whenever the transmit logic has finished transmitting the requested packets in the Ethernet Descriptor Table (EDT). If a '0' is written by the CPU, the transmit logic finishes the current packet's transmission and then stops any further.

This bit only affects TX operations.

bit 8 **RXEN:** Receive Enable bit(1)

1 = Enable RX logic, packets are received and stored in the RX buffer as controlled by the filter configuration
0 = Disable RX logic, no packets are received in the RX buffer

This bit only affects RX operations.

Note 1: It is not recommended to clear the RXEN bit and then make changes to any RX related field/register. The Ethernet Controller must be reinitialized (ON cleared to '0'), and then the RX changes applied.

REGISTER 31-1: ETHCON1: ETHERNET CONTROLLER CONTROL REGISTER 1 (CONTINUED)

bit 7 **AUTOFC:** Automatic Flow Control bit

1 = Automatic Flow Control is enabled
0 = Automatic Flow Control is disabled

Setting this bit will enable automatic Flow Control. If set, the full and empty watermarks are used to automatically enable and disable the Flow Control, respectively. When the number of received buffers BUFCNT (ETHSTAT<16:23>) rises to the full watermark, Flow Control is automatically enabled. When the BUFCNT falls to the empty watermark, Flow Control is automatically disabled.

This bit is only used for Flow Control operations and affects both TX and RX operations.

bit 6-5 **Unimplemented:** Read as '0'

bit 4 **MANFC:** Manual Flow Control bit

1 = Manual Flow Control is enabled
0 = Manual Flow Control is disabled

Setting this bit will enable manual Flow Control. If set, the Flow Control logic will send a PAUSE frame using the PAUSE timer value in the PTV register. It will then resend a PAUSE frame every 128 * PTV<15:0>/2 TX clock cycles until the bit is cleared.

Note: For 10 Mbps operation, TX clock runs at 2.5 MHz. For 100 Mbps operation, TX clock runs at 25 MHz.

When this bit is cleared, the Flow Control logic will automatically send a PAUSE frame with a 0x0000 PAUSE timer value to disable Flow Control.

This bit is only used for Flow Control operations and affects both TX and RX operations.

bit 3-1 **Unimplemented:** Read as '0'

bit 0 **BUFCDEC:** Descriptor Buffer Count Decrement bit

The BUFCDEC bit is a write-1 bit that reads as '0'. When written with a '1', the Descriptor Buffer Counter, BUFCNT, will decrement by one. If BUFCNT is incremented by the RX logic at the same time that this bit is written, the BUFCNT value will remain unchanged. Writing a '0' will have no effect.

This bit is only used for RX operations.

Note 1: It is not recommended to clear the RXEN bit and then make changes to any RX related field/register. The Ethernet Controller must be reinitialized (ON cleared to '0'), and then the RX changes applied.

REGISTER 31-2: ETHCON2: ETHERNET CONTROLLER CONTROL REGISTER 2

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **HTEN:** Enable Hash Table Filtering bit
1 = Enable Hash Table Filtering
0 = Disable Hash Table Filtering

bit 14 **MPEN:** Magic Packet™ Enable bit
1 = Enable Magic Packet Filtering
0 = Disable Magic Packet Filtering

bit 13 **Unimplemented:** Read as '0'

bit 12 **NOTPM:** Pattern Match Inversion bit
1 = The Pattern Match Checksum must not match for a successful Pattern Match to occur
0 = The Pattern Match Checksum must match for a successful Pattern Match to occur
This bit determines whether Pattern Match Checksum must match in order for a successful Pattern Match to occur.

bit 11-8 **PMMODE<3:0>:** Pattern Match Mode bits
1001 = Pattern match is successful if (NOTPM = 1 XOR Pattern Match Checksum matches) AND (Packet = Magic Packet)**(1,3)**
1000 = Pattern match is successful if (NOTPM = 1 XOR Pattern Match Checksum matches) AND (Hash Table Filter match)**(1,1)**
0111 = Pattern match is successful if (NOTPM = 1 XOR Pattern Match Checksum matches) AND (Destination Address = Broadcast Address)**(1)**
0110 = Pattern match is successful if (NOTPM = 1 XOR Pattern Match Checksum matches) AND (Destination Address = Broadcast Address)**(1)**
0101 = Pattern match is successful if (NOTPM = 1 XOR Pattern Match Checksum matches) AND (Destination Address = Unicast Address)**(1)**
0100 = Pattern match is successful if (NOTPM = 1 XOR Pattern Match Checksum matches) AND (Destination Address = Unicast Address)**(1)**
0011 = Pattern match is successful if (NOTPM = 1 XOR Pattern Match Checksum matches) AND (Destination Address = Station Address)**(1)**
0010 = Pattern match is successful if (NOTPM = 1 XOR Pattern Match Checksum matches) AND (Destination Address = Station Address)**(1)**
0001 = Pattern match is successful if (NOTPM = 1 XOR Pattern Match Checksum matches)**(1)**
0000 = Pattern Match is disabled; pattern match is always unsuccessful

Note 1: XOR = True when either one or the other conditions are true, but not both.
2: This Hash Table Filter match is active regardless of the value of the HTEN bit.
3: This Magic Packet Filter match is active regardless of the value of the MPEN bit.

Note 1: This register is only used for RX operations.
2: The bits in this register may only be changed while the RXEN bit (ETHCON1<8>) = 0.

REGISTER 31-11: ETHRXFC: ETHERNET CONTROLLER RECEIVE FILTER CONFIGURATION REGISTER (CONTINUED)

bit 7 **CRCERREN:** CRC Error Collection Enable bit
1 = The received packet CRC must be invalid for the packet to be accepted
0 = Disable CRC Error Collection filtering
This bit allows the user to collect all packets that have an invalid CRC.

bit 6 **CRCOKEN:** CRC OK Enable bit
1 = The received packet CRC must be valid for the packet to be accepted
0 = Disable CRC filtering
This bit allows the user to reject all packets that have an invalid CRC.

bit 5 **RUNTERREN:** Runt Error Collection Enable bit
1 = The received packet must be a runt packet for the packet to be accepted
0 = Disable Runt Error Collection filtering

This bit allows the user to collect all packets that are runt packets. For this filter, a runt packet is defined as any packet with a size of less than 64 bytes (when CRCOKEN = 0) or any packet with a size of less than 64 bytes that has a valid CRC (when CRCOKEN = 1).

bit 4 **RUNTEN:** Runt Enable bit
1 = The received packet must not be a runt packet for the packet to be accepted
0 = Disable Runt filtering

This bit allows the user to reject all runt packets. For this filter, a runt packet is defined as any packet with a size of less than 64 bytes.

bit 3 **UCEN:** Unicast Enable bit
1 = Enable Unicast Filtering
0 = Disable Unicast Filtering

This bit allows the user to accept all unicast packets whose Destination Address matches the Station Address.

bit 2 **NOTMEEN:** Not Me Unicast Enable bit
1 = Enable Not Me Unicast Filtering
0 = Disable Not Me Unicast Filtering

This bit allows the user to accept all unicast packets whose Destination Address does not match the Station Address.

bit 1 **MCEN:** Multicast Enable bit
1 = Enable Multicast Filtering
0 = Disable Multicast Filtering

This bit allows the user to accept all Multicast Address packets.

bit 0 **BCEN:** Broadcast Enable bit
1 = Enable Broadcast Filtering
0 = Disable Broadcast Filtering

This bit allows the user to accept all Broadcast Address packets.

Note 1: XOR = True when either one or the other conditions are true, but not both.
2: This Hash Table Filter match is active regardless of the value of the HTEN bit.
3: This Magic Packet Filter match is active regardless of the value of the MPEN bit.

Note 1: This register is only used for RX operations.
2: The bits in this register may only be changed while the RXEN bit (ETHCON1<8>) = 0.

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-15 **Unimplemented:** Read as '0'

bit 14 **TXBUSE:** Transmit BVCI Bus Error Interrupt bit(2)

1 = BVCI Bus Error has occurred
0 = BVCI Bus Error has not occurred

This bit is set when the TX DMA encounters a BVCI Bus error during a memory access. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 13 **RXBUSE:** Receive BVCI Bus Error Interrupt bit(2)

1 = BVCI Bus Error has occurred
0 = BVCI Bus Error has not occurred

This bit is set when the RX DMA encounters a BVCI Bus error during a memory access. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 12-10 **Unimplemented:** Read as '0'

bit 9 **EWMARK:** Empty Watermark Interrupt bit(2)

1 = Empty Watermark pointer reached
0 = No interrupt pending

This bit is set when the RX Descriptor Buffer Count is less than or equal to the value in the RXEWM bit (ETHRXWM<0:7>) value. It is cleared by BUFCNT bit (ETHSTAT<16:23>) being incremented by hardware. Writing a '0' or a '1' has no effect.

bit 8 **FWMARK:** Full Watermark Interrupt bit(2)

1 = Full Watermark pointer reached
0 = No interrupt pending

This bit is set when the RX Descriptor Buffer Count is greater than or equal to the value in the RXFWM bit (ETHRXWM<16:23>) field. It is cleared by writing the BUFCDEC (ETHCON1<0>) bit to decrement the BUFCNT counter. Writing a '0' or a '1' has no effect.

Note 1: This bit is only used for TX operations.
2: This bit is are only used for RX operations.

Note: It is recommended to use the SET, CLR, or INV registers to set or clear any bit in this register. Setting or clearing any bits in this register should only be done for debug/test purposes.

REGISTER 31-14: ETHIRQ: ETHERNET CONTROLLER INTERRUPT REQUEST REGISTER

bit 7 **RXDONE:** Receive Done Interrupt bit(2)

1 = RX packet was successfully received
0 = No interrupt pending

This bit is set whenever an RX packet is successfully received. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 6 **PKTPEND:** Packet Pending Interrupt bit(2)

1 = RX packet pending in memory
0 = RX packet is not pending in memory

This bit is set when the BUFCNT counter has a value other than '0'. It is cleared by either a Reset or by writing the BUFCDEC bit to decrement the BUFCNT counter. Writing a '0' or a '1' has no effect.

bit 5 **RXACT:** Receive Activity Interrupt bit(2)

1 = RX packet data was successfully received
0 = No interrupt pending

This bit is set whenever RX packet data is stored in the RXBM FIFO. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 4 **Unimplemented:** Read as '0'

bit 3 **TXDONE:** Transmit Done Interrupt bit(2)

1 = TX packet was successfully sent
0 = No interrupt pending

This bit is set when the currently transmitted TX packet completes transmission, and the Transmit Status Vector is loaded into the first descriptor used for the packet. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 2 **TXABORT:** Transmit Abort Condition Interrupt bit(2)

1 = TX abort condition occurred on the last TX packet
0 = No interrupt pending

This bit is set when the MAC aborts the transmission of a TX packet for one of the following reasons:

- Jumbo TX packet abort
- Underrun abort
- Excessive defer abort
- Late collision abort
- Excessive collisions abort

This bit is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 1 **RXBUFNA:** Receive Buffer Not Available Interrupt bit(2)

1 = RX Buffer Descriptor Not Available condition has occurred
0 = No interrupt pending

This bit is set by a RX Buffer Descriptor Overrun condition. It is cleared by either a Reset or a CPU write of a '1' to the CLR register.

bit 0 **RXOVFLW:** Receive FIFO Over Flow Error bit(2)

1 = RX FIFO Overflow Error condition has occurred
0 = No interrupt pending

RXOVFLW is set by the RXBM Logic for an RX FIFO Overflow condition. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

Note 1: This bit is only used for TX operations.
2: This bit is are only used for RX operations.

Note:	It is recommended to use the SET, CLR, or INV registers to set or clear any bit in this register. Setting or clearing any bits in this register should only be done for debug/test purposes.

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-24 **Unimplemented:** Read as '0'

bit 23-16 **BUFCNT<7:0>:** Packet Buffer Count bits(1)

Number of packet buffers received in memory. Once a packet has been successfully received, this register is incremented by hardware based on the number of descriptors used by the packet. Software decrements the counter (by writing to the BUFCDEC bit (ETHCON1<0>) for each descriptor used) after a packet has been read out of the buffer. The register does not roll over (0xFF to 0x00) when hardware tries to increment the register and the register is already at 0xFF. Conversely, the register does not roll under (0x00 to 0xFF) when software tries to decrement the register and the register is already at 0x0000. When software attempts to decrement the counter at the same time that the hardware attempts to increment the counter, the counter value will remain unchanged.

When this register value reaches 0xFF, the RX logic will halt (only if automatic Flow Control is enabled) awaiting software to write the BUFCDEC bit in order to decrement the register below 0xFF.

If automatic Flow Control is disabled, the RXDMA will continue processing and the BUFCNT will saturate at a value of 0xFF.

When this register is non-zero, the PKTPEND status bit will be set and an interrupt may be generated, depending on the value of the ETHIEN bit <PKTPENDIE> register.

When the ETHRXST register is written, the BUFCNT counter is automatically cleared to 0x00.

Note: BUFCNT will not be cleared when ON is set to '0'. This enables software to continue to utilize and decrement this count.

bit 15-8 **Unimplemented:** Read as '0'

bit 7 **ETHBUSY:** Ethernet Module busy bit(4,5)

1 = Ethernet logic has been turned on (ON (ETHCON1<15>) = 1) or is completing a transaction
0 = Ethernet logic is idle

This bit indicates that the module has been turned on or is completing a transaction after being turned off.

Note 1: This bit is only used for RX operations.
2: This bit is only affected by TX operations.
3: This bit is only affected by RX operations.
4: This bit is affected by TX and RX operations.
5: This bit will be *set* when the ON bit (ETHCON1<15>) = 1.
6: This bit will be *cleared* when the ON bit (ETHCON1<15>) = 0.

REGISTER 31-15: ETHSTAT: ETHERNET CONTROLLER STATUS REGISTER (CONTINUED)

bit 6 **TXBUSY:** Transmit Busy bit(2,6)

1 = TX logic is receiving data
0 = TX logic is idle

This bit indicates that a packet is currently being transmitted. A change in this status bit is not necessarily reflected by the TXDONE interrupt, as TX packets may be aborted or rejected by the MAC.

bit 5 **RXBUSY:** Receive Busy bit(3,6)

1 = RX logic is receiving data
0 = RX logic is idle

This bit indicates that a packet is currently being received. A change in this status bit is not necessarily reflected by the RXDONE interrupt, as RX packets may be aborted or rejected by the RX filter.

bit 4-0 **Unimplemented:** Read as '0'

Note 1: This bit is only used for RX operations.
2: This bit is only affected by TX operations.
3: This bit is only affected by RX operations.
4: This bit is affected by TX and RX operations.
5: This bit will be *set* when the ON bit (ETHCON1<15>) = 1.
6: This bit will be *cleared* when the ON bit (ETHCON1<15>) = 0.

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **SOFTRESET:** Soft Reset bit
Setting this bit will put the MACMII in reset. Its default value is '1'.

bit 14 **SIMRESET:** Simulation Reset bit
Setting this bit will cause a reset to the random number generator within the Transmit Function.

bit 13-12 **Unimplemented:** Read as '0'

bit 11 **RESETRMCS:** Reset MCS/RX bit
Setting this bit will put the MAC Control Sub-layer/Receive domain logic in reset.

bit 10 **RESETRFUN:** Reset RX Function bit
Setting this bit will put the MAC Receive function logic in reset.

bit 9 **RESETTMCS:** Reset MCS/TX bit
Setting this bit will put the MAC Control Sub-layer/TX domain logic in reset.

bit 8 **RESETTFUN:** Reset TX Function bit
Setting this bit will put the MAC Transmit function logic in reset.

bit 7-5 **Unimplemented:** Read as '0'

bit 4 **LOOPBACK:** MAC Loopback mode bit
1 = MAC Transmit interface is loop backed to the MAC Receive interface
0 = MAC normal operation

bit 3 **TXPAUSE:** MAC TX Flow Control bit
1 = PAUSE Flow Control frames are allowed to be transmitted
0 = PAUSE Flow Control frames are blocked

bit 2 **RXPAUSE:** MAC RX Flow Control bit
1 = The MAC acts upon received PAUSE Flow Control frames
0 = Received PAUSE Flow Control frames are ignored

bit 1 **PASSALL:** MAC Pass all Receive Frames bit
1 = The MAC will accept all frames regardless of type (Normal vs. Control)
0 = The received Control frames are ignored

bit 0 **RXENABLE:** MAC Receive Enable bit
1 = Enable the MAC receiving of frames
0 = Disable the MAC receiving of frames

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

REGISTER 31-24: EMAC1CFG2: ETHERNET CONTROLLER MAC CONFIGURATION 2 REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 25/16/8/0

	AUTO PAD(1,2)	VLAN PAD(1,2)	PAD ENABLE(1,3)	CRC ENABLE	DELAYCRC	HUGEFRM	LENGTHCK	FULLDPLX

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-15 **Unimplemented:** Read as '0'

bit 14 **EXCESSDER:** Excess Defer bit
1 = The MAC will defer to carrier indefinitely as per the Standard
0 = The MAC will abort when the excessive deferral limit is reached

bit 13 **BPNOBKOFF:** Backpressure/No Backoff bit
1 = The MAC after incidentally causing a collision during backpressure will immediately retransmit without backoff reducing the chance of further collisions and ensuring transmit packets get sent
0 = The MAC will not remove the backoff

bit 12 **NOBKOFF:** No Backoff bit
1 = Following a collision, the MAC will immediately retransmit rather than using the Binary Exponential Backoff algorithm as specified in the Standard
0 = Following a collision, the MAC will use the Binary Exponential Backoff algorithm

bit 11-10 **Unimplemented:** Read as '0'

bit 9 **LONGPRE:** Long Preamble Enforcement bit
1 = The MAC only allows receive packets which contain preamble fields less than 12 bytes in length
0 = The MAC allows any length preamble as per the Standard

bit 8 **PUREPRE:** Pure Preamble Enforcement bit
1 = The MAC will verify the content of the preamble to ensure it contains 0x55 and is error-free. A packet with errors in its preamble is discarded
0 = The MAC does not perform any preamble checking

bit 7 **AUTOPAD:** Automatic Detect Pad Enable bit(1,2)
1 = The MAC will automatically detect the type of frame, either tagged or untagged, by comparing the two octets following the source address with 0x8100 (VLAN Protocol ID) and pad accordingly
0 = The MAC does not perform automatic detection

Note 1: Table 31-4 provides a description of the pad function based on the configuration of this register.
2: This bit is ignored if the PADENABLE bit is cleared.
3: This bit is used in conjunction with the AUTOPAD and VLANPAD bits.

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware

REGISTER 31-24: EMAC1CFG2: ETHERNET CONTROLLER MAC CONFIGURATION 2 REGISTER

bit 6 **VLANPAD:** VLAN Pad Enable bit(1,2)
1 = The MAC will pad all short frames to 64 bytes and append a valid CRC
0 = The MAC does not perform padding of short frames

bit 5 **PADENABLE:** Pad/CRC Enable bit(1,3)
1 = The MAC will pad all short frames
0 = The frames presented to the MAC have a valid length

bit 4 **CRCENABLE:** CRC Enable1 bit
1 = The MAC will append a CRC to every frame whether padding was required or not. Must be set if the PADENABLE bit is set.
0 = The frames presented to the MAC have a valid CRC

bit 3 **DELAYCRC:** Delayed CRC bit
This bit determines the number of bytes, if any, of proprietary header information that exist on the front of the IEEE 802.3 frames.
1 = Four bytes of header (ignored by the CRC function)
0 = No proprietary header

bit 2 **HUGEFRM:** Huge Frame enable bit
1 = Frames of any length are transmitted and received
0 = Huge frames are not allowed for receive or transmit

bit 1 **LENGTHCK:** Frame Length checking bit
1 = Both transmit and receive frame lengths are compared to the Length/Type field. If the Length/Type field represents a length then the check is performed. Mismatches are reported on the transmit/receive statistics vector.
0 = Length/Type field check is not performed

bit 0 **FULLDPLX:** Full-Duplex Operation bit
1 = The MAC operates in Full-Duplex mode
0 = The MAC operates in Half-Duplex mode

Note 1: Table 31-4 provides a description of the pad function based on the configuration of this register.
2: This bit is ignored if the PADENABLE bit is cleared.
3: This bit is used in conjunction with the AUTOPAD and VLANPAD bits.

Note:	Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware

TABLE 31-4: PAD OPERATION

Type	AUTOPAD	VLANPAD	PADENABLE	Action
Any	x	x	0	No pad, check CRC
Any	0	0	1	Pad to 60 Bytes, append CRC
Any	x	1	1	Pad to 64 Bytes, append CRC
Any	1	0	1	If untagged: Pad to 60 Bytes, append CRC If VLAN tagged: Pad to 64 Bytes, append CRC

bit 31-7 **Unimplemented:** Read as '0'

bit 6-0 **B2BIPKTGP<6:0>:** Back-to-Back Interpacket Gap bits

This is a programmable field representing the nibble time offset of the minimum possible period between the end of any transmitted packet to the beginning of the next. In Full-Duplex mode, the register value should be the desired period in nibble times minus 3. In Half-Duplex mode, the register value should be the desired period in nibble times minus 6. In Full-Duplex the recommended setting is 0x15 (21d), which represents the minimum IPG of 0.96 µs (in 100 Mbps) or 9.6 µs (in 10 Mbps). In Half-Duplex mode, the recommended setting is 0x12 (18d), which also represents the minimum IPG of 0.96 µs (in 100 Mbps) or 9.6 µs (in 10 Mbps).

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-15 **Unimplemented:** Read as '0'

bit 14-8 **NB2BIPKTGP1<6:0>:** Non-Back-to-Back Interpacket Gap Part 1 bits

This is a programmable field representing the optional carrierSense window referenced in section 4.2.3.2.1 "Deference" of the IEEE 80.23 Specification. If carrier is detected during the timing of IPGR1, the MAC defers to carrier. If, however, carrier becomes after IPGR1, the MAC continues timing IPGR2 and transmits, knowingly causing a collision, thus ensuring fair access to medium. Its range of values is 0x0 to IPGR2. Its recommend value is 0xC (12d).

bit 7 **Unimplemented:** Read as '0'

bit 6-0 **NB2BIPKTGP2<6:0>:** Non-Back-to-Back Interpacket Gap Part 2 bits

This is a programmable field representing the non-back-to-back Inter-Packet-Gap. Its recommended value is 0x12 (18d), which represents the minimum IPG of 0.96 µs (in 100 Mbps) or 9.6 µs (in 10 Mbps).

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

bit 31-14 **Unimplemented:** Read as '0'

bit 13-8 **CWINDOW<5:0>:** Collision Window bits

This is a programmable field representing the slot time or collision window during which collisions occur in properly configured networks. Since the collision window starts at the beginning of transmission, the preamble and SFD is included. Its default of 0x37 (55d) corresponds to the count of frame bytes at the end of the window.

bit 7-4 **Unimplemented:** Read as '0'

bit 3-0 **RETX<3:0>:** Retransmission Maximum bits

This is a programmable field specifying the number of retransmission attempts following a collision before aborting the packet due to excessive collisions. The Standard specifies the maximum number of attempts (attemptLimit) to be 0xF (15d). Its default is '0xF'.

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15-0 **MACMAXF<15:0>:** Maximum Frame Length bits(1)

These bits reset to 0x05EE, which represents a maximum receive frame of 1518 octets. An untagged maximum size Ethernet frame is 1518 octets. A tagged frame adds four octets for a total of 1522 octets. If a shorter/longer maximum length restriction is desired, program this 16-bit field.

Note 1: If a proprietary header is allowed, this bit should be adjusted accordingly. For example, if 4-byte headers are prepended to frames, MACMAXF could be set to 1527 octets. This would allow the maximum VLAN tagged frame plus the 4-byte header.

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-12 **Unimplemented:** Read as '0'

bit 11 **RESETRMII:** Reset RMII Logic bit(1)
1 = Reset the MAC RMII module
0 = Normal operation.

bit 10-9 **Unimplemented:** Read as '0'

bit 8 **SPEEDRMII:** RMII Speed bit(1)
This bit configures the Reduced MII logic for the current operating speed.
1 = RMII is running at 100 Mbps
0 = RMII is running at 10 Mbps

bit 7-0 **Unimplemented:** Read as '0'

Note 1: This bit is only used for the RMII module.

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

REGISTER 31-30: EMAC1TEST: ETHERNET CONTROLLER MAC TEST REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-3 **Unimplemented:** Read as '0'

bit 2 **TESTBP:** Test Backpressure bit

1 = The MAC will assert backpressure on the link. Backpressure causes preamble to be transmitted, raising carrier sense. A transmit packet from the system will be sent during backpressure.

0 = Normal operation

bit 1 **TESTPAUSE:** Test PAUSE bit(1)

1 = The MAC Control sub-layer will inhibit transmissions, just as if a PAUSE Receive Control frame with a non-zero pause time parameter was received

0 = Normal operation

bit 0 **SHRTQNTA:** Shortcut PAUSE Quanta bit(1)

1 = The MAC reduces the effective PAUSE Quanta from 64 byte-times to 1 byte-time

0 = Normal operation

Note 1: This bit is only used for testing purposes.

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **RESETMGMT:** Test Reset MII Management bit
1 = Reset the MII Management module
0 = Normal Operation

bit 14-6 **Unimplemented:** Read as '0'

bit 5-2 **CLKSEL<3:0>:** MII Management Clock Select 1 bits(1)
These bits are used by the clock divide logic in creating the MII Management Clock (MDC), which the IEEE 802.3 Specification defines to be no faster than 2.5 MHz. Some PHYs support clock rates up to 12.5 MHz.

bit 1 **NOPRE:** Suppress Preamble bit
1 = The MII Management will perform read/write cycles without the 32-bit preamble field. Some PHYs support suppressed preamble
0 = Normal read/write cycles are performed

bit 0 **SCANINC:** Scan Increment bit
1 = The MII Management module will perform read cycles across a range of PHYs. The read cycles will start from address 1 through the value set in EMAC1MADR<PHYADDR>
0 = Continuous reads of the same PHY

Note 1: Table 31-5 provides a description of the clock divider encoding.

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-4 **Unimplemented:** Read as '0'

bit 3 **LINKFAIL:** Link Fail bit

When '1' is returned - indicates link fail has occurred. This bit reflects the value last read from the PHY status register.

bit 2 **NOTVALID:** MII Management Read Data Not Valid bit

When '1' is returned - indicates an MII management read cycle has not completed and the Read Data is not yet valid.

bit 1 **SCAN:** MII Management Scanning bit

When '1' is returned - indicates a scan operation (continuous MII Management Read cycles) is in progress.

bit 0 **MIIMBUSY:** MII Management Busy bit

When '1' is returned - indicates MII Management module is currently performing an MII Management Read or Write cycle.

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

bit 31-16 **Reserved:** Maintain as '0'; ignore read

bit 15-8 **STNADDR2<7:0>:** Station Address Octet 2 bits
These bits hold the second transmitted octet of the station address.

bit 7-0 **STNADDR1<7:0>:** Station Address Octet 1 bits
These bits hold the most significant (first transmitted) octet of the station address.

Note 1: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

2: This register is loaded at reset from the factory preprogrammed station address.

32.0 COMPARATOR

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 19. "Comparator"** (DS60001110), which is available from the *Documentation* > *Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

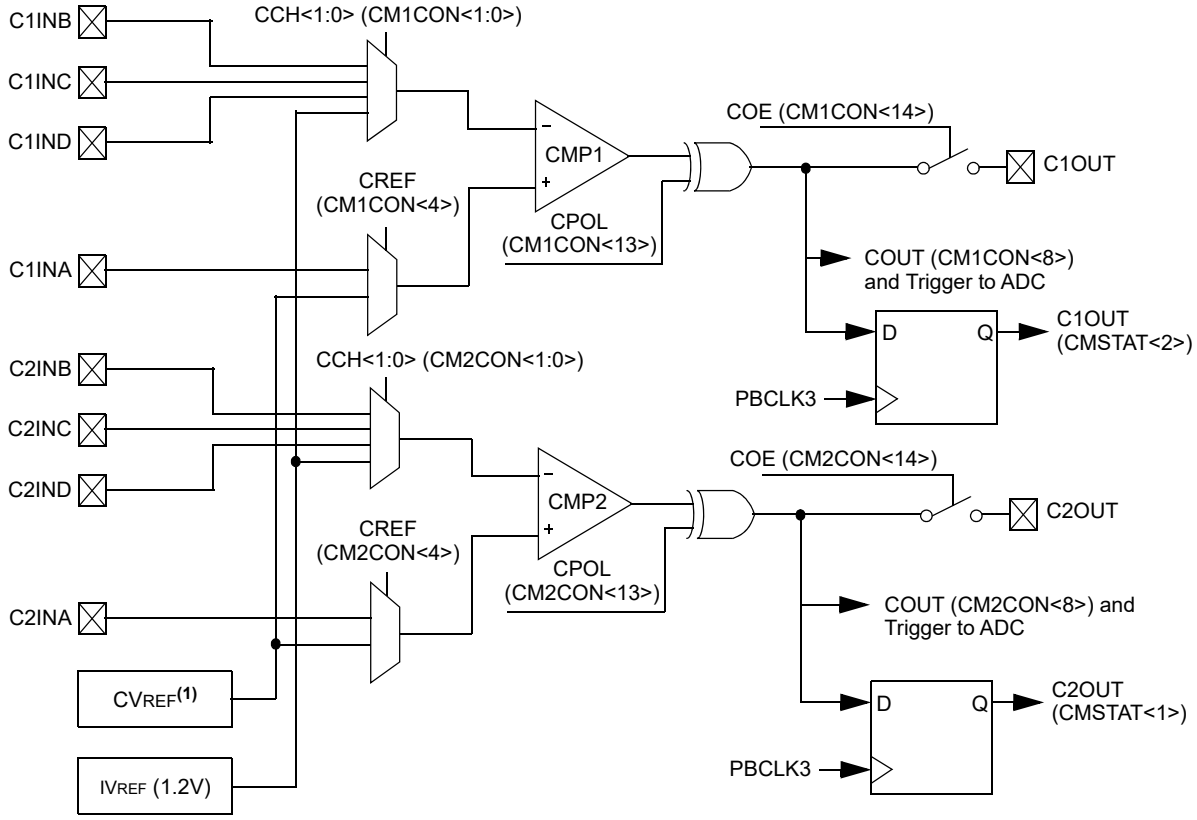
The Analog Comparator module consists of two comparators that can be configured in a variety of ways.

Key features of the Analog Comparator module are:

- Differential inputs
- Rail-to-rail operation
- Selectable output polarity
- Selectable inputs:
  - Analog inputs multiplexed with I/O pins
  - On-chip internal absolute voltage reference
  - Comparator voltage reference (CVREF)
- Selectable interrupt generation

A block diagram of the comparator module is illustrated in Figure 32-1.

FIGURE 32-1: COMPARATOR BLOCK DIAGRAM



Note 1: Internally connected. See **Section 33.0 "Comparator Voltage Reference (CVREF)"** for more information.

32.1 Comparator Control Registers

33.0 COMPARATOR VOLTAGE REFERENCE (CVREF)

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 20. "Comparator Voltage Reference (CVREF)"** (DS60001109), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The CVREF module is a 16-tap, resistor ladder network that provides a selectable reference voltage. Although its primary purpose is to provide a reference for the analog comparators, it also may be used independently of them.

The resistor ladder is segmented to provide two ranges of voltage reference values and has a power-down function to conserve power when the reference is not being used. The module's supply reference can be provided from either device VDDIO/VSS or an external voltage reference. The CVREF output is available for the comparators and typically available for pin output.

The comparator voltage reference has the following features:

- High and low range selection
- Sixteen output levels available for each range
- Internally connected to comparators to conserve device pins
- Output can be connected to a pin

A block diagram of the CVREF module is illustrated in Figure 33-1.

FIGURE 33-1: COMPARATOR VOLTAGE REFERENCE BLOCK DIAGRAM

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ON:** Comparator Voltage Reference On bit
- 1 = Module is enabled
  Setting this bit does not affect other bits in the register.
- 0 = Module is disabled and does not consume current.
  Clearing this bit does not affect the other bits in the register.

bit 14-7 **Unimplemented:** Read as '0'

bit 6 **CVROE:** CV_{REFOUT} Enable bit
- 1 = Voltage level is output on CV_{REFOUT} pin
- 0 = Voltage level is disconnected from CV_{REFOUT} pin

bit 5 **CVRR:** CV_{REF} Range Selection bit
- 1 = 0 to 0.67 CV_{RSRC}, with $CV_{RSRC}/24$ step size
- 0 = 0.25 CV_{RSRC} to 0.75 CV_{RSRC}, with $CV_{RSRC}/32$ step size

bit 4 **CVRSS:** CV_{REF} Source Selection bit
- 1 = Comparator voltage reference source, $CV_{RSRC} = (V_{REF}+) – (V_{REF}-)$
- 0 = Comparator voltage reference source, $CV_{RSRC} = AV_{DD} – AV_{SS}$

bit 3-0 **CVR<3:0>:** CV_{REF} Value Selection $0 \le CVR<3:0> \le 15$ bits

When CVRR = 1:
$CV_{REF} = (CVR<3:0>/24) \bullet (CV_{RSRC})$

When CVRR = 0:
$CV_{REF} = 1/4 \bullet (CV_{RSRC}) + (CVR<3:0>/32) \bullet (CV_{RSRC})$

NOTES:

34.0 HIGH/LOW-VOLTAGE DETECT (HLVD)

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 38. "High/Low-Voltage Detect (HLVD)"** (DS60001408), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The High/Low-Voltage Detect (HLVD) module is a programmable circuit that allows the user to specify both the device voltage trip point and the direction of change.

The HLVD module provides the following features:

- Hysteresis detection
- Low-to-high or high-to-low voltage change detection
- Generation of Non-Maskable Interrupts (NMI)
- LVDIN pin to provide external voltage trip point

FIGURE 34-1: HIGH/LOW-VOLTAGE DETECT (HLVD) MODULE BLOCK DIAGRAM

Note 1: To avoid false HLVD events, all HLVD module setting changes should occur only when the module is disabled (ON = 0). See Table 44-6 in **44.0 "Electrical Characteristics"** for the actual trip points.

2: Once this bit is set to '1', it can only be cleared by disabling or enabling the HLVD module (or through the HLVDMD bit).

35.0 CHARGE TIME MEASUREMENT UNIT (CTMU)

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 37. "Charge Time Measurement Unit (CTMU)"** (DS60001167), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The Charge Time Measurement Unit (CTMU) is a flexible analog module that has a configurable current source with a digital configuration circuit built around it. The CTMU can be used for differential time measurement between pulse sources and can be used for generating an asynchronous pulse. By working with other on-chip analog modules, the CTMU can be used for high resolution time measurement, measure capacitance, measure relative changes in capacitance or generate output pulses with a specific time delay. The CTMU is ideal for interfacing with capacitive-based sensors.

The CTMU module includes the following key features:

- Up to 35 channels available for capacitive or time measurement input (AN5 to AN39)
- On-chip precision current source
- 16-edge input trigger sources
- Selection of edge or level-sensitive inputs
- Polarity control for each edge source
- Control of edge sequence
- Control of response to edges
- High precision time measurement
- Time delay of external or internal signal asynchronous to system clock
- Integrated temperature sensing diode
- Control of current source during auto-sampling
- Four current source ranges
- Time measurement resolution of one nanosecond

A block diagram of the CTMU is shown in Figure 35-1.

1 = Trigger output is enabled
0 = Trigger output is disabled

bit 7-2 **ITRIM<5:0>:** Current Source Trim bits
011111 = Maximum positive change from nominal current
011110
•
•
•
000001 = Minimum positive change from nominal current
000000 = Nominal current output specified by IRNG<1:0>
111111 = Minimum negative change from nominal current
•
•
•
100010
100001 = Maximum negative change from nominal current

bit 1-0 **IRNG<1:0>:** Current Range Select bits(3)
11 = 100 times base current
10 = 10 times base current
01 = Base current level
00 = 1000 times base current(4)

Note 1: When this bit is set for Pulse Delay Generation, the EDG2SEL<2:0> bits must be set to '1110' to select the C2OUT pin.

2: The ADC module Sample and Hold capacitor is not automatically discharged between sample/conversion cycles. Software using the ADC as part of a capacitive measurement, must discharge the ADC capacitor before conducting the measurement. The IDISSEN bit, when set to '1', performs this function. The ADC module must be sampling while the IDISSEN bit is active to connect the discharge sink to the capacitor array.

3: Refer to the CTMU Current Source Specifications (Table 44-20) in **Section 44.0 "Electrical Characteristics"** for current values.

4: This bit setting is not available for the CTMU temperature diode.

NOTES:

36.0 GRAPHICS LCD (GLCD) CONTROLLER

Note 1: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 54. "Graphics LCD Controller"** (DS60001379), which is available from the *Documentation* > *Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The Graphics LCD (GLCD) Controller is designed to directly interface with display panels with up to 24-bit color depth.

The GLCD Controller transfers display data from a memory device and formats it for a display device. The memory may be internal RAM or DDR2.

The parallel interface at the pins will operate at standard 3.3V output, requires 28 pins for 24-bit color, and is shared by general purpose I/O functions.

Key features of the GLCD Controller include:

- Supports a 50 MHz Pixel Clock (dependent on DDR2 bandwidth)
- Up to 800x480 (WVGA) with Overlay and smaller with three Overlay layers. High resolution is possible with smaller displays.
- Color depths: 8-bit, 16-bit, 18-bit, and 24-bit

  Note: 16-bit color depth is supported through the GLCDMODE bit (CFGCON2<30>). When set, functions shared with GD0, GD1, GD2, GD8, GD9, GD16, GD17, GD18 are available for general purpose use.

- Up to three design timing layers, each including:
  - Configurable Alpha blending
  - Configurable Stride and Pitch
- Input formats: RGBA8888, ARGB8888, RGB888, RGB565, RGBA5551, YUYV, RGB332, LUT8, and Gray-scale
- Output formats: RGB888, RGB666, BT.656
- Dithering for 18-bit displays
- High-quality YUV conversion
- Global color palette look-up table (CLUT) supporting 256 colors
- Global gamma correction, brightness and contrast support
- Programmable cursors supporting 16 colors
- Programmable polarity on HSYNC, VSYNC, DE, and PCLK
- Integrated DMA to offload the CPU
- Programmable (level/edge) interrupt on HSYNC and VSYNC

The following table provides the RGB color mapping in 16 bit and 24 bit modes with GLCD output signals.

TABLE 36-1: RGB COLOR MAPPING

GLCD signal on pin	GD23	GD22	GD21	GD20	GD19	GD18	GD17	GD16	GD15	GD14	GD13	GD12	GD11	GD10	GD9	GD8	GD7	GD6	GD5
24 bit color	B7	B6	B5	B4	B3	B2	B1	B0	G7	G6	G5	G4	G3	G2	G1	G0	R7	R6	R5
16 bit color	B7	B6	B5	B4	B3	x	x	x	G7	G6	G5	G4	G3	G2	x	x	R7	R6	R5

Figure 36-1 shows a block diagram of the GLCD Controller interface.

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-24 **Unimplemented:** Read as '0'

bit 23-16 **RED<7:0>:** Cursor Lookup Table Red Component bit

bit 15-8 **GREEN<7:0>:** Cursor Lookup Table Green Component bit

bit 7-0 **BLUE<7:0>:** Cursor Lookup Table Blue Component bit

Note: The bits in this register contain the 8-bit RGB color value (0-255).

37.0 2-D GRAPHICS PROCESSING UNIT (GPU)

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the documents listed in the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The 2-D Graphics Processing Unit manipulates and alters the contents of the frame buffer in system RAM or DDR2 memory to accelerate the rendering of images for eventual pixel display. Hardware acceleration is brought to numerous 2-D applications, such as graphics user interfaces (menus, objects, and so on).

The 2-D GPU also provides accelerated on-the-fly rendering of vertical and horizontal lines, rectangles, copying of a rectangular area between different locations in memory. Once initiated, the hardware will perform the rendering through DMA, which makes the CPU available for other tasks.

A block diagram showing the interface for the 2-D Graphics Processing Unit is provided in Figure 37-1.

Note: For this peripheral, no hardware interface is documented. Use the Nano-2D Library, which is available in MPLAB Harmony, to manage this module.

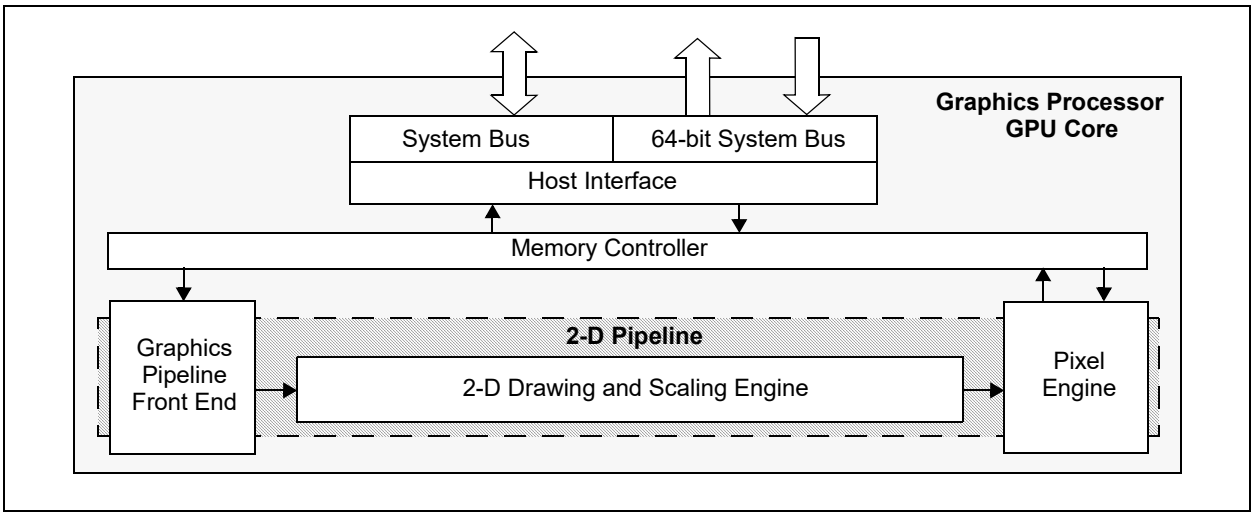
The following are key features of the 2-D Graphics Processing Unit:

- 64-bit bus access to memory (higher throughput)
- Global clock gating (low power)
- Command buffers
- Fixed Functions:
  - Line draw
  - Rectangle fill
  - Rectangle clear
  - Bit blit (stretch/shrink/filter)
  - Programmable raster operation (ROP2), with full alpha blending and transparency
- Source data formats:
  - RGBA8888, RGB565, RGB5551, 8-bit Index
- Destination data formats:
  - RGBA8888, RGB565, RGB5551
- Dithering (18-bit)
- Orientation in 90-degree steps
- Clipping

Note 1: For RGB source formats, their related swizzle formats, such as ARGB and RGBA are supported.

2: The GPU is enabled and ready out of POR. However, the GPU can be soft Reset at run-time using the GPURESET bit (CFGCON2<0>). Make sure that the GPUMD bit is set to '0' and wait 10 µs before toggling the GPURESET bit to achieve proper soft Reset.

FIGURE 37-1: 2-D GRAPHICS PROCESSING UNIT BLOCK DIAGRAM



NOTES:

38.0 DDR2 SDRAM CONTROLLER

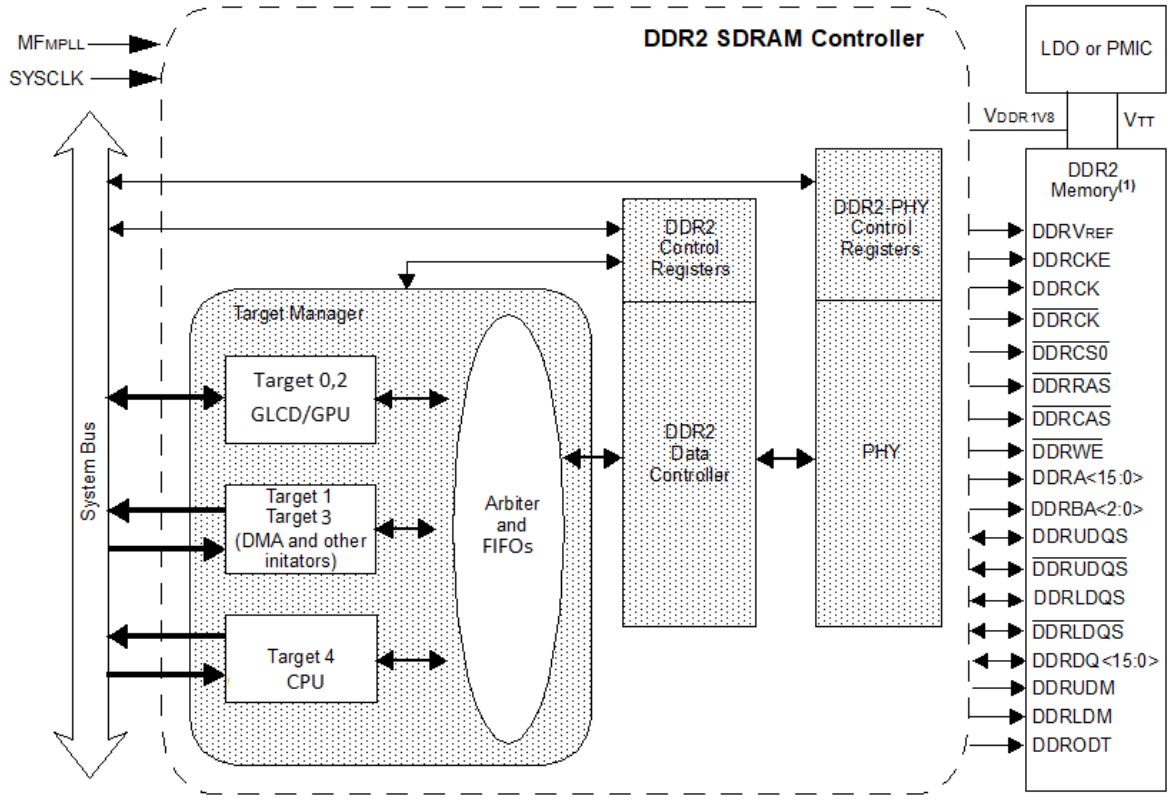
Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 55. "DDR SDRAM Controller"** (DS60001321‘), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The DDR2 SDRAM Controller implements the controls for an external memory bus interface using the Dual Data Rate version 2 (DDR2) protocol and electrical interface that adheres to the JEDEC Standard JESD79-2F (Nov. 2009).

The component consists of a DDR2 SDRAM Controller Core with configurable options and a DDR2 Physical Interface.

A block diagram showing how these components interface is provided in Figure 38-1.

FIGURE 38-1: DDR2 SDRAM CONTROLLER BLOCK DIAGRAM



Note 1: DDR2 memory is internal in 169-pin LFBGA and 176-pin LQFP packages and is external in 288-pin LFBGA packages.

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-8 **Unimplemented:** Read as '0'

bit 7-0 **TSEL<7:0>:** Target Select bits

These bits select the target to program arbitration parameters. This field must be set before an arbitration parameter is programmed for a target. The value in this field represents the target number (0-4) multiplied by the field size of the arbitration parameter.

REGISTER 38-2: DDRMINLIM: DDR MINIMUM BURST LIMIT REGISTER

	—	—	—	MINLIMIT<4:0>				

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-5 **Unimplemented:** Read as '0'

bit 4-0 **MINLIMIT<4:0>:** Minimum Burst Limit bits

These bits determine the minimum number of DDR bursts (two cycles per burst) that a target must have uninterrupted access to without interference from another target.

Note: The TSEL<7:0> bits (DDRTSEL<7:0>) must be programmed with the target number multiplied by the size of the MINLIMIT field (5) before this register is used to program the minimum burst limit for that target.

REGISTER 38-3: DDRRQPER: DDR REQUEST PERIOD REGISTER

This bit specifies the minimum number of clocks required before normal operation after exiting Self Refresh mode.

bit 29 **NXTDATAVDLY:** Next Data Available Delay bit 4

These bits specify the minimum number of clock cycles required between a Write command and the write data transfer handshake signal "next data request". Also, see the NXTDATAVDLY<3:0> bits (DDRXFERCFG<7:4>).

bit 28 **W2RCSDLY:** Write-to-Read Chip Select Delay bit 4

This bit specify the minimum number of clocks required between a write command and a read command to different Chip Selects. Also, see W2RCSDLY<3:0> (DDRDLYCFG0<7:4>).

bit 27 **W2RDLY:** Write-to-Read Delay bit 4

This bit specifies the minimum number of clocks required between a write command and a read command to the same Chip Select. Also, see W2RDLY<3:0> (DDRDLYCFG0<3:0>).

bit 26 **W2PCHRGDLY:** Write to Precharge Delay bit 4

These bits specify the minimum number of clocks required from a Write command to a Precharge command to the same bank as the write. Also, see WPCHRGDLY<3:0> (DDRDLYCFG2<15:12>).

bit 25-20 **PWRDNEXDLY<5:0>:** Power Down Exit Delay bits

These bits specify the minimum number of clocks required before normal operation after exiting Power Down mode.

bit 19-16 **PWRDNMINDLY<3:0>:** Power Down Minimum Delay bits

These bits specify the minimum number of clocks to stay in Power Down mode after entering it.

bit 15-8 **SLFREFEXDLY<7:0>:** Self Refresh Exit Delay bits

These bits specify the minimum number of clocks required before normal operation after exiting Self Refresh mode.

bit 7-0 **SLFREFMINDLY<7:0>:** Self Refresh Minimum Delay bits

These bits specify the minimum number of clocks to stay in Self Refresh mode after entering it.

bit 31-28 **RBENDDLY<3:0>:** Read Burst End Delay bits

These bits specify the minimum number of clocks required from issue of a Read command to the read data burst completion.

bit 27-24 **PCHRG2RASDLY<3:0>:** Precharge-to-RAS Delay bits

These bits specify the minimum number of clocks required from a Precharge command to a RAS command to the same bank.

bit 23-20 **RAS2CASDLY<3:0>:** RAS-to-CAS Delay bits

These bits specify the minimum number of clocks required from a RAS command to a CAS command to the same bank.

bit 19-16 **RAS2RASDLY<3:0>:** Write-to-Read Delay bits

These bits specify the minimum number of clocks required from a RAS command to a RAS command to a different bank on the same Chip Select.

bit 15-12 **W2PCHRGDLY<3:0>:** Write-to-Precharge Delay bits 3-0

These bits specify the minimum number of clocks required from a Write command to a Precharge command to the same bank as the write.

An overflow bit (DDRDLYCFG1<26>) is provided for delays greater than 15 clock cycles.

bit 11-8 **R2PCHRGDLY<3:0>:** Read-to-Precharge Delay bits

These bits specify the minimum number of clocks required from a read command to a Precharge command to the same bank as the read.

bit 7-4 **Unimplemented:** Read as '0'

bit 3-0 **PCHRGALLDLY<3:0>:** Precharge All Delay bits

These bits specify the minimum number of clocks required from a Precharge all banks command to an Activate or Refresh command.

bit 31-23 **Unimplemented:** Read as '0'

bit 22-20 **ODTWLEN<2:0>:** On-Die Termination Write Length bits
These bits specify the number of clocks ODT is turned on for writes.

bit 19 **Unimplemented:** Read as '0'

bit 18-16 **ODTRLEN<2:0>:** On-Die Termination Read Length bits
These bits specify the number of clocks ODT is turned on for reads.

bit 15-12 **ODTWDLY<3:0>:** On-Die Termination Write Delay bits
These bits specify the number of clocks after a Write command before turning on ODT to the DDR.

bit 11-8 **ODTRDLY<3:0>:** On-Die Termination Read Delay bits
These bits specify the number of clocks after a Read command before turning on ODT to the DDR.

bit 7-0 **ODTCSEN<7:0>:** On-Die Termination Chip Select Enable bits
These bits are used with the DDRODTENCFG register (Register 38-20) to program the ODT control for each Chip Select. The value in this field represents the number of Chip Selects multiplied by the Chip Select number to be programmed.

These bits define the bank address to use when running SCL.

bit 28-16 **SCLCOLADR<12:0>:** SCL Column Address bits
These bits define the column address to use when running SCL.

bit 15-0 **SCLROWADR<15:0>:** SCL Row Address bits
These bits define the row address to use when running SCL.

39.0 SECURE DIGITAL HOST CONTROLLER (SDHC)

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 57. "Secure Digital Host Controller (SDHC)"** (DS60001334), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The SDHC module uses a 32-bit System Bus host and client interface to connect the Host system and standard card interface on the device side.

The core has a built-in DMA controller so that data can be automatically transferred between system memory and the SD/SDIO/eMMC card without intervention from the CPU.

The SDHC module includes the following features:

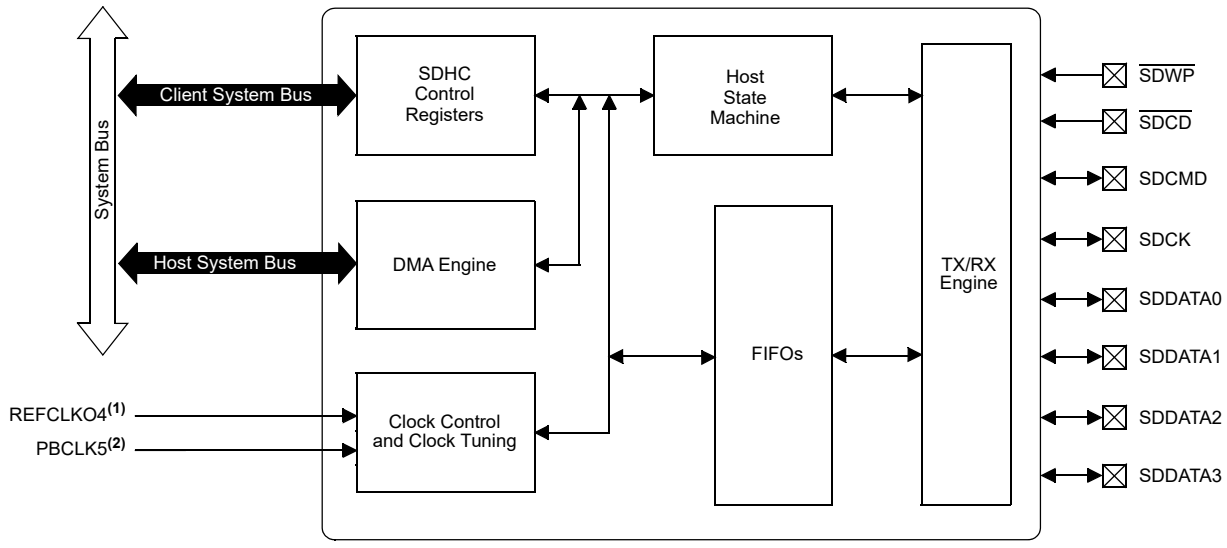
- SD Association specification compliance:
  - SD Host Controller Simplified Specification, version 2.00
  - Physical Layer Simplified Specification, version 2.00
  - SDIO Simplified Specification, version 2.00
- eMMC Standard: JESD84-A441
- Default and high-speed modes of operation
- 1-bit or 4-bit data transfers
- Built-in clock divider
- PIO and ADMA modes of data transfer
- 3.3V operation
- Interrupt support
- Stop at block gap

A block diagram of the SDHC module is provided in Figure 39-1.

Note 1: Transmit and receive buffer addresses in ADMA mode should be word-aligned. When multiple descriptors are used to transfer a single block, all but the last descriptor should have a transfer size in multiples of four.

2: REFCLKO4 must be less or equal to PBCLK5 when used as SDHC clock.

FIGURE 39-1: SECURE DIGITAL HOST CONTROLLER (SDHC) BLOCK DIAGRAM



Note 1: When configuring the REFCLKO4 clock source, a value of '0' for the ROTRIM<8:0> bits must be selected. REFCLKO4 must be turned on before SDHC Special Function Registers (SFR) access.

2: This clock source is only used for SDHC Special Function Register (SFR) access.

31:24	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	BCOUNT<15:8>(1)							
23:16	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	BCOUNT<7:0>(1)							
15:8	U-0	U-0	U-0	U-0	U-0	U-0	R/W-0	R/W-0
	—	—	—	—	—	—	BSIZE<9:8>(2)	
7:0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	BSIZE<7:0>(2)							

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **BCOUNT<31:0>:** Blocks Count for Current Transfer bits(1)
These bits represent the number of blocks. The software sets this value between 1 and 65,535 blocks and the SDHC decrements the count after each block transfer and stops when the count reaches zero.
0xFFFF = 65,535 blocks
0x0002 = 2 blocks
0x0001 = 1 block
0x0000 = Stop count Blocks Count for Current Transfer bits

bit 15-10 **Unimplemented:** Read as '0'

bit 9-0 **BSIZE<9:0>:** Transfer Block Size bits(2)
These bits specify the block size of the data transfer for CMD17, CMD18, CMD24, CMD25, and CMD53.
0x200 = 512 bytes
0x1FF = 511 bytes
•
•
•
0x002 = 2 bytes
0x001 = 1 byte
0x000 = No data transfer

Note 1: These bits are only used when the BCEN bit (SDHCMODE<1>) is set to '1' and is valid only for multiple block transfers. The BCOUNT<15:0> bits need not be set if the BSIZE bit (SDHCMODE<5>) is set to '0'.

2: These bits can only be accessed when no transactions are in progress. Read operations during transfers will return an invalid value and write operations to these bits will be ignored.

1 = Command index check is enabled
0 = Command index check is disabled

bit 19 **CCRCCEN:** Command CRC Check Enable bit(3)
1 = Command CRC check is enabled
0 = Command CRC check is disabled

bit 18 **Unimplemented:** Read as '0'

bit 17-16 **RESPTYPE<1:0>:** Response Type Select bits
11 = Response length 48; check busy after response
10 = Response length 48
01 = Response length 136
00 = No response

bit 15-6 **Unimplemented:** Read as '0'

bit 5 **BSEL:** Multiple/Single Block Select bit
1 = Multiple block, set when issuing multiple transfer commands using DAT lines
0 = Single block

Note 1: Refer to bits 45-40 of the command format in the *"SD Host Controller Simplified Specification"* (version 2.00).

2: If these bits are set to '1', the SDHC will check the index field in the response to see if it has the same value as the CIDX<5:0> bits, if not, it will be reported as a command index error.

3: If these bits are set to '1', the SDHC will check the CRC field in the response and reports a command CRC error upon a CRC error detection.

REGISTER 39-3: SDHCMODE: SDHC MODE REGISTER (CONTINUED)

bit 4 **DTXDSEL:** Data Transfer Direction Select bit
1 = Read (card to SDHC)
0 = Write (SDHC to card)

bit 3-2 **ACEN<1:0>:** Auto CMD12 Enable bits
Auto CMD12 is used to stop multiple-block read/write operations.
11 = Reserved
10 = Reserved
01 = Auto CMD12 is enabled
00 = Auto CMD 12 is disabled

bit 1 **BCEN:** Block Count Enable Bit
1 = Block count is enabled
0 = Block count is disabled

bit 0 **DMAEN:** DMA Enable bit
1 = DMA (ADMA) is used to transfer data
0 = CPU is used to transfer data

Note 1: Refer to bits 45-40 of the command format in the *"SD Host Controller Simplified Specification"* (version 2.00).

2: If these bits are set to '1', the SDHC will check the index field in the response to see if it has the same value as the CIDX<5:0> bits, if not, it will be reported as a command index error.

3: If these bits are set to '1', the SDHC will check the CRC field in the response and reports a command CRC error upon a CRC error detection.

bit 31-0 **ADDR<31:0>:** ADMA Address Register bits
These bits contain the address of the executing command of the ADMA descriptor table.

NOTES:

40.0 POWER-SAVING FEATURES

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 10. "Power-Saving Features"** (DS60001130), which is available from the *Documentation* > *Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

This section describes the power-saving features on the PIC32MZ DA devices. These devices have multiple power domains and offer various methods and modes that allow the user to balance the power consumption with device performance.

40.1 Power Saving with CPU Running

When the CPU is running, power consumption can be controlled by reducing the CPU clock frequency, lowering the speed of PBCLK7, or selecting a lower power clock source (i.e., LPRC or SOSC).

In addition, the Peripheral Bus Scaling mode is available for each peripheral bus where peripherals are clocked at reduced speed by selecting a higher divider for the associated PBCLKx, or by disabling the clock completely.

40.2 Power-Saving with CPU Halted

Peripherals and the CPU can be Halted or disabled to further reduce power consumption.

40.2.1 SLEEP MODE

Sleep mode has the lowest power consumption of the device power-saving operating modes. The CPU and most peripherals are Halted and the associated clocks are disabled. Select peripherals can continue to operate in Sleep mode and can be used to wake the device from Sleep. See the individual peripheral module sections for descriptions of behavior in Sleep mode.

Sleep mode includes the following characteristics:

- There can be a wake-up delay based on the oscillator selection
- The Fail-Safe Clock Monitor (FSCM) does not operate during Sleep mode
- The BOR circuit remains operative during Sleep mode
- The WDT, if enabled, is not automatically cleared prior to entering Sleep mode
- Some peripherals can continue to operate at limited functionality in Sleep mode. These peripherals include I/O pins that detect a change in the input signal, WDT, ADC, UART and peripherals that use an external clock input or the internal LPRC oscillator (e.g., RTCC, Timer1 and Input Capture).
- I/O pins continue to sink or source current in the same manner as they do when the device is not in Sleep

The processor will exit, or 'wake-up', from Sleep on one of the following events:

- On any interrupt from an enabled source that is operating in Sleep. The interrupt priority must be greater than the current CPU priority.
- On any form of device Reset
- On a WDT time-out

If the interrupt priority is lower than or equal to the current priority, the CPU will remain Halted, but the peripheral bus clocks will start running and the device will enter into Idle mode.

40.2.2 IDLE MODE

In Idle mode, the CPU is Halted; however, all clocks are still enabled. This allows peripherals to continue to operate. Peripherals can be individually configured to Halt when entering Idle by setting their respective SIDL bit. Latency, when exiting Idle mode, is very low due to the CPU oscillator source remaining active.

The device enters Idle mode when the SLPEN bit (OSCCON<4>) is clear and a `WAIT` instruction is executed.

The processor will wake or exit from Idle mode on the following events:

- On any interrupt event for which the interrupt source is enabled. The priority of the interrupt event must be greater than the current priority of the CPU. If the priority of the interrupt event is lower than or equal to current priority of the CPU, the CPU will remain Halted and the device will remain in Idle mode.
- On any form of device Reset
- On a WDT time-out interrupt

40.2.3 DEEP SLEEP MODE

Deep Sleep mode brings the device into its lowest power consumption state without requiring the use of external switches to remove power from the device.

- **Deep Sleep**
  In this mode, the CPU, RAM and most peripherals are powered down. Power is maintained to the DSGPR0 register and one or more of the RTCC, DSWDT and DSGPR1 through DSGPR32 registers.

Which of these peripherals is active depends on the state of the following register bits when Deep Sleep mode is entered:

- **RTCDIS (DSCON<12>)**
  This bit must be set to disable the RTCC in Deep Sleep mode (see Register 40-1).
- **DSWDTEN (DEVCFG2<27>)**
  This Configuration bit must be set to enable the DSWDT register in Deep Sleep mode (see Register 41-5)
- **DSGPREN (DSCON<13>)**
  This bit must be set to enable the DSGPR1 through DSGPR32 registers in Deep Sleep mode (see Register 40-1).

Note:	The Deep Sleep Control registers can only be accessed after the system unlock sequence has been performed. In addition, the Deep Sleep Control registers must be written twice.

In addition to the conditionally enabled peripherals described above, the $\overline{\text{MCLR}}$ filter and INT0 pin are enabled in Deep Sleep mode.

40.2.4 VBAT MODE

VBAT mode is similar to Deep Sleep mode, except that the device is powered from the VBAT pin. VBAT mode is controlled strictly by hardware, without any software intervention. Device enters VBAT mode upon VDDCORE Power-on Reset (refer to Table 44-4 for definitions of VPORCORE and VBATSW). An external power source must be connected to the VBAT pin before power is removed from VDDIO/VDDCORE to enter VBAT mode. VBAT is the lowest battery-powered mode that can maintain an RTCC. Wake-up from VBAT mode can only occur when VDDIO/VDDCORE is reapplied. The wake-up will appear to be a POR to the rest of the device.

In VBAT mode, the Deep Sleep Watchdog Timer is disabled. The RTCC and DSGPR1 through DSGPR32 registers may be enabled or disabled depending on the state of the RTCDIS bit (DSCON<12>) and the DSGPREN bit (DSCON<13>), respectively. Deep Sleep Persistent General Purpose Register 0 (DSGPR0) is always enabled in VBAT mode.

40.2.5 XLP POWER-SAVING MODES

Figure 40-1 shows a block diagram of the system domain for XLP devices and the related power-saving features. The various blocks are controlled by the following Configuration bit settings and SFRs:

- DSBOREN (DEVCFG2<20>)
- DSEN (DSCON<15>)
- DSGPREN (DSCON<13>)
- DSWDTEN (DEVCFG2<27>)
- DSWDTOSC (DEVCFG2<26>)
- RELEASE (DSCON<0>)
- RTCCLKSEL (RTCCON <9:8>)
- RTCDIS (DSCON<12>)
- SLPEN (OSCCON<4>)
- VREGS (PWRCON<0>)

	—	—	—	—	—	—	DSBOR(2)	RELEASE

Legend:	HC = Hardware Cleared	y = Value set from Configuration bits on POR
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **DSEN:** Deep Sleep Enable bit(1)
- 1 = Deep Sleep mode is entered on a WAIT instruction
- 0 = Sleep mode is entered on a WAIT instruction

bit 14 **Unimplemented:** Read as '0'

bit 13 **DSGPREN:** General Purpose Registers Enable bit
- 1 = General purpose register retention is enabled in Deep Sleep mode
- 0 = No general purpose register retention in Deep Sleep mode

bit 12 **RTCDIS:** RTCC Module Disable bit
- 1 = RTCC module is not enabled
- 0 = RTCC module is enabled

bit 11-9 **Unimplemented:** Read as '0'

bit 8 **RTCCWDIS:** RTCC Wake-up Disable bit
- 1 = Wake-up from RTCC is disabled
- 0 = Wake-up from RTCC is enabled

bit 7-2 **Unimplemented:** Read as '0'

bit 1 **DSBOR:** Deep Sleep BOR Event Status bit(2)
- 1 = DSBOREN was enabled and VDDIO dropped below the DSBOR threshold during Deep Sleep(2)
- 0 = DSBOREN was disabled, or VDDIO did not drop below the DSBOR threshold during Deep Sleep

bit 0 **RELEASE:** I/O Pin State Release bit
- 1 = Upon waking from Deep Sleep, the I/O pins maintain their previous states
- 0 = Release I/O pins and allow their respective TRIS and LAT bits to control their states

Note 1: To enter Deep Sleep mode, Sleep mode must be executed after setting the DSEN bit.

2: Unlike all other events, a Deep Sleep Brown-out Reset (BOR) event will not cause a wake-up from Deep Sleep mode; this bit is present only as a status bit.

	Deep Sleep Persistent General Purpose bits							
7:0	R/W-x	R/W-x	R/W-x	R/W-x	R/W-x	R/W-x	R/W-x	R/W-x
	Deep Sleep Persistent General Purpose bits							

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-0 Deep Sleep Persistent General Purpose bits

Note: The contents of the DSGPR0 register are retained, even in Deep Sleep and VBAT modes. The DSPGR1 through DSPGR32 registers are disabled by default in Deep Sleep and VBAT modes, but can be enabled with the DSGPREN bit (DSCON<13>). All register bits are reset only if a VDDCORE Power-on Reset (POR) event outside of Deep-Sleep mode.

40.4 Peripheral Module Disable

The Peripheral Module Disable (PMD) registers provide a method to disable a peripheral module by stopping all clock sources supplied to that module. When a peripheral is disabled using the appropriate PMD control bit, the peripheral is in a minimum power consumption state. The control and status registers associated with the peripheral are also disabled, so writes to those registers do not have effect and read values are invalid.

To disable a peripheral, the associated PMDx bit must be set to '1'. To enable a peripheral, the associated PMDx bit must be cleared (default). See Table 40-2 for more information.

Note: Disabling a peripheral module while it's ON bit is set, may result in undefined behavior. The ON bit for the associated peripheral module must be cleared prior to disable a module via the PMDx bits.

Note: When a peripheral is disabled with the PMD register, it resets the Interrupt Enable Control (IECx) and Interrupt Priority Control (IPCx) registers. When the peripheral is re-enabled with the PMD register, the IECx and IPCx registers must be configured again.

TABLE 40-2: PERIPHERAL MODULE DISABLE REGISTER SUMMARY

Note 1: The USB module must not be busy after clearing the associated ON bit and prior to setting the USBMD bit.

2: This peripheral is not available on all devices. Refer to the pin feature tables (Table 2 through Table 4) to determine availability.

40.4.1 CONTROLLING CONFIGURATION CHANGES

Because peripherals can be disabled during run time, some restrictions on disabling peripherals are needed to prevent accidental configuration changes. PIC32MZ DA devices include two features to prevent alterations to enabled or disabled peripherals:

- Control Register Lock Sequence
- Configuration Bit Select Lock

40.4.1.1 Control Register Lock

Under normal operation, writes to the PMDx registers are not allowed. Attempted writes appear to execute normally, but the contents of the registers remain unchanged. To change these registers, they must be unlocked in hardware. The register lock is controlled by the PMDLOCK Configuration bit (CFGCON<12>). Setting the PMDLOCK bit prevents writes to the control registers and clearing the PMDLOCK bit allows writes.

To set or clear the PMDLOCK bit, an unlock sequence must be executed. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

40.4.1.2 Configuration Bit Select Lock

As an additional level of safety, the device can be configured to prevent more than one write session to the PMDx registers. The PMDL1WAY Configuration bit (DEVCFG3<28>) blocks the PMDLOCK bit from being cleared after it has been set once. If the PMDLOCK bit remains set, the register unlock procedure does not execute, and the PPS control registers cannot be written to. The only way to clear the bit and re-enable PMD functionality is to perform a device Reset.

41.0 SPECIAL FEATURES

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. However, it is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 32. "Configuration"** (DS60001124) and **Section 33. "Programming and Diagnostics"** (DS60001129), which are available from the *Documentation* > *Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

PIC32MZ DA devices include several features intended to maximize application flexibility and reliability and minimize cost through elimination of external components. These are:

- Flexible device configuration
- Joint Test Action Group (JTAG) interface
- In-Circuit Serial Programming™ (ICSP™)
- Internal temperature sensor

41.1 Configuration Bits

PIC32MZ DA devices contain two Boot Flash memories (Boot Flash 1 and Boot Flash 2), each with an associated configuration space. These configuration spaces can be programmed to contain various device configurations. Configuration space that is aliased by the Lower Boot Alias memory region is used to provide values for the following Configuration registers. See **4.1.1 "Boot Flash Sequence and Configuration Spaces"** for more information.

- DEVSIGN0/ADEVSIGN0: Device Signature Word 0 Register
- DEVCP0/ADEVCP0: Device Code-Protect 0 Register
- DEVCFG0/ADEVCFG0: Device/Alternate Device Configuration Word 0
- DEVCFG1/ADEVCFG1: Device Configuration Word 1
- DEVCFG2/ADEVCFG2: Device Configuration Word 2
- DEVCFG3/ADEVCFG3: Device Configuration Word 3
- DEVCFG4/ADEVCFG4: Device Configuration Word 4
- DEVADCx: Device ADC Calibration Word 'x' ('x' = 0-4, 7)

The following run-time programmable Configuration registers provide additional configuration control:

- CFGCON: Configuration Control Register
- CFGEBIA: External Bus Interface Address Pin Configuration Register
- CFGEBIC: External Bus Interface Control Pin Configuration Register
- CFGPG: Permission Group Configuration Register
- CFGCON2: Configuration Control Register 2
- CFGMPLL: Memory PLL Configuration Register

In addition, the DEVID register (see Register 41-15) provides device and revision information and the DEVSN0 and DEVSN3 registers contain a unique serial number of the device (see Register 41-16).

Note: Do not use word program operation (NVMOP<3:0> = 0001) when programming the device words that are described in this chapter.

bit 27 **POSCAGC:** Primary Oscillator Automatic Gain Control bit

1 = Automatic gain control is enabled (default)
0 = Manual oscillator gain control

When the POSCAGC bit is enabled and POSC HS mode is selected, DEVCFG1<9:8> = '0b10 (i.e., POSCMOD), the Primary Oscillator will automatically do a linear search to find the lowest power/gain setting to guarantee oscillation with the users crystal.

Note: If the POSCMOD<1:0> bits (DEVCFG1/ADEVCFG1<9:8>_ = '0b00 (i.e., POSCMOD = EC mode), the POSCAGC bit must be set to '0'. POSCMOD = EC mode with POSCAGC = 1 is not permitted and will result in no oscillation.

bit 26 **Reserved:** Write as '1'

bit 25-24 **POSCAGCDLY<1:0>:** Primary Crystal AGC Gain Search Step Settling Time Control bits

11 = Approximately (25 ms, default)
10 = Approximately (6.25 ms)
01 = Approximately (400 ms)
00 = Approximately (100 ms)

Note 1: When the POSCAGC bit (DEVCFG0<27>) = 0 (i.e., manual oscillator gain control), these bits are not used. They are only used when AGC is enabled.

2: For POSC HS mode (DEVCFG1<9:8> = '0b10), the default setting should meet the user crystal requirements. Internally, there are a maximum of 16 and a minimum of one AGC linear gain search steps the logic may utilize before locking. A lock will occur when the crystal is oscillating and the amplitude of the crystal signal is between a max and min fixed internal threshold. The POSCAGCDLY is the time for each of the possible AGC search steps settling time to allow the crystal to startup and amplitude stabilize before determining if a lock is true or to continue to search for the required gain. The POSCAGCDLY<1:0> bits represent a balance between start-up time and crystal power optimization. The lower the POSCAGCDLY delay time the faster the crystal start-up time but potentially at a higher crystal power level. The higher the POSCAGCDLY delay time the slower the crystal start-up time but with a better crystal power optimization level (i.e., less power).

3: For resonators, due to their long start-up times it may be necessary to use a longer AGC gain step settling time. Note that resonators are not validated on PIC32MZ DA devices.

REGISTER 41-3: DEVCFG0/ADEVCFG0: DEVICE/ALTERNATE DEVICE CONFIGURATION WORD 0 (CONTINUED)

bit 23-22 **POSCFGAIN<1:0>:** Primary Crystal Oscillator Fine Gain Control bits
11 = Gain is G3 (default)
10 = Gain is G2
01 = Gain is G1
00 = Gain is G0

Note 1: G3 > G2 > G1 > G0.

2: When the POSCAGC bit (DEVCFG0<27>) = 1 (i.e., automatic gain control), or the POSCMOD<1:0> bits (DEVCFG1/ADEVCFG1<9:8>) ≠ '0b10 (i.e., HS Crystal mode), the POSCGAIN<1:0> bits are not used.

3: These bits are used in conjunction with DEVCFG0/ADEVCFG0<20:19>. In almost all cases, the crystal fine gain default setting of '0b11 will work with the users course gain setting selection.

bit 21 **POSCBOOST:** Primary Oscillator Boost bit
1 = Uses internal XTAL feedback gain resistor (Default, in which case the user application should not use any external XTAL feedback resistor in the crystal circuit)
0 = Disconnects the internal XTAL feedback resistor

bit 20-19 **POSCGAIN<1:0>:** Primary Crystal Oscillator Coarse Gain Control bits
11 = Gain Level 3 (highest)
10 = Gain Level 2
01 = Gain Level 1
00 = Gain Level 0 (lowest)

Note 1: G3 > G2 > G1 > G0.

2: When the POSCAGC bit (DEVCFG0<27>) = 1 (i.e., automatic gain control), or the POSCMOD<1:0> bits (DEVCFG1/ADEVCFG1<9:8>) ≠ '0b10 (i.e., HS crystal mode), the POSCGAIN<1:0> bits are not used.

bit 18 **SOSCBOOST:** Secondary Oscillator Kick Start Programmability bit
1 = Start up and operate with high-power SOSC internal buffer only. This option will consume more current than allowed in the XLP specifications.
0 = Start up with internal SOSC high-power buffer, and then switch to low-power buffer when the SOSC is stable.

bit 17-16 **SOSCGAIN<1:0>:** Secondary Oscillator Gain Control bits
If SOSCGAIN<2> = 0:
11 = Gain is G3 (default)
10 = Gain is G2
01 = Gain is G1
00 = Gain is G0

Note: G3 > G2 > G1 > G0.

bit 15 **SMCLR:** Soft Master Clear Enable bit
1 = MCLR pin generates a normal system Reset
0 = MCLR pin generates a POR

bit 14-12 **DBGPER<2:0>:** Debug Mode CPU Access Permission bits
1xx = Allow CPU access to Permission Group 2 permission regions
x1x = Allow CPU access to Permission Group 1 permission regions
xx1 = Allow CPU access to Permission Group 0 permission regions
0xx = Deny CPU access to Permission Group 2 permission regions
x0x = Deny CPU access to Permission Group 1 permission regions
xx0 = Deny CPU access to Permission Group 0 permission regions

Note: When the CPU is in Debug mode and the CPU1PG<1:0> bits (CFGPG<1:0>) are set to a denied permission group as defined by DBGPER<2:0>, the transaction request is assigned Group 3 permissions.

bit 11 **Reserved:** This bit is controlled by debugger/emulator development tools and should not be modified by the user.

REGISTER 41-3: DEVCFG0/ADEVCFG0: DEVICE/ALTERNATE DEVICE CONFIGURATION WORD 0 (CONTINUED)

bit 10 **FSLEEP:** Flash Sleep Mode bit
1 = Flash is powered down when the device is in Sleep mode
0 = Flash power down is controlled by the VREGS bit (PWRCON<0>)

bit 9-8 **FECCCON<1:0>:** Dynamic Flash ECC Configuration bits
11 = ECC and dynamic ECC are disabled (ECCCON<1:0> bits are writable)
10 = ECC and dynamic ECC are disabled (ECCCON<1:0> bits are locked)
01 = Dynamic Flash ECC is enabled (ECCCON<1:0> bits are locked)
00 = Flash ECC is enabled (ECCCON<1:0> bits are locked; disables word Flash writes)

Note: Upon a device POR, the value of these bits are copied by hardware into CFGCON<5:4> bits, (i.e. ECCCON<1:0>.

bit 7 **Reserved:** Write as '1'

bit 6 **BOOTISA:** Boot ISA Selection bit
1 = Boot code and Exception code is MIPS32
(ISAONEXC bit is set to '0' and the ISA<1:0> bits are set to '10' in the CP0 Config3 register)
0 = Boot code and Exception code is microMIPS
(ISAONEXC bit is set to '1' and the ISA<1:0> bits are set to '11' in the CP0 Config3 register)

bit 5 **TRCEN:** Trace Enable bit
1 = Trace features in the CPU are enabled
0 = Trace features in the CPU are disabled

bit 4-3 **ICESEL<1:0>:** In-Circuit Emulator/Debugger Communication Channel Select bits
11 = PGEC1/PGED1 pair is used
10 = PGEC2/PGED2 pair is used
01 = PGEC3/PGED3 pair is used
00 = Reserved

bit 2 **JTAGEN:** JTAG Enable bit
1 = JTAG is enabled
0 = JTAG is disabled

Note 1: On Reset, this Configuration bit is copied into JTAGEN (CFGCON<3>). If JTAGEN (DEVCFG0<2>) = 0, the JTAGEN bit cannot be set to '1' by the user application at run-time, as JTAG is always disabled. However, if JTAGEN (DEVCFG0<2>) = 1, the user application may enable/disable JTAG at run-time by simply writing JTAGEN (CFGCON<3> as required.

2: This bit sets the value of the JTAGEN bit in the CFGCON register.

bit 1-0 **DEBUG<1:0>:** Background Debugger Enable bits (forced to '11' if code-protect is enabled)
11 = 4-wire JTAG Enabled - PGECx/PGEDx Disabled - ICD module Disabled
10 = 4-wire JTAG Enabled - PGECx/PGEDx Disabled - ICD module Enabled
01 = PGECx/PGEDx Enabled - 4-wire JTAG I/F Disabled - ICD module Disabled
00 = PGECx/PGEDx Enabled - 4-wire JTAG I/F Disabled - ICD module Enabled

Note: When the FJTAGEN or JTAGEN bits are equal to '0', this prevents 4-wire JTAG debugging, but not PGECx/PGEDx debugging.

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-18 **Unimplemented:** Read as '0'

bit 17 **ICACLK:** Input Capture Alternate Clock Selection bit(1)

1 = Input Capture modules use an alternative Timer pair as their timebase clock
0 = All Input Capture modules use Timer2/3 as their timebase clock

bit 16 **OCACLK:** Output Compare Alternate Clock Selection bit(1)

1 = Output Compare modules use an alternative Timer pair as their timebase clock
0 = All Output Compare modules use Timer2/3 as their timebase clock

bit 15-14 **Unimplemented:** Read as '0'

bit 13 **IOLOCK:** Peripheral Pin Select Lock bit(1)

1 = Peripheral Pin Select is locked. Writes to PPS registers is not allowed.
0 = Peripheral Pin Select is not locked. Writes to PPS registers is allowed.

bit 12 **PMDLOCK:** Peripheral Module Disable bit(1)

1 = Peripheral module is locked. Writes to PMD registers is not allowed.
0 = Peripheral module is not locked. Writes to PMD registers is allowed.

bit 11 **PGLOCK:** Permission Group Lock bit(1)

1 = Permission Group registers are locked. Writes to PG registers are not allowed.
0 = Permission Group registers are not locked. Writes to PG registers are allowed.

bit 10-9 **Unimplemented:** Read as '0'

bit 8 **USBSSEN:** USB Suspend Sleep Enable bit(1)

Enables features for USB PHY clock shutdown in Sleep mode.

1 = USB PHY clock is shut down when Sleep mode is active
0 = USB PHY clock continues to run when Sleep is active

Note 1: To change this bit, the unlock sequence must be performed. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

2: The JTAGEN bit is only available at run-time when the JTAGEN (DEVCFG0<2>) fuse bit is set at start-up.

REGISTER 41-9: CFGCON: CONFIGURATION CONTROL REGISTER (CONTINUED)

bit 7 **IOANCPEN:** I/O Analog Charge Pump Enable bit

1 = Charge pumps are enabled
0 = Charge pumps are disabled

Note 1: For proper analog operation at VDD is less than 2.5V, the AICPMPEN bit (ADCCON1<12>) must be = 1 and the IOANCPEN bit must be set to '1'; however, the charge pumps will consume additional current. These bits should not be set if VDD is greater than 2.5V.

2: ADC throughput rate performance is reduced as defined in the table below if ADCCON1<AICPMPEN> = 1 and CFGCON<IOANCPEN> = 1.

ADC0	ADC1	ADC2	ADC3	ADC4	ADC7	Maximum combined
ON	OFF	OFF	OFF	OFF	OFF	2 MSPS
ON	ON	OFF	OFF	OFF	OFF	4 MSPS
ON	ON	ON	OFF	OFF	OFF	5 MSPS
OFF	OFF	OFF	ON	OFF	OFF	2 MSPS
OFF	OFF	OFF	ON	ON	OFF	4 MSPS

ON	ON	ON	ON	OFF	OFF	7 MSPS
ON	ON	ON	ON	ON	OFF	9 MSPS
ON	ON	ON	ON	ON	ON	10 MSPS

bit 6 **Unimplemented:** Read as '0'

bit 5-4 **ECCCON<1:0>:** Flash ECC Configuration bits

11 = ECC and dynamic ECC are disabled (ECCCON<1:0> bits are writable)
10 = ECC and dynamic ECC are disabled (ECCCON<1:0> bits are locked)
01 = Dynamic Flash ECC is enabled (ECCCON<1:0> bits are locked)
00 = Flash ECC is enabled (ECCCON<1:0> bits are locked; disables word Flash writes)

bit 3 **JTAGEN:** JTAG Port Enable bit(2)

1 = Enable the JTAG port
0 = Disable the JTAG port

bit 2 **TROEN:** Trace Output Enable bit

1 = Enable trace outputs and start trace clock (trace probe must be present)
0 = Disable trace outputs and stop trace clock

bit 1 **Unimplemented:** Read as '0'

bit 0 **TDOEN:** TDO Enable for 2-Wire JTAG

1 = 2-wire JTAG protocol uses TDO
0 = 2-wire JTAG protocol does not use TDO

Note 1: To change this bit, the unlock sequence must be performed. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

2: The JTAGEN bit is only available at run-time when the JTAGEN (DEVCFG0<2>) fuse bit is set at start-up.

bit 31 **GLCDPINEN:** Graphics Display Pin Enable bit
1 = GLCD pins are used by the GLCD module
0 = GLCD pins are available for general purpose use

bit 30 **GLCDMODE:** Graphics Display Mode bit(1)
1 = GLCD pins are set to RGB565 mode. Other GDx pins are available for general purpose use.
0 = GLCD pins are set to RGB888 mode

bit 29 **SDCDEN:** SD Card Detect Pin Enable bit
1 = $\overline{\text{SDCD}}$ pin is enabled for use by SDHC
0 = $\overline{\text{SDCD}}$ pin is available for general purpose use

bit 28 **SDWPEN:** SD card Write Protect Enable bit
1 = $\overline{\text{SDWP}}$ pin is enabled for use by SDHC
0 = $\overline{\text{SDWP}}$ pin is available for general purpose use

bit 27-26 **Unimplemented:** Read as '0'

bit 25-16 **SDWRFTHR<9:0>:** SDHC Write FIFO Threshold bits
SDHC FIFO threshold value in bytes (FIFO size is 512 bytes).

bit 15-14 **Unimplemented:** Read as '0'

bit 13-4 **SDRDFTHR<9:0>:** SDHC Read FIFO Threshold bits
SDHC FIFO threshold value in bytes (FIFO size is 512 bytes).

bit 3 **Reserved:** Read as '1'

bit 2 **SDWPPOL:** SD card Write Protect Polarity bit
1 = $\overline{\text{SDWP}}$ pin is Active-High
0 = $\overline{\text{SDWP}}$ pin is Active-Low

Note: This bit supports SD cards with different write-protect polarity types.

bit 1 **Unimplemented:** Read as '0'

bit 0 **GPURESET:** GPU Reset Bit
1 = Hold GPU in RESET
0 = Release RESET to the GPU module

Note: This bit is only used if the GPU functionality is to be enabled or disabled at run-time. Writing to this bit requires the GPUMD bit (PMD6<18>) be set to '0' (GPU is enabled).

Note 1: To use GLCD in RGB888 mode, the GLCDMODE bit should be set to '0', which will turn-off the general purpose I/O functionality on six additional pins. Refer to the specific package in **"Device Pin Tables"** for information on GDx pin sharing.

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-0 **SN<31:0>:** Device Unique Serial Number bits

Note: These registers contain a value, programmed during factory production test, that is unique to each unit and are user read only. These values are persistent and not erased even when a new application code is programmed into the device. These values can be used if desired as an encryption key in combination with the Microchip encryption library.

41.3 High-Voltage Detect (HVD1V8) on V_{DDR1V8}

The High-Voltage Detect (HVD) module monitors the DDR2 PHY voltage at the V_{DDR1V8} supply voltage (1.8V). If a dangerously high voltage is detected, the device is held in reset as long as the HVD condition persists.

Recovery from an HVD event is indicated by the HVD1V8R bit (RCON<29>).

41.4 On-Chip Voltage Regulator

The core and digital logic for all PIC32MZ DA devices is designed to operate at a nominal 1.2V. To simplify system designs, devices in the PIC32MZ DA family incorporate an on-chip regulator providing the required core logic voltage from V_{DDCORE}.

41.4.1 ON-CHIP REGULATOR AND POR

It takes a fixed delay for the on-chip regulator to generate an output. During this time, designated as T_{PU}, code execution is disabled. T_{PU} is applied every time the device resumes operation after any power-down, including Sleep mode.

41.4.2 ON-CHIP REGULATOR AND BOR

PIC32MZ DA devices also have a simple brown-out capability. If the voltage supplied to the regulator is inadequate to maintain a regulated level, the regulator Reset circuitry will generate a Brown-out Reset (BOR). This event is captured by the BOR Flag bit (RCON<1>). The brown-out voltage levels are specific in **Section 44.1 "DC Characteristics"**.

41.5 On-chip Temperature Sensor

PIC32MZ DA devices include a temperature sensor that provides accurate measurement of a device's junction temperature (see **Section 44.2 "AC Characteristics and Timing Parameters"** for more information).

The temperature sensor is connected to the ADC module and can be measured using the shared S&H circuit (see **Section 29.0 "12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC)"** for more information).

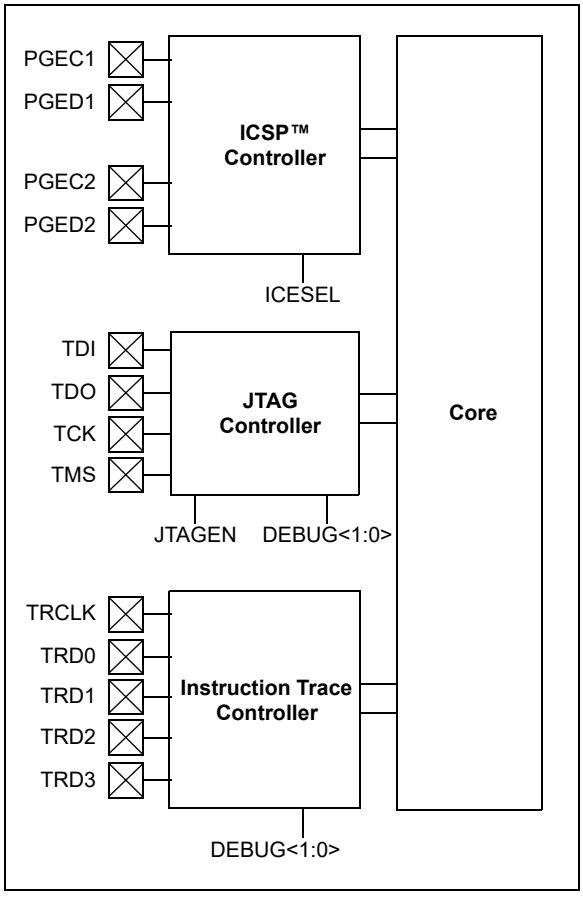
41.6 Programming and Diagnostics

PIC32MZ DA devices provide a complete range of programming and diagnostic features that can increase the flexibility of any application using them. These features allow system designers to include:

- Simplified field programmability using two-wire In-Circuit Serial Programming™ (ICSP™) interfaces
- Debugging using ICSP
- Programming and debugging capabilities using the EJTAG extension of JTAG
- JTAG boundary scan testing for device and board diagnostics

PIC32 devices incorporate two programming and diagnostic modules, and a trace controller, that provide a range of functions to the application developer.

FIGURE 41-1: BLOCK DIAGRAM OF PROGRAMMING, DEBUGGING AND TRACE PORTS



NOTES:

42.0 INSTRUCTION SET

The PIC32MZ Graphics (DA) Family family instruction set complies with the MIPS32® Release 2 instruction set architecture. The PIC32MZ DA device family *does not* support the following features:

- Core extend instructions
- Coprocessor 2 instructions

Note:	Refer to *"MIPS32® Architecture for Programmers Volume II: The MIPS32® Instruction Set"* at www.imgtec.com for more information.

NOTES:

43.0 DEVELOPMENT SUPPORT

The PIC® microcontrollers (MCU) and dsPIC® digital signal controllers (DSC) are supported with a full range of software and hardware development tools:

- Integrated Development Environment
  - MPLAB® X IDE Software
- Compilers/Assemblers/Linkers
  - MPLAB XC Compiler
  - MPASM™ Assembler
  - MPLINK™ Object Linker/ MPLIB™ Object Librarian
  - MPLAB Assembler/Linker/Librarian for Various Device Families
- Simulators
  - MPLAB X SIM Software Simulator
- Emulators
  - MPLAB REAL ICE™ In-Circuit Emulator
- In-Circuit Debuggers/Programmers
  - MPLAB ICD 3
  - PICkit™ 3
- Device Programmers
  - MPLAB PM3 Device Programmer
- Low-Cost Demonstration/Development Boards, Evaluation Kits and Starter Kits
- Third-party development tools

43.1 MPLAB X Integrated Development Environment Software

The MPLAB X IDE is a single, unified graphical user interface for Microchip and third-party software, and hardware development tool that runs on Windows®, Linux and Mac OS® X. Based on the NetBeans IDE, MPLAB X IDE is an entirely new IDE with a host of free software components and plug-ins for high-performance application development and debugging. Moving between tools and upgrading from software simulators to hardware debugging and programming tools is simple with the seamless user interface.

With complete project management, visual call graphs, a configurable watch window and a feature-rich editor that includes code completion and context menus, MPLAB X IDE is flexible and friendly enough for new users. With the ability to support multiple tools on multiple projects with simultaneous debugging, MPLAB X IDE is also suitable for the needs of experienced users.

Feature-Rich Editor:

- Color syntax highlighting
- Smart code completion makes suggestions and provides hints as you type
- Automatic code formatting based on user-defined rules
- Live parsing

User-Friendly, Customizable Interface:

- Fully customizable interface: toolbars, toolbar buttons, windows, window placement, etc.
- Call graph window

Project-Based Workspaces:

- Multiple projects
- Multiple tools
- Multiple configurations
- Simultaneous debugging sessions

File History and Bug Tracking:

- Local file history feature
- Built-in support for Bugzilla issue tracker

43.2 MPLAB XC Compilers

The MPLAB XC Compilers are complete ANSI C compilers for all of Microchip's 8, 16, and 32-bit MCU and DSC devices. These compilers provide powerful integration capabilities, superior code optimization and ease of use. MPLAB XC Compilers run on Windows, Linux or MAC OS X.

For easy source level debugging, the compilers provide debug information that is optimized to the MPLAB X IDE.

The free MPLAB XC Compiler editions support all devices and commands, with no time or memory restrictions, and offer sufficient code optimization for most applications.

MPLAB XC Compilers include an assembler, linker and utilities. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. MPLAB XC Compiler uses the assembler to produce its object file. Notable features of the assembler include:

- Support for the entire device instruction set
- Support for fixed-point and floating-point data
- Command-line interface
- Rich directive set
- Flexible macro language
- MPLAB X IDE compatibility

43.3 MPASM Assembler

The MPASM Assembler is a full-featured, universal macro assembler for PIC10/12/16/18 MCUs.

The MPASM Assembler generates relocatable object files for the MPLINK Object Linker, Intel® standard HEX files, MAP files to detail memory usage and symbol reference, absolute LST files that contain source lines and generated machine code, and COFF files for debugging.

The MPASM Assembler features include:

- Integration into MPLAB X IDE projects
- User-defined macros to streamline assembly code
- Conditional assembly for multipurpose source files
- Directives that allow complete control over the assembly process

43.4 MPLINK Object Linker/ MPLIB Object Librarian

The MPLINK Object Linker combines relocatable objects created by the MPASM Assembler. It can link relocatable objects from precompiled libraries, using directives from a linker script.

The MPLIB Object Librarian manages the creation and modification of library files of precompiled code. When a routine from a library is called from a source file, only the modules that contain that routine will be linked in with the application. This allows large libraries to be used efficiently in many different applications.

The object linker/library features include:

- Efficient linking of single libraries instead of many smaller files
- Enhanced code maintainability by grouping related modules together
- Flexible creation of libraries with easy module listing, replacement, deletion and extraction

43.5 MPLAB Assembler, Linker and Librarian for Various Device Families

MPLAB Assembler produces relocatable machine code from symbolic assembly language for PIC24, PIC32 and dsPIC DSC devices. MPLAB XC Compiler uses the assembler to produce its object file. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. Notable features of the assembler include:

- Support for the entire device instruction set
- Support for fixed-point and floating-point data
- Command-line interface
- Rich directive set
- Flexible macro language
- MPLAB X IDE compatibility

43.6 MPLAB X SIM Software Simulator

The MPLAB X SIM Software Simulator allows code development in a PC-hosted environment by simulating the PIC MCUs and dsPIC DSCs on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a comprehensive stimulus controller. Registers can be logged to files for further run-time analysis. The trace buffer and logic analyzer display extend the power of the simulator to record and track program execution, actions on I/O, most peripherals and internal registers.

The MPLAB X SIM Software Simulator fully supports symbolic debugging using the MPLAB XC Compilers, and the MPASM and MPLAB Assemblers. The software simulator offers the flexibility to develop and debug code outside of the hardware laboratory environment, making it an excellent, economical software development tool.

43.7 MPLAB REAL ICE In-Circuit Emulator System

The MPLAB REAL ICE In-Circuit Emulator System is Microchip's next generation high-speed emulator for Microchip Flash DSC and MCU devices. It debugs and programs all 8, 16 and 32-bit MCU, and DSC devices with the easy-to-use, powerful graphical user interface of the MPLAB X IDE.

The emulator is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with either a connector compatible with in-circuit debugger systems (RJ-11) or with the new high-speed, noise tolerant, Low-Voltage Differential Signal (LVDS) interconnection (CAT5).

The emulator is field upgradable through future firmware downloads in MPLAB X IDE. MPLAB REAL ICE offers significant advantages over competitive emulators including full-speed emulation, run-time variable watches, trace analysis, complex breakpoints, logic probes, a ruggedized probe interface and long (up to three meters) interconnection cables.

43.8 MPLAB ICD 3 In-Circuit Debugger System

The MPLAB ICD 3 In-Circuit Debugger System is Microchip's most cost-effective, high-speed hardware debugger/programmer for Microchip Flash DSC and MCU devices. It debugs and programs PIC Flash microcontrollers and dsPIC DSCs with the powerful, yet easy-to-use graphical user interface of the MPLAB IDE.

The MPLAB ICD 3 In-Circuit Debugger probe is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with a connector compatible with the MPLAB ICD 2 or MPLAB REAL ICE systems (RJ-11). MPLAB ICD 3 supports all MPLAB ICD 2 headers.

43.9 PICkit 3 In-Circuit Debugger/ Programmer

The MPLAB PICkit 3 allows debugging and programming of PIC and dsPIC Flash microcontrollers at a most affordable price point using the powerful graphical user interface of the MPLAB IDE. The MPLAB PICkit 3 is connected to the design engineer's PC using a full-speed USB interface and can be connected to the target via a Microchip debug (RJ-11) connector (compatible with MPLAB ICD 3 and MPLAB REAL ICE). The connector uses two device I/O pins and the Reset line to implement in-circuit debugging and In-Circuit Serial Programming™ (ICSP™).

43.10 MPLAB PM3 Device Programmer

The MPLAB PM3 Device Programmer is a universal, CE compliant device programmer with programmable voltage verification at $V_{DDIOMIN}$ and $V_{DDIOMAX}$ for maximum reliability. It features a large LCD display (128 x 64) for menus and error messages, and a modular, detachable socket assembly to support various package types. The ICSP cable assembly is included as a standard item. In Stand-Alone mode, the MPLAB PM3 Device Programmer can read, verify and program PIC devices without a PC connection. It can also set code protection in this mode. The MPLAB PM3 connects to the host PC via an RS-232 or USB cable. The MPLAB PM3 has high-speed communications and optimized algorithms for quick programming of large memory devices, and incorporates an MMC card for file storage and data applications.

43.11 Demonstration/Development Boards, Evaluation Kits, and Starter Kits

A wide variety of demonstration, development and evaluation boards for various PIC MCUs and dsPIC DSCs allows quick application development on fully functional systems. Most boards include prototyping areas for adding custom circuitry and provide application firmware and source code for examination and modification.

The boards support a variety of features, including LEDs, temperature sensors, switches, speakers, RS-232 interfaces, LCD displays, potentiometers and additional EEPROM memory.

The demonstration and development boards can be used in teaching environments, for prototyping custom circuits and for learning about various microcontroller applications.

In addition to the PICDEM™ and dsPICDEM™ demonstration/development board series of circuits, Microchip has a line of evaluation kits and demonstration software for analog filter design, KEELOQ® security ICs, CAN, IrDA®, PowerSmart battery management, SEEVAL® evaluation system, Sigma-Delta ADC, flow rate sensing, plus many more.

Also available are starter kits that contain everything needed to experience the specified device. This usually includes a single application and debug capability, all on one board.

Check the Microchip web page (www.microchip.com) for the complete list of demonstration, development and evaluation kits.

43.12 Third-Party Development Tools

Microchip also offers a great collection of tools from third-party vendors. These tools are carefully selected to offer good value and unique functionality.

- Device Programmers and Gang Programmers from companies, such as SoftLog and CCS
- Software Tools from companies, such as Gimpel and Trace Systems
- Protocol Analyzers from companies, such as Saleae and Total Phase
- Demonstration Boards from companies, such as MikroElektronika, Digilent® and Olimex
- Embedded Ethernet Solutions from companies, such as EZ Web Lynx, WIZnet and IPLogika®

44.0 ELECTRICAL CHARACTERISTICS

This section provides an overview of the PIC32MZ DA electrical characteristics. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the PIC32MZ DA devices are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these or any other conditions, above the parameters indicated in the operation listings of this specification, is not implied.

ABSOLUTE MAXIMUM RATINGS

(see Note1)

Ambient temperature under bias ..... -40°C to +85°C
Storage temperature ..... -65°C to +150°C
Voltage on V_{DDIO}, V_{DDCORE}, and V_{BAT} with respect to V_{SS} ..... -0.3V to +4.0V
Voltage on V_{DDR1V8} pin with respect to V_{SS1V8} ..... -0.5V to +1.98V
Voltage on DDR2 pins with respect to V_{SS1V8} ..... -0.3V to (V_{DDR1V8} + 0.3V)
Voltage on any pin that is not 5V tolerant, with respect to V_{SS} **(Note 3)** ..... -0.3V to (V_{DDIO} + 0.3V)
Voltage on any 5V tolerant pin with respect to V_{SS} when $V_{DDIO} \geq 2.2V$ **(Note 3)** ..... -0.3V to +5.5V
Voltage on any 5V tolerant pin with respect to V_{SS} when $V_{DDIO} < 2.2V$ **(Note 3)** ..... -0.3V to +3.6V
Voltage on D+ or D- pin with respect to V_{USB3V3} ..... -0.3V to (V_{USB3V3} + 0.3V)
Voltage on V_{BUS} with respect to V_{SS} ..... -0.3V to +5.5V
Maximum current out of V_{SS} pin(s) ..... 500 mA
Maximum current into V_{DDIO} pin(s) **(Note 2)** ..... 200 mA
Maximum current into V_{DDCORE} pin(s) **(Note 2)** ..... 300 mA
Maximum current into V_{DDR1V8} pin(s) **(Note 2)** ..... 270 mA
Maximum current out of V_{SS1V8} pin(s) ..... 270 mA
Maximum current sunk/sourced by DDR2 pin ..... 22 mA
Maximum current sunk/sourced by any 4x I/O pin **(Note 4)** ..... 15 mA
Maximum current sunk/sourced by any 8x I/O pin **(Note 4)** ..... 25 mA
Maximum current sunk/sourced by any 12x I/O pin **(Note 4)** ..... 33 mA
Maximum current sunk by all ports **(Note 5)** ..... 150 mA
Maximum current sourced by all ports **(Note 2, Note 5)** ..... 150 mA

ESD Qualification:

Human Body Model (HBM) per JESD22-A114 ..... 2000V
Machine Model (MM) per JESD22-A115 ..... 200V
Changed Device Model (CDM) AEC Q100-011 (ANSI/ESD STM 5.3.1) 500V

Note 1: Stresses above those listed under **"Absolute Maximum Ratings"** may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions, above those indicated in the operation listings of this specification, is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

2: Maximum allowable current is a function of device maximum power dissipation (see Table 44-2).

3: See the pin name tables (Table 5 through Table 7) for the 5V tolerant pins.

4: Characterized, but not tested. Refer to parameters DO10, DO20, and DO20a for the 4x, 8x, and 12x I/O pin lists.

5: Excludes DDR2 pins.

44.1 DC Characteristics

TABLE 44-1: OPERATING MIPS VS. VOLTAGE

Characteristic	V_{DDIO} Range (in Volts) (Note 1)	V_{DDCORE} Range (in Volts) (Note 1)	Temp. Range (in °C)	Max. Frequency	Comments
				PIC32MZ DA Devices	
DC5	2.2V-3.6V	1.7V-1.9V	-40°C to +85°C	200 MHz	—

Note 1: Overall functional device operation below operating voltages guaranteed (but not characterized) until Reset is issued. All device Analog modules, when enabled, will function, but with degraded performance below operating voltages. Refer to Table 44-5 for Reset values.

TABLE 44-2: THERMAL OPERATING CONDITIONS

Rating	Symbol	Min.	Typ.	Max.	Unit
Industrial Temperature Devices					
Operating Junction Temperature Range	T_J	-40	—	+125	°C
Operating Ambient Temperature Range	T_A	-40	—	+85	°C
Power Dissipation: Internal Chip Power Dissipation (Device without DDR2): $P_{INT} = V_{DDIO} \times (I_{DDIO} - \Sigma I_{OH}) + V_{DDCORE} \times I_{DDCORE}$ Internal Chip Power Dissipation (Device with DDR2): $P_{INT} = V_{DDIO} \times (I_{DDIO} - \Sigma I_{OH}) + V_{DDCORE} \times I_{DDCORE} + V_{DDR1V8} \times I_{DDR1V8}$ **I/O Pin Power Dissipation**: $P_{I/O} = \Sigma (\{V_{DDIO} - V_{OH}\} \times I_{OH}) + \Sigma (V_{OL} \times I_{OL})$	P_D	$P_{INT} + P_{I/O}$			W
Maximum Allowed Power Dissipation	P_{DMAX}	$(T_J - T_A)/\theta_{JA}$			W

TABLE 44-3: THERMAL PACKAGING CHARACTERISTICS

Characteristics	Symbol	Typ.	Max.	Unit	Notes
Package Thermal Resistance, 169-pin LFBGA (11x11x1.4 mm)	θ_{JA}	25	—	°C/W	**1**
Package Thermal Resistance, 169-pin LFBGA (11x11x1.56 mm)	θ_{JA}	23.5	—	°C/W	**1,2**
Package Thermal Resistance, 176-pin LQFP (20x20x1.45 mm)	θ_{JA}	20	—	°C/W	**1**
Package Thermal Resistance, 176-pin LQFP (20x20x1.45 mm)	θ_{JA}	20	—	°C/W	**1,2**
Package Thermal Resistance, 288-pin LFBGA (15x15x1.4 mm)	θ_{JA}	22	—	°C/W	**1**

Note 1: Junction to ambient thermal resistance, Theta-$_{JA}$ (θ_{JA}) numbers are achieved by package simulations.

2: Devices with internal DDR2 SDRAM.

TABLE 44-4: DC TEMPERATURE AND VOLTAGE SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
Operating Voltage							
DC10	VDDIO	I/O Supply Voltage **(Note 1)**	2.2	—	3.6	V	—
DC11	VDDCORE	Core Supply Voltage **(Note 1)**	1.7	1.8	1.9	V	—
DC12	SVDDIO/ SVDDCORE	**VDDIO/VDDCORE Rise Rate** to Ensure Internal Power-on Reset Signal **(Note 2)**	0.000011	—	1.1	V/µs	300 ms to 3 µs @ 3.3v
DC13	VBAT	Battery Supply Voltage	2.2	—	3.6	V	—
DC14	VDDR1V8	DDR Memory Supply Voltage	1.7	1.8	1.9	V	—
DC15	DDRVREF	DDR Reference Voltage	0.49 x VDDR1V8	0.50 x VDDR1V8	0.51 x VDDR1V8	V	—

Note 1: Overall functional device operation below operating voltages guaranteed (but not characterized) until Reset is issued. All device Analog modules, when enabled, will function, but with degraded performance below operating voltages. Refer to Table 44-5 for Reset values.

2: Voltage on VDDIO must always be greater than or equal to VDDCORE during power-up.

TABLE 44-5: ELECTRICAL CHARACTERISTICS: RESETS

DC CHARACTERISTICS (Note 1)			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
RST10	VPORIO	VDDIO POR Voltage **(Note 2)**	—	—	1.75	V	—
RST11	VPORCORE /VBATSW	VDDCORE POR Voltage **(Note 2)** VDDCORE to VBAT Switch Voltage **(Note 3)**	—	—	VSS+ 0.3	V	Failure to meet this specification when power cycling the part may lead to unexpected and abnormal behavior.
RST12	VBORIO	BOR Event on VDDIO transition high-to-low **(Note 4)**	1.92	—	2.2	V	—
RST13	VPORBAT	POR Event on VBAT **(Note 4)**	1.35	—	2.2	V	—
RST14	VHVD1V8	High Voltage Detect on VDDR1V8 pins	2.16	—	2.24	V	—

Note 1: Parameters are for design guidance only and are not tested in manufacturing.

2: This is the limit to which VDDIO/VDDCORE must be lowered to ensure Power-on Reset (POR)

3: Device enters VBAT mode upon VDDCORE Power-on Reset (POR).

4: Overall functional device operation below operating voltages guaranteed (but not characterized) until Reset is issued. All device analog modules when enabled will function, but with degraded performance below operating voltages.

TABLE 44-6: LOW-VOLTAGE DETECT CHARACTERISTICS

DC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial					
Param No.	**Symbol**	**Characteristic**		**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
LV10	VHLVD	HLVD Voltage on VDDIO Transition	HLVDL<3:0> = 0100(1)	—	3.52	—	V	—
			HLVDL<3:0> = 0101	—	3.29	—	V	—
			HLVDL<3:0> = 0110	—	3.00	—	V	—
			HLVDL<3:0> = 0111	—	2.79	—	V	—
			HLVDL<3:0> = 1000	—	2.70	—	V	—
			HLVDL<3:0> = 1001	—	2.50	—	V	—
			HLVDL<3:0> = 1010	—	2.40	—	V	—
			HLVDL<3:0> = 1011	—	2.30	—	V	—
LV11	VTHL	Voltage on HLVDIN Pin Transition	HLVDL<3:0> = 1111	—	1.20	—	V	—

Note 1: Trip points for values of LVD<3:0>, from '0000' to '0011', are not implemented, and '1100,' '1101' to '1110' are reserved.

TABLE 44-7: DC CHARACTERISTICS: OPERATING CURRENT ($I_{DD} = I_{DDIO} + I_{DDCORE}$)

DC CHARACTERISTICS[1,2]			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial	
Parameter No.	**Typical[3]**	**Maximum**	**Units**	**Conditions**
I/O Operating Current (I_{DDIO}): Peripherals Enabled (PMDx=0, ON(PBxDIV<15>)=1)				
DC20	1.4	2.1	mA	8 MHz
DC21	3.5	4.1	mA	100 MHz[4]
DC22	5.6	6.5	mA	200 MHz
DC23	5.6	6.5	mA	200 MHz (L1 Cache and Prefetch modules disabled)[4]
I/O Operating Current (I_{DDCORE}): Peripherals Enabled (PMDx=0, ON(PBxDIV<15>)=1)				
DC20a	20	34	mA	8 MHz
DC21a	97	118	mA	100 MHz[4]
DC22a	152	180	mA	200 MHz
DC23a	128	153	mA	200 MHz (L1 Cache and Prefetch modules disabled)[4]
I/O Operating Current (I_{DDIO}): Peripherals Disabled (PMDx=1, ON(PBxDIV<15>)=0)				
DC24	1.4	2.1	mA	8 MHz
DC25	3.5	4.1	mA	100 MHz[4]
DC26	5.6	6.5	mA	200 MHz
DC27	5.6	6.5	mA	200 MHz (L1 Cache and Prefetch modules disabled)[4]
I/O Operating Current (I_{DDCORE}): Peripherals Disabled (PMDx=1, ON(PBxDIV<15>)=0)				
DC24a	19	33	mA	8 MHz
DC25a	90	109	mA	100 MHz[4]
DC26a	146	177	mA	200 MHz
DC27a	121	147	mA	200 MHz (L1 Cache and Prefetch modules disabled)[4]

Note 1: A device's I_{DD} supply current is mainly a function of the operating voltage and frequency. Other factors, such as Peripheral Bus Clock (PBCLK) frequency, number of peripheral modules enabled, internal code execution pattern, I/O pin loading and switching rate, oscillator type, as well as temperature, can have an impact on the current consumption.

2: The test conditions for I_{DD} measurements are as follows:
- V_{DDR1V8} = 1.8V
- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL is disabled (USBMD = `1`), V_{USB3V3} is connected to V_{SS}
- CPU, Program Flash, and SRAM data memory are operational, Program Flash memory Wait states are equal to two
- No peripheral modules are operating (ON bit = `0`)
- L1 Cache and Prefetch modules are enabled, unless otherwise specified in conditions.
- No peripheral modules are operating, (ON bit = `0`)
- WDT, DMT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to V_{SS}
- $\overline{MCLR}$ = V_{DDIO}
- CPU executing `while(1)` statement from Flash
- RTCC and JTAG are disabled
- I/O Analog Charge Pump is disabled (IOANCPEN bit (CFGCON<7>) = `0`)
- ADC Input Charge Pump is disabled (AICPMPEN bit (ADCCON1<12> = `0`)
- All Peripheral Bus Clocks, except PBCLK7, are disabled (ON bit (PBxDIV<15>) = `0`, x = 2 through 6)

3: Data in "Typical" column is at 3.3V, +25°C at specified operating frequency unless otherwise stated. Parameters are for design guidance only and are not tested.

4: This parameter is characterized, but not tested in manufacturing.

TABLE 44-8: DC CHARACTERISTICS: IDLE CURRENT (I_{IDLE})

DC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial	
Parameter No.	**Typical(2)**	**Maximum**	**Units**	**Conditions**
Idle Current (I_{IDLE}): Core Off, Clock on Base Current (1)				
DC30	19	35	mA	8 MHz(3)
DC31	55	70	mA	100 MHz(3)
DC32	90	123	mA	200 MHz

Note 1: The test conditions for I_{IDLE} current measurements are as follows:

- V_{DDR1V8} = 1.8V
- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL is disabled (USBMD = 1), V_{USB3V3} is connected to V_{SS}, PBCLKx divisor = 1:2 ('x' ≠ 7)
- CPU is in Idle mode (CPU core Halted)
- No peripheral modules are operating, (ON bit = 0), but the associated PMD bit is cleared (except USBMD)
- WDT, DMT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to V_{SS}
- $\overline{MCLR}$ = V_{DDIO}
- RTCC and JTAG are disabled
- I/O Analog Charge Pump is disabled (IOANCPEN bit (CFGCON<7>) = 0)
- ADC Input Charge Pump is disabled (AICPMPEN bit (ADCCON1<12> = 0)

2: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

3: This parameter is characterized, but not tested in manufacturing.

TABLE 44-9: DC CHARACTERISTICS: POWER-DOWN CURRENT (I_{PD})

DC CHARACTERISTICS[1,2]			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ T_A ≤ +85°C for Industrial		
Param. No.	**Typical[2]**	**Maximum**	**Units**	**Conditions**	
Power-Down Current (I_{PD}) (Note 1)					
DC40k	9	14	mA	-40°C	Sleep[1]
DC40l	9.5	14	mA	+25°C	
DC40m	15	25	mA	+85°C	
Module Differential Current					
DC44a	50	350	µA	3.6V	Watchdog Timer Current: ΔI_{WDT}[3]
DC44b	3.5	5	mA	3.6V	ADC Current: ΔI_{ADC}[3,4]
DC44c	50	350	µA	3.6V	Deadman Timer Current: ΔI_{DMT}

Note 1: The test conditions for I_{PD} current measurements are as follows:

- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL is disabled (USBMD = 1), V_{USB3V3} is connected to V_{SS}
- CPU is in Sleep mode
- L1 Cache and Prefetch modules are disabled
- No peripheral modules are operating, (ON bit = 0), and the associated PMD bit is set. All clocks are disabled ON bit (PBxDIV<15>) = 0 (x ≠ 1,7)
- WDT, DMT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to V_{SS}
- $\overline{MCLR}$ = V_{DDIO}
- RTCC and JTAG are disabled
- Voltage regulator is in Stand-by mode (VREGS = 0; IOANCPEN = 0)

2: Data in the "Typical" column is at 3.3V, unless otherwise stated. Parameters are for design guidance only and are not tested.

3: The Δ current is the additional current consumed when the module is enabled. This current should be added to the base I_{PD} current.

4: Voltage regulator is operational (VREGS = 1).

TABLE 44-10: DC CHARACTERISTICS: I/O PIN INPUT SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics**	**Min.**	**Typ.(1)**	**Max.**	**Units**	**Conditions**
	VIL	**Input Low Voltage**					
DI10		I/O Pins with PMP	VSS	—	0.15 * VDDIO	V	—
		I/O Pins	VSS	—	0.2 * VDDIO	V	—
DI18		SDAx, SCLx	VSS	—	0.3 * VDDIO	V	SMBus disabled **(Note 4)**
DI19		SDAx, SCLx	VSS	—	0.8	V	SMBus enabled **(Note 4)**
	VIH	**Input High Voltage**					
DI20		I/O Pins not 5V-tolerant(5)	0.65 * VDDIO	—	VDDIO	V	**(Note 4)**
		I/O Pins 5V-tolerant with PMP(5)	0.65 * VDDIO	—	5.5	V	**(Note 4)**
		I/O Pins 5V-tolerant(5)	0.65 * VDDIO	—	5.5	V	—
DI28a		SDAx, SCLx on non-5V tolerant pins(5)	0.65 * VDDIO	—	VDDIO	V	SMBus disabled **(Note 4)**
DI29a		SDAx, SCLx on non-5V tolerant pins(5)	2.1	—	VDDIO	V	SMBus enabled, 2.2V ≤ VPIN ≤ 5.5 **(Note 4)**
DI28b		SDAx, SCLx on 5V tolerant pins(5)	0.65 * VDDIO	—	5.5	V	SMBus disabled **(Note 4)**
DI29b		SDAx, SCLx on 5V tolerant pins(5	2.1	—	5.5	V	SMBus enabled, 2.2V ≤ VPIN ≤ 5.5 **(Note 4)**
DI30	ICNPU	**Change Notification Pull-up Current**	-400	-300	-50	µA	VDDIO = 3.3V, VPIN = VSS
DI31	ICNPD	**Change Notification Pull-down Current(4)**	50	175	400	µA	VDDIO = 3.3V, VPIN = VDDIO
	IIL	**Input Leakage Current (Note 3)**					
DI50		I/O Ports	—	—	±1	µA	VSS ≤ VPIN ≤ VDDIO, Pin at high-impedance
DI51		Analog Input Pins	—	—	±1	µA	VSS ≤ VPIN ≤ VDDIO, Pin at high-impedance
DI55		$\overline{MCLR}$(2)	—	—	±1	µA	VSS ≤ VPIN ≤ VDDIO
DI56		OSC1	—	—	±1	µA	VSS ≤ VPIN ≤ VDDIO, HS mode

Note 1: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: The leakage current on the $\overline{MCLR}$ pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.

3: Negative current is defined as current sourced by the pin.

4: This parameter is characterized, but not tested in manufacturing.

5: See the pin name tables (Table 5 through Table 7) for the 5V-tolerant pins.

TABLE 44-11: DC CHARACTERISTICS: I/O PIN OUTPUT SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial

TABLE 44-12: DC CHARACTERISTICS: I/O PIN INPUT INJECTION CURRENT SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics**	**Min.**	**Typ.(1)**	**Max.**	**Units**	**Conditions**
DI60a	IICL	**Input Low Injection Current**	0	—	-5(2,5)	mA	This parameter applies to all pins, with the exception of RB10. Maximum IICH current for this exception is 0 mA.
DI60b	IICH	**Input High Injection Current**	0	—	+5(3,4,5)	mA	This parameter applies to all pins, with the exception of all 5V tolerant pins, SOSCI, and RB10. Maximum IICH current for these exceptions is 0 mA.
DI60c	∑IICT	**Total Input Injection Current (sum of all I/O and control pins)**	-20(6)	—	+20(6)	mA	Absolute instantaneous sum of all ± input injection currents from all I/O pins (| IICL + | IICH |) ≤ ∑IICT

Note 1: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: VIL source < (VSS - 0.3). Characterized but not tested.

3: VIH source > (VDDIO + 0.3) for non-5V tolerant pins only.

4: Digital 5V tolerant pins do not have an internal high side diode to VDDIO, and therefore, cannot tolerate any "positive" input injection current.

5: Injection currents > | 0 | can affect the ADC results by approximately 4 to 6 counts (i.e., VIH Source > (VDDIO + 0.3) or VIL source < (VSS - 0.3)).

6: Any number and/or combination of I/O pins not excluded under IICL or IICH conditions are permitted provided the "absolute instantaneous" sum of the input injection currents from all pins do not exceed the specified limit. If **Note 2**, IICL = (((Vss - 0.3) - VIL source) / Rs). If **Note 3**, IICH = ((IICH source - (VDDIO + 0.3)) / RS). RS = Resistance between input source voltage and device pin. If (VSS - 0.3) ≤ VSOURCE ≤ (VDDIO + 0.3), injection current = 0.

TABLE 44-13: DDR2 SDRAM CONTROLLER I/O SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
DDR1	VOH	Output High Voltage	V_{DDR1V8} – 0.28	—	—	V	—
DDR2	VOL	Output Low Voltage	—	—	0.28	V	—
DDR5	VIH	Input High Voltage	$DDRV_{REF}$ + 0.125	—	V_{DDR1V8} + 0.3	—	—
DDR6	VIL	Input Low Voltage	0.3	—	$DDRV_{REF}$ – 0.125	—	—

Note 1: These parameters are characterized but not tested.

TABLE 44-14: SD HOST CONTROLLER I/O SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristic**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
SD10	VOH	Output High Voltage	2.4	—	—	V	I_{OH} ≥ 20 mA, V_{DDIO} = 3.3V
SD11	VOL	Output Low Voltage	—	—	0.4	V	I_{OL} ≤ 20 mA, V_{DDIO} = 3.3V
SD12	VIH	Input High Voltage	0.65*V_{DDIO}	—	V_{DDIO}	V	—
SD13	VIL	Input Low Voltage	VSS	—	0.2*V_{DDIO}	V	—

TABLE 44-15: DC CHARACTERISTICS: PROGRAM MEMORY(3)

DC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Sym.**	**Characteristics**	**Min.**	**Typ.(1)**	**Max.**	**Units**	**Conditions**
D130a	EP	Cell Endurance	10,000	—	—	E/W	Without ECC
D130b			20,000	—	—	E/W	With ECC
D131	VPR	VDDCORE for Read	VDDCOREMIN	—	VDDCOREMAX	V	—
D132	VPEW	VDDCORE for Erase or Write	VDDCOREMIN	—	VDDCOREMAX	V	—
D134a	TRETD	Characteristic Retention	10	—	—	Year	Without ECC
D134b			20	—	—	Year	With ECC
D135	IDDP	Supply Current during Programming	—	—	30	mA	—
D136	TRW	Row Write Cycle Time **(Notes 2, 4)**	—	66813	—	FRC Cycles	—
D137	TQWW	Quad Word Write Cycle Time **(Note 4)**	—	773	—	FRC Cycles	—
D138	TWW	Word Write Cycle Time **(Note 4)**	—	383	—	FRC Cycles	—
D139	TCE	Chip Erase Cycle Time **(Note 4)**	—	515373	—	FRC Cycles	—
D140	TPFE	All Program Flash (Upper and Lower regions) Erase Cycle Time **(Note 4)**	—	256909	—	FRC Cycles	—
D141	TPBE	Program Flash (Upper or Lower regions) Erase Cycle Time **(Note 4)**	—	128453	—	FRC Cycles	—
D142	TPGE	Page Erase Cycle Time **(Note 4)**	—	128453	—	FRC Cycles	—

Note 1: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated.

2: The minimum PBCLK5 for row programming is 4 MHz.

3: Refer to the *"PIC32 Flash Programming Specification"* (DS60001145) for operating conditions during programming and erase cycles.

4: Translating this value to seconds depends on FRC accuracy (see Table 44-27) and FRC tuning values (see the OSCTUN register: Register 8-2).

TABLE 44-16: DC CHARACTERISTICS: PROGRAM FLASH MEMORY WAIT STATES

DC CHARACTERISTICS	Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial		
Required Flash Wait States(1)	**SYSCLK**	**Units**	**Conditions**
With ECC:			
0 Wait states	0 < SYSCLK ≤ 60	MHz	—
1 Wait state	60 < SYSCLK ≤ 120		
2 Wait states	120 < SYSCLK ≤ 200		
Without ECC:			
0 Wait states	0 < SYSCLK ≤ 74	MHz	—
1 Wait state	74 < SYSCLK ≤ 140		
2 Wait states	140 < SYSCLK ≤ 200		

Note 1: To use Wait states, the Prefetch module must be enabled (PREFEN<1:0> ≠ 00) and the PFMWS<2:0> bits must be written with the desired Wait state value.

TABLE 44-17: DC CHARACTERISTICS: DDR2 SDRAM MEMORY

DC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. Nos. (Note 1)	**Symbol**	**Characteristics**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
DDRM12	I_{DD0}	Operating Current, One Bank Active Precharge	—	—	60	mA	**Note 2**
DDRM13	I_{DD1}	Operating Current, One Back Active-Read Precharge	—	—	70	mA	**Note 2**
DDRM14	I_{DD2}	Precharge Power-Down Current	—	—	6	mA	**Note 3**
DDRM15	I_{DD3}	Precharge Stand-by Current	—	—	40	mA	**Note 2**
DDRM16	I_{DD4}	Precharge Quiet Stand-by Current	—	—	35	mA	**Note 4**
DDRM17	I_{DD5}	Active Power-Down Current	—	—	12	mA	**Note 3**
DDRM18	I_{DD6}	Active Stand-by Current	—	—	50	mA	**Note 2**
DDRM19	I_{DD7}	Operating Burst Read Current	—	—	105	mA	**Note 2**
DDRM20	I_{DD8}	Operating Burst Write Current	—	—	110	mA	**Note 2**
DDRM21	I_{DD9}	Burst Refresh Current	—	—	70	mA	**Note 2**
DDRM22	I_{DD10}	Self-Refresh Current	—	—	6	mA	**Note 5**
DDRM23	I_{DD11}	Operating Bank Interleave Read Current	—	—	135	mA	**Note 6**

Note 1: These parameters are characterized, but not tested in manufacturing. The specifications are only valid after the memory is initialized.

2: DDRCKE is high, $\overline{\text{DDRCS0}}$ is high between valid commands. Address, control, and data bus inputs are switching.

3: DDRCKE is low. Other control and address inputs are stable. Data bus inputs are floating.

4: DDRCKE is high and $\overline{\text{DDRCS0}}$ is high. Other control and address inputs are stable. Data bus inputs are floating.

5: DDRCKE is low and DDRCK/$\overline{\text{DDRCK}}$ are low. Other control and address inputs are floating. Data bus inputs are floating.

6: DDRCKE is high and $\overline{\text{DDRCS0}}$ is high between valid commands. Address bus inputs are stable. Data bus inputs are switching.

TABLE 44-18: COMPARATOR SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics**	**Min.**	**Typ.**	**Max.**	**Units**	**Comments**
D300	VIOFF	Input Offset Voltage	—	±10	—	mV	AVDD = VDDIO, AVSS = VSS
D301	VICM	Input Common Mode Voltage	0.8	—	2.37	V	AVDD = VDDIO, AVSS = VSS **(Note 2)**
D302	CMRR	Common Mode Rejection Ratio	50	—	—	dB	Max VICM = (VDDIO - 1)V **(Note 2)**
D303	TRESP	Small Signal Response Time	—	150	—	ns	VCM = VDD/2 in 100 mV steps **(Notes 1,2)**
D304	ON2OV	Comparator Enabled to Output Valid	—	—	10	μs	Comparator module is configured before setting the comparator ON bit **(Note 2)**
D305	IVREF	Internal Voltage Reference	—	1.2	—	V	—
D306	VHYST	Input Hysteresis Voltage	48	120	192	mV	—

Note 1: These parameters are characterized but not tested.

2: The Comparator module is functional at VBORIOMIN < VDDIO < VDDIOMIN, but with degraded performance. Unless otherwise stated, module functionality is guaranteed, but not characterized.

TABLE 44-19: COMPARATOR VOLTAGE REFERENCE SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics**	**Min.**	**Typ.**	**Max.**	**Units**	**Comments**

			VREF-	—	VREF+	V	CVRSRC with CVRSS = 1
D314	DVREF	CVREF Programmable Output Range	0	—	0.625 x DACREFH	V	0 to 0.625 DACREFH with DACREFH/24 step size
			0.25 x DACREFH	—	0.719 x DACREFH	V	0.25 x DACREFH to 0.719 DACREFH with DACREFH/32 step size
D315	DACRES	Resolution	—	—	DACREFH/24		CVRCON<CVRR> = 1
			—	—	DACREFH/32		CVRCON<CVRR> = 0
D316	DACACC	Absolute Accuracy(2)	—	—	1/4	LSB	DACREFH/24, CVRCON<CVRR> = 1
			—	—	1/2	LSB	DACREFH/32, CVRCON<CVRR> = 0

Note 1: Settling time was measured while CVRR = 1 and CVR<3:0> transitions from '0000' to '1111'. This parameter is characterized, but is not tested in manufacturing.

2: These parameters are characterized but not tested.

TABLE 44-20: CTMU CURRENT SOURCE SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param No.	**Symbol**	**Characteristic**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
CTMU CURRENT SOURCE							
CTMUI1	IOUT1	Base Range(1)	—	0.55	—	µA	CTMUCON<1:0> = 01
CTMUI2	IOUT2	10x Range(1)	—	5.5	—	µA	CTMUCON<1:0> = 10
CTMUI3	IOUT3	100x Range(1)	—	55	—	µA	CTMUCON<1:0> = 11
CTMUI4	IOUT4	1000x Range(1)	—	550	—	µA	CTMUCON<1:0> = 00
CTMUFV1	VF	Temperature Diode Forward Voltage(1,2)	—	0.598	—	V	TA = +25ºC, CTMUCON<1:0> = 01
			—	0.658	—	V	TA = +25ºC, CTMUCON<1:0> = 10
			—	0.721	—	V	TA = +25ºC, CTMUCON<1:0> = 11
CTMUFV2	VFVR	Temperature Diode Rate of Change(1,2)	—	-1.92	—	mV/ºC	CTMUCON<1:0> = 01
			—	-1.74	—	mV/ºC	CTMUCON<1:0> = 10
			—	-1.56	—	mV/ºC	CTMUCON<1:0> = 11

Note 1: Nominal value at center point of current trim range (CTMUCON<7:2> = 000000).

2: Parameters are characterized but not tested in manufacturing. Measurements taken with the following conditions:

- VREF+ = AVDD = 3.3V
- ADC module configured for conversion speed of 500 ksps
- All PMD bits are cleared (PMDx = 0)
- Executing a `while(1)` statement
- Device operating from the FRC with no PLL

TABLE 44-21: GLCD CONTROLLER DC SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristic**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
GD10	VOH	Output High Voltage	2.4	—	—	V	IOH ≥ 20 mA, VDDIO = 3.3V
GD11	VOL	Output Low Voltage	—	—	0.4	V	IOL ≤ 20 mA, VDDIO = 3.3V
GD12	VIH	Input High Voltage	0.65*VDDIO	—	VDDIO	V	—
GD13	VIL	Input Low Voltage	VSS	—	0.2*VDDIO	V	—

44.2 AC Characteristics and Timing Parameters

The information contained in this section defines PIC32MZ DA device AC characteristics and timing parameters.

FIGURE 44-1: LOAD CONDITIONS FOR DEVICE TIMING SPECIFICATIONS

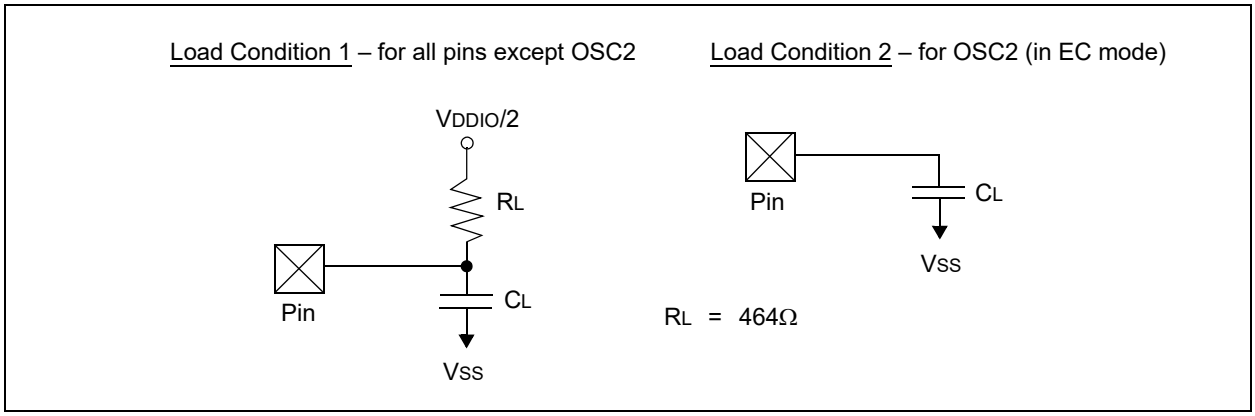

TABLE 44-22: CAPACITIVE LOADING REQUIREMENTS ON OUTPUT PINS

AC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics**	**Min.**	**Typ.(1)**	**Max.**	**Units**	**Conditions**
DO56	C_L	All I/O pins	—	—	50	pF	EC mode for OSC2
DO58	C_B	SCLx, SDAx	—	—	400	pF	In I^2C mode
DO59	C_{SQI}	All SQI pins	—	—	10	pF	—

Note 1: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

FIGURE 44-2: EXTERNAL CLOCK TIMING

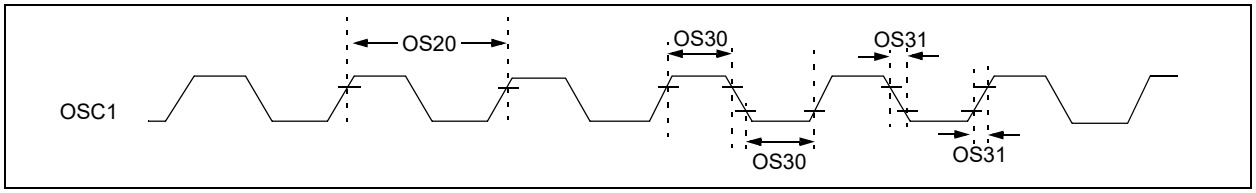

TABLE 44-23: EXTERNAL CLOCK TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics**	**Min.**	**Typ.(1)**	**Max.**	**Units**	**Conditions**
OS10	FOSC	External CLKI Frequency (External clocks allowed only in EC and ECPLL modes)	DC	—	64	MHz	EC **(Note 2)**
OS13		Oscillator Crystal Frequency	4	—	32	MHz	HS **(Note 2)**
OS15			32	32.768	100	kHz	SOSC **(Note 2)**
OS20	TOSC	TOSC = 1/FOSC	—	—	—	—	See parameter OS10 for FOSC value
OS30	TOSL, TOSH	External Clock In (OSC1) High or Low Time	0.375 x TOSC	—	—	ns	EC **(Note 2)**
OS31	TOSR, TOSF	External Clock In (OSC1) Rise or Fall Time	—	—	7.5	ns	EC **(Note 2)**
OS40	TOST	Oscillator Start-up Timer Period (Only applies to HS, HSPLL, and SOSC Clock Oscillator modes)	—	1024	—	TOSC	**(Note 2)**
OS41	TFSCM	Primary Clock Fail Safe Time-out Period	—	2	—	ms	**(Note 2)**
OS42	GM	External Oscillator Transconductance (Primary Oscillator Only)	—	400	—	µA/V	VDDIO = 3.3V, TA = +25°C **(Note 2)**

Note 1: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are characterized but are not tested.

2: This parameter is characterized, but not tested in manufacturing.

TABLE 44-24: SYSTEM TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
OS51	FSYS	System Frequency	DC	—	200	MHz	USB module disabled
			30	—	200	MHz	USB module enabled
OS55a	FPB	Peripheral Bus Frequency	DC	—	100	MHz	For PBCLKx, 'x' < 7
OS55b			DC	—	200	MHz	For PBCLK7
OS56	FREF	Reference Clock Frequency	—	—	50	MHz	For REFCLKI1, REFCLKI3, REFCLKI4, REFCLKO1, REFCLKO3, and REFCLKO4 pins

TABLE 44-25: SPLL CLOCK TIMING SPECIFICATIONS

AC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics(1)**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
OS50	FIN	PLL Input Frequency Range	5	—	64	MHz	ECPLL, HSPLL, FRCPLL modes
OS52	TLOCK	PLL Start-up Time (Lock Time)	—	—	100	µs	—
OS53	DCLK	CLKO Stability(2) (Period Jitter or Cumulative)	-0.25	—	+0.25	%	Measured over 100 ms period
OS54	FVCO	PLL VCO Frequency Range	350	—	700	MHz	—
OS54a	FPLL	PLL Output Frequency Range	10	—	200	MHz	—

Note 1: These parameters are characterized, but not tested in manufacturing.

2: This jitter specification is based on clock-cycle by clock-cycle measurements. To get the effective jitter for individual time-bases on communication clocks, use the following formula:

$$EffectiveJitter = \frac{D_{CLK}}{\sqrt{\frac{PBCLK2}{CommunicationClock}}}$$

For example, if PBCLK2 = 100 MHz and SPI bit rate = 50 MHz, the effective jitter is as follows:

$$EffectiveJitter = \frac{D_{CLK}}{\sqrt{\frac{100}{50}}} = \frac{D_{CLK}}{1.41}$$

TABLE 44-26: MPLL CLOCK TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristic(1)**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
MP10	MF_{IN}	MPLL Input Frequency	8	—	64	MHz	—
MP11	MFV_{CO}	MPLL Vco Frequency Range	400	—	1600	MHz	—
MP12	MF_{MPLL}	MPLL Output Frequency	8	—	200	MHz	—
MP13	M_{LOCK}	MPLL Start-up Time (Lock Time)	—	—	1500 x 1/MF_{IN}	µs	—
MP14	M_{PJ}	MPLL Period Jitter	—		0.015	%	—
MP15	M_{CJ}	MPLL Cycle Jitter	—	—	0.02	%	—
MP16	M_{LTJ}	MPLL Long-term Jitter	—	—	0.5	%	—

Note 1: These parameters are characterized, but not tested in manufacturing.

TABLE 44-27: INTERNAL FRC ACCURACY

AC CHARACTERISTICS		Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Characteristics**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
Internal FRC Accuracy @ 8.00 MHz(1)						
F20	FRC	-5	—	+5	%	0°C ≤ TA ≤ +85°C
		-8	—	+8	%	-40°C ≤ TA ≤ +85°C

Note 1: Frequency calibrated at +25°C and 3.3V. The TUN bits can be used to compensate for temperature drift.

TABLE 44-28: INTERNAL LPRC ACCURACY

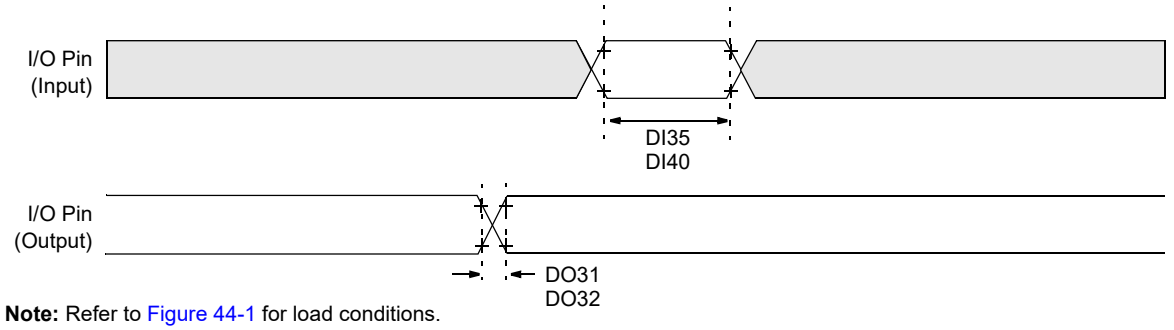
AC CHARACTERISTICS		Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Characteristics**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
LPRC @ 31.25 kHz(1)						
F21	LPRC	-8	—	+8	%	0°C ≤ TA ≤ +85°C
		-25	—	+25	%	-40°C ≤ TA ≤ +85°C

Note 1: Change of LPRC frequency as V_{DDIO} changes.

TABLE 44-29: INTERNAL BACKUP FRC (BFRC) ACCURACY

AC CHARACTERISTICS		Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Characteristics**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
Internal BFRC Accuracy @ 8 MHz						
F22	BFRC	-30	—	+30	%	—

FIGURE 44-3: I/O TIMING CHARACTERISTICS



Note: Refer to Figure 44-1 for load conditions.

TABLE 44-30: I/O TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics(2)**	**Min.**	**Typ.(1)**	**Max.**	**Units**	**Conditions**
DO31	TIOR	**Port Output Rise Time** I/O Pins: 4x Source Driver Pins - RA3, RA9, RA10, RA14, RA15 RB0-7, RB11, RB13 RC12-RC15 RD0, RD6-RD7, RD11, RD14 RE8, RE9 RF2, RF3, RF8 RG15 RH0, RH1, RH4-RH6, RH8-RH13 RJ0-RJ2, RJ8, RJ9, RJ11	—	—	9.5	ns	CLOAD = 50 pF
			—	—	6	ns	CLOAD = 20 pF
		Port Output Rise Time I/O Pins: 8x Source Driver Pins - RA0-RA2, RA4, RA5 RB8-RB10, RB12, RB14, RB15 RC1-RC4 RD1-RD5, RD9, RD10, RD12, RD13, RD15 RE4-RE7 RF0, RF4, RF5, RF12, RF13 RG0, RG1, RG6-RG9 RH2, RH3, RH7, RH14, RH15 RJ3-RJ7, RJ10, RJ12-RJ15 RK0-RK7	—	—	8	ns	CLOAD = 50 pF
			—	—	6	ns	CLOAD = 20 pF
		Port Output Rise Time I/O Pins: 12x Source Driver Pins - RA6, RA7 RE0-RE3 RF1 RG12-RG14	—	—	3.5	ns	CLOAD = 50 pF
			—	—	2	ns	CLOAD = 20 pF

Note 1: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated.

2: This parameter is characterized, but not tested in manufacturing.

TABLE 44-30: I/O TIMING REQUIREMENTS (CONTINUED)

AC CHARACTERISTICS		Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial					
Param. No.	**Symbol**	**Characteristics(2)**	**Min.**	**Typ.(1)**	**Max.**	**Units**	**Conditions**
DO32	TIOF	**Port Output Fall Time** I/O Pins: 4x Source Driver Pins - RA3, RA9, RA10, RA14, RA15 RB0-7, RB11, RB13 RC12-RC15 RD0, RD6-RD7, RD11, RD14 RE8, RE9 RF2, RF3, RF8 RG15 RH0, RH1, RH4-RH6, RH8-RH13 RJ0-RJ2, RJ8, RJ9, RJ11	—	—	9.5	ns	CLOAD = 50 pF
			—	—	6	ns	CLOAD = 20 pF
		Port Output Fall Time I/O Pins: 8x Source Driver Pins - RA0-RA2, RA4, RA5 RB8-RB10, RB12, RB14, RB15 RC1-RC4 RD1-RD5, RD9, RD10, RD12, RD13, RD15 RE4-RE7 RF0, RF4, RF5, RF12, RF13 RG0, RG1, RG6-RG9 RH2, RH3, RH7, RH14, RH15 RJ3-RJ7, RJ10, RJ12-RJ15 RK0-RK7	—	—	8	ns	CLOAD = 50 pF
			—	—	6	ns	CLOAD = 20 pF

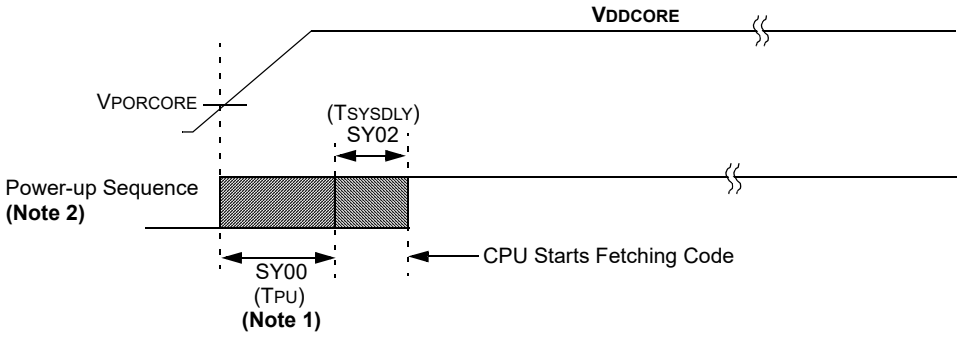
			—	—	2	ns	CLOAD = 20 pF
DI35	TINP	INTx Pin High or Low Time	5	—	—	ns	—
DI40	TRBP	CNx High or Low Time (input)	5	—	—	ns	—

Note 1: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated.

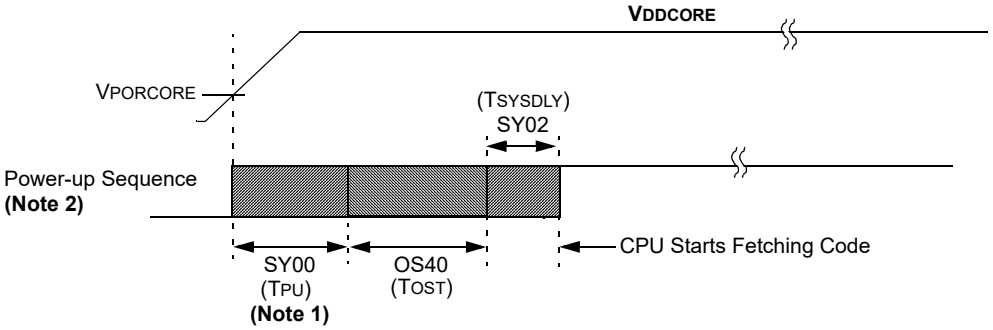
2: This parameter is characterized, but not tested in manufacturing.

FIGURE 44-4: POWER-ON RESET TIMING CHARACTERISTICS

Internal Voltage Regulator Enabled
Clock Sources = (FRC, FRCDIV, FRCDIV16, FRCPLL, EC, ECPLL and LPRC)



Internal Voltage Regulator Enabled
Clock Sources = (HS, HSPLL, and SOSC)



Note 1: The power-up period will be extended if the power-up sequence completes before the device exits from BOR (VDDIO < VDDIOMIN).

2: Includes interval voltage regulator stabilization delay.

FIGURE 44-5: EXTERNAL RESET TIMING CHARACTERISTICS

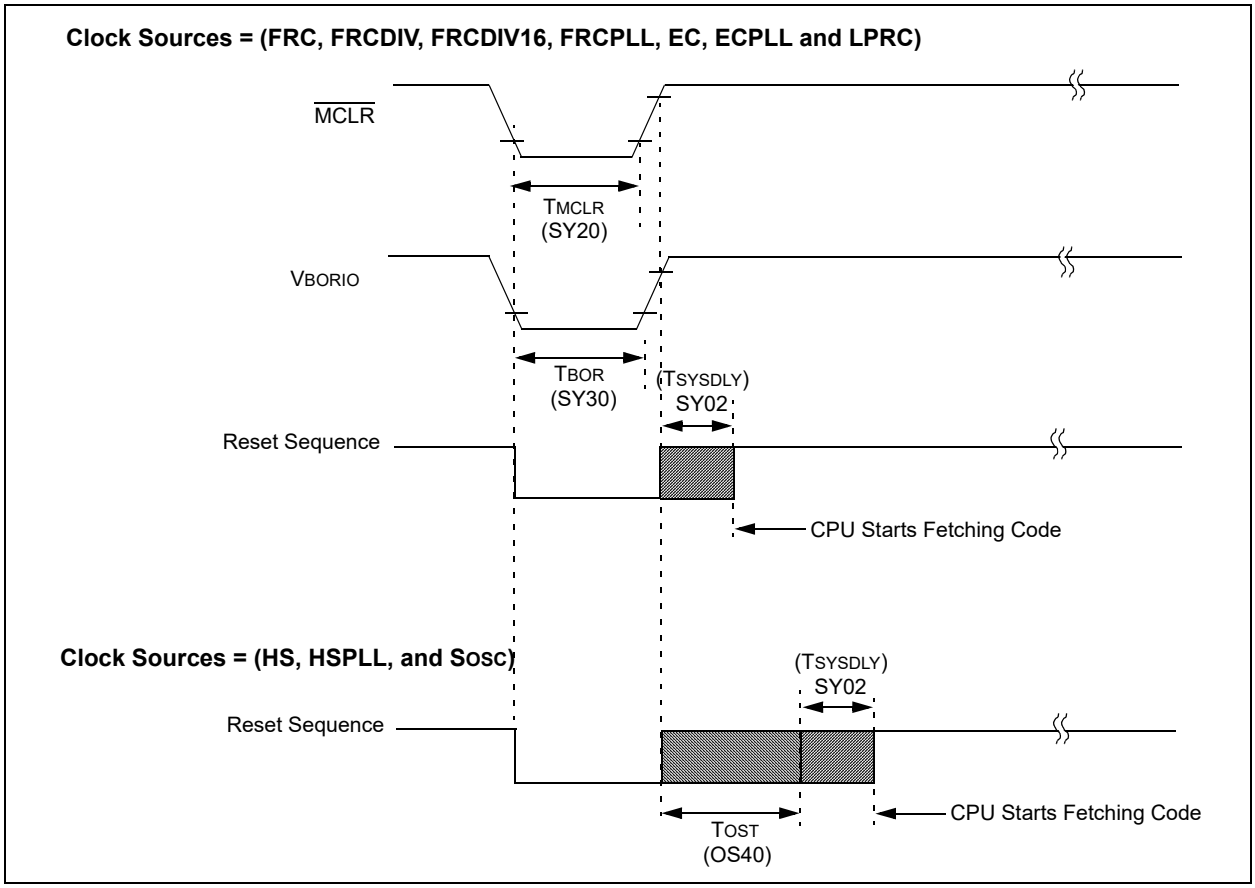


TABLE 44-31: RESETS TIMING

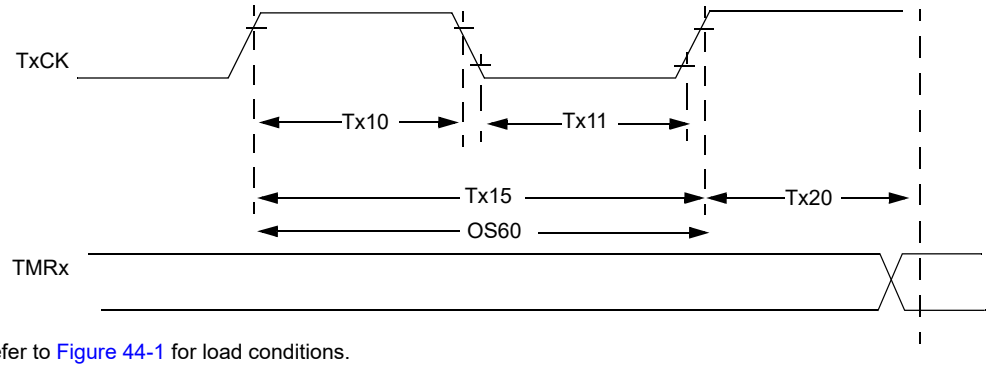
AC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics(1)**	**Min.**	**Typ.(2)**	**Max.**	**Units**	**Conditions**
SY00	TPU	Power-up Period Internal Voltage Regulator Enabled	—	400	600	μs	—
SY02	TSYSDLY	System Delay Period: Time Required to Reload Device Configuration Fuses plus SYSCLK Delay before First instruction is Fetched.	—	1 μs + 8 SYSCLK cycles	—	—	—
SY20	TMCLR	$\overline{MCLR}$ Pulse Width (low)	2	—	—	μs	—
SY30	TBOR	BOR Pulse Width (low)	—	1	—	μs	—

Note 1: These parameters are characterized, but not tested in manufacturing.

2: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Characterized by design but not tested.

FIGURE 44-6: TIMER1-TIMER9 EXTERNAL CLOCK TIMING CHARACTERISTICS



Note: Refer to Figure 44-1 for load conditions.

TABLE 44-32: TIMER1 EXTERNAL CLOCK TIMING REQUIREMENTS(1)

AC CHARACTERISTICS				Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics(2)**		**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
TA10	TTXH	TxCK High Time	Synchronous, with prescaler	[(12.5 ns or 1 TPBCLK3) /N] + 20 ns	—	—	ns	Must also meet parameter TA15 (**Note 3**)
			Asynchronous, with prescaler	10	—	—	ns	—
TA11	TTXL	TxCK Low Time	Synchronous, with prescaler	[(12.5 ns or 1 TPBCLK3) /N] + 20 ns	—	—	ns	Must also meet parameter TA15 (**Note 3**)
			Asynchronous, with prescaler	10	—	—	ns	—
TA15	TTXP	TxCK Input Period	Synchronous, with prescaler	[(Greater of 20 ns or 2 TPBCLK3)/N] + 30 ns	—	—	ns	V_{DDIO} > 2.7V (**Note 3**)
				[(Greater of 20 ns or 2 TPBCLK3)/N] + 50 ns	—	—	ns	V_{DDIO} < 2.7V (**Note 3**)
			Asynchronous, with prescaler	20	—	—	ns	V_{DDIO} > 2.7V
				50	—	—	ns	V_{DDIO} < 2.7V
OS60	FT1	SOSC1/T1CK Oscillator Input Frequency Range (oscillator enabled by setting TCS bit (T1CON<1>))		32	—	50	kHz	—
TA20	TCKEXTMRL	Delay from External TxCK Clock Edge to Timer Increment		—	—	1	TPBCLK3	—

Note 1: Timer1 is a Type A.

2: This parameter is characterized, but not tested in manufacturing.

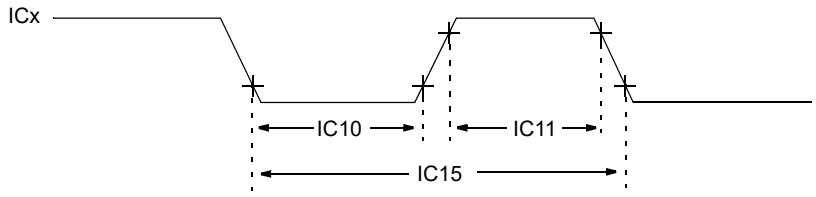
3: N = Prescale Value (1, 8, 64, 256).

TABLE 44-33: TIMER2-TIMER9 EXTERNAL CLOCK TIMING REQUIREMENTS

AC CHARACTERISTICS				Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics(1)**		**Min.**	**Max.**	**Units**	**Conditions**	
TB10	TTxH	TxCK High Time	Synchronous, with prescaler	[(12.5 ns or 1 TPBCLK3) /N] + 25 ns	—	ns	Must also meet parameter TB15	N = prescale value (1, 2, 4, 8, 16, 32, 64, 256)
TB11	TTxL	TxCK Low Time	Synchronous, with prescaler	[(12.5 ns or 1 TPBCLK3) /N] + 25 ns	—	ns	Must also meet parameter TB15	
TB15	TTxP	TxCK Input Period	Synchronous, with prescaler	[(Greater of [(25 ns or 2 TPBCLK3)/N] + 30 ns	—	ns	V_{DDIO} > 2.7V	
				[(Greater of [(25 ns or 2 TPBCLK3)/N] + 50 ns	—	ns	V_{DDIO} < 2.7V	
TB20	TCKEXTMRL	Delay from External TxCK Clock Edge to Timer Increment		—	1	TPBCLK3	—	

Note 1: These parameters are characterized, but not tested in manufacturing.

FIGURE 44-7: INPUT CAPTURE (CAPx) TIMING CHARACTERISTICS



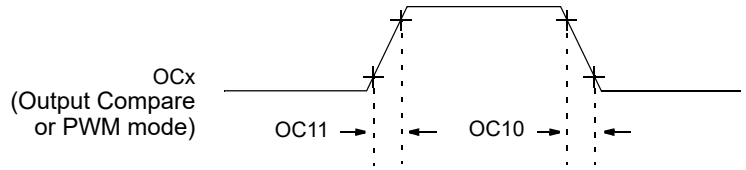
Note: Refer to Figure 44-1 for load conditions.

TABLE 44-34: INPUT CAPTURE MODULE TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics(1)**	**Min.**	**Max.**	**Units**	**Conditions**	
IC10	TCCL	ICx Input Low Time	[(12.5 ns or 1 TPBCLK3) /N] + 25 ns	—	ns	Must also meet parameter IC15.	N = prescale value (1, 4, 16)
IC11	TCCH	ICx Input High Time	[(12.5 ns or 1 TPBCLK3) /N] + 25 ns	—	ns	Must also meet parameter IC15.	
IC15	TCCP	ICx Input Period	[(25 ns or 2 TPBCLK3) /N] + 50 ns	—	ns	—	

Note 1: These parameters are characterized, but not tested in manufacturing.

FIGURE 44-8: OUTPUT COMPARE MODULE (OCx) TIMING CHARACTERISTICS



Note: Refer to Figure 44-1 for load conditions.

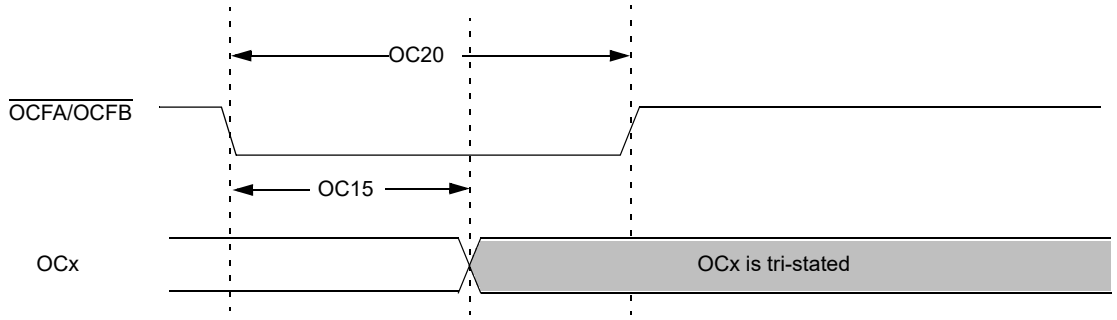
TABLE 44-35: OUTPUT COMPARE MODULE TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics(1)**	**Min.**	**Typ.(2)**	**Max.**	**Units**	**Conditions**
OC10	TccF	OCx Output Fall Time	—	—	—	ns	See parameter DO32
OC11	TccR	OCx Output Rise Time	—	—	—	ns	See parameter DO31

Note 1: These parameters are characterized, but not tested in manufacturing.

2: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

FIGURE 44-9: OCx/PWM MODULE TIMING CHARACTERISTICS



Note: Refer to Figure 44-1 for load conditions.

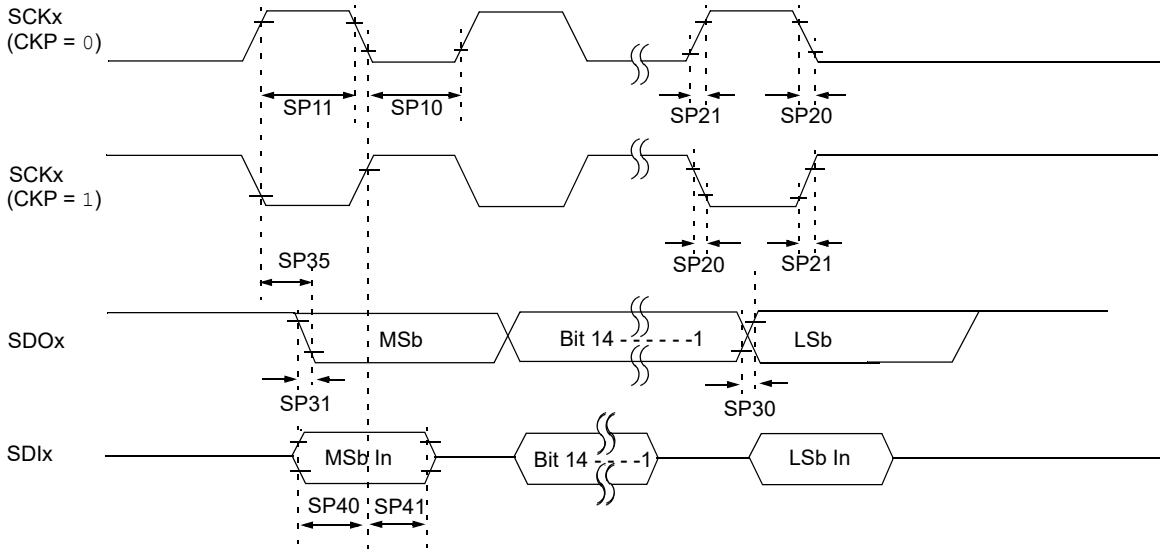
TABLE 44-36: SIMPLE OCx/PWM MODE TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param No.	**Symbol**	**Characteristics(1)**	**Min,**	**Typ.(2)**	**Max,**	**Units**	**Conditions**
OC15	TFD	Fault Input to PWM I/O Change	—	—	50	ns	—
OC20	TFLT	Fault Input Pulse Width	50	—	—	ns	—

Note 1: These parameters are characterized, but not tested in manufacturing.

2: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

FIGURE 44-10: SPIx MODULE HOST MODE (CKE = 0) TIMING CHARACTERISTICS



Note: Refer to Figure 44-1 for load conditions.

TABLE 44-37: SPIx HOST MODE (CKE = 0) TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics(1)**	**Min.**	**Typ.(2)**	**Max.**	**Units**	**Conditions**
SP10	TscL	SCKx Output Low Time **(Note 3)**	Tsck/2	—	—	ns	**Note 5**
SP11	TscH	SCKx Output High Time **(Note 3)**	Tsck/2	—	—	ns	**Note 5**
SP15	TscK	SPI Clock Speed **(Note 5)**	—	—	25	MHz	SPI1, SPI3, SPI4, SPI6
			—	—	50	MHz	SPI2 on RPG7, RPG8
			—	—	25	MHz	SPI2 on other I/O
			—	—	50	MHz	SPI5 on RPC1, RPC4
			—	—	25	MHz	SPI5 on other I/O
SP20	TscF	SCKx Output Fall Time **(Note 4)**	—	—	—	ns	See parameter DO32
SP21	TscR	SCKx Output Rise Time **(Note 4)**	—	—	—	ns	See parameter DO31
SP30	TdoF	SDOx Data Output Fall Time **(Note 4)**	—	—	—	ns	See parameter DO32
SP31	TdoR	SDOx Data Output Rise Time **(Note 4)**	—	—	—	ns	See parameter DO31
SP35	TscH2doV, TscL2doV	SDOx Data Output Valid after SCKx Edge	—	—	7	ns	V_{DDIO} > 2.7V
			—	—	10	ns	V_{DDIO} < 2.7V
SP40	TdiV2scH, TdiV2scL	Setup Time of SDIx Data Input to SCKx Edge	5	—	—	ns	—
SP41	TscH2diL, TscL2diL	Hold Time of SDIx Data Input to SCKx Edge	5	—	—	ns	—

Note 1: These parameters are characterized, but not tested in manufacturing.

2: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

3: The minimum clock period for SCKx is 20 ns. Therefore, the clock generated in Host mode must not violate this specification.

4: Assumes 30 pF load on all SPIx pins.

5: To achieve maximum data rate, V_{DDIO} must be greater than or equal to 3.0V and the SMP bit (SPIxCON<9>) must be set to '1'.

FIGURE 44-11: SPIx MODULE HOST MODE (CKE = 1) TIMING CHARACTERISTICS

EB19	TEBIDH	EBI Input Data Hold	3	—	—	ns	See **Note 2,3**

Note 1: EBI Timings Requirements data are from simulation.

2: Maximum pin capacitance = 10 pF.

3: Hold time from EBI Address change is 0 ns.

TABLE 44-55: GLCD CONTROLLER TIMING SPECIFICATIONS

AC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristic**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
GD20	tGCLK	Pixel Clock Frequency on GLCD pin	—	—	50	MHz	—

TABLE 44-56: INTERNAL DDR2 SDRAM TIMING SPECIFICATIONS

AC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristic(1)**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
DDR10	tCK	Clock Frequency	—	5	—	ns	—
DDR11	tDUTY	Duty Cycle	48	50	52	%	—
DDR12	tRCD	Active to Read/Write Command Delay Time	20	—	—	ns	—
DDR13	tRP	Precharge to Active Command Period	20	—	—	ns	—
DDR14	tRC	Active to Ref/Active Command Period	65	—	—	ns	—
DDR15	tRAS	Active to Precharge Command Period	40	70000	—	ns	**Note 1**
DDR16	tRFC	Auto Refresh to Active/Auto Refresh Command Period	75	—	—	ns	**Note 2**
DDR17	tREFI	Average Periodic Refresh Interval	—	—	7.8	µs	-40°C ≤ TJ ≤ 85°C **Note 2**
			—	—	3.9	µs	85°C ≤ TJ ≤ 95°C **Note 2**
			—	—	1.95	µs	95°C ≤ TJ ≤ 125°C **Note 2**
DDR18	tCKE	DDRCKE Minimum High and Low Pulse Width	6	—	—	ntCK	—
DDR19	tRRD	Active to active command period for 1 KB page size	10	—	—	ns	**Note 3**
DDR20	tFAW	Four Activate Window for 1 KB Page Size	35	—	—	ns	—
DDR21	tWR	Write Recovery Time	15	—	—	ns	—
DDR22	tWTR	Internal Write to Read Command Delay	10	—	—	ns	**Note 4**
DDR23	tRTP	Internal Read To Precharge Command Delay	10	—	—	ns	**Note 1**
DDR24	tXSRD	Exit Self Refresh to a Read Command	200	—	—	ntCK	—

Note 1: This is a minimum requirement. Minimum read to precharge timing is AL + BL / 2 provided that the tRTP and tRAS(min) have been satisfied.

2: If refresh timing is violated, data corruption may occur and the data must be rewritten with valid data before a valid READ can be executed.

3: A minimum of two clocks (2 * ntCK) is required regardless of operating frequency.

4: tWTR is at least two clocks (2 * ntCK) independent of operation frequency.

5: When DRAM is operated at 85°C < Tj ≤ 125°C the extended Self Refresh rate must be enabled by setting bit A7 to “1” in extended mode register (2) EMR(2) before the Self Refresh mode can be entered.

Note: For detailed information about the EMR(2) register please check the DDR2 SDRAM Specification JESD79-2F.

TABLE 44-56: INTERNAL DDR2 SDRAM TIMING SPECIFICATIONS (CONTINUED)

AC CHARACTERISTICS			Standard Operating Conditions: V_{DDIO} = 2.2V to 3.6V, V_{DDCORE} = 1.7V to 1.9V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristic(1)**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
DDR25	tXP	Exit Precharge Power Down to Any Command	2	—	—	ntCK	—
DDR26	tMRD	Mode Register Set Command Cycle Time	2	—	—	ntCK	—
DDR27	RL	Read Latency	CL	—	—	ntCK	—
DDR28	CL	CAS Latency	3	—	4	ntCK	—
DDR29	WL	Write Latency	RL – 1	—	—	ntCK	—
DDR30	BL	Burst Length	8	—	—	ntCK	—

Note 1: This is a minimum requirement. Minimum read to precharge timing is AL + BL / 2 provided that the tRTP and tRAS(min) have been satisfied.

2: If refresh timing is violated, data corruption may occur and the data must be rewritten with valid data before a valid READ can be executed.

3: A minimum of two clocks (2 * ntCK) is required regardless of operating frequency.

4: tWTR is at least two clocks (2 * ntCK) independent of operation frequency.

5: When DRAM is operated at 85°C < Tj ≤ 125°C the extended Self Refresh rate must be enabled by setting bit A7 to “1” in extended mode register (2) EMR(2) before the Self Refresh mode can be entered.

Note: For detailed information about the EMR(2) register please check the DDR2 SDRAM Specification JESD79-2F.

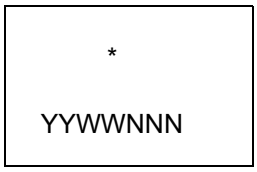
46.0 PACKAGING INFORMATION

46.1 Package Marking Information

All devices are marked with Microchip logo and ordering code.
Additional marking is as shown below:



Where,

- YY : Manufacturing year (last 2 digits of calender year)
- WW : Manufacturing week (week of January 1 is week 01)
- NNN: Alphanumeric traceability code
- * : Pb-free JEDEC designator for Matte Tin (Sn)

This package is Pb free. The Pb-free JEDEC designator, (e3), can be found on this package or outer packaging of this package.

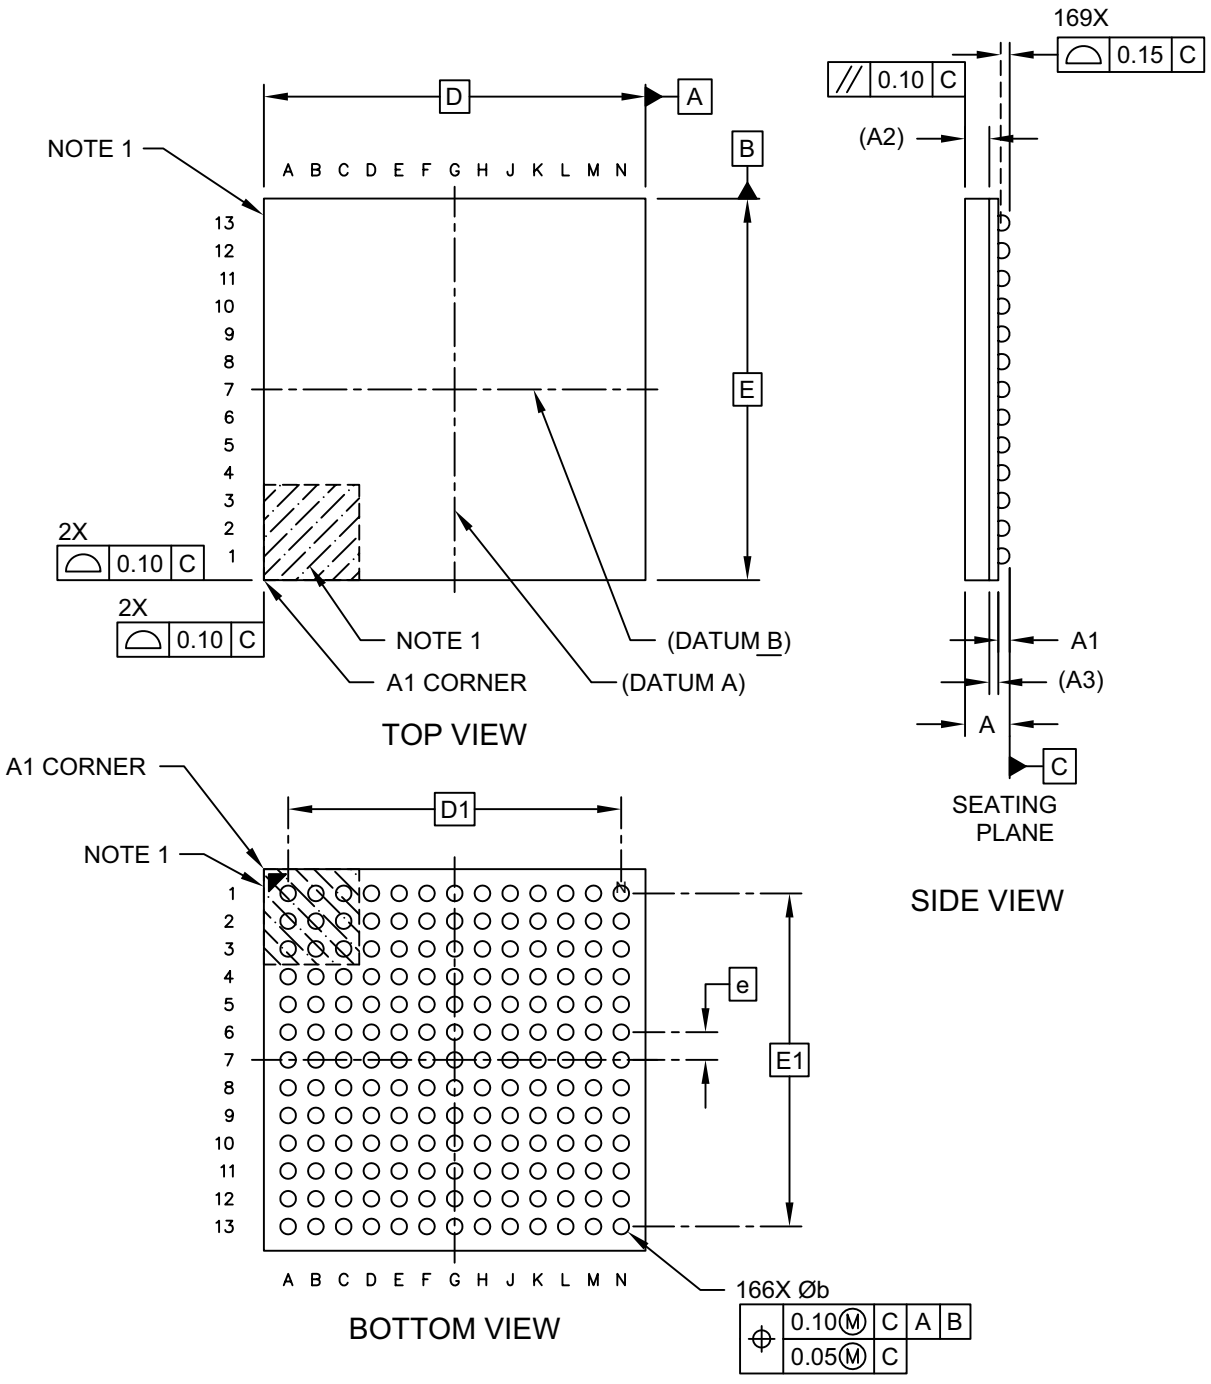
Note: If the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

46.2 Package Details

The following sections give the technical details of the packages.

169-Ball Low Profile Fine Pitch Ball Grid Array (HF) - 11x11x1.4 mm Body [LFBGA]

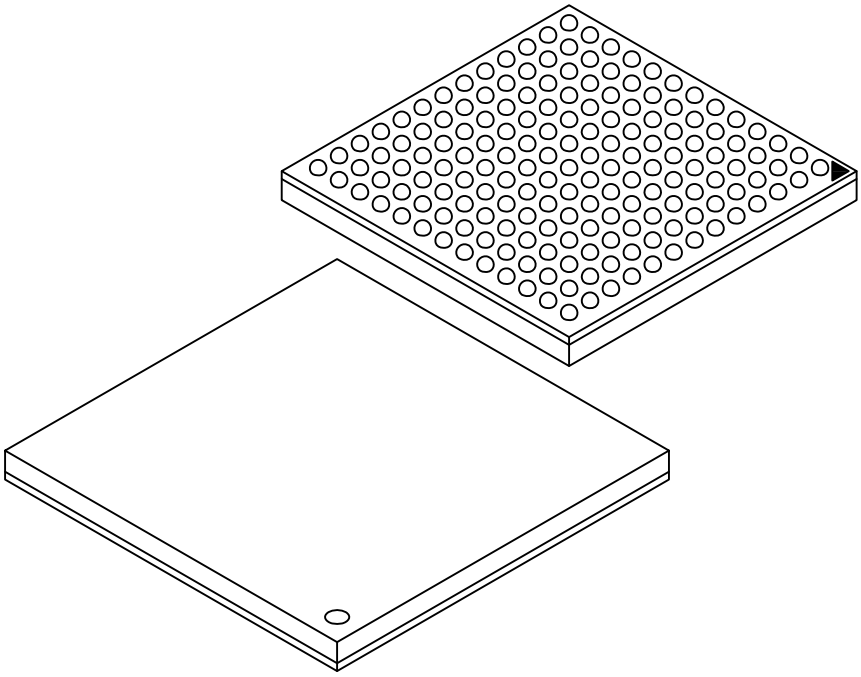
Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



Microchip Technology Drawing C04-365B Sheet 1 of 2

169-Ball Low Profile Fine Pitch Ball Grid Array (HF) - 11x11x1.4 mm Body [LFBGA]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Number of Terminals (Balls)	N		169	
Pitch	e		0.80 BSC	
Overall Height	A	1.17	1.285	1.40
Terminal (Ball) Height	A1	0.25	0.325	0.40
Mold Cap Thickness	(A2)		0.70 REF	
Substrate Thickness	(A3)		0.26 REF	
Overall Length	D		11.00 BSC	
Overall Width	E		11.00 BSC	
Overall Ball Pitch	D1		9.60	
Overall Ball Pitch	E1		9.60	
Ball Diameter	b	0.40	0.45	0.50

Notes:

1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. Dimensioning and tolerancing per ASME Y14.5M

   BSC: Basic Dimension. Theoretically exact value shown without tolerances.

   REF: Reference Dimension, usually without tolerance, for information purposes only.

NOTES:

APPENDIX A: REVISION HISTORY

Revision A (July 2015)

This is the initial released version of the document.

Revision B (November 2015)

In this revision, the document status has been updated from Advance Information to Preliminary.

This revision includes the following major changes, which are referenced by their respective chapter in Table TABLE A-1:Major Section Updates.

In addition, minor updates to text and formatting were incorporated throughout the document.

TABLE A-1: MAJOR SECTION UPDATES

Section Name	Update Description
32-bit Graphics Applications MCUs (up to 2 MB Live Update Flash, 640 KB SRAM, and 32 MB DDR2 SDRAM) with XLP Technology	The pin names for 169-pin devices were updated (see Table 5). The pin names for 288-pin devices were updated (see Table 7).
4.0 “Memory Organization”	The Boot Flash Sequence and Configuration Word Summary tables were updated (see Table 4-3 and Table 4-4). The BFxSEQ3/ABFxSEQ3: Boot Flash ‘x’ Sequence Word 0 Register was updated (see Register 4-1).
6.0 “Resets”	The All Resets values were updated for the RCON register in the Resets Register Map (see Table 6-1).
7.0 “CPU Exceptions and Interrupt Controller”	The OFF199 register was added to the Interrupt Register Map (see Table 7-3).
8.0 “Oscillator Configuration”	The All Resets values for the OSCON and PB6DIV registers were updated in the Oscillator Register Map (see Table 8-2). The PLLODIV<2:0> bit values in the SPLLCON register were updated (see Register 8-3).
10.0 “Direct Memory Access (DMA) Controller”	The All Resets values were updated in the DMA Channel 0 through Channel 7 Register Map (see Table 10-3).
11.0 “Hi-Speed USB with On-The-Go (OTG)”	The All Resets value for bits 15:0 of the USBOTG register was updated in the USB Register Map 1 (see Table 11-1). The value at POR was updated for bits 24 and 13 of the USBCRCON register (see Register 11-30).
12.0 “I/O Ports”	The TRISC bits in the PORTC Register Map were updated (see Table 12-5). The ANSH3 bit was added to the ANSELH register in the PORTH Register Map (see Table 12-10). The RPD15R register was removed from the Peripheral Pin Select Output Register Map (see Table 12-14).
18.0 “Watchdog Timer (WDT)”	The All Resets value for bits 15:0 of the WDTCON register in the Watchdog Timer Register Map was updated (see Table 18-1).
21.0 “Serial Peripheral Interface (SPI) and Inter-IC Sound (I^{2S})”	The All Resets value for bits 15:0 of the SPI1STAT and SPI1CON2 registers in the Watchdog Timer Register Map were updated (see Table 21-1).
22.0 “Serial Quad Interface (SQI)”	The All Resets value for bits 15:0 of the SQI1XCON1 register in the Serial Quadrature Interface (SQI) Register Map was updated (see Table 22-1).

TABLE A-1: MAJOR SECTION UPDATES (CONTINUED)

Section Name	Update Description
25.0 "Parallel Master Port (PMP)"	The All Resets value for bits 15:0 of the PMSTAT register in the Parallel Master Port Register Map was updated (see Table 25-1).
26.0 "External Bus Interface (EBI)"	The All Resets values were updated in the EBI Register Map (see Table 26-2).
29.0 "12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC)"	The All Resets values for the ADCCON1 and ADCxTIME registers were updated and the Virtual Addresses for the ADCxCFG, ADCSYSCFGx, and ADCDATAx registers were updated in the ADC Register Map (see Table 29-1).
34.0 "High/Low-Voltage Detect (HLVD)"	The chapter was renamed and the introduction was updated. The HLVDCON register was updated (see Table 34-1 and Register 34-1). High/Low-Voltage Detect (HLVD) Module Block Diagram was updated (see Figure 34-1)
36.0 "Graphics LCD (GLCD) Controller"	The Graphics LCD Controller Register Map was updated (see Table 36-1). These registers were updated: • **Register 36-2: "GLCDCLKCON: Graphics LCD Controller Clock Control Register"** • **Register 36-4: "GLCDRES: Graphics LCD Controller Resolution Register"** • **Register 36-5: "GLCDFPORCH: Graphics LCD Controller Front Porch Register"** • **Register 36-6: "GLCDBLANKING: Graphics LCD Controller Blanking Register"** • **Register 36-7: "GLCDBPORCH: Graphics LCD Controller Back Porch Register"** • **Register 36-8: "GLCDCURSOR: Graphics LCD Controller Cursor Register"** • **Register 36-10: "GLCDLxstart: graphics lcd controller layer 'x' start register ('x' = 0-2)"** • **Register 36-11: "GLCDLxsize: graphics lcd controller layer 'x' size register ('x' = 0-2)"** • **Register 36-14: "GLCDLxres: graphics lcd controller layer 'x' resolution register ('x' = 0-2)"**
37.0 "2-D Graphics Processing Unit (GPU)"	The introduction was updated.
39.0 "Secure Digital Host Controller (SDHC)"	The SDHC block diagram was updated (see Figure 39-1). The SDHC Register Map was updated (see Table 39-1). The bit values for the CDSLVL bit in the SDHCSTAT1 register were updated (see Register 39-6). The SDHCCAP register was updated (see Register 39-13).
40.0 "Power-Saving Features"	**40.2.3 "Deep Sleep Mode"** was updated. References to High-Voltage Detect were removed in the PMD Register Summary (Table 40-2) and the PMD Bits and Locations (Table 40-3).
41.0 "Special Features"	The CFGCON2 register was updated (see Table 41-3 and Register 41-12).

TABLE A-1: MAJOR SECTION UPDATES (CONTINUED)

Section Name	Update Description
44.0 "Electrical Characteristics"	The following tables were updated: • **Table 44-1: "Operating MIPS vs. Voltage"** • **Table 44-3: "Thermal Packaging Characteristics"** • **Table 44-4: "DC Temperature and Voltage Specifications"** • **Table 44-8: "DC Characteristics: Operating Current (Idd)"** • **Table 44-9: "DC Characteristics: Idle Current (Iidle)"** • **Table 44-10: "DC Characteristics: Power-Down Current (Ipd)"** • **Table 44-12: "DC Characteristics: I/O Pin Output Specifications"** • **Table 44-38: "SPIx Master Mode (CKE = 0) Timing Requirements"** • **Table 44-39: "SPIx Module Master Mode (CKE = 1) Timing Requirements"** • **Table 44-53: "USB OTG Electrical Specifications"**

Revision C (October/November 2016)

All instances of VDD1V8 were changed to: VDDR1V8 and VDD were changed to VDDIO throughout the data sheet.

All instances of V-Temp specifications were removed throughout the data sheet.

This revision includes the following major changes, which are referenced by their respective chapter in Table TABLE A-2:Major Section Updates.

In addition, minor updates to text and formatting were incorporated throughout the document.

TABLE A-2: MAJOR SECTION UPDATES

Section Name	Update Description
32-bit Graphics Applications MCUs (up to 2 MB Live Update Flash, 640 KB SRAM, and 32 MB DDR2 SDRAM) with XLP Technology	The Operating Conditions were updated from 2.0V to 3.6V to 2.2V to 3.6V. All Device Pin Tables were updated (see Table 5 through Table 7).
1.0 "Device Overview"	Note 1 was added to the Timer1 through Timer9 and RTCC Pinout I/O Descriptions (see Table 1-7). Note 2 and the pin numbers for the Power, Ground, and Voltage Reference Pinout I/O Descriptions were updated (see Table 1-23).
2.0 "Guidelines for Getting Started with 32-bit Microcontrollers"	The Recommended Minimum Connection diagram was updated (see Figure 2-1). **2.9.1.3 "EMI/EMC/EFT (IEC 61000-4-4 and IEC 61000-4-2) Suppression Considerations"** was added.
3.0 "CPU"	The SB bit was updated in the Configuration Register; CP0 Register 16, Select 0 (see Register 3-1).
4.0 "Memory Organization"	**4.3 "Timing Parameters"** was updated.
6.0 "Resets"	Note 1 was added to the Resets Register Map (see Table 6-1).
8.0 "Oscillator Configuration"	The DIVSPLLRDY bit was removed from the CLKSTAT register (see Table 8-2 and Register 8-8). Updated bit 5-0 center frequency values from -2% to -4% and +2% to +4% (see Register 8-2).

TABLE A-2: MAJOR SECTION UPDATES (CONTINUED)

Section Name	Update Description
12.0 "I/O Ports"	The CNCON registers in the Port Register Maps were updated (see Table 12-3 through Table 12-12). The SIDL bit was removed from the CNCONx registers (see Register 12-3).
20.0 "Real-Time Clock and Calendar (RTCC)"	A note regarding the RTCC pin was added in the key features.
22.0 "Serial Quad Interface (SQI)"	Note 1 in the SQI Module Block Diagram was updated (see Figure 22-1).
26.0 "External Bus Interface (EBI)"	Note 2 was added on EBI module usage with the Graphics LCD (GLCD) Controller. Table 26-1: EBI Module Features was removed. Note 1 was removed from the External Bus Interface Address Mask register (see Register 26-2).
29.0 "12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC)"	**EQUATION 29-1: "ADC Throughput Rate"** and notes were added. Note 1 was added to the ADC Register Map (see Table 29-1). A note was added to the SELRES bits in the ADCCON1 and the ADCxTIME registers (see Register 29-1 and Register 29-27, respectively). The AICPMPEN bit was added to the ADC Control Register 1 (see Table 29-1 and Register 29-1). The bit values and the note for the CHNLID bits in the ADCFLTRx register were updated (see Register 29-16). The bit values for the ADCID bits in the ADCFSTAT register were updated (see Register 29-22). The ADCCFG bit definition and the note were updated in the ADCxCFG register (see Register 29-33).
34.0 "High/Low-Voltage Detect (HLVD)"	The SIDL bit was removed from the HLVDCON register (see Table 34-1 and Register 34-1).
36.0 "Graphics LCD (GLCD) Controller"	The bit positions of FORCEALPHA and DISABIFIL in the GLCDLxMODE register were switched (see Table 36-1 and Register 36-9).
38.0 "DDR2 SDRAM Controller"	The DDRPHYPADCON register was updated (see Table 38-1 and Register 38-28). The values at POR were updated in the following registers: • Register 38-18 • Register 38-25 • Register 38-26 • Register 38-28
39.0 "Secure Digital Host Controller (SDHC)"	Note 1 in the Secure Digital Host Controller (SDHC) Block Diagram was updated (see Figure 39-1).
40.0 "Power-Saving Features"	The WAKEDIS bit was removed from the Deep Sleep Control register (see Table 40-1 and Register 40-1).
41.0 "Special Features"	DEVSN2 and DEVSN3 were added to the Device Serial Number Summary (see Table 41-4). The Device ADC Calibration Summary was added (see Table 41-5). Note 2 was added to the JTAGEN bit in the CFGCON register (see Register 41-9).

TABLE A-2: MAJOR SECTION UPDATES (CONTINUED)

Section Name	Update Description
44.0 "Electrical Characteristics"	The Operating Conditions were updated from 2.0V - 3.6V to 2.2V - 3.6V for VDDIO and 1.7V - 1.9V for VDDCORE throughout the chapter. The Absolute Maximum Ratings were updated. Updated VDDIO values from 0.8*VDDIO to 0.65*VDDIO.(see Table 44-10, Table 44-15, Table 44-22). Updated thermal packaging characteristics (see Table 44-3). Updated typical DC characteristics (see Table 44-7). Updated SD Host Controller timing specs - min. standard operating conditions (see Table 44-58 and Table 44-59). All tables were updated.
46.0 "Packaging Information"	Updated packaging dimensions (see **46.1 "Package Marking Information"**). Added information for 6JX packaging (see **46.1 "Package Marking Information"** and **46.2 "Package Details"**).
Product Identification System	The package marking for V-Temp devices was changed to V.

Revision D (March 2017)

This revision includes the following major changes, which are referenced by their respective chapter in Table TABLE A-3:Major Section Updates.

In addition, minor updates to text and formatting were incorporated throughout the document.

TABLE A-3: MAJOR SECTION UPDATES

Section Name	Update Description
32-bit Graphics Applications MCUs (up to 2 MB Live Update Flash, 640 KB SRAM, and 32 MB DDR2 SDRAM) with XLP Technology	Table 5, updated pin B4 to VDDCORE and B6 to VDDIO.
4.0 "Memory Organization"	Figure 4-1, updated KSEG3 from "cacheable" to "not cacheable"
6.0 "Resets"	Updated Figure 6-1.
8.0 "Oscillator Configuration"	Table 8-1, added SYSCLK to peripheral EBI.
26.0 "External Bus Interface (EBI)"	Figure 26-1, changed PBCLK8 to SYSCLK
29.0 "12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC)"	Register 29-1, bit 12, updated notes and added table.
38.0 "DDR2 SDRAM Controller"	Table 38-1, swapped register names DRVSTRPFET and DRVSTRNFET. Table 38-1, added offset address 9140. Register 38-28, swapped register names and definitions DRVSTRPFET and DRVSTRNFET. Added Register 38-30,
40.0 "Power-Saving Features"	Register 40-1, updated "command" to "instruction." Updated **40.2.4 "VBAT Mode"**
41.0 "Special Features"	Register 41-5, updated "command" to "instruction.". Register 41-9, bit 7, updated notes and added table.
44.0 "Electrical Characteristics"	Updated **44.1 "DC Characteristics"** Updated Table 44-4 and Table 44-5. Table 44-18, Added parameter D306. Table 44-56, updated values for parameters DDR10, DDR19, DDR22, and DDR23.

Revision E (May 2017)

This revision includes the following major changes, which are referenced by their respective chapter in Table TABLE A-4:Major Section Updates.

In addition, minor updates to text and formatting were incorporated throughout the document.

TABLE A-4: MAJOR SECTION UPDATES

Section Name	Update Description
32-bit Graphics Applications MCUs (up to 2 MB Live Update Flash, 640 KB SRAM, and 32 MB DDR2 SDRAM) with XLP Technology	Updated the value of pin 168 from "CVREFOUT/AN5/RPB10/RB10" to "AN5/RPB10/RB10" (see Table 6).
25.0 "Parallel Master Port (PMP)"	The Virtual Address column heading was updated from BF80 to BF82 and the virtual addresses were updated from 70xx to E0xx (see Table 25-1).
36.0 "Graphics LCD (GLCD) Controller"	The resolutions in the key features list were updated.
39.0 "Secure Digital Host Controller (SDHC)"	The eMMC Standard: JESD84-A441 was added to the features list.
44.0 "Electrical Characteristics"	Table 44-7, Table 44-8, Table 44-9, Table 44-10, Table 44-11, Table 44-16, Table 44-18 updated various DC Characteristics parameters. Table 44-27, Table 44-28, Table 44-29 updated various AC Characteristics parameters.

Revision F (January 2018)

This revision includes the following major changes, which are referenced by their respective chapter in Table TABLE A-5:Major Section Updates.

In addition, minor updates to text and formatting were incorporated throughout the document.

TABLE A-5: MAJOR SECTION UPDATES

Section Name	Update Description
1.0 "Device Overview"	The PIC32MZ DA Family Block Diagram was updated (see Figure 1-1). The 176-pin LQFP pin number for SDA3 in the I1C1 through I2C5 Pinout I/O Descriptions was updated (see Table Table 1-10:I2C1 through I2C5 Pinout I/O Descriptions). The 169-pin LFBGA pin numbers for EBIOE and EBIWE in the EBI Pinout I/O Descriptions were updated (see Table Table 1-13:EBI Pinout I/O Descriptions).
2.0 "Guidelines for Getting Started with 32-bit Microcontrollers"	The following sections were added: • **2.7.1 "Crystal Oscillator Design Consideration"** • **2.9 "Considerations When Interfacing to Remotely Powered Circuits"**
4.0 "Memory Organization"	The PIC32MZ DA Family Memory Map was updated (see Figure 4-1).
10.0 "Direct Memory Access (DMA) Controller"	CRCTYP bit number references in the DMA CRC Control Register were updated (see Register 10-4 DCRCCON: DMA CRC Control Register, Register 10-5 DCRCDATA: DMA CRC Data Register, and Register 10-6 DCRCXOR: DMA CRCXOR Enable Register).
36.0 "Graphics LCD (GLCD) Controller"	The key features for the module were updated.
37.0 "2-D Graphics Processing Unit (GPU)"	The key features for the module were updated. The GPURESET bit reference in **Note 2** was updated.
38.0 "DDR2 SDRAM Controller"	The definition when SCLLBPASS is set to '0' was updated and the SCLPHCAL bit was added (see Register 38-24 DDRSCLSTART: DDL SELF CALIBRATION LOGIC START REGISTER). The following registers were added: • **Register 38-31: "DDRPHYCLKDLY: DDR Clock Delta Delay Register"** • **Register 38-32: "DDRADLLBYP: DDR ANALOG DLL BYPASS Register"** • **Register 38-33: "DDRSCLCFG2: DDR SCL Configuration Register 2"** • **Register 38-34: "DDRPHYSCLADR: DDR PHY SCL Address Register"**
41.0 "Special Features"	The Device Configuration Word 0 registers, DEVCFG0/ADEVCFG0, was extensively updated (see Register 41-3 DEVCFG0/ADEVCFG0: Device/Alternate Device Configuration Word 0). The bit value definitions for the FCKSM<1:0> bits and the POSCMOD<1:0> bits in the Device Configuration Word 1 registers, DEVCFG1/ADEVCFG1, were updated (see Register 41-4 DEVCFG1/ADEVCFG1: Device Configuration Word 1).
44.0 "Electrical Characteristics"	Parameter DO50 (COSCO) was removed from the Capacitive Loading Requirements on Output Pins (see Table Table 44-22:Capacitive Loading Requirements on Output Pins).

Revision G (September 2018)

This revision includes the following major changes, which are referenced by their respective chapter in the following table.

In addition, minor updates to text and formatting were incorporated throughout the document.

TABLE A-6: MAJOR SECTION UPDATES

Section Name	Update Description
TABLE 2: "169-pin LFBGA PIC32MZ DA Features", TABLE 3: "176-pin LQFP PIC32MZ DA Features", and TABLE 4: "288-pin LFBGA PIC32MZ DA Features"	Updated three tables with package information
4.0 "Memory Organization"	The PIC32MZ DA Family Memory Map was updated (see Figure 4-1).
Register 6-3: "RNMICON: Non-Maskable Interrupt (NMI) Control Register"	Added attributes and new note.
TABLE 12-1: "Input Pin Selection"	Corrected peripheral pin name.
Register 17-3: "DMTCLR: Deadman Timer Clear Register" and Register 17-4: "DMTSTAT: Deadman Timer Status Register"	Corrected and added description of bits.
Register 28-4: "RNGNUMGENx: Random Number Generator Register 'x' ('x' = 1 or 2)" and Register 28-5: "RNGSEEDx: True Random Number Generator Seed Register 'x' ('x' = 1 or 2)"	Added Note to both registers.
Register 34-1: "HLVDCON: High/Low-Voltage Detect Control Register"	Corrected Pin Description for HLVDL bits.
FIGURE 39-1: "Secure Digital Host Controller (SDHC) Block Diagram"	Pin name corrected to SDDATA3.
FIGURE 40-1: "XLP Device Block Diagram"	Corrected text in figure.
Register 40-1: "DSCON: Deep Sleep Control Register"	Corrected Bit 1 DSBOR description
Table 44-2: "Thermal Operating Conditions"	Corrected the Formula for PINT and PI/O
TABLE 44-6: "Low-Voltage Detect Characteristics"	Removed bitfields 1100, 1101, and 1110 as they are reserved.
"Communication Interfaces"	Corrected Lin support from LIN1.2 to LIN2.1
Table 1-6: "PORTA through PORTK Pinout I/O Descriptions"	RB14 pin for LQFP176 corrected from 175 to 159
Table TABLE 4-3:Boot Flash 1 Sequence and Configuration Words Summary	Table Note Updated
Table TABLE 4-4:Boot Flash 2 Sequence and Configuration Words Summary	Table Note Updated
Table Register 8-4:REFOxCON: Reference Oscillator Control Register ('x' = 1-5)	Bit 30-16 explained in detail
Table Register 21-1:SPIx CON: SPI Control Register	Bit 29 Description Corrected
Table Register 26-1:EBICSx: External Bus Interface Chip Select Register ('x' = 0-3)	Note added
Table Register 36-16:GLCDSTAT: Graphics LCD Controller Status Register	Note Added for bit 3 and bit 2
Table Register 41-13:CFGCON2: Configuration Control Register 2	Bit 0 definition corrected
Table Table 44-23:External Clock Timing Requirements	OS42 detail added
Table Table 44-53:Ethernet Module Specifications	Corrected parameter ET13 name from setup and Hold to output Delay
46.1 "Package Marking Information"	Updated package marking information

Revision H (May 2019)

This revision includes the following major changes, which are referenced by their respective chapter in the following table.

In addition, minor updates to text and formatting were incorporated throughout the document.

TABLE A-7: MAJOR SECTION UPDATES

Section Name	Update Description
Table TABLE 2:169-pin LFBGA PIC32MZ DA Features	Package information was added
Table Table 1-2:Oscillator Pinout I/O Descriptions	SOSCO description was added
Table Table 1-6:PORTA through PORTK Pinout I/O Descriptions	Pin Number for 176-pin LQFP was corrected
Table Table 1-13:EBI Pinout I/O Descriptions	Pin Number for 176-pin LQFP was corrected
Table Table 4-5:Timing Parameters	Timing parameters was corrected
Register 8-6 PBxDIV: Peripheral Bus 'x' Clock Divisor Control Register ('x' = 1-7)	Added Note 2
Register 11-9 USBIENCSR1: USB Indexed Endpoint Control Status Register 1 (Endpoint 1-7)	Note added
Register 11-13 USBOTG: USB OTG Control/Status Register	bit 4-3 was corrected
Register 11-25 USBDPBFD: USB Double Packet Buffer Disable Register	Register bitfields were corrected
Register 23-1 I2CxCON: I2C Control Register	In bit16 and bit 18 the bit name SCKREL is corrected to read SCLREL
Register 25-2 PMMODE: Parallel Port Mode Register	Note added for bitfield 14-13 IRQM<1:0>
Register 25-7 PMSTAT: Parallel Port Status Register (Slave modes only)	• Note added for bit 14 IBOV • Note added for bit 6 OBUF
28.0 "Random Number Generator (RNG)"	LSFR was corrected to read LFSR
Register 29-3 ADCCON3: ADC Control Register 3	bitfield 15-13 bits definition was corrected
Register 29-16 ADCFLTRx: ADC Digital Filter 'x' Register ('x' = 1 through 6)	Note added for bit 31 AFEN
39.0 "Secure Digital Host Controller (SDHC)"	Added Note 2.
Register 41-5 DEVCFG2/ADEVCFG2: Device Configuration Word 2	Note added for bit 28 FDSEN
44.0 "Electrical Characteristics"	• Maximum current rating added for VDDCORE and VDDR1V8 • ESD Qualification added
Table Table 44-2:Thermal Operating Conditions	Formula added for DDR2 version
Table Table 44-5:Electrical Characteristics: RESETS	Parameter numbers RST10 and RST11 corrected and Note added for RST11
Table Table 44-17:DC Characteristics: DDR2 SDRAM Memory	Maximum current rating reduced for some parameters
Table Table 44-18:Comparator Specifications	CMRR and VICM values corrected

Revision J (June 2021)

The I^2C, SPI, and I^2S standards use the terminology "Master" and "Slave". The equivalent Microchip terminology used in this document is "Host" and "Client" respectively.

This revision includes the following major changes, which are referenced by their respective chapter in the following table.

In addition, minor updates to text and formatting were incorporated throughout the document.

Section Name or Type	Update Description
General	• Throughout the document, References to both “Master” and “Slave” were revised to read “Host” and “Client” where applicable • Updated **“Operating Conditions”** to reflect correct temperature ranges
2.0 “Guidelines for Getting Started with 32-bit Microcontrollers”	• Updated **2.9.2 “5V Tolerant Input Pins”**, correcting VDD to VDDIO, and updated VDDIO specifications in the text
8.0 “Oscillator Configuration”	• Removed erroneous information within parenthesis on Note 6 for **Table 8-1: “System and Peripheral clock Distribution”** • Updated **Register 8-4: “REFOxCON: Reference Oscillator Control Register (‘x’ = 1-5)”** to properly display x=1-5, and added a note number 4
17.0 “Deadman Timer (DMT)”	• Updated to note for **Register 17-1: “DMTCON: Deadman Timer Control Register”**
21.0 “Serial Peripheral Interface (SPI) and Inter-IC Sound (I^2S)”	• Updated **FIGURE 21-1: “SPI/I^2S Module Block Diagram”** to read “SPI Select” instead of “Slave Select”
25.0 “Parallel HOST Port (PMP)””	• Added a new note to the IRQM bit of **Register 25-2: “PMMODE: Parallel Port Mode Register”** • Added a new note to the IBOV bit of **Register 25-7: “PMSTAT: Parallel Port Status Register (Client modes only)”**
35.0 “Charge Time Measurement Unit (CTMU)”	• Added AN5 to AN39 to the first bulleted item on page 585
36.0 “Graphics LCD (GLCD) Controller”	• Corrected typographical errors in bitfield 5-0 for **Register 36-2: “GLCDCLKCON: Graphics LCD Controller Clock Control Register”**
38.0 “DDR2 SDRAM Controller”	• Added a note to bit 28 of **Register 38-24: “DDRSCLSTART: DDL SELF CALIBRATION LOGIC START REGISTER”** • Corrected a typographical error is the DLYSTVAL bitfield of **Register 38-29: “DDRPHYDLLR: DDR PHY DLL Recalibrate Register”**
40.0 “Power-Saving Features”	• Updated **FIGURE 40-1: “XLP Device Block Diagram”** to properly display VDDCORE • A new note was added to **40.4 “Peripheral Module Disable”**

Section Name or Type	Update Description
41.0 “Special Features”	• Added a new note to the FDMTEN bitfield for Register 41-4: “DEVCFG1/ADEVCFG1: Device Configuration Word 1” • Corrected typographical errors in 41.4 “On-Chip Voltage Regulator”
44.0 “Electrical Characteristics”	• Updated Table 44-24: “System Timing Requirements” with new conditions for the Reference Clock frequency • Updated Table 44-26: “MPLL Clock Timing Requirements” with a new maximum value for the MP12 Parameter • Updated the characteristics for Table 44-55: “GLCD Controller Timing Specifications”with the addition of GLCD pin verbiage • Updated TABLE 44-56: “Internal DDR2 SDRAM Timing Specifications” with a correction to note 5
46.0 “Packaging Information”	• Updated the Descriptions for the 169-Ball Low Profile Ball Grid Array
“Product Identification System”	• Updated the Package description for the 169 Lead LFBGA

INDEX

A

AC Characteristics 751
- ADC Specifications 776
- Analog-to-Digital Conversion Requirements 777
- DDR2 SDRAM Timing Requirements 754
- EBI Timing Requirements 745, 750, 787, 789
- EJTAG Timing Requirements 791
- Ethernet 784
- Internal BFRC Accuracy 755
- Internal FRC Accuracy 755
- Internal RC Accuracy 755
- OTG Electrical Specifications 783
- Parallel Master Port Read Requirements 781
- Parallel Master Port Write 782
- Parallel Master Port Write Requirements 782
- Parallel Slave Port Requirements 780
- PLL Clock Timing 753

THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

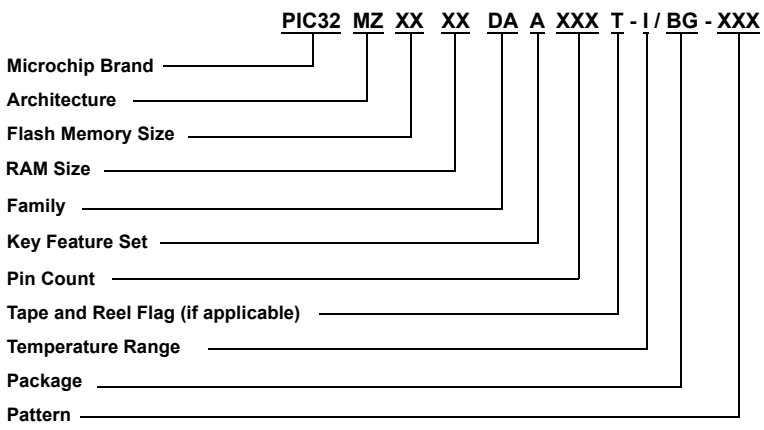
- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: http://microchip.com/support

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.



Example:

PIC32MZ0512DAA176-I/2J:
Graphics MCU Family, PIC32,
MIPS32® microAptiv™ MPU core,
512 KB program memory,
176-pin, Industrial temperature,
LQFP package.

Flash Memory Family

Architecture	MZ	= MIPS32® microAptiv™ MPU Core
Flash Memory Size	10	= 1024 KB
	20	= 2048 KB
RAM Size	25	= 256 KB
	64	= 640 KB
Family	DA	= Graphics MCU Family
Key Feature	A	= PIC32 DA Family Features, no Crypto, no DDR memory
	B	= PIC32 DA Family Features, with Crypto, no DDR memory
	G	= PIC32 DA Family Features, no Crypto, with DDR memory
	H	= PIC32 DA Family Features, with Crypto, with DDR memory
Pin Count	169	= 169-pin
	176	= 176-pin
	288	= 288-pin
Temperature Range	I	= -40°C to +85°C (Industrial)
Package	HF	= 169-Lead (11x11x1.4 mm) LFBGA (Low Profile Fine Pitch Ball Grid Array)
	6J	= 169-Lead (11x11x1.56 mm) LFBGA (Low Profile Fine Pitch Ball Grid Array)
	2J	= 176-Lead (22x22x1.4 mm) LQFP (Low Profile Quad Flat Pack)
	4J	= 288-Lead (15x15x1.4 mm) LFBGA (Low Profile Fine Pitch Ball Grid Array)
Pattern		Three-digit QTP, SQTP, Code or Special Requirements (blank otherwise)
	ES	= Engineering Sample

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods being used in attempts to breach the code protection features of the Microchip devices. We believe that these methods require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Attempts to breach these code protection features, most likely, cannot be accomplished without violating Microchip's intellectual property rights.
- Microchip is willing to work with any customer who is concerned about the integrity of its code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable." Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
