## 32-Mbit (x16) Multi-Purpose Flash Plus

---

---

The SST39VF3201C and SST39VF3202C devices are 2M x16, CMOS Multi-Purpose Flash Plus (MPF+) manufactured with proprietary, high-performance CMOS SuperFlash<sup>®</sup> technology. The split-gate cell design and thick-oxide tunneling injector attain better reliability and manufacturability compared with alternate approaches. The SST39VF3201C and SST39VF3202C write (Program or Erase) with a 2.7V-3.6V power supply. This device conforms to JEDEC standard pinouts for x16 memories.

### Features

- Organized as 2M x16
  - Single Voltage Read and Write Operations:
    - 2.7V-3.6V
  - Superior Reliability:
    - Endurance: 100,000 Cycles (Typical)
    - Greater than 100 years Data Retention
  - Low-Power Consumption (typical values at 5 MHz):
    - Active Current: 6 mA (typical)
    - Standby Current: 4  $\mu$ A (typical)
    - Auto Low-Power Mode: 4  $\mu$ A (typical)
  - Hardware Block Protection/WP# Input Pin:
    - Top Block Protection (top two 4-KWord blocks) for SST39VF3202C
    - Bottom Block-Protection (bottom two 4-KWord blocks) for SST39VF3201C
  - Sector-Erase Capability:
    - Uniform 2 KWord sectors
  - Block-Erase Capability:
    - Flexible block architecture
    - Eight 4-KWord blocks, 63 32-KWord blocks
  - Chip-Erase Capability
  - Erase-Suspend/Erase-Resume Capabilities
  - Hardware Reset Pin (RST#)
  - Security-ID Feature:
    - Microchip: 128 bits; User: 128 words
  - Fast Read Access Time:
    - 70 ns
  - Latched Address and Data
- Fast Erase and Word-Program:
    - Sector-Erase Time: 18 ms (typical)
    - Block-Erase Time: 18 ms (typical)
    - Chip-Erase Time: 35 ms (typical)
    - Word-Program Time: 7  $\mu$ s (typical)
  - Automatic Write Timing:
    - Internal V<sub>PP</sub> Generation
  - End-of-Write Detection:
    - Toggle Bits
    - Data# Polling
    - RY/BY# Pin
  - CMOS I/O Compatibility
  - JEDEC Standard:
    - Flash EEPROM Pin Assignments
  - Packages Available:
    - 48-lead TSOP (12 mm x 20 mm)
    - 48-ball TFBGA (6 mm x 8 mm)
  - All devices are RoHS compliant

### Packages

- 48-lead TSOP (12 mm x 20 mm)
- 48-ball TFBGA (6 mm x 8 mm)

# SST39VF3201C/SST39VF3202C

## DESCRIPTION

The SST39VF3201C and SST39VF3202C devices are 2M x16 CMOS Multi-Purpose Flash Plus (MPF+) manufactured with proprietary, high-performance CMOS SuperFlash technology. The split-gate cell design and thick-oxide tunneling injector attain better reliability and manufacturability compared with alternate approaches. The SST39VF3201C/SST39VF3202C write (Program or Erase) with a 2.7V-3.6V power supply. These devices conform to JEDEC standard pin assignments for x16 memories.

Featuring high-performance Word Program, the SST39VF3201C/SST39VF3202C devices provide a typical Word Program time of 7  $\mu$ sec. These devices use Toggle Bit, Data# Polling or RY/BY# pin to indicate the completion of Program operation. To protect against inadvertent write, they have on-chip hardware and Software Data Protection schemes. Designed, manufactured and tested for a wide spectrum of applications, these devices are offered with a typical endurance of 100,000 cycles. Data retention is rated at greater than 100 years.

The SST39VF3201C/SST39VF3202C devices are suited for applications that require convenient and economical updating of program, configuration or data memory. For all system applications, they significantly improve performance and reliability, while lowering power consumption. They inherently use less energy during Erase and Program than alternative Flash technologies. The total energy consumed is a function of the applied voltage, current and time of application. Since for any given voltage range, the SuperFlash technology uses less current to program and has a shorter erase time, the total energy consumed during any Erase or Program operation is less than alternative Flash technologies. These devices also improve flexibility while lowering the cost for program, data and configuration storage applications.

The SuperFlash technology provides fixed Erase and Program times, independent of the number of Erase/Program cycles that have occurred. Therefore, the system software or hardware does not have to be modified or derated as is necessary with alternative Flash technologies, whose Erase and Program times increase with accumulated Erase/Program cycles.

To meet high-density, surface mount requirements, the SST39VF3201C/SST39VF3202C devices are offered in 48-lead TSOP and 48-ball TFBGA packages. See [Figure 2](#) and [Figure 3](#) for pin assignments.

## BLOCK DIAGRAM

## PIN DESCRIPTION

**FIGURE 2: PIN ASSIGNMENTS FOR 48-LEAD TSOP**

**FIGURE 3: PIN ASSIGNMENTS FOR 48-BALL TFBGA**

# SST39VF3201C/SST39VF3202C

**TABLE 1: PIN DESCRIPTION**

Symbol	Pin Name	Functions
A <sub>MS</sub> <sup>(1)</sup> -A <sub>0</sub>	Address Inputs	To provide memory addresses. During Sector-Erase A <sub>MS</sub> -A <sub>11</sub> address lines will select the sector. During Block-Erase A <sub>MS</sub> -A <sub>15</sub> address lines will select the block.
DQ <sub>15</sub> -DQ <sub>0</sub>	Data Input/output	To output data during Read cycles and receive input data during Write cycles. Data is internally latched during a Write cycle. The outputs are in tri-state when OE# or CE# is high.
WP#	Write-Protect	To protect the top/bottom boot block from Erase/Program operation when grounded.
RST#	Reset	To reset and return the device to Read mode.
CE#	Chip Enable	To activate the device when CE# is low.
OE#	Output Enable	To gate the data output buffers.
WE#	Write Enable	To control the Write operations.
V <sub>DD</sub>	Power Supply	To provide power supply voltage: 2.7V-3.6V
V <sub>SS</sub>	Ground	
NC	No Connection	Unconnected pins.
RY/BY#	Ready/Busy#	To output the status of a Program or Erase operation RY/BY# is a open-drain output, so a 10 KW-100 KW pull-up resistor is required to allow RY/BY# to transition high indicating the device is ready to read.

**Note 1:** A<sub>MS</sub> = Most Significant address.  
A<sub>MS</sub> = A<sub>20</sub> for SST39VF3201C/SST39VF3202C.

## DEVICE OPERATION

Comments are used to initiate the memory operation functions of the device. Commands are written to the device using standard microprocessor write sequences. A command is written by asserting WE# low while keeping CE# low. The address bus is latched on the falling edge of WE# or CE#, whichever occurs last. The data bus is latched on the rising edge of WE# or CE#, whichever occurs first.

The SST39VF3201C/SST39VF3202C also have the Auto-Low-Power mode which puts the device in a near Standby mode after data has been accessed with a valid Read operation. This reduces the IDD active read current from typically 9 mA to typically 4  $\mu$ A. The Auto-Low-Power mode reduces the typical IDD active read current to the range of 2 mA/MHz of Read cycle time. The device exits the Auto-Low-Power mode with any address transition or control signal transition used to initiate another Read cycle, with no access time penalty. Note that the device does not enter Auto-Low-Power mode after power-up with CE# held steadily low, until the first address transition or CE# is driven high.

## Read

The Read operation of the SST39VF3201C/SST39VF3202C is controlled by CE# and OE#, both have to be low for the system to obtain data from the outputs. CE# is used for device selection. When CE# is high, the chip is deselected and only standby power is consumed. OE# is the output control and is used to gate data from the output pins. The data bus is in high-impedance state when either CE# or OE# is high. Refer to [Figure 5](#) for further details.

## Word Program Operation

The SST39VF3201C/SST39VF3202C are programmed on a word-by-word basis. Before programming, the sector where the word exists must be fully erased. The Program operation is accomplished in three steps. The first step is the three-byte load sequence for Software Data Protection. The second step is to load word address and word data. During the Word Program operation, the addresses are latched on the falling edge of either CE# or WE#, whichever occurs last. The data is latched on the rising edge of either CE# or WE#, whichever occurs first. The third step is the internal Program operation which is initiated after the rising edge of the fourth WE# or CE#, whichever occurs first. The Program operation, once initiated, will be completed within 10  $\mu$ s. See [Figure 6](#) and [Figure 7](#) for WE# and CE# controlled Program operation timing diagrams and [Figure 21](#) for flowcharts. During the Program operation, the only valid reads are Data# Polling and Toggle Bit. During the internal Program operation, the host is free to perform additional tasks. Any commands issued during the internal Program operation are ignored. During the command sequence, WP# should be statically held high or low.

# SST39VF3201C/SST39VF3202C

---

## Sector/Block-Erase Operation

The Sector- (or Block-) Erase operation allows the system to erase the device on a sector-by-sector (or block-by-block) basis. The SST39VF3201C/SST39VF3202C offer both Sector-Erase and Block-Erase mode. The sector architecture is based on uniform sector size of 2 KWord. The Block-Erase mode is based on block sizes of 4 and 32 KWord. The Sector-Erase operation is initiated by executing a six-byte command sequence with Sector-Erase command (50H) and sector address (SA) in the last bus cycle. The Block-Erase operation is initiated by executing a six-byte command sequence with Block-Erase command (30H) and block address (BA) in the last bus cycle. The sector or block address is latched on the falling edge of the sixth WE# pulse, while the command (50H or 30H) is latched on the rising edge of the sixth WE# pulse. The internal Erase operation begins after the sixth WE# pulse. The End-of-Erase operation can be determined using either Data# Polling or Toggle Bit methods. See [Figure 11](#) and [Figure 12](#) for timing waveforms and [Figure 25](#) for the flowchart. Any commands issued during the Sector- or Block-Erase operation are ignored. When WP# is low, any attempt to Sector- (Block-) Erase the protected block will be ignored. During the command sequence, WP# should be statically held high or low.

## Erase-Suspend/Erase-Resume Commands

The Erase-Suspend operation temporarily suspends a Sector- or Block-Erase operation thus allowing data to be read from any memory location, or program data into any sector/block that is not suspended for an Erase operation. The operation is executed by issuing one byte command sequence with Erase-Suspend command (B0H). The device automatically enters Read mode typically within 10  $\mu$ s after the Erase-Suspend command had been issued. Valid data can be read from any sector or block that is not suspended from an Erase operation. Reading at address location within erase-suspended sectors/blocks will output DQ<sub>2</sub> toggling and DQ<sub>6</sub> at '1'. While in Erase-Suspend mode, a Word-Program operation is allowed except for the sector or block selected for Erase-Suspend.

To resume Sector-Erase or Block-Erase operation that has been suspended, the system must issue a Erase Resume command. The operation is executed by issuing one byte command sequence with Erase Resume command (30H) at any address in the last Byte sequence.

## Chip-Erase Operation

The SST39VF3201C/SST39VF3202C provide a Chip-Erase operation, which allows the user to erase the entire memory array to the '1' state. This is useful when the entire device must be quickly erased.

The Chip-Erase operation is initiated by executing a six-byte command sequence with Chip-Erase command (10H) at address 555H in the last byte sequence. The Erase operation begins with the rising edge of the sixth WE# or CE#, whichever occurs first. During the Erase operation, the only valid read is Toggle Bit or Data# Polling. See [Table 7](#) for the command sequence, [Figure 10](#) for timing diagram and [Figure 25](#) for the flowchart. Any commands issued during the Chip-Erase operation are ignored. When WP# is low, any attempt to Chip-Erase will be ignored. During the command sequence, WP# should be statically held high or low.

## Write Operation Status Detection

The SST39VF3201C/SST39VF3202C provide two software means to detect the completion of a Write (Program or Erase) cycle, in order to optimize the system write cycle time. The software detection includes two Status bits: Data# Polling (DQ<sub>7</sub>) and Toggle Bit (DQ<sub>6</sub>). The End-of-Write Detection mode is enabled after the rising edge of WE#, which initiates the internal Program or Erase operation.

The actual completion of the nonvolatile write is asynchronous with the system; therefore, either a Data# Polling or Toggle Bit read may be simultaneous with the completion of the write cycle. If this occurs, the system may possibly get an erroneous result (i.e., valid data may appear to conflict with either DQ<sub>7</sub> or DQ<sub>6</sub>). In order to prevent spurious rejection, if an erroneous result occurs, the software routine should include a loop to read the accessed location an additional two (2) times. If both reads are valid, then the device has completed the Write cycle, otherwise the rejection is valid.

## Data# Polling (DQ<sub>7</sub>)

When the SST39VF3201C/SST39VF3202C are in the internal Program operation, any attempt to read DQ<sub>7</sub> will produce the complement of the true data. Once the Program operation is completed, DQ<sub>7</sub> will produce true data. Note that even though DQ<sub>7</sub> may have valid data immediately following the completion of an internal Write operation, the remaining data outputs may still be invalid: valid data on the entire data bus will appear in subsequent successive Read cycles after an interval of 1  $\mu$ s. During internal Erase operation, any attempt to read DQ<sub>7</sub> will produce a '0'. Once the internal Erase operation is com-

# SST39VF3201C/SST39VF3202C

pleted, DQ<sub>7</sub> will produce a '1'. The Data# Polling is valid after the rising edge of fourth WE# (or CE#) pulse for Program operation. For Sector-, Block- or Chip-Erase, the Data# Polling is valid after the rising edge of sixth WE# (or CE#) pulse. See [Figure 8](#) for Data# Polling timing diagram and [Figure 22](#) for a flowchart.

## Toggle Bits (DQ<sub>6</sub> and DQ<sub>2</sub>)

During the internal Program or Erase operation, any consecutive attempts to read DQ<sub>6</sub> will produce alternating '1's and '0's (i.e., toggling between '1' and '0'.) When the internal Program or Erase operation is completed, the DQ<sub>6</sub> bit will stop toggling. The device is then ready for the next operation. For Sector-, Block-, or Chip-Erase, the toggle bit (DQ<sub>6</sub>) is valid after the rising edge of sixth WE# (or CE#) pulse. DQ<sub>6</sub> will be set to '1' if a Read operation is attempted on an Erase-Suspended Sector/Block. If Program operation is initiated in a sector/block not selected in Erase-Suspend mode, DQ<sub>6</sub> will toggle.

An additional Toggle Bit is available on DQ<sub>2</sub>, which can be used in conjunction with DQ<sub>6</sub> to check whether a particular sector is being actively erased or erase-suspended. [Table 3](#) shows detailed Status bits information. The Toggle Bit (DQ<sub>2</sub>) is valid after the rising edge of the last WE# (or CE#) pulse of Write operation. See [Figure 9](#) for Toggle Bit timing diagram and [Figure 22](#) for a flowchart.

**TABLE 3: WRITE OPERATION STATUS**

Status		DQ <sub>7</sub> <sup>(1)</sup>	DQ <sub>6</sub> <sup>(1)</sup>	DQ <sub>2</sub> <sup>(1)</sup>	RY/BY#
Normal Operation	Standard Program	DQ <sub>7</sub> #	Toggle	No Toggle	0
	Standard Erase	0	Toggle	Toggle	0
Erase-Suspend Mode	Read from Erase-Suspended Sector/Block	1	1	Toggle	1
	Read from Non- Erase-Suspended Sector/Block	Data	Data	Data	1
	Program	DQ <sub>7</sub> #	Toggle	N/A	0

**Note 1:** DQ<sub>7</sub>, DQ<sub>6</sub> and DQ<sub>2</sub> require a valid address when reading status information.

## Ready/Busy# (RY/BY#)

The devices include a Ready/Busy# (RY/BY#) output signal. RY/BY# is an open-drain output pin that indicates whether an Erase or Program operation is in progress. Since RY/BY# is an open-drain output, it allows several devices to be tied in parallel to VDD via an external pull-up resistor. After the rising edge of the final WE# pulse in the command sequence, the RY/BY# status is valid.

When RY/BY# is actively pulled low, it indicates that an Erase or Program operation is in progress. When RY/BY# is high (Ready), the devices may be read or left in Standby mode.

## Data Protection

The SST39VF3201C/SST39VF3202C provide both hardware and software features to protect nonvolatile data from inadvertent writes.

### Hardware Data Protection

Noise/Glitch Protection: A WE# or CE# pulse of less than 5 ns will not initiate a write cycle.

VDD Power Up/Down Detection: The Write operation is inhibited when VDD is less than 1.5V.

Write Inhibit Mode: Forcing OE# low, CE# high, or WE# high will inhibit the Write operation. This prevents inadvertent writes during power-up or power-down.

### Hardware Block Protection

The SST39VF3202C supports top hardware block protection, which protects the top two 4-KWord blocks of the device. The SST39VF3201C supports bottom hardware block protection, which protects the bottom two 4-KWord blocks of the device. The Boot Block address ranges are described in [Table 4](#). Program and Erase operations are prevented on the two 4-KWord blocks when WP# is low. If WP# is left floating, it is internally held high via a pull-up resistor, and the Boot Block is unprotected, enabling Program and Erase operations on that block.

<b>Top Boot Block</b> SST39VF3202C	1FE000H-1FFFFFFH

## Hardware Reset (RST#)

The RST# pin provides a hardware method of resetting the device to read array data. When the RST# pin is held low for at least TRP, any in-progress operation will terminate and return to Read mode. When no internal Program/Erase operation is in progress, a minimum period of TRHR is required after RST# is driven high before a valid Read can take place. See [Figure 17](#).

The Erase or Program operation that has been interrupted needs to be re-initiated after the device resumes normal operation mode to ensure data integrity.

## Software Data Protection (SDP)

The SST39VF3201C/SST39VF3202C provide the JEDEC approved Software Data Protection scheme for all data alteration operations (i.e., Program and Erase). Any Program operation requires the inclusion of the three-byte sequence. The three-byte load sequence is used to initiate the Program operation, providing optimal protection from inadvertent Write operations (e.g., during the system power-up or power-down). Any Erase operation requires the inclusion of six-byte sequence. These devices are shipped with the Software Data Protection permanently enabled. See [Table 7](#) for the specific software command codes. During the SDP command sequence, invalid commands will abort the device to Read mode within TRC. The contents of DQ<sub>15</sub>-DQ<sub>8</sub> can be VIL or VIH, but no other value, during any SDP command sequence.

## Common Flash Memory Interface (CFI)

The SST39VF3201C/SST39VF3202C also contain the CFI information to describe the characteristics of the device. In order to enter the CFI Query mode, the system must write the three-byte sequence, same as product ID entry command with 98H (CFI Query command) to address 555H in the last byte sequence. The system can also enter the CFI Query mode, by using the one-byte sequence with 55H on Address and 98H on Data Bus. Once the device enters the CFI Query mode, the system can read CFI data at the addresses given in [Table 9](#) through [Table 11](#). The system must write the CFI Exit command to return to Read mode from the CFI Query mode.

## Product Identification

The Product Identification mode identifies the devices as the SST39VF3201C and SST39VF3202C and the manufacturer as Microchip. This mode may be accessed through software operations. Users may use the Software Product Identification operation to identify the part (i.e., using the device ID) when using multiple manufacturers in the same socket. For details, see [Table 7](#) for software operation, [Figure 13](#) for the Software ID Entry and Read timing diagram and [Figure 23](#) for the Software ID Entry command sequence flowchart.

**TABLE 5: PRODUCT IDENTIFICATION**

	Address	Data
Manufacturer's ID	0000H	BFH
Device ID	I	
SST39VF3201C	0001H	235F
SST39VF3202C	0001H	235E

# SST39VF3201C/SST39VF3202C

## Product Identification Mode Exit/CFI Mode Exit

In order to return to the standard Read mode, the Software Product Identification mode must be exited. Exit is accomplished by issuing the Software ID Exit command sequence, which returns the device to the Read mode. This command may also be used to reset the device to the Read mode after any inadvertent transient condition that apparently causes the device to behave abnormally (e.g., not read correctly). Note that the Software ID Exit/CFI Exit command is ignored during an internal Program or Erase operation. See [Table 7](#) for software command codes, [Figure 15](#) for timing waveform and [Figure 23](#) and [Figure 24](#) for flowcharts.

## Security ID

The SST39VF3201C/SST39VF3202C devices offer a 136-word Security ID space. The Secure ID space is divided into two segments - one factory-programmed segment and one user-programmed segment. The first segment is programmed and locked at Microchip with a random 128-bit number.

The 128-word user segment is left unprogrammed for the customer to program as desired.

To program the user segment of the Security ID, the user must use the Security ID Word-Program command. To detect end-of-write for the SEC ID, read the toggle bits. Do not use Data# Polling. Once this is complete, the Sec ID should be locked using the User Sec ID Program Lock-Out. This disables any future corruption of this space. Note that regardless of whether or not the Sec ID is locked, neither Sec ID segment can be erased.

The Secure ID space can be queried by executing a three-byte command sequence with Enter Sec ID command (88H) at address 555H in the last byte sequence. To exit this mode, the Exit Sec ID command should be executed. Refer to [Table 7](#) for more details.

## OPERATIONS

Output Short Circuit Current <sup>(1)</sup> .....	50 mA

**Note 1:** Outputs shorted for no more than one second. No more than one output shorted at a time.

**TABLE 11: OPERATING RANGES**

Range	Ambient Temperature	V <sub>DD</sub>
Commercial	0°C to +70°C	2.7V-3.6V
Industrial	-40°C to +85°C	2.7V-3.6V

**TABLE 12: AC CONDITIONS OF TEST<sup>(1)</sup>**

Input Rise/Fall Time	Output Load
5 ns	C <sub>L</sub> = 30 pF

**Note 1:** See [Figure 19](#) and [Figure 20](#).

## Power-Up Specifications

All functionalities and DC specifications are specified for a V<sub>DD</sub> ramp rate of greater than 1V per 100 ms (0V to 3V in less than 300 ms). If the V<sub>DD</sub> ramp rate is slower than 1V per 100 ms, a hardware Reset is required. The recommended V<sub>DD</sub> power-up to RESET# high time should be greater than 100 μs to ensure a proper Reset.

# SST39VF3201C/SST39VF3202C

**FIGURE 4: POWER-UP DIAGRAM**

## THE MICROCHIP WEBSITE

Microchip provides online support via our website at [www.microchip.com](http://www.microchip.com). This website is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the website contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

## CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip website at [www.microchip.com](http://www.microchip.com). Under "Support", click on "Customer Change Notification" and follow the registration instructions.

## CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

**Technical support is available through the website at: <http://microchip.com/support>**

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

---

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

### Trademarks

The Microchip name and logo, the Microchip logo, Adaptec, AnyRate, AVR, AVR logo, AVR Freaks, BesTime, BitCloud, chipKIT, chipKIT logo, CryptoMemory, CryptoRF, dsPIC, FlashFlex, flexPWR, HELDO, IGLoo, JukeBlox, KeeLoq, Klear, LANCheck, LinkMD, maXStylus, maXTouch, MediaLB, megaAVR, Microsemi, Microsemi logo, MOST, MOST logo, MPLAB, OptoLyzer, PackeTime, PIC, picoPower, PICSTART, PIC32 logo, PolarFire, Prochip Designer, QTouch, SAM-BA, SenGenuity, SpyNIC, SST, SST Logo, SuperFlash, Symmetricom, SyncServer, Tachyon, TempTrackr, TimeSource, tinyAVR, UNI/O, Vectron, and XMEGA are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

APT, ClockWorks, The Embedded Control Solutions Company, EtherSynch, FlashTec, Hyper Speed Control, HyperLight Load, IntellIMOS, Libero, motorBench, mTouch, Powermite 3, Precision Edge, ProASIC, ProASIC Plus, ProASIC Plus logo, Quiet-Wire, SmartFusion, SyncWorld, Temux, TimeCesium, TimeHub, TimePictra, TimeProvider, Vite, WinPath, and ZL are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Adjacent Key Suppression, AKS, Analog-for-the-Digital Age, Any Capacitor, AnyIn, AnyOut, BlueSky, BodyCom, CodeGuard, CryptoAuthentication, CryptoAutomotive, CryptoCompanion, CryptoController, dsPICDEM, dsPICDEM.net, Dynamic Average Matching, DAM, ECAN, EtherGREEN, In-Circuit Serial Programming, ICSP, INICnet, Inter-Chip Connectivity, JitterBlocker, KlearNet, KlearNet logo, memBrain, Mindi, MiWi, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, MultiTRAK, NetDetach, Omniscient Code Generation, PICDEM, PICDEM.net, PICkit, PICtail, PowerSmart, PureSilicon, QMatrix, REAL ICE, Ripple Blocker, SAM-ICE, Serial Quad I/O, SMART-I.S., SQR, SuperSwitcher, SuperSwitcher II, Total Endurance, TSHARC, USBCheck, VariSense, ViewSpan, WiperLock, Wireless DNA, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

The Adaptec logo, Frequency on Demand, Silicon Storage Technology, and Symmcom are registered trademarks of Microchip Technology Inc. in other countries.

GestIC is a registered trademark of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.
