4x4 CML Crosspoint Switch with Internal Termination

SY58040U Evaluation Board

General Description

The SY58040U evaluation board is designed for convenient setup and quick evaluation of the SY58040U. The board is optimized to interface directly to 50Ω oscilloscope. The default evaluation board I/O configuration is AC-coupled.

All data sheets and support documentation can be found on Micrel's web site at www.micrel.com.

Features

- SY58040U
- +2.5V or +3.3V power supply
- AC-coupled configuration
- I/O interface includes on-board termination

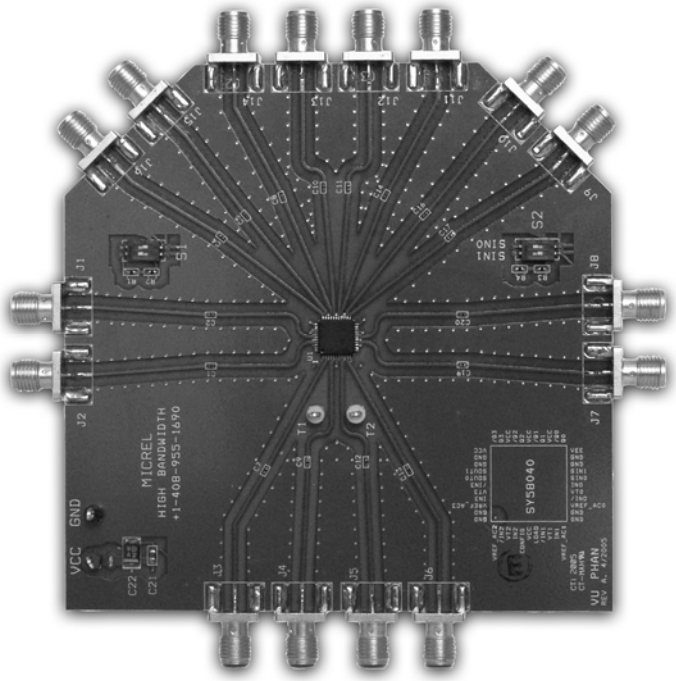
Evaluation Board



Evaluation Board Description

The SY58040U evaluation board is designed to operate at 2.5V or 3.3V. The default configuration for the board is AC-coupled inputs and outputs.

AC-Coupled Inputs

AC-coupled input is suited for most applications and is preferred because of its ease-of-use. It requires a single power supply and offers flexibility in interfacing to a variety of signal sources. Each input contains AC-coupling capacitors and the DC-operating point is set to V_{CC}–1.3V.

AC-Coupled Outputs

The outputs of the SY58040U are AC-coupled and directly interfaces with 50Ω systems.

SY58040U Evaluation Board

AC-Coupled Evaluation Board Setup

The following steps describe the procedure for setting up the evaluation board:

Buffer Mode

1. Connect V_{CC} to 2.5V or 3.3V.
2. Connect GND to 0V.
3. Set the dipswitches to select input and output channels.

Input Channel			Output Channel		
SIN1	SIN0	Input	SOUT1	SOUT0	Output
0	0	IN0	0	0	Q0
0	1	IN1	0	1	Q1
1	0	IN2	1	0	Q2
1	1	IN3	1	1	Q3

Table 2. Input/Output Channel

4. Using a differential signal source set the amplitude of each input to 800mV (1600mV$_{PP}$). Set the offset to a positive value, the value of the offset is not critical, since the inputs will automatically bias to the correct offset.
5. Using equal length 50Ω impedance coaxial cables, connect the outputs to an oscilloscope.

Crosspoint Switch Mode

1. Follow steps #1-5 (Buffer Mode).
2. Program SIN with an input address.
3. Program SOUT with an output address.
4. Pulse the LOAD signal with a Low to High to Low signal to latch SIN and SOUT.
5. Pulse CONFIG with a Low to High to Low signal to load the latched signal.
6. Monitor the outputs.

Evaluation Board Layout

PCB Board Layout

The evaluation board is constructed with Rogers 4003 material and is coplanar in design, fabricated to minimize noise, achieve high bandwidth and minimize crosstalk.
