

M58BW16F, M58BW32F

16Mb or 32Mb (x32, Boot Block, Burst) 3.3V Supply Flash Memory

Features

- Supply voltage
 - $V_{DD} = 2.7\text{--}3.6\text{V}$ (45ns) or $V_{DD} = 2.5\text{--}3.3\text{V}$ (55ns)
 - $V_{DDQ} = V_{DDQIN} = 2.4\text{V}$ to V_{DD} for I/O buffers
- High performance
 - Access times: 45ns and 55ns
 - Synchronous burst reads
 - 75 MHz effective zero wait-state burst read
 - Asynchronous page reads (4 double words)
- M58BW32F memory organization:
 - Eight 64 Kbit small parameter blocks
 - Four 128 Kbit large parameter blocks
 - Sixty-two 512 Kbit main blocks
- M58BW16F memory organization:
 - Eight 64 Kbit parameter blocks
 - Thirty-one 512 Kbit main blocks
- Hardware block protection
 - WP# pin to protect any block combination from PROGRAM and ERASE operations
 - PEN signal for program/erase enable
- Irreversible modify protection (OTP like) on 128 Kbits:
 - Block 1 (bottom device) or block 72 (top device) in the M58BW32F
 - Blocks 2 and 3 (bottom device) or blocks 36 and 35 (top device) in the M58BW16F
- Security
 - 64-bit unique device identifier (UID)
- Fast programming
 - Write to buffer and program capability (8 double words)
- Optimized for FDI drivers
 - Common flash interface (CFI)
 - Fast Program/Erase Suspend feature in each block
- Low power consumption
 - 100 μ A typical Standby current
- Electronic signature
- Manufacturer code: 0020h
 - Top device codes:
M58BW32FT: 8838h
M58BW16FT: 883Ah
 - Bottom device codes:
M58BW32FB: 8837h
M58BW16FB: 8839h
- Automotive device grade 3:
 - Temperature: -40 to 125 °C
- Automotive grade certified

Part Numbering Information

Devices are shipped from the factory with memory content bits erased to 1. For available options, such as packages or speed, or for further information, contact your Micron sales representative. Part numbers can be verified at www.micron.com. Feature and specification comparison by device type is available at www.micron.com/products. Contact the factory for devices not found.

Table 1: Part Number Information Scheme

| Part Number Category | Category Details |
|-------------------------|--|
| Device type | M58 = Parallel Flash memory |
| Architecture | B = Burst mode |
| Operating voltage | W = [2.7V to 3.6V] V _{DD} range for 45ns speed class 2.5V to 3.3V] V _{DD} range for 55ns speed class [2.4V to V _{DD}] V _{DDQ} range for 45ns and 55ns speed classes |
| Device function/density | 32F = 32Mb (x32), boot block, burst, 0.11µm technology |
| | 16F = 16Mb (x32), boot block, burst, 0.11µm technology |
| Array matrix | T = Top boot B = Bottom boot |
| Speed | 4 = 45ns 5 = 55ns |
| Package | T = PQFP80 |
| | ZA = LBGA80, 1.0mm pitch |
| Temperature range | 3 = Automotive grade certified, ¹ -40 to 125 °C |
| Packing Option | Blank = Standard packing |
| | T = Tape and reel packing |
| | F = ECOPACK® package, tape and reel 24mm packing |

Note: 1. Qualified and characterized according to AEC Q100 and Q003 or equivalent, advanced screening according to AEC Q001 and Q002 or equivalent.

Important Notes and Warnings

Micron Technology, Inc. ("Micron") reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions. This document supersedes and replaces all information supplied prior to the publication hereof. You may not rely on any information set forth in this document if you obtain the product described herein from any unauthorized distributor or other source not authorized by Micron.

Automotive Applications. Products are not designed or intended for use in automotive applications unless specifically designated by Micron as automotive-grade by their respective data sheets. Distributor and customer/distributor shall assume the sole risk and liability for and shall indemnify and hold Micron harmless against all claims, costs, damages, and expenses and reasonable attorneys' fees arising out of, directly or indirectly, any claim of product liability, personal injury, death, or property damage resulting directly or indirectly from any use of non-automotive-grade products in automotive applications. Customer/distributor shall ensure that the terms and conditions of sale between customer/distributor and any customer of distributor/customer (1) state that Micron products are not designed or intended for use in automotive applications unless specifically designated by Micron as automotive-grade by their respective data sheets and (2) require such customer of distributor/customer to indemnify and hold Micron harmless against all claims, costs, damages, and expenses and reasonable attorneys' fees arising out of, directly or indirectly, any claim of product liability, personal injury, death, or property damage resulting from any use of non-automotive-grade products in automotive applications.

Critical Applications. Products are not authorized for use in applications in which failure of the Micron component could result, directly or indirectly in death, personal injury, or severe property or environmental damage ("Critical Applications"). Customer must protect against death, personal injury, and severe property and environmental damage by incorporating safety design measures into customer's applications to ensure that failure of the Micron component will not result in such harms. Should customer or distributor purchase, use, or sell any Micron component for any critical application, customer and distributor shall indemnify and hold harmless Micron and its subsidiaries, subcontractors, and affiliates and the directors, officers, and employees of each against all claims, costs, damages, and expenses and reasonable attorneys' fees arising out of, directly or indirectly, any claim of product liability, personal injury, or death arising in any way out of such critical application, whether or not Micron or its subsidiaries, subcontractors, or affiliates were negligent in the design, manufacture, or warning of the Micron product.

Customer Responsibility. Customers are responsible for the design, manufacture, and operation of their systems, applications, and products using Micron products. ALL SEMICONDUCTOR PRODUCTS HAVE INHERENT FAILURE RATES AND LIMITED USEFUL LIVES. IT IS THE CUSTOMER'S SOLE RESPONSIBILITY TO DETERMINE WHETHER THE MICRON PRODUCT IS SUITABLE AND FIT FOR THE CUSTOMER'S SYSTEM, APPLICATION, OR PRODUCT. Customers must ensure that adequate design, manufacturing, and operating safeguards are included in customer's applications and products to eliminate the risk that personal injury, death, or severe property or environmental damages will result from failure of any semiconductor component.

Limited Warranty. In no event shall Micron be liable for any indirect, incidental, punitive, special or consequential damages (including without limitation lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort, warranty, breach of contract or other legal theory, unless explicitly stated in a written agreement executed by Micron's duly authorized representative.

Description

The M58BW16F and M58BW32F are 16 and 32 Mbit non-volatile Flash memories, respectively. They can be erased electrically at block level and programmed in-system on a double-word basis using a 2.7–3.6V or 2.5–3.3V V_{DD} supply for the circuit and a V_{DDQ} supply voltage (2.4V to V_{DD}) for the input and output buffers.

In the rest of the document the M58BW16F and M58BW32F will be referred to as M58BWxxF unless otherwise specified.

The devices support asynchronous (latch controlled READ and page READ) and synchronous bus operations. The synchronous burst read interface allows a high data transfer rate controlled by the burst clock signal, K. It is capable of bursting fixed or unlimited lengths of data. The burst type, latency and length are configurable and can be easily adapted to a large variety of system clock frequencies and microprocessors. All WRITE operations are asynchronous. On power-up the memory defaults to read mode with an asynchronous bus.

The device features an asymmetrical block architecture:

- The M58BW32F has an array of 62 main blocks of 512Kb each, plus 4 large parameter blocks of 128Kb each and 8 small parameter blocks of 64Kb each. The large and small parameter blocks are located either at the top (M58BW32FT) or at the bottom (M58BW32FB) of the address space. The first large parameter block is referred to as boot block and can be used either to store a boot code or parameters. The memory array organization is detailed in the M58BW32F top boot block addresses table and the M58BW32F bottom boot block addresses table.
- The M58BW16F has an array of 8 parameter blocks of 64Kb each and 31 main blocks of 512Kb each. In the M58BW16FT the parameter blocks are located at the top of the address space whereas in the M58BW16FB, they are located at the bottom. The memory array organization is detailed in the M58BW16F top boot block addresses table and the M58BW16F bottom boot block addresses table.

PROGRAM and ERASE commands are written to the command interface of the memory. An on-chip program/erase controller simplifies the process of programming or erasing the memory by taking care of all of the special operations that are required to update the memory contents. The end of a PROGRAM or ERASE operation can be detected and any error conditions identified in the status register. The command set required to control the memory is consistent with JEDEC standards.

An ERASE operation can be suspended in order to perform either READ or PROGRAM in any other block, and then resumed. The PROGRAM operation can be suspended to read data in any other block, and then resumed. Each block can be programmed and erased over 100,000 cycles.

All blocks are protected during power-up. The M58BWxxF features the following levels of hardware and software block protection to avoid unwanted PROGRAM/ERASE operations:

- Write/protect enable input, WP#, hardware protects a combination of blocks from PROGRAM and ERASE operations. The blocks to be protected are configured individually by issuing a SET BLOCK PROTECTION CONFIGURATION REGISTER or a CLEAR BLOCK PROTECTION CONFIGURATION REGISTER command.
- All PROGRAM or ERASE operations are blocked when RP#, is held LOW.
- A program/erase enable input, PEN, is used to protect all blocks, preventing PROGRAM and ERASE operations from affecting their data.
- A permanent user-enabled protection against Modify operations is available:

on one specific 128Kb parameter block in the M58BW32F – block 1 for bottom devices or block 72 for top devices

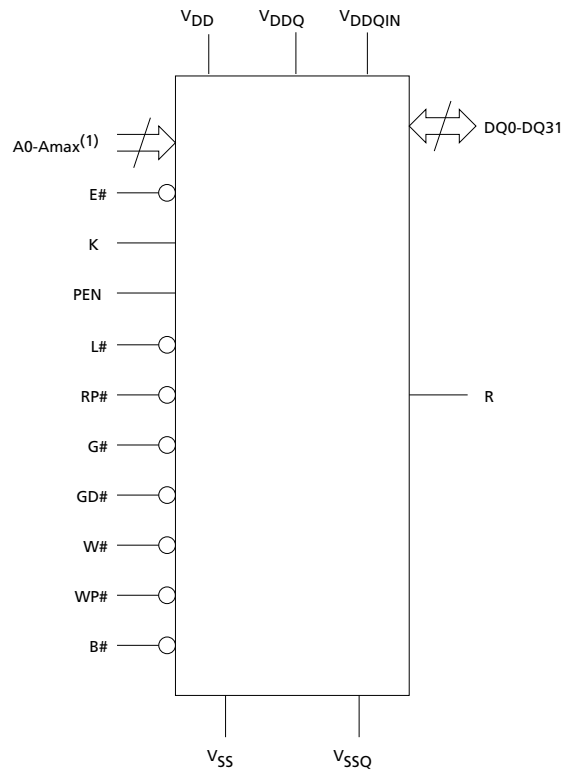

on two specific 64Kb parameter blocks in the M58BW16F – blocks 2 and 3 for bottom devices or blocks 36 and 35 for top devices.

A reset/power-down mode is entered when the RP# input is LOW. In this mode the power consumption is reduced to the standby level, the device is write protected and both the status and burst configuration registers are cleared. A recovery time is required when the RP# input goes HIGH.

A manufacturer code and a device code are available. They can be read from the memory allowing programming equipment or applications to automatically match their interface to the characteristics of the memory.

Finally, the M58BWxxF features a 64-bit unique device identifier (UID) which is programmed by Micron on the production line. It is unique for each die and can be used to implement cryptographic algorithms to improve security. Information is available in the CFI area (see the M58BW16F extended query information table).

The memory is offered in PQFP80 (14 x 20mm) and LBG80 (1.0mm pitch) packages and it is supplied with all the bits erased (set to '1').

Figure 1: Logic Diagram

Note: 1. Amax is equal to A18 in the M58BW16F, and to A19 in the M58BW32F.

Table 2: Signal Names

| Signal name | Function | Direction |
|-----------------------|---|-----------|
| A[MAX:0] ¹ | Address inputs | Inputs |
| DQ[7:0] | Data input/output, command input | I/O |
| DQ[15:8] | Data input/output, Burst configuration register | I/O |
| DQ[31:16] | Data input/output | I/O |
| B# | Burst address advance | Input |
| E# | Chip enable | Input |
| G# | Output enable | Input |
| K | Burst clock | Input |
| L# | Latch enable | Input |
| R | Valid data ready | Output |
| RP# | Reset/Power-down | Input |
| W# | Write enable | Input |
| GD# | Output disable | Input |
| WP# | Write protect | Input |

Table 2: Signal Names (Continued)

| Signal name | Function | Direction |
|--------------------|-------------------------------------|-----------|
| V _{DD} | Supply voltage | |
| V _{DDQ} | Power supply for output buffers | |
| V _{DDQIN} | Power supply for input buffers only | |
| PEN | Program/Erase enable | Input |
| V _{SS} | Ground | |
| V _{SSQ} | Input/output ground | |
| NC | Not connected internally | |
| DNU | Don't use as internally connected | |

Note: 1. A[*MAX*] is equal to A18 in the M58BW16F, and to A19 in the M58BW32F.

Figure 2: LBGA Connections (Top View through Package)

Note: 1. Ball D3 is NC in the M58BW16F and A19 in the M58BW32F.

Figure 3: PQFP Connections (Top View through Package)

Note: 1. Pin 44 is NC in the M58BW16F and A19 in the M58BW32F.

Block Protection

The M58BWxxF features four different levels of block protection.

- **Write Protect pin, WP#**, - When WP# is LOW, V_{IL} , the protection status that has been configured in the Block Protection Configuration Register is activated. The Block Protection Configuration Register is volatile. Any combination of blocks is possible. Any attempt to program or erase a protected block will return an error in the Status Register (see the Status Register bits table).
- **Reset/Power-down pin, RP#**, - If the device is held in reset mode (RP# at V_{IL}), no PROGRAM or ERASE operation can be performed on any block.

- **Program/Erase Enable (PEN)**, - The Program/Erase Enable input, PEN, protects all blocks by preventing PROGRAM and ERASE operations from modifying the data. Prior to issuing a PROGRAM or ERASE command, the program/erase enable must be set to HIGH (V_{IH}). If it is LOW (V_{IL}), the PROGRAM or ERASE operation is not accepted and an error is generated in the Status Register.
- **Permanent protection against modify operations** - specific OTP-like blocks can be permanently protected against modify operations (Program/Erase):
 - in the M58BW32F, a unique 128-Kbit parameter block – block 1 (01000h-01FFFh) for bottom devices or block 72 (FE000h-FEFFFh) for top devices
 - in the M58BW16F, two 64-Kbit parameter blocks – blocks 2 and 3 (01000h-01FFFh) for bottom devices or blocks 36 and 35 (7E000h-7EFFFh) for top devices
 This protection is user-enabled. Details of how this protection is activated are provided in a dedicated application note.

After a device reset the first two kinds of block protection (WP#, RP#) can be combined to give a flexible block protection. All blocks are protected at power-up.

OTP Protection

The OTP protection is an user-enabled feature that permanently protects specific blocks, so called OTP blocks, against modify operations (program/erase). It is available:

- On one specific 128-kbit parameter block in the M58BW32F- block 1 (01000h-01FFFh) for bottom devices or block 72 (FE000h-FEFFFh) for top devices
- On two specific 64-kbit parameter blocks in the M58BW16F- block 2 and 3 (01000h-01FFFh) for bottom devices or block 36 and 35 (7E000h-7EFFFh) for top devices.

The default state is unprotected. However, once the protection has been enabled, it is impossible to disable it and the OTP blocks will remain “modify protected” permanently.

Obviously, this information is stored in internal nonvolatile registers.

Activation Sequence

If the user wants to make the OTP protection effective on a part, he has to issue the LOCK OTP PROTECTION command.

The Lock OTP protection requires 2 write cycles:

- write (ADD=000AAh, DATA=49h) - LOCK OTP PROTECTION command 1
- write (ADD=00003h, DATA=0000 0000h) - LOCK OTP PROTECTION command 2

This sequence of commands has to be given with Write Protect Enable WP_N='1'. The user can check its execution polling on the SR in the same way as a normal PROGRAM command.

The program duration lasts about 35 μ s like for a standard PROGRAM command. It is also possible to detect the end of the operation by polling the Status Register.

Any Erase attempt returns A3h in the Status Register while any Program attempt returns 93h.

Once the first write cycle of the LOCK OTP PROTECTION command is issued, a wrong address on second write cycle will cause the activation sequence to fail. The Status Register allows detecting this event and its value is then B1h (invalid sequence).

As a consequence, the protection is not active and the sequence must be restarted after a CLEAR STATUS REGISTER command.

The LOCK OTP PROTECTION command cannot be suspended.

Memory Map Addresses

Table 3: M58BW32F Top Boot Block Addresses

| Block Number | Size (Kbit) | Address Range ¹ |
|--------------|-------------|----------------------------|
| 73 | 128 | FF000h-FFFFFh |

Signal Descriptions

See the Logic Diagram figure and the Signal Names table for an overview of the signals connected to this device.

Address Inputs (A[**MAX:0**])

Amax is equal to A18 in the M58BW16F, and to A19 in the M58BW32F.

The address inputs are used to select the cells to access in the memory array during bus operations. During WRITE operations they control the commands sent to the command interface of the Program/Erase controller. E# must be LOW when selecting the addresses.

The address inputs are latched on the rising edge of L#, or on the active edge of K, whichever occurs first, in a READ operation. The address inputs are latched on the rising edge of E#, W#, or L#, whichever occurs first in a WRITE operation. The address latch is transparent when L# is LOW. The address is internally latched in an ERASE or PROGRAM operation.

Data Inputs/Outputs (DQ[**31:0**])

The data inputs/outputs output the data stored at the selected address during a bus READ operation, or are used to input the data during a PROGRAM operation. During bus WRITE operations they represent the commands sent to the command interface of the program/erase controller. When used to input data or WRITE commands they are latched on the rising edge of W# or E#, whichever occurs first.

When E# and G# are both LOW and GD# is HIGH, the data bus outputs data from the memory array, the electronic signature, the block protection configuration register, the CFI information, or the contents of the burst configuration register or status register. The data bus is high impedance when the device is deselected with E# and G# both HIGH, and either GD# or RP# LOW. The status register content is output on DQ0-DQ7 and DQ8-DQ31 are LOW.

Chip Enable (E#)

The chip enable, E#, input activates the memory control logic, input buffers, decoders, and sense amplifiers. E# at HIGH deselects the memory and reduces the power consumption to the standby level.

Output Enable (G#)

The output enable, G#, gates the outputs through the data output buffers during a READ operation, when GD# is HIGH. When G# is HIGH, the outputs are high impedance independently of G#.

Output Disable (GD#)

The output disable, GD#, deactivates the data output buffers. When GD#, is HIGH, the outputs are driven by G#. When GD#, is LOW, the outputs are high impedance independently of GD#. The GD# pin must be connected to an external pull-up resistor as there is no internal pull-up resistor to drive the pin.

Write Enable (W#)

The write enable, W#, input controls writing to the command interface, input address, and data latches. Both addresses and data can be latched on the rising edge of W# (also see Latch Enable, L#).

Reset/Power-Down (RP#)

The reset/power-down, RP#, is used to apply a hardware reset to the memory. A hardware reset is achieved by holding RP# LOW for at least t_{PLPH} . Writing is inhibited to protect data, and the command interface and program/erase controller are reset. The status register information is cleared and power consumption is reduced to the standby level (I_{DD1}). The device acts as deselected; that is, the data outputs are high impedance.

After RP# goes HIGH, the memory will be ready for bus READ operations after a delay of t_{PHEL} or bus WRITE operations after t_{PHWL} .

If Reset/Power-down goes LOW, V_{IL} , during a BLOCK ERASE or a PROGRAM operation, the internal state machine handles the operation as a program/erase suspend, so the maximum time defined in the Program, Erase times and endurance cycles table must be applied.

During power-up, power should be applied simultaneously to V_{DD} and V_{DDQIN} with RP# held LOW. When the supplies are stable RP# is taken to HIGH. G#, E#, and W#, should be held HIGH during power-up.

In an application, it is recommended to associate RP# with the reset signal of the microprocessor. Otherwise, if a RESET operation occurs while the memory is performing an ERASE or PROGRAM operation, the memory may output the status register information instead of being initialized to the default asynchronous random read mode.

See the Reset, Power-down, and Power-up AC characteristics table and the Reset, Power-down and Power-up AC waveforms - Control pins Low figure for more details.

Program/Erase Enable (PEN)

The program/erase enable input, PEN, protects all blocks by preventing PROGRAM and ERASE operations from modifying the data. Prior to issuing a PROGRAM or ERASE command, PEN must be set to HIGH. If it is LOW, the PROGRAM or ERASE operation is not accepted and an error is generated in the status register.

Latch Enable (L#)

The bus interface can be configured to latch the address inputs on the rising edge of latch enable, L#, for asynchronous latch enable controlled READ or WRITE operations or synchronous burst READ operations. In synchronous burst READ operations, the address is latched on the active edge of the clock when L# is LOW. Once latched, the addresses may change without affecting the address used by the memory. When L# is LOW, the latch is transparent. L# can remain LOW for asynchronous random READ and WRITE operations.

Burst Clock (K)

The Burst Clock, K, is used to synchronize the memory with the external bus during synchronous burst READ operations. Bus signals are latched on the active edge of the K. In synchronous burst read mode, the address is latched on the first active clock edge

when L# is LOW, or on the rising edge of L#, whichever occurs first. During asynchronous bus operations the clock is not used.

Burst Address Advance (B#)

The burst address advance, B#, controls the advancing of the address by the internal address counter during synchronous burst READ operations.

B# is only sampled on the active clock edge of K when the X-latency time has expired. If B# is LOW, the internal address counter advances. If B# is HIGH, the internal address counter does not change; the same data remains on the data inputs/outputs and B# is not sampled until the Y-latency expires. B# may be tied to V_{IL}.

Valid Data Ready (R)

The Valid Data Ready output, R, can be used during synchronous burst READ operations to identify if the memory is ready to output data or not. The R pin output can be configured to be active on the clock edge of the invalid data read cycle or one cycle before that. The R pin HIGH indicates that new data is or will be available. When R is LOW, the previous data outputs remain active.

Write Protect (WP#)

The Write Protect, WP#, provides protection against PROGRAM or ERASE operations. When WP# is LOW, the protection status that has been configured in the block protection configuration register is activated. PROGRAM and ERASE operations to protected blocks are disabled. When WP# is HIGH, all the blocks can be programmed or erased, if no other protection is used.

Supply Voltage (V_{DD})

The supply voltage, V_{DD}, is the core power supply. All internal circuits draw their current from the V_{DD} pin, including the program/erase controller.

Output Supply Voltage (V_{DDQ})

The output supply voltage, V_{DDQ}, is the output buffer power supply for all operations (READ, PROGRAM, and ERASE) used for DQ0-DQ31 when used as outputs.

Input Supply Voltage (V_{DDQIN})

The input supply voltage, V_{DDQIN}, is the power supply for all input signal. Input signals are: K, B#, L#, W#, GD#, G#, E#, A0-Amax, and DQ0-DQ31, when used as inputs.

Ground (V_{SS} and V_{SSQ})

The ground V_{SS} is the reference for the internal supply voltage V_{DD}. The ground V_{SSQ} is the reference for the output and input supplies V_{DDQ}, and V_{DDQIN}. It is essential to connect V_{SS} and V_{SSQ} together.

Note: A 0.1μF capacitor should be connected between the supply voltages, V_{DD}, V_{DDQ}, and V_{DDQIN}, and the grounds, V_{SS} and V_{SSQ} to decouple the current surges from the power supply. The PCB track widths must be sufficient to carry the currents required during all operations of the parts, see the DC Characteristics table, for maximum current supply requirements.

Don't Use (DNU)

The DNU pin should not be used as it is internally connected. Its voltage level can be between V_{SS} and V_{DDQ} or leave it unconnected.

Not Connected (NC)

The NC pin is not physically connected to the device.

Bus Operations

Each bus operation that controls the memory is described in this section, see the Asynchronous Bus Operations table and the Synchronous Burst Read Bus Operations table for a summary. The bus operation is selected through the burst configuration register; the bits in this register are described at the end of this section.

On power-up or after a hardware reset the memory defaults to asynchronous bus read and asynchronous bus write. No synchronous operation can be performed until the burst configuration register has been configured. The electronic signature, block protection configuration, CFI, or status register will be read in asynchronous mode regardless of the burst configuration register settings.

Typically glitches of less than 5 ns on CE# or WE# are ignored by the memory and do not affect bus operations.

Asynchronous Bus Operations

For ASYNCHRONOUS BUS operations refer to the Asynchronous Bus Operations table together with the following text. The read access will start at whichever of the three following events occurs last: valid address transition, E# going LOW, or L# going LOW.

Asynchronous Bus Read

Asynchronous bus READ operations read from the memory cells, or specific registers (electronic signature, block protection configuration register, status register, CFI, and burst configuration register) in the command interface. A valid bus operation involves setting the desired address on the address inputs, applying a LOW signal to E# and G# and keeping W# and GD# HIGH. The data inputs/outputs will output the value, see the Asynchronous Bus Read AC Waveforms figure and the Asynchronous Bus Read AC Characteristics table for details of when the output becomes valid.

Asynchronous read is the default read mode which the device enters on power-up or on return from reset/power-down.

Asynchronous Latch Controlled Bus Read

Asynchronous latch controlled bus READ operations read from the memory cells or specific registers in the command interface. The address is latched in the memory before the value is output on the data bus, allowing the address to change during the cycle without affecting the address that the memory uses.

A valid bus operation involves setting the desired address on the address inputs, setting E# and L# LOW and keeping W# and GD# HIGH; the address is latched on the rising edge of L#. Once latched, the address inputs can change. To read data on the data inputs/outputs, G# must be set LOW; see the Asynchronous Latch Controlled Bus Read AC Waveforms figure and the Asynchronous Bus Read AC Characteristics table for details on when the output becomes valid.

Note that, since the L# input is transparent when set LOW, asynchronous bus READ operations can be performed when the memory is configured for asynchronous latch enable bus operations by holding L# LOW throughout the bus operation.

Asynchronous Page Read

Asynchronous page READ operations are used to read from several addresses within the same memory page. Each memory page is 4 double-words and is addressed by the address inputs A0 and A1.

Data is read internally and stored in the page buffer. Valid bus operations are the same as asynchronous bus READ operations but with different timings. The first READ operation within the page has identical timings, while subsequent reads within the same page have much shorter access times. If the page changes, then the normal, longer timings apply again. A page READ does not support latched controlled READ.

See the Asynchronous Page Read AC Waveforms figure and the Asynchronous Page Read AC Characteristics table for details on when the outputs become valid.

Asynchronous Bus Write

Asynchronous bus WRITE operations write to the command interface in order to send commands to the memory or to latch addresses and input data for programming. Bus WRITE operations are asynchronous, and K is don't care during bus WRITE operations.

A valid asynchronous bus WRITE operation begins by setting the desired address on the address inputs, and setting E#, W#, and L# LOW and G# HIGH. The address inputs are latched by the command interface on the rising edge of E#, W#, or L# whichever occurs first. Commands and input data are latched on the rising edge of E# or W#, whichever occurs first. G# must remain HIGH during the entire asynchronous bus WRITE operation.

See DC and AC Parameters for details of the timing and waveforms requirements.

Output Disable

The data outputs are high impedance when the G# is HIGH or GD# is LOW.

Standby

When E# is HIGH, and the program/erase controller is idle, the memory enters standby mode, the power consumption is reduced to the standby level (I_{DD1}) and the data inputs/output pins are placed in the high impedance state regardless of G#, W#, or GD# inputs.

The standby mode can be disabled by setting the standby disable bit (M14) of the burst configuration register to '1' (see the DC Characteristics table).

Reset/Power-Down

The memory is in Reset/Power-down mode when Reset/Power-down (RP#) is LOW. The power consumption is reduced to the standby level (I_{DD1}) and the outputs are high impedance, independent of the E#, G#, GD#, or W# inputs. In this mode the device is write protected and both the status and the burst configuration registers are cleared. A recovery time is required when the RP# input goes HIGH.

Table 7: Asynchronous Bus Operations¹

| Bus Operation | Step | E# | G# | GD# | W# | RP# | L# | A[MAX:0] | DQ[31:0] |
|--|---------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|----------|-------------|
| ASYNCHRONOUS BUS READ ² | | V _{IL} | V _{IL} | V _{IH} | V _{IH} | V _{IH} | V _{IL} | Address | Data output |
| ASYNCHRONOUS LATCH CONTROLLED BUS READ | Address latch | V _{IL} | V _{IH} | V _{IH} | V _{IH} | V _{IH} | V _{IL} | Address | High-Z |
| | Read | V _{IL} | V _{IL} | V _{IH} | V _{IH} | V _{IH} | V _{IH} | X | Data output |
| ASYNCHRONOUS PAGE READ | | V _{IL} | V _{IL} | V _{IH} | V _{IH} | V _{IH} | X | Address | Data output |
| ASYNCHRONOUS BUS WRITE | | V _{IL} | V _{IH} | X | V _{IL} | V _{IH} | V _{IL} | Address | Data input |
| OUTPUT ENABLE, G# | | V _{IL} | V _{IH} | V _{IH} | V _{IH} | V _{IH} | X | X | High-Z |
| OUTPUT DISABLE, GD# | | V _{IL} | V _{IL} | V _{IL} | V _{IH} | V _{IH} | X | X | High-Z |
| STANDBY | | V _{IH} | X | X | X | V _{IH} | X | X | High-Z |
| RESET/POWER-DOWN, RP# | | X | X | X | X | V _{IL} | X | X | High-Z |

- Notes:
1. X = Don't care.
 2. Data, Manufacturer code, Device code, Burst Configuration Register, Standby Status, and Block Protection Configuration Register are read using the ASYNCHRONOUS BUS READ command.

Synchronous Bus Operations

Synchronous Burst Read

Synchronous burst READ operations are used to read from the memory at specific times synchronized to an external reference clock. The valid edge of the clock signal is the rising edge for M58BW32F, while for M58BW16F it is determined by setting M6 bit of the burst configuration register. Once the Flash memory is configured in burst mode, it is mandatory to have an active clock signal since the switching of the output buffer data-bus is synchronized to the active edge of the clock. In the absence of clock, no data is output.

The burst type, length and latency can be configured. The different configurations for synchronous burst READ operations are described in the Burst Configuration Register. Refer to the Example Burst Configuration X-1-1-1 figure for examples of synchronous burst operations.

In continuous burst read, one burst READ operation can access the entire memory sequentially by keeping B# LOW for the appropriate number of clock cycles. At the end of the memory address space, the burst read restarts from the beginning at address 000000h.

A valid synchronous burst READ operation begins when the burst clock is active and E# and L# are LOW. The burst start address is latched and loaded into the internal burst address counter on the valid edge of K or on the rising edge of L#, whichever occurs first.

After an initial memory latency time, the memory outputs data at each clock cycle (or two clock cycles depending on the value of bit M9 of Burst Configuration Register). The

B# input controls the memory burst output. The second burst output is on the next clock valid edge after the B# has been pulled LOW.

Valid data ready, R, monitors if the memory burst boundary is exceeded and the burst controller of the microprocessor needs to insert wait states. When R is LOW on the active clock edge, no new data is available and the memory does not increment the internal address counter at the active clock edge even if B# is LOW. R may be configured (by bit M8 of Burst Configuration Register) to be valid immediately at the active clock edge.

A synchronous burst READ operation will be suspended if B# goes HIGH. If G# is LOW and GD# is HIGH, the last data is still valid. If G# is HIGH or GD#, is LOW, but B# is LOW, the internal burst address counter is incremented at each active edge of K.

The synchronous burst read timing diagrams and AC characteristics are described in the AC and DC Parameters. See Figures Synchronous Burst Read, Latch Enable Controlled (data valid from 'n' clock rising edge), Synchronous Burst Read (data valid from 'n' clock rising edge), Synchronous Burst Read - valid data ready output, and Synchronous Burst Read - Burst Address Advance and the Synchronous Burst Read AC Characteristics table.

Synchronous Burst Read Suspend

During a synchronous burst READ operation, it is possible to suspend the operation, freeing the data bus for other higher priority devices.

A valid synchronous burst READ operation is suspended when both G# and B# are HIGH. The B# going HIGH stops the burst counter, and the G# going HIGH inhibits the data outputs. The synchronous burst READ operation can be resumed by setting G# LOW.

Table 8: Synchronous Burst Read Bus Operations¹

| Bus operation | Step | E# | G# | GD# | RP# | K | L# | B# | A[MAX:0] DQ[31:0] |
|--|-----------------------|-----------------|-----------------|-----------------|-----------------|----------------|-----------------|-----------------|----------------------|
| SYNCHRONOUS BURST READ ² | Address latch | V _{IL} | V _{IH} | X | V _{IH} | A ³ | V _{IL} | X | Address input |
| | Read | V _{IL} | V _{IL} | V _{IH} | V _{IH} | A ³ | V _{IH} | V _{IL} | Data output |
| | Read suspend | V _{IL} | V _{IH} | X | V _{IH} | X | V _{IH} | V _{IH} | High-Z |
| | Read resume | V _{IL} | V _{IL} | V _{IH} | V _{IH} | A ³ | V _{IH} | V _{IL} | Data output |
| | Burst address advance | V _{IL} | V _{IH} | X | V _{IH} | A ³ | V _{IH} | V _{IL} | High-Z |
| | Read abort, E# | V _{IH} | X | X | V _{IH} | X | X | X | High-Z |
| | Read abort, RP# | X | X | X | V _{IL} | X | X | X | High-Z |

- Notes:
1. X = Don't care, V_{IL} or V_{IH}.
 2. M15 = 0, Bit M15 is in the Burst Configuration Register.
 3. A = Active edge (See bit M6 in the burst configuration register for further details on the active edge of K).

Burst Configuration Register

The burst configuration register is used to configure the type of bus access that the memory will perform.

The burst configuration register is set through the command interface and will retain its information until it is re-configured, the device is reset, or the device goes into reset/power-down mode. The burst configuration register bits are described in the Burst Configuration Register table. They specify the selection of the burst length, burst type, burst X and Y latencies and the READ operation. Refer to the Example Burst Configuration X-1-1-1 figure for examples of synchronous burst configurations.

Read Select Bit M15

The read select bit, M15, is used to switch between asynchronous and synchronous bus READ operations. When the read select bit is set to 1, bus READ operations are asynchronous; when the read select bit is set to 0, bus READ operations are synchronous. On reset or power-up, the read select bit is set to 1 for asynchronous accesses.

Standby Disable Bit M14

The standby disable bit, M14, is used to disable the standby mode. When the standby bit is 1, the device will not enter standby mode when E# goes HIGH.

X-Latency Bits M13-M11

The X-latency bits M13-M11 are used during synchronous bus READ operations to set the number of clock edges between the address being latched and the edge where the first data become available. For correct operation the X-latency bits can only assume the values in the burst configuration register table.

Y-Latency Bit M9

The Y-latency bit is used during synchronous bus READ operations to set the number of clock cycles between consecutive reads. When the Y-latency bit is 1, the data changes each clock cycle. When the Y-latency is 2, the data changes every second clock cycle.

Valid Data Ready Bit M8

The valid data ready bit controls the timing of pin R. When the valid data ready bit is 0, pin R output is driven LOW for the active clock edge when invalid data is output on the bus. When the valid data ready bit is 1, pin R output is driven LOW one clock cycle prior to invalid data being output on the bus.

Valid Clock Edge Bit (M6)

For M58BW16F, the valid clock edge bit, M6, is used to configure the active edge of K during synchronous burst READ operations. When the valid clock edge bit is 0, the falling edge of K is the active edge; when the valid clock edge bit is 1, the rising edge of K is active. For M58BW32F, bit M6 is "Don't Care." Only rising edge of K is available.

Burst Wrap Bit M3

The burst READ operations can be confined inside the 4 or 8 double-word boundary (wrap) or overcome the boundary (no wrap). The wrap burst bit is used to select between wrap and no wrap. When the wrap burst bit is set to 0, the burst READ operation wraps; when it is set to 1, the burst READ operation does not wrap.

Burst Length Bits M2-M0

The burst length bits set the maximum number of double-words that can be output during a synchronous burst READ operation. Burst lengths of 4, 8, or continuous burst

are available. The Burst Configuration Register table gives the valid combinations of the burst length bits that the memory accepts.

If either a continuous or a no wrap burst READ operation has been initiated, the device will output data synchronously. Depending on the starting address, the device asserts the pin R to communicate that some wait states are needed before the data valid appearance. As shown in the WAIT States table, the bits ADD[4:0] of the starting address will determine the number of WAIT states that the device is going to drive in the data bus lines. Elsewhere, the burst mode will run without activating the pin R output.

Table 9: Burst Configuration Register

Note 1 applies to the entire table.

| Bit | Description | Value | Description | Notes |
|---------|------------------|-------|--|-------|
| M15 | Read select | 0 | Synchronous burst read | |
| | | 1 | Asynchronous read (default at power-up) | |
| M14 | Standby disable | 0 | Standby mode enabled (default at power-up) | |
| | | 1 | Standby mode disabled | |
| M13-M11 | X-latency | 000 | Reserved (default at power-up) | 2 |
| | | 001 | 3, 3-1-1-1, 3-2-2-2 | |
| | | 010 | 4, 4-1-1-1, 4-2-2-2 | |
| | | 011 | 5, 5-1-1-1, 5-2-2-2 | |
| | | 100 | 6, 6-1-1-1, 6-2-2-2 | |
| | | 101 | 7, 7-1-1-1, 7-2-2-2 | |
| | | 110 | 8, 8-1-1-1, 8-2-2-2 | |
| | | 111 | Reserved | |
| M10 | Reserved | 0 | Write 0 to reserved bits | |
| M9 | Y-latency | 0 | One burst clock cycle (default at power-up) | 3 |
| | | 1 | Two burst clock cycles | |
| M8 | Valid data ready | 0 | R valid LOW during valid burst clock edge (default at power-up) | |
| | | 1 | R valid LOW 1 data cycle before valid burst clock edge | |
| M7 | | 0 | Reserved (default at power-up) | 4 |
| | | 1 | To be set to "1" whenever synchronous burst read is selected (this is M15 = 0) | |
| M6 | Valid clock edge | 0 | Falling burst clock edge (default at power-up) | 5 |
| | | 1 | Rising burst clock edge | |
| M5-M4 | Reserved | 00 | Write 0 to reserved bits | |
| M3 | Wrapping | 0 | Wrap (default at power-up) | |
| | | 1 | No Wrap | |

Table 9: Burst Configuration Register (Continued)

Note 1 applies to the entire table.

| Bit | Description | Value | Description | Notes |
|-------|--------------|-------|--------------------------------|-------|
| M2-M0 | Burst length | 000 | Reserved (default at power-up) | |
| | | 001 | 4 double-words | |
| | | 010 | 8 double-words | |
| | | 011 | Reserved | |
| | | 100 | Reserved | |
| | | 101 | Reserved | |
| | | 110 | Reserved | |
| | | 111 | Continuous | |

- Notes:
- M10, M5, and M4 are reserved for future use.
 - X latencies can be calculated as: $(t_{AVQV} - t_{LLKH} + t_{QVKH}) + t_{SYSTEM\ MARGIN} < (X - 1) t_K$. X is an integer number from 4 to 8, t_K is the clock period and $t_{SYSTEM\ MARGIN}$ is the time margin required for the calculation.
 - Y latencies can be calculated as: $t_{KHQV} + t_{SYSTEM\ MARGIN} + t_{QVKH} < Y t_K$.
 - M7 bit is Don't Care in the M58BW32F.
 - M6 bit is Don't Care in the M58BW32F and the device has the rising burst clock edge set. To maintain the compatibility this could be modified and read.

Table 10: WAIT States

| ADD[4:0] | Number of Clock WAIT States |
|----------|-----------------------------|
| 11101 | 1 |
| 11110 | 2 |

Figure 4: Example Burst Configuration X-1-1-1

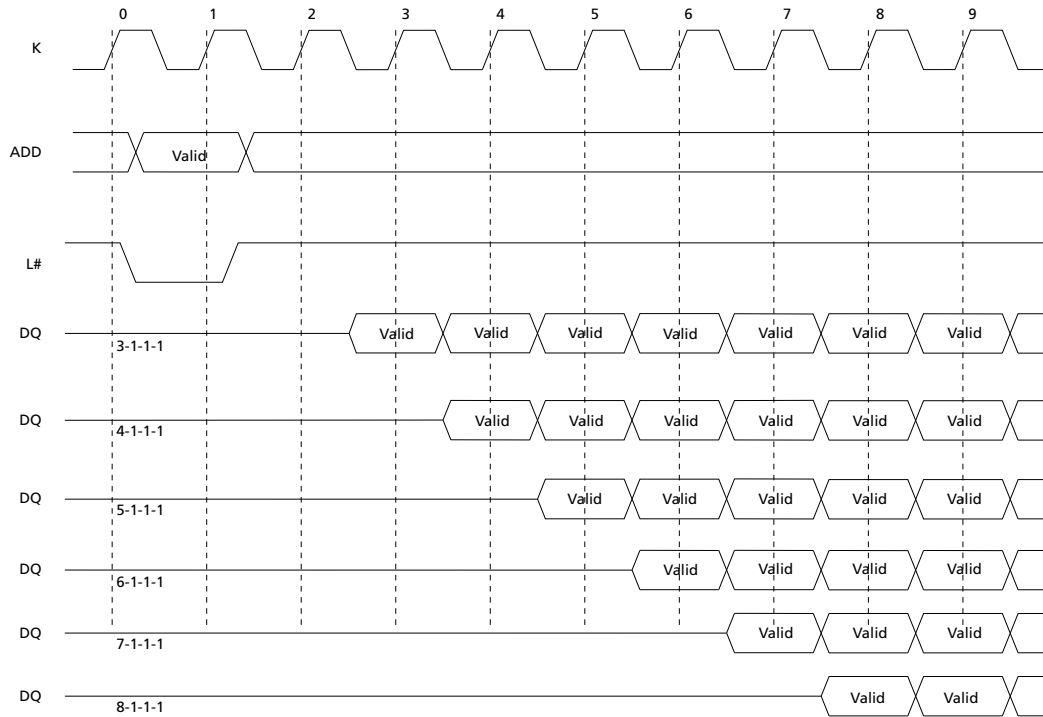

Figure 5: Example Burst Configuration X-2-2-2

Device Commands

All bus WRITE operations to the memory are interpreted by the command interface. Commands consist of one or more sequential bus WRITE operations. The commands are summarized in the Commands table.

Table 12: Commands¹

| Command | Cycles | Bus Operations | | | | | | | | | | | |
|---|-----------|----------------|-------|------|-----------|-------|------|-----------|-------|------|-----------|-------|------|
| | | 1st cycle | | | 2nd cycle | | | 3rd cycle | | | 4th cycle | | |
| | | Op. | Addr. | Data | Op. | Addr. | Data | Op. | Addr. | Data | Op. | Addr. | Data |
| READ MEMORY ARRAY | ≥ 2 | Write | X | FFh | Read | RA | RD | | | | | | |
| READ ELECTRONIC SIGNATURE ² | ≥ 2 | Write | X | 90h | Read | IDA | IDD | | | | | | |
| READ STATUS REGISTER | 1 | Write | X | 70h | | | | | | | | | |
| READ QUERY | ≥ 2 | Write | X | 98h | Read | RA | RD | | | | | | |
| CLEAR STATUS REGISTER | 1 | Write | X | 50h | | | | | | | | | |
| BULK ERASE | 2 | Write | 55h | 20h | Write | BA | D0h | | | | | | |
| ERASE ALL MAIN BLOCKS | 2 | Write | 55h | 80h | Write | AAh | D0h | | | | | | |
| PROGRAM | any block | 2 | Write | AAh | 40h | Write | PA | PD | | | | | |
| | OTP block | 2 | Write | AAh | 40h | Write | PA | PD | | | | | |
| WRITE TO BUFFER AND PROGRAM | N+4 | Write | AAh | E8h | Write | BA | N | Write | PA | PD | Write | X | D0h |
| PROGRAM/ERASE SUSPEND | 1 | Write | X | B0h | | | | | | | | | |
| PROGRAM/ERASE RESUME | 1 | Write | X | D0h | | | | | | | | | |
| SET BURST CONFIGURATION REGISTER | 3 | Write | X | 60h | Write | BCRh | 03h | Read | RA | RD | | | |
| SET BLOCK PROTECTION CONFIGURATION REGISTER | 2 | Write | X | 60h | Write | BA | 01h | | | | | | |
| CLEAR BLOCK PROTECTION CONFIGURATION REGISTER | 2 | Write | X | 60h | Write | BA | D0h | | | | | | |
| LOCK OTP PROTECTION | 2 | Write | AAh | 49h | Write | 03h | 00h | | | | | | |

- Notes:
1. X Don't care; RA Read Address, RD Read Data, ID Device Code, IDA Identifier Address, IDD Identifier Data, SRD Status Register Data, PA Program Address; PD Program Data, QA Query Address, QD Query Data, BA Any address in the Block, BCR Burst Configuration Register value, N+1 number of Words to program, BA Block address.
 2. Manufacturer code, device code, burst configuration register, and block protection configuration register of each block are read using the READ ELECTRONIC SIGNATURE command.

READ MEMORY ARRAY Command

The READ MEMORY ARRAY command returns the memory to read mode. One bus write cycle is required to issue the command and return the memory to read mode. Subsequent READ operations will output the addressed memory array data. Once the command is issued, the memory remains in read mode until another command is issued. From read mode, READ commands will access the memory array.

READ ELECTRONIC SIGNATURE Command

The READ ELECTRONIC SIGNATURE command is used to read the manufacturer code, the device code, the block protection configuration register and the burst configuration register. One bus write cycle is required to issue the command. Once the command is issued, subsequent bus READ operations, depending on the address specified, read the manufacturer code, the device code, the block protection configuration or the burst configuration register until another command is issued.

Table 13: Read Electronic Signature

| Code | Device | A[MAX:0] | DQ[31:0] |
|---|-----------|----------------------|-------------------------|
| Manufacturer | All | 00000h | 00000020h |
| Device | M58BW16FT | 00001h | 0000883Ah |
| | M58BW16FB | 00001h | 00008839h |
| | M58BW32FT | 00001h | 00008838h |
| | M58BW32FB | 00001h | 00008837h |
| Burst Configuration Register | All | 00005h | BCR ¹ |
| Block Protection Configuration Register | All | SBA+02h ² | 00000000h (Unprotected) |
| | | | 00000001h (Protected) |

- Notes: 1. BCR = Burst Configuration Register.
2. SBA is the start address of each block.

READ QUERY Command

The READ QUERY command is used to read data from the common flash interface (CFI) memory area. One bus write cycle is required to issue the command. Once the command is issued, subsequent bus READ operations read from the CFI memory area, depending on the address specified.

READ STATUS REGISTER Command

The READ STATUS REGISTER command is used to read the status register. One bus write cycle is required to issue the command. Once it is issued, subsequent bus READ operations read the status register until another command is issued.

The status register information is present on DQ0-DQ7 when E# and G# are LOW and GD# is at HIGH.

An interactive update of the status register bits is possible by toggling G# or GD#. This update is also possible during PROGRAM, ERASE, or WRITE TO BUFFER and PROGRAM operations by performing the following: deactivate the device with E# LOW and then reactivate the device with E# and G# LOW and GD# HIGH.

The content of the status register may also be read at the completion of PROGRAM, ERASE, SUSPEND, or WRITE TO BUFFER and PROGRAM operations. During PROGRAM, ERASE, or WRITE TO BUFFER and PROGRAM commands, DQ7 indicates the program/erase controller status. It is valid until the operation is completed or suspended.

See the Status Register and Status Register Bits tables for details on the definitions of the status register bits.

CLEAR STATUS REGISTER Command

The CLEAR STATUS REGISTER command can be used to reset to 0 bits 1, 3, 4 and 5 in the status register. One bus write cycle is required to issue this command. Once the command is issued, the memory returns to its previous mode, and subsequent bus READ operations continue to output the same data.

The bits in the status register do not automatically return to 0 when a new PROGRAM, ERASE, BLOCK PROTECT, BLOCK UNPROTECT, or WRITE TO BUFFER and PROGRAM commands are issued. If an error occurs, it is essential to clear any error bits in the status register by issuing a CLEAR STATUS REGISTER command before attempting a new PROGRAM, ERASE, RESUME, or WRITE TO BUFFER and PROGRAM commands.

BLOCK ERASE Command

The BLOCK ERASE command can be used to erase a block. It sets all of the bits in the block to '1'. All previous data in the block is lost. If the block is protected then the ERASE operation will abort, the data in the block will not be changed and the Status Register will output the error.

Two bus write cycles are required to issue the command; the first write cycle sets up the command, the second confirms the command, latches the block address in the program/erase controller, and starts the program/erase controller. The sequence is aborted if the CONFIRM command is not given, and the device will output the status register data with bits 4 and 5 set to 1.

Once the command is issued, subsequent bus READ operations read the status register. See the section on the status register for details on the definitions of the status register bits. During the ERASE operation, the memory will accept only the READ STATUS REGISTER command and the PROGRAM/ERASE SUSPEND command. All other commands are ignored.

If PEN is HIGH, the operation can be performed. If PEN goes below HIGH, the operation aborts and the PEN status bit in the status register is set to 1. The status register should be cleared before reissuing the command.

Typical erase times are given in the Program and Erase Times and Endurance Cycles table. See the Block Erase Flowchart and Pseudocode figure for a suggested flowchart on using the BLOCK ERASE command.

ERASE ALL MAIN BLOCKS Command

The ERASE ALL MAIN BLOCKS command is used to erase all main blocks (62 main blocks for M58BW32F and 31 main blocks for M58BW16F).

without affecting the parameter blocks. Issuing the command sets every bit in each main block to 1. All data previously stored in the main blocks are lost.

Two bus write cycles are required to issue this command. The first cycle sets up the command, and the second cycle confirms the command and starts the program/erase controller. If the CONFIRM command is not given, the sequence is aborted, and status register bits 4 and 5 are set to 1.

If the address given in the second cycle is located in a protected block, the ERASE ALL MAIN BLOCKS operation aborts. The data remains unchanged in all blocks and the status register outputs the error.

Once the command has been issued, subsequent bus READ operations output the status register. See the Status Register for details.

During an ERASE ALL MAIN BLOCKS operation, only the READ STATUS REGISTER command is accepted by the memory; any other command are ignored. The ERASE ALL MAIN BLOCKS command cannot be suspended once it has begun.

If PEN is HIGH, the operation will be performed. Otherwise, the operation aborts and the status register PEN bit (bit 3) is set to 1. The status register should be cleared before reissuing the command.

PROGRAM Command

The PROGRAM command is used to program the memory array. Two bus write operations are required to issue the command; the first write cycle sets up the PROGRAM command, and the second write cycle latches the address and data to be programmed and starts the program/erase controller. A PROGRAM operation can be aborted by writing FFFFFFFFh to any address after the program set-up command has been given.

The PROGRAM command is also used to program the OTP block. Refer to the Commands table for details of the address.

Once the command is issued, subsequent bus READ operations read the status register. See the Status Register table for details on the definitions of the status register bits. During the PROGRAM operation, the memory will accept only the READ STATUS REGISTER command and the PROGRAM/ERASE SUSPEND command. All other commands will be ignored.

If RP#, falls to LOW during programming, the operation will be aborted.

If PEN is HIGH, the operation can be performed. Otherwise, the operation aborts, and the PEN status bit in the status register is set to 1. The status register should be cleared before reissuing the command. See also the Program Flowchart and Pseudocode figure.

WRITE TO BUFFER AND PROGRAM Command

The WRITE TO BUFFER AND PROGRAM command makes use of the device's double word (32 bit) write buffer to speed up programming. Up to eight double words can be loaded into the write buffer and programmed into the memory. The following successive steps are required to issue the command.

1. One bus WRITE operation is required to set up the WRITE TO BUFFER AND PROGRAM command. Any bus READ operations will start to output the status register after the 1st cycle.
2. Use one bus WRITE operation to write the selected memory block address (any address in the block where the values will be programmed can be used) along with the value N on the data inputs/outputs, where N+1 is the number of words to be programmed. The maximum value of N+1 is 8 words.

3. Use N+1 bus WRITE operations to load the address and data for each word into the write buffer. The address must be between Start address and Start address plus N, where start address is the first word address.
4. Finally, use one bus WRITE operation to issue the final cycle to confirm the command and start the PROGRAM operation.

If any address is outside the block boundaries or if the correct sequence is not followed, status register bits 4 and 5 are set to 1 and the operation will abort without affecting the data in the memory array. A protected block must be unprotected using the BLOCKS UNPROTECT command.

During a WRITE TO BUFFER AND PROGRAM operation, the memory will accept only the READ STATUS REGISTER and the PROGRAM/ERASE SUSPEND commands. All other commands are ignored. If PEN is HIGH, the operation executes. Otherwise, the operation aborts and the status register PEN bit (bit 3) is set to 1. The status register should be cleared before reissuing the command.

PROGRAM/ERASE SUSPEND Command

The PROGRAM/ERASE SUSPEND command is used to pause a PROGRAM, ERASE, or WRITE TO BUFFER AND PROGRAM operation. The command will be accepted only during a PROGRAM, ERASE, or WRITE TO BUFFER AND PROGRAM operation. It can be issued at any time during a PROGRAM, ERASE, or WRITE TO BUFFER AND PROGRAM operation. The command is ignored if the device is already in suspend mode.

One bus write cycle is required to issue the command and pause the program/erase controller. Once the command is issued, it is necessary to poll the program/erase controller status bit (bit 7) to find out when the program/erase controller has paused. No other commands will be accepted until the program/erase controller has paused, after which the memory will continue to output the status register until another command is issued.

During the polling period between issuing the PROGRAM/ERASE SUSPEND command and the program/erase controller pausing, it is possible for the operation to complete. Once the program/erase controller status bit (bit 7) indicates that the program/erase controller is no longer active, the program suspend status bit (bit 2) or the erase suspend status bit (bit 6) can be used to determine if the operation has completed or is suspended. For timing on the delay between issuing the PROGRAM/ERASE SUSPEND command and the program/erase controller pausing, see the Program and Erase Times and Endurance Cycles table.

During execution of a PROGRAM/ERASE SUSPEND command, the READ MEMORY ARRAY, READ STATUS REGISTER, READ ELECTRONIC SIGNATURE, READ QUERY, and PROGRAM/ERASE SUSPEND commands will be accepted by the command interface. Additionally, if the suspended operation was an ERASE operation, the PROGRAM, WRITE TO BUFFER AND PROGRAM, SET/CLEAR BLOCK PROTECTION CONFIGURATION REGISTER, and PROGRAM SUSPEND commands will also be accepted. When a PROGRAM operation is completed inside a BLOCK ERASE SUSPEND operation, the READ MEMORY ARRAY command must be issued to reset the device in read mode. Then, the ERASE RESUME command can be issued to complete the whole sequence. Only the blocks not being erased may be read or programmed correctly.

ERASE operations can be suspended in a systematic and periodical way; however, to ensure the effectiveness of ERASE operations and avoid infinite erase times, it is imperative to wait a minimum time between successive ERASE RESUME and ERASE SUS-

PEND commands. This time, called the minimum effective erase time, is given in the Program and Erase Times and Endurance Cycles table.

See the Program Suspend & Resume Flowchart and Pseudocode figure and the Erase Suspend and Resume Flowchart and Pseudocode figure for suggested flowcharts on using the PROGRAM/ERASE SUSPEND command.

PROGRAM/ERASE RESUME Command

The PROGRAM/ERASE RESUME command can be used to restart the program/erase controller after a PROGRAM/ERASE SUSPEND operation has paused it. One bus write cycle is required to issue the PROGRAM/ERASE RESUME command.

See the Program Suspend and Resume Flowchart and Pseudocode figure, and the Erase Suspend and Resume Flowchart and Pseudocode figure for information on using the PROGRAM/ERASE RESUME command.

SET BURST CONFIGURATION REGISTER Command

The SET BURST CONFIGURATION REGISTER command is used to write a new value to the burst configuration register. This register defines the burst length, type, X and Y latencies, and synchronous/asynchronous read mode. For M58BW16F only, it also defines the valid clock edge configuration.

Two bus write cycles are required to issue the SET BURST CONFIGURATION REGISTER command. The first cycle writes the setup command. The second cycle writes the address where the new burst configuration register content is to be written and then confirms the command. If the command is not confirmed, the sequence is aborted and the device outputs the status register with bits 4 and 5 set to 1. Once the command is issued, the memory returns to read mode as if a READ MEMORY ARRAY command had been issued.

The value for the burst configuration register is always presented on A0-A15. M0 is on A0, M1 on A1, etc.; address bits A16-Amax are ignored.

SET BLOCK PROTECTION CONFIGURATION REGISTER Command

The SET BLOCK PROTECTION CONFIGURATION REGISTER command is used to configure the block protection configuration register to 'protected', for a specific block. Protected blocks are fully protected from program or erase when WP# pin is LOW. The status of a protected block can be changed to 'unprotected' by using the CLEAR BLOCK PROTECTION CONFIGURATION REGISTER command. At power-up, all blocks are configured as 'protected'.

Two bus operations are required to issue a SET BLOCK PROTECTION CONFIGURATION REGISTER command:

- The first cycle writes the setup command
- The second write cycle specifies the address of the block to protect and confirms the command. If the command is not confirmed, the sequence is aborted and the device outputs the status register with bits 4 and 5 set to 1.

To protect multiple blocks, the SET BLOCK PROTECTION CONFIGURATION REGISTER command must be repeated for each block. Any attempt to reprotect a block already protected does not change its status.

CLEAR BLOCK PROTECTION CONFIGURATION REGISTER Command

The CLEAR BLOCK PROTECTION CONFIGURATION REGISTER command is used to configure the block protection configuration register to 'unprotected', for a specific block thus allowing PROGRAM/ERASE operations to this block, regardless of the WP# pin status.

Two bus operations are required to issue a CLEAR BLOCK PROTECTION CONFIGURATION REGISTER command:

- The first cycle writes the setup command
- The second write cycle specifies the address of the block to unprotect and confirms the command. If the command is not confirmed, the sequence is aborted and the device outputs the status register with bits 4 and 5 set to 1.

To unprotect multiple blocks, the CLEAR BLOCK PROTECTION CONFIGURATION REGISTER command must be repeated for each block. Any attempt to unprotect a block already unprotected does not affect its status.

Flowcharts

Figure 6: Program Flowchart and Pseudocode

Note: 1. If an error is found, the Status Register must be cleared before further P/E operations.

Figure 7: Program Suspend & Resume Flowchart and Pseudocode

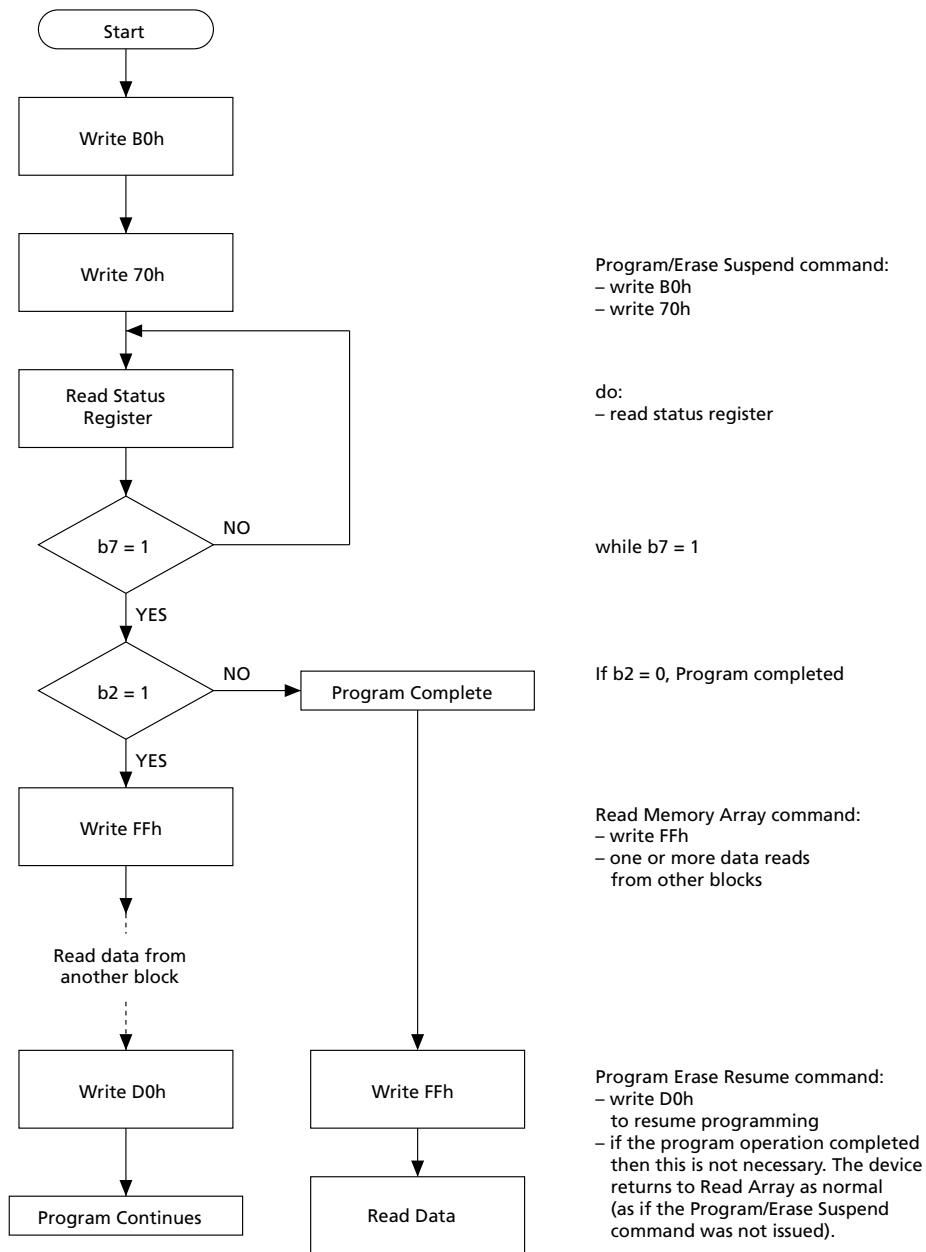

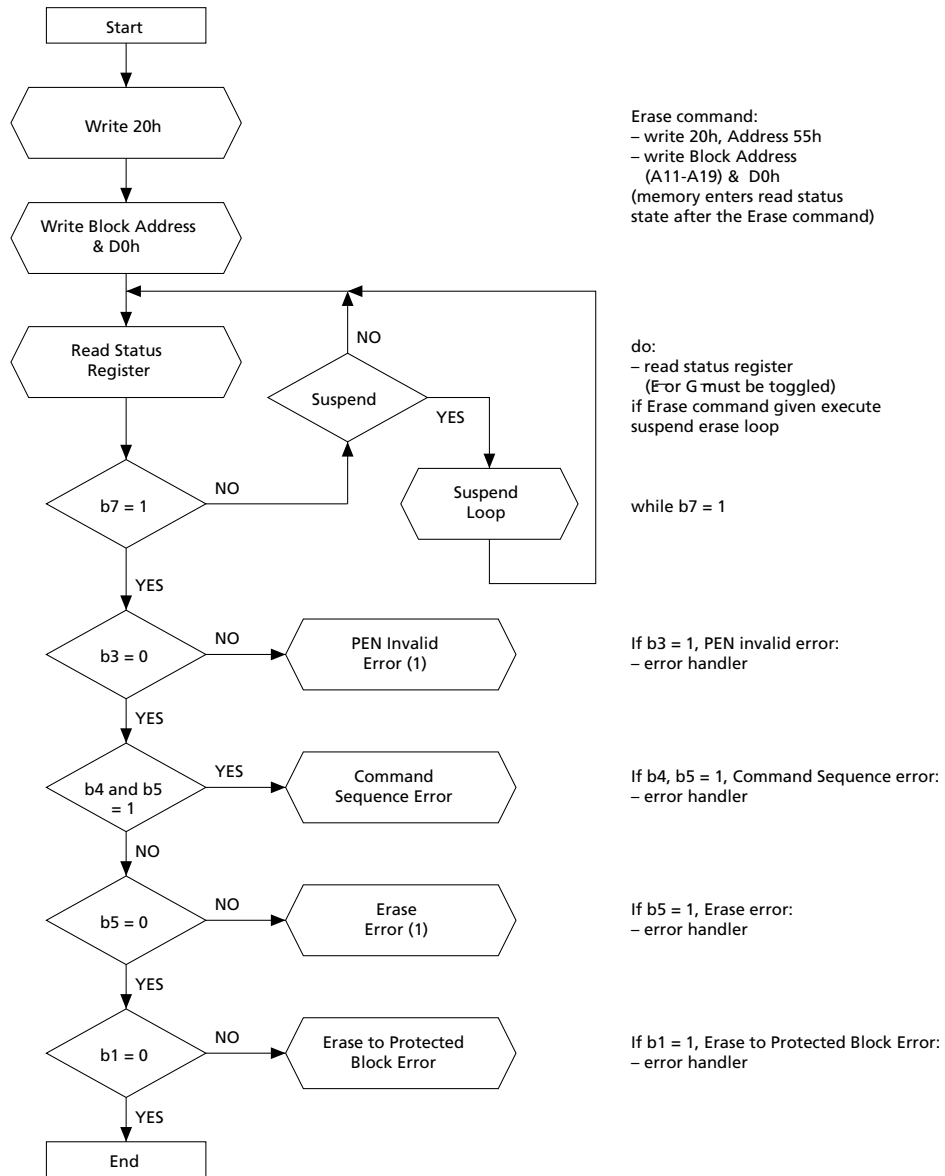

Figure 8: Block Erase Flowchart and Pseudocode

Note: 1. If an error is found, the Status Register must be cleared before further Program/Erase operations.

Figure 14: Command Interface and Program/Erase Controller Flowchart (D)

Status Register

The Status Register provides information on the current or previous PROGRAM, ERASE, WRITE TO BUFFER AND PROGRAM, or BLOCK PROTECT operation. The various bits in the Status Register convey information and errors on the operation. They are output on DQ[7:0].

To read the Status Register the READ STATUS REGISTER command can be issued. The Status Register is automatically read after PROGRAM, ERASE, WRITE TO BUFFER AND PROGRAM, BLOCK PROTECT, PROGRAM/ERASE RESUME commands. The Status Register can be read from any address.

The contents of the Status Register can be updated during a PROGRAM, ERASE, OR WRITE TO BUFFER AND PROGRAM operation by toggling the Output Enable or Output Disable pins or by de-activating (Chip Enable, V_{IH}) and then reactivating (Chip Enable and Output Enable, V_{IL} , and Output Disable, V_{IH} .) the device.

The Status Register bits are summarized in the Status Register bits table. Refer to the Status Register bits table in conjunction with the following text descriptions.

Table 14: Status Register Bits

| Bit | Name | Logic level | Definition |
|-----|------------------------------------|-------------|---|
| 7 | Program/Erase controller status | '1' | Ready |
| | | '0' | Busy |
| 6 | Erase suspend status | '1' | Suspended |
| | | '0' | In progress or completed |
| 5 | Erase status | '1' | Erase error |
| | | '0' | Erase success |
| 4 | Program status, | '1' | Program error |
| | | '0' | Program success |
| 3 | PEN status bit | '0' | No program or erase attempted |
| | | '1' | Program or erase attempted |
| 2 | Program suspend status | '1' | Suspended |
| | | '0' | In progress or completed |
| 1 | Erase/Program in a protected block | '1' | Program/erase on protected block, abort |
| | | '0' | No operations to protected blocks |
| 0 | Reserved | '1' | Reserved |

Program/Erase Controller Status (bit 7)

The program/erase controller status bit indicates whether the program/erase controller is active or inactive. When the program/erase controller status bit is set to '0', the program/erase controller is active; when bit 7 is set to 1, the program/erase controller is inactive.

The program/erase controller status is set to 0 immediately after a PROGRAM/ERASE SUSPEND command is issued and until the program/erase controller pauses. After the program/erase controller pauses, the bit is set to 1.

During PROGRAM, ERASE, and WRITE TO BUFFER AND PROGRAM operations, the program/erase controller status bit can be polled to find the end of the operation. The other bits in the status register should not be tested until the program/erase controller completes the operation and the bit is set to '1'.

After the program/erase controller completes its operation, the erase status (bit 5) and program status (bit 4) should be tested for errors.

Erase Suspend Status (bit 6)

The Erase Suspend Status bit indicates that an ERASE operation has been suspended and is waiting to be resumed. The Erase Suspend Status should only be considered valid when the Program/Erase Controller Status bit is set to '1' (Program/Erase controller inactive); after a Program/Erase Suspend command is issued the memory may still complete the operation rather than entering the Suspend mode.

When the Erase Suspend Status bit is set to '0', the Program/Erase controller is active or has completed its operation; when the bit is set to '1', a PROGRAM/ERASE SUSPEND command has been issued and the memory is waiting for a PROGRAM/ERASE RESUME command.

When a PROGRAM/ERASE RESUME command is issued the Erase Suspend Status bit returns to '0'.

Erase Status (Bit 5)

The Erase Status bit can be used to identify if the memory has failed to verify that the block has erased correctly. The Erase Status bit should be read once the Program/Erase Controller Status bit is High (Program/Erase controller inactive).

When the Erase Status bit is set to '0', the memory has successfully verified that the block has erased correctly. When the Erase Status bit is set to '1', the Program/Erase controller has applied the maximum number of pulses to the block and still failed to verify that the block has erased correctly.

Once set to '1', the Erase Status bit can only be reset to '0' by a CLEAR STATUS REGISTER command or a hardware reset. If set to 1 it should be reset before a new PROGRAM, ERASE, or WRITE TO BUFFER AND PROGRAM command is issued, otherwise the new command will appear to fail.

Program/Write to Buffer and Program Status (Bit 4)

The Program/Write to Buffer and Program Status bit is used to identify a Program failure or a Write to Buffer and Program failure. Bit 4 should be read once the Program/Erase Controller Status bit is High (Program/Erase controller inactive).

When bit 4 is set to '0' the memory has successfully verified that the device has programmed correctly. When bit 4 is set to '1' the device has failed to verify that the data has been programmed correctly.

Once set to '1', the Program Status bit can only be reset to '0' by a CLEAR STATUS REGISTER command or a hardware reset. If set to 1 it should be reset before a new PROGRAM, ERASE, or WRITE TO BUFFER AND PROGRAM command is issued, otherwise the new command will appear to fail.

PEN Status (Bit 3)

The PEN Status bit can be used to identify when a PROGRAM, ERASE, or WRITE TO BUFFER AND PROGRAM operation has been attempted when PEN is LOW.

When bit 3 is set to 0, no PROGRAM, ERASE, or WRITE TO BUFFER AND PROGRAM operation has been attempted with PEN LOW since the last CLEAR STATUS REGISTER command or hardware reset.

When bit 3 is set to 1, a PROGRAM, ERASE, or WRITE TO BUFFER AND PROGRAM operation has been attempted with PEN LOW.

Once set to 1, bit 3 can only be reset by a CLEAR STATUS REGISTER command or a hardware reset. If set to 1, it should be reset before a new PROGRAM, ERASE, or WRITE TO BUFFER AND PROGRAM command is issued. Otherwise the new command will appear to fail.

Program Suspend Status (Bit 2)

The program suspend status bit indicates that a PROGRAM or WRITE TO BUFFER AND PROGRAM operation has been suspended and is waiting to be resumed. The program suspend status should be considered valid only when the program/erase controller status bit is set to 1 (program/erase controller inactive). After a PROGRAM/ERASE SUSPEND command is issued, the memory may still complete the operation rather than entering the suspend mode.

When the program suspend status bit is set to '0', the program/erase controller is active or has completed its operation. When the bit is set to 1, a PROGRAM/ERASE SUSPEND command has been issued and the memory is waiting for a PROGRAM/ERASE RESUME command.

When a PROGRAM/ERASE RESUME command is issued the program suspend status bit returns to 0.

Block Protection Status (Bit 1)

The block protection status bit can be used to identify if a PROGRAM, ERASE, or WRITE TO BUFFER AND PROGRAM operation has tried to modify the contents of a protected block.

When the block protection status bit is set to 0, no PROGRAM, ERASE, or WRITE TO BUFFER AND PROGRAM operation has been attempted to protected blocks since the last CLEAR STATUS REGISTER command or hardware reset. When the block protection status bit is set to 1, a PROGRAM, ERASE, or WRITE TO BUFFER AND PROGRAM operation has been attempted on a protected block.

Once set to 1, the block protection status bit can only be reset LOW by a CLEAR STATUS REGISTER command or a hardware reset. If set to 1, it should be reset before a new PROGRAM, ERASE, or WRITE TO BUFFER AND PROGRAM command is issued. Otherwise the new command will appear to fail.

Reserved (Bit 0)

This bit is reserved for future use.

Common Flash Interface (CFI)

The common Flash interface is a JEDEC approved, standardized data structure that can be read from the Flash memory device. It allows a system software to query the device to determine various electrical and timing parameters, density information and functions supported by the memory. The system can interface easily with the device, enabling the software to upgrade itself when necessary.

When the CFI QUERY command (RCFI) is issued the device enters CFI Query mode and the data structure is read from the memory. The following tables show the addresses used to retrieve the data.

Table 15: Query Structure Overview

| Offset | Sub-section name | Description | |
|-------------------|---|---|--|
| 00h | 0020h | Manufacturer code | Micron |
| 01h | 883A 8839 8838 8837 | Device code | M58BW16FT (top) M58BW16FB (bottom) M58BW32FT (top) M58BW32FB (bottom) |
| 10h | CFI query identification string | Command set ID and algorithm data offset | |
| 1Bh | System interface information | Device timing and voltage information | |
| 27h | Device geometry definition | Flash memory layout | |
| P(h) ¹ | Primary algorithm-specific extended query table | Additional information specific to the primary algorithm (optional) | |
| A(h) ² | Alternate algorithm-specific extended query table | Additional information specific to the alternate algorithm (optional) | |

- Notes: 1. Offset 15h defines P which points to the primary algorithm extended query address table.
2. Offset 19h defines A which points to the alternate algorithm extended query address table.

Table 16: CFI - Query Address and Data Output

| Address A0-Amax | Data | | Instruction |
|-----------------|----------------------------------|-----|--|
| 10h | 51h | "Q" | 51h; "Q" |
| 11h | 52h | "R" | Query ASCII string 52h; "R" |
| 12h | 59h | "Y" | 59h; "Y" |
| 13h | 03h | | Primary vendor: |
| 14h | 00h | | Command set and control interface ID code |
| 15h | 35h (M58BW16F) 39h (M58BW32F) | | Primary algorithm extended query address table: P(h) |
| 16h | 00h | | |
| 17h | 00h | | Alternate vendor: |
| 18h | 00h | | Command set and control interface ID code |

Table 16: CFI - Query Address and Data Output (Continued)

| Address A0-Amax | Data | Instruction |
|-----------------|------|--|
| 19h | 00h | Alternate algorithm extended query address table |
| 1Ah | 00h | |

- Notes: 1. The x 8 or byte address and the x 16 or word address mode are not available.
2. Query data are always presented on DQ7-DQ0. DQ31-DQ8 are set to '0'.

Table 17: CFI - Device Voltage and Timing Specification

| Address A0-Amax | Data | Description | Value |
|-----------------|------------------|---|-------|
| 1Bh | 27h ¹ | V _{DD} min | 2.7V |
| 1Ch | 36h ¹ | V _{DD} max | 3.6V |
| 1Dh | xxxx xxxxh | Reserved | |
| 1Eh | xxxx xxxxh | Reserved | |
| 1Fh | 04h | 2 ⁿ μs typical for word, double word program | 16μs |
| 20h | xxxx xxxxh | Reserved | |
| 21h | 0Ah | 2 ⁿ ms, typical time-out for erase block | 1s |
| 22h | xxxx xxxxh | Reserved | |
| 23h | xxxx xxxxh | Reserved | |
| 24h | xxxx xxxxh | Reserved | |
| 25h | xxxx xxxxh | Reserved | |
| 26h | xxxx xxxxh | Reserved | |

- Note: 1. 1 Bits are coded in binary code decimal, bit7 to bit4 are scaled in Volts and bit3 to bit0 in mV.

Table 18: M58BW16F Device Geometry Definition

| Address A0-Amax | Data | Description | Value |
|-----------------|------|--|--------------|
| 27h | 15h | 2 ⁿ number of bytes memory size | 2 Mbytes |
| 28h | 03h | Device interface sync./async. | x 32 |
| 29h | 00h | Organization sync./async. | Asynchronous |
| 2Ah | 00h | Maximum number of byte in multi-byte program = 2 ⁿ | 32 bytes |
| 2Bh | 00h | | |
| 2Ch | 02h | Bit7-0 = number of erase block regions in device | 2 |
| 2Dh | 1Eh | Number (n-1) of erase blocks of identical size; n = 31 | 31 blocks |
| 2Eh | 00h | | |
| 2Fh | 00h | Erase block region information x 256 bytes per erase block (64 Kbytes) | 512 Kbits |
| 30h | 01h | | |
| 31h | 07h | Number (n-1) of erase blocks of identical size; n = 8 | 8 blocks |
| 32h | 00h | | |
| 33h | 20h | Erase block region information x 256 bytes per erase block (8 Kbytes) | 64 Kbits |
| 34h | 00h | | |

Note: 1. This table is valid for top configuration. For bottom configuration, refer to the M58BW16F Bottom Boot Block Addresses table.

Table 19: M58BW16F Extended Query Information

| Address Offset | Address Amax-A0 | Data (hex) | | Description |

Maximum Rating

Stressing the device above the ratings listed in the Absolute maximum ratings table, may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 23: Absolute Maximum Ratings

| Symbol | Parameter | Value | | Unit |
|------------------------------|-------------------------|-------|--------------------------------------|------|
| | | Min | Max | |
| T_{BIAS} | Temperature under bias | -40 | 125 | °C |
| T_{STG} | Storage temperature | -55 | 155 | °C |
| V_{IO} | Input or output voltage | -0.6 | $V_{DDQ} + 0.6$ $V_{DDQIN} + 0.6$ | V |
| $V_{DD}, V_{DDQ}, V_{DDQIN}$ | Supply voltage | -0.6 | 4.2 | V |

Table 24: Data Retention

| Power Supply V_{DD} | Unit | External Temperature | | Unit |
|--------------------------|------|----------------------|--------|-------|
| | | 25 °C | 125 °C | |
| 0 | V | 20 | 7 | Years |
| 2.5 | V | - | 25 | Years |
| 2.7 | V | - | 15 | Years |

Program and Erase Times and Endurance Cycles

Table 25: Program and Erase Times and Endurance Cycles¹

| Parameters | M58BW16F | | | M58BW32F | | | Unit |
|---|----------|-----|---------|----------|-----|---------|--------|
| | Min | Typ | Max | Min | Typ | Max | |
| Full chip program | | 15 | 20 | | 15 | 20 | s |
| Double word program | | 15 | 35 | | 15 | 35 | μs |
| 512 Kbit block erase | | 1 | 2 | | 1 | 2 | s |
| 128 Kbit block erase | | 0.8 | 1.6 | | 0.8 | 1.6 | s |
| 64 Kbit block erase | | 0.6 | 1.2 | | 0.6 | 1.2 | s |
| Erase all main blocks | | 45 | 60 | | 30 | 50 | s |
| Program suspend latency time | | | 10 | | | 10 | μs |
| Erase suspend latency time | | | 30 | | | 30 | μs |
| Minimum effective erase time ² | | | 40 | | | 40 | μs |
| Program/erase cycles (per block) | | | 100,000 | | | 100,000 | cycles |

- Notes: 1. $T_A = -40$ to 125 °C, $V_{DD} = 2.7V$ to $3.6V$, $V_{DDQ} = 2.6V$ to V_{DD} .
2. The minimum effective erase time is defined as the minimum time required between the last ERASE RESUME command and the next ERASE SUSPEND command for the internal Flash memory program/erase controller to be able to execute its algorithm.

DC and AC Parameters

This section summarizes the operating and measurement conditions, and the DC and AC characteristics of the device. The parameters in the DC and AC characteristics tables that follow, are derived from tests performed under the measurement conditions summarized in Operating and AC measurement conditions table. Designers should check that the operating conditions in their circuit match the measurement conditions when relying on the quoted parameters.

Operating Conditions and Capacitance

This section summarizes the operating and measurement conditions, and the DC and AC characteristics of the device. The parameters in the DC and AC characteristics tables that follow, are derived from tests performed under the measurement conditions summarized in Operating and AC measurement conditions table. Designers should check that the operating conditions in their circuit match the measurement conditions when relying on the quoted parameters.

Table 26: Operating and AC Measurement Conditions

| Parameter | M58BW16F, M58BW32F | | | | Units |
|---|--------------------|-----|----------------|-----|-------|
| | 45ns | | 55ns | | |
| | Min | Max | Min | Max | |
| Supply voltage (V_{DD}) | 2.7 | 3.6 | 2.5 | 3.3 | V |
| Input/output supply voltage (V_{DDQ}) | 2.4 | 3.6 | 2.4 | 3.3 | V |
| Ambient temperature (T_A) Grade 3 | -40 | 125 | -40 | 125 | °C |
| Load capacitance (C_L) | 30 | | 30 | | pF |
| Clock rise and fall times | | 3 | | 3 | ns |
| Input rise and fall times | | 3 | | 3 | ns |
| Input pulses voltages | 0 to V_{DDQ} | | 0 to V_{DDQ} | | V |
| Input and output timing ref. voltages | $V_{DDQ}/2$ | | $V_{DDQ}/2$ | | V |

Figure 15: AC Measurement Input/Output Waveform

Note: 1. $V_{DD} = V_{DDQ}$.

Figure 16: AC Measurement Load Circuit

C_L includes JIG capacitance

Table 27: Device Capacitance

| Symbol | Parameter | Test condition | Typ | Max | Unit |
|-----------|--------------------|------------------------|-----|-----|------|
| C_{IN} | Input capacitance | $V_{IN} = 0\text{ V}$ | 6 | 8 | pF |
| C_{OUT} | Output capacitance | $V_{OUT} = 0\text{ V}$ | 8 | 12 | pF |

- Notes: 1. $T_A = 25\text{ °C}$, $f = 1\text{ MHz}$.
2. Sampled only, not 100% tested.

DC Characteristics

| Symbol | Parameter | Test Condition | Min | Max | Unit | Notes |
|--------------|---|---|-----------------|-----------------|---------|-------|
| I_{LI} | Input leakage current | $0V \leq V_{IN} \leq V_{DDQIN}$ | | ± 1 | μA | |
| I_{LO} | Output leakage current | $0V \leq V_{OUT} \leq V_{DDQ}$ | | ± 5 | μA | |
| I_{DD} | Supply current (Random read) | $E\# = V_{IL}$, $G\# = V_{IH}$, $f_{add} = 6 \text{ MHz}$ | | 25 | mA | |
| I_{DDP-UP} | Supply current (Power-up) | | | 20 | mA | 1 |
| I_{DDB} | Supply current (Burst read) | $E\# = V_{IL}$, $G\# = V_{IH}$, $f_{clock} = 75 \text{ MHz}$ | | 50 | mA | |
| I_{DD1} | Supply current (Standby) | $E\# = RP\# = V_{DD} \pm 0.2V$ | | 150 | μA | 2 |
| I_{DD2} | Supply current (Program or Erase) | Program, Erase in progress | | 30 | mA | |
| I_{DD3} | Supply current (Erase/Program suspend) | $E\# = V_{IH}$ | | 150 | μA | |
| I_{DD4} | Supply current (Standby disable) | | 5 | 10 | mA | |
| V_{IL} | Input LOW voltage | | -0.5 | $0.2V_{DDQIN}$ | V | |
| V_{IH} | Input HIGH voltage (for DQ lines) | | $0.8V_{DDQIN}$ | $V_{DDQ} + 0.3$ | V | |
| V_{IH} | Input HIGH voltage (for input only lines) | | $0.8V_{DDQIN}$ | 3.6 | V | |
| V_{OL} | Output LOW voltage | $I_{OL} = 100\mu A$ | | 0.1 | V | |
| V_{OH} | Output HIGH voltage CMOS | $I_{OH} = -100\mu A$ | $V_{DDQ} - 0.1$ | | V | |
| V_{LKO} | V_{DD} supply voltage (Erase and program lockout) | | | 2.2 | V | |

- Notes:
- I_{DDP-UP} is the current needed from the device until RP goes to its logic HIGH level when the power supply is stable (t_{VDHPPH}). See the Reset, Power-down, and Power-up AC waveforms - Control pins Low figure and the Reset, Power-down, and Power-up AC waveforms - Control pins toggling.
 - The Standby mode can be disabled by setting the standby disable bit (M14) of the burst configuration register to '1'.

Asynchronous Bus Read AC Characteristics

Figure 17: Asynchronous Bus Read AC Waveforms

Figure 18: Asynchronous Latch Controlled Bus Read AC Waveforms

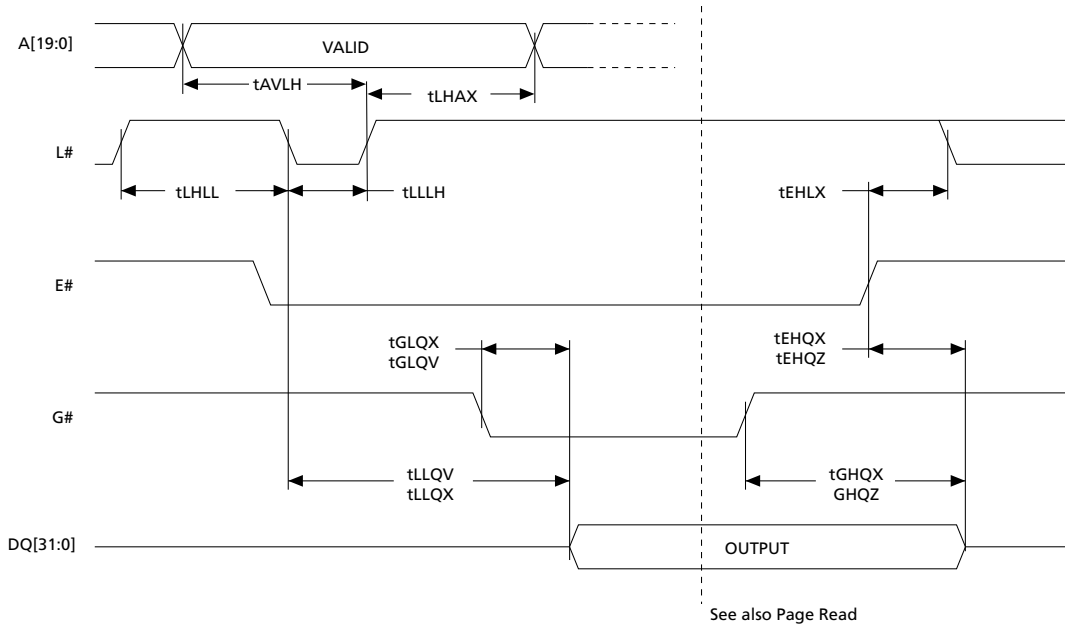

Figure 19: Asynchronous Chip Enable Controlled Bus Read AC Waveforms

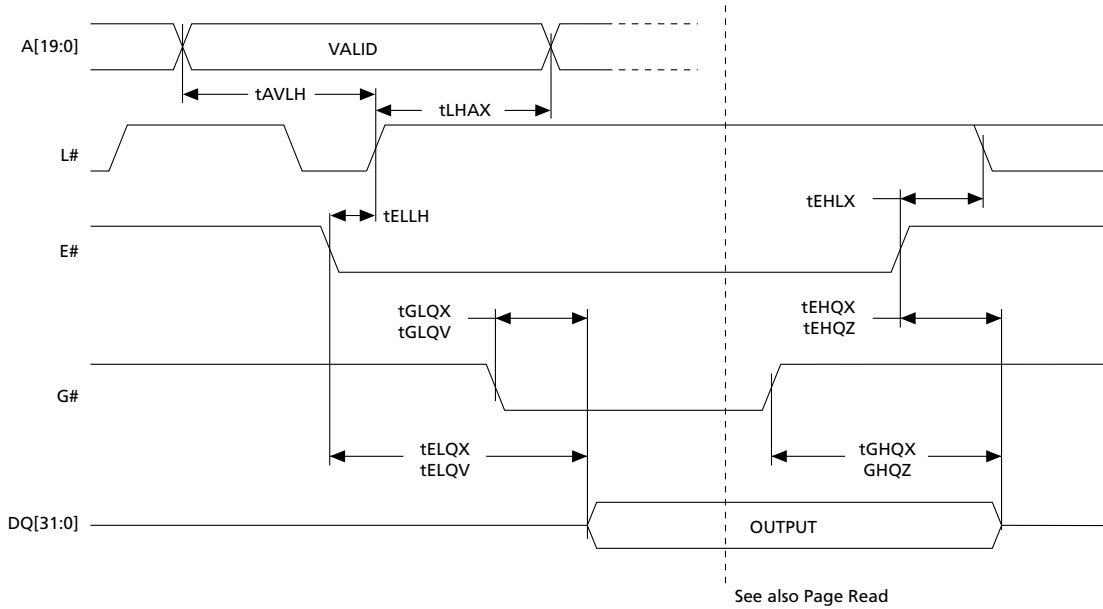

Figure 20: Asynchronous Address Controlled Bus Read AC Waveforms

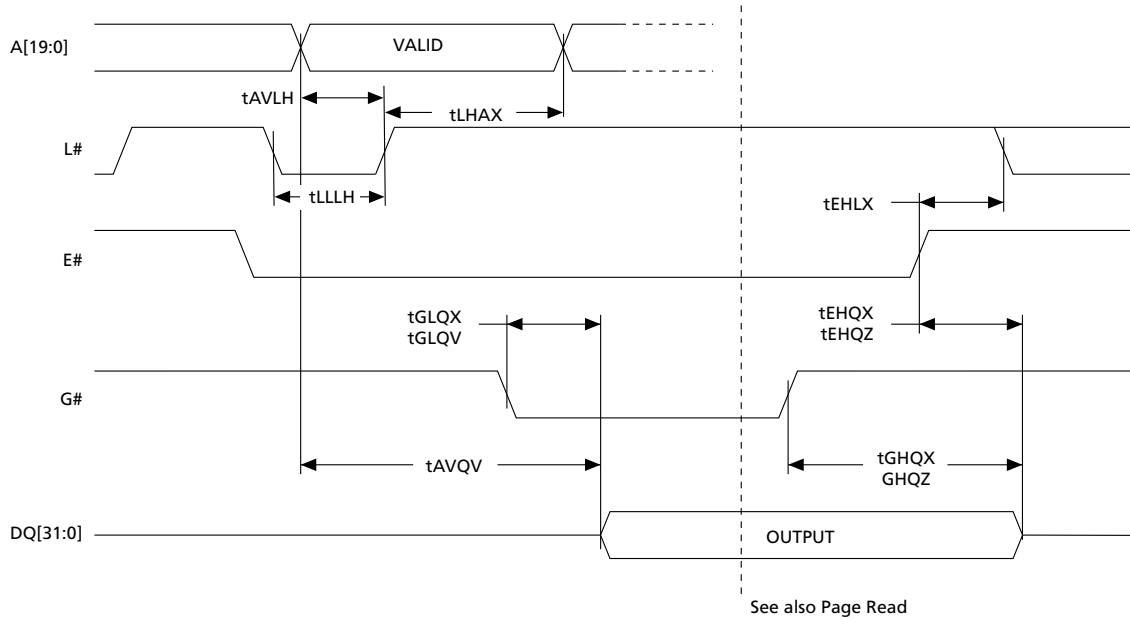

Table 28: Asynchronous Bus Read AC Characteristics

| Symbol | Parameter | Test condition | Min/Max | M58BWxxF | | Unit | Notes |
|------------|---|------------------------------|---------|----------|------|------|-------|
| | | | | 45ns | 55ns | | |
| t_{AVAV} | Address valid to address valid | $E\# = V_{IL}, G\# = V_{IL}$ | Min | 45 | 55 | ns | |
| t_{AVQV} | Address valid to output valid | $E\# = V_{IL}, G\# = V_{IL}$ | Max | 45 | 55 | ns | |
| t_{AXQX} | Address transition to output transition | $L\# = V_{IL}, G\# = V_{IL}$ | Min | 0 | 0 | ns | |
| t_{EHLX} | Chip enable HIGH to latch enable transition | | Min | 0 | 0 | ns | |
| t_{EHQX} | Chip enable HIGH to output transition | $G\# = V_{IL}$ | Min | 0 | 0 | ns | |
| t_{EHQZ} | Chip enable HIGH to output High-Z | $G\# = V_{IL}$ | Max | 20 | 20 | ns | |
| t_{ELQV} | Chip enable LOW to output valid | $G\# = V_{IL}$ | Max | 45 | 55 | ns | 1 |
| t_{GHQX} | Output enable HIGH to output transition | $E\# = V_{IL}$ | Min | 0 | 0 | ns | |
| t_{GHQZ} | Output enable HIGH to output High-Z | $E\# = V_{IL}$ | Max | 15 | 15 | ns | |
| t_{GLQV} | Output enable LOW to output valid | $E\# = V_{IL}$ | Max | 15 | 15 | ns | |
| t_{GLQX} | Output enable LOW to output transition | $E = V_{IL}$ | Min | 0 | 0 | ns | |
| t_{LHAX} | Latch enable HIGH to address transition | $E\# = V_{IL}$ | Min | 5 | 5 | ns | |
| t_{LHLL} | Latch enable HIGH to latch enable LOW | | Min | 10 | 10 | ns | |
| t_{LLLH} | Latch enable LOW to latch enable HIGH | $E\# = V_{IL}$ | Min | 10 | 10 | ns | |
| t_{LLQV} | Latch enable LOW to output valid chip enable LOW to output valid | $E\# = V_{IL}, G\# = V_{IL}$ | Max | 45 | 55 | ns | |
| t_{LLQX} | Latch enable LOW to output transition | $E\# = V_{IL}, G\# = V_{IL}$ | Min | 0 | 0 | ns | |
| t_{ELQX} | Chip enable LOW to output transition | $L\# = V_{IL}, G\# = V_{IL}$ | Min | 0 | 0 | ns | |
| t_{AVLH} | Address valid to latch enable LOW | | Min | 10 | 10 | ns | |
| t_{ELLH} | Chip enable LOW to latch enable HIGH | | Min | 10 | 10 | ns | |

Note: 1. Output enable G# may be delayed up to $t_{ELQV} - t_{GLQV}$ after the falling edge of chip enable E# without increasing t_{ELQV} .

Asynchronous Page Read AC Characteristics

Figure 21: Asynchronous Page Read AC Waveforms

Table 29: Asynchronous Page Read AC Characteristics

| Symbol | Parameter | Test Conditions | Max/Min | M58BWxxF | | Unit |
|-------------|---|------------------------------|---------|----------|------|------|
| | | | | 45ns | 55ns | |
| t_{AVQV1} | Address valid to output valid | $E\# = V_{IL}, G\# = V_{IL}$ | Max | 25 | 25 | ns |
| t_{AXQX} | Address transition to output transition | $E\# = V_{IL}, G\# = V_{IL}$ | Min | 0 | 0 | ns |

Note: 1. For other timings see the Asynchronous Bus Read AC characteristics table.

Asynchronous Write AC Characteristics

Figure 22: Asynchronous Write E# - Controlled AC Waveforms

Table 30: Asynchronous Write E# - Controlled AC Characteristics

| Symbol | Parameter | Test condition | Max/Min | M58BWxxF | | Unit |
|--------------------|---|----------------------|---------|----------|------|------|
| | | | | 45ns | 55ns | |
| t _{AVAV} | Address valid to address valid | | Min | 45 | 55 | ns |
| t _{AVEH} | Address valid to chip enable HIGH | | Min | 25 | 30 | ns |
| t _{EHAX} | Chip enable HIGH to address transition | | Min | 0 | 0 | ns |
| t _{ELEH} | Chip enable LOW to chip enable HIGH | W# = V _{IL} | Min | 25 | 30 | ns |

| t_{WHEH} | Write enable HIGH to chip enable HIGH | | Min | 0 | 0 | ns |
| t_{WHGL} | Write enable HIGH to output enable LOW | | Min | 150 | 150 | ns |
| t_{ELQV} | Chip enable LOW to output valid | $G\# = V_{IL}$ | Max | 45 | 55 | ns |
| t_{VPHWH} | PEN HIGH to write enable HIGH | | Min | 0 | 0 | ns |

Synchronous Burst Read AC Characteristics

Figure 24: Synchronous Burst Read, Latch Enable Controlled (data valid from 'n' clock rising edge)

Figure 25: Synchronous Burst Read, Chip Enable Controlled (data valid from 'n' clock rising edge)

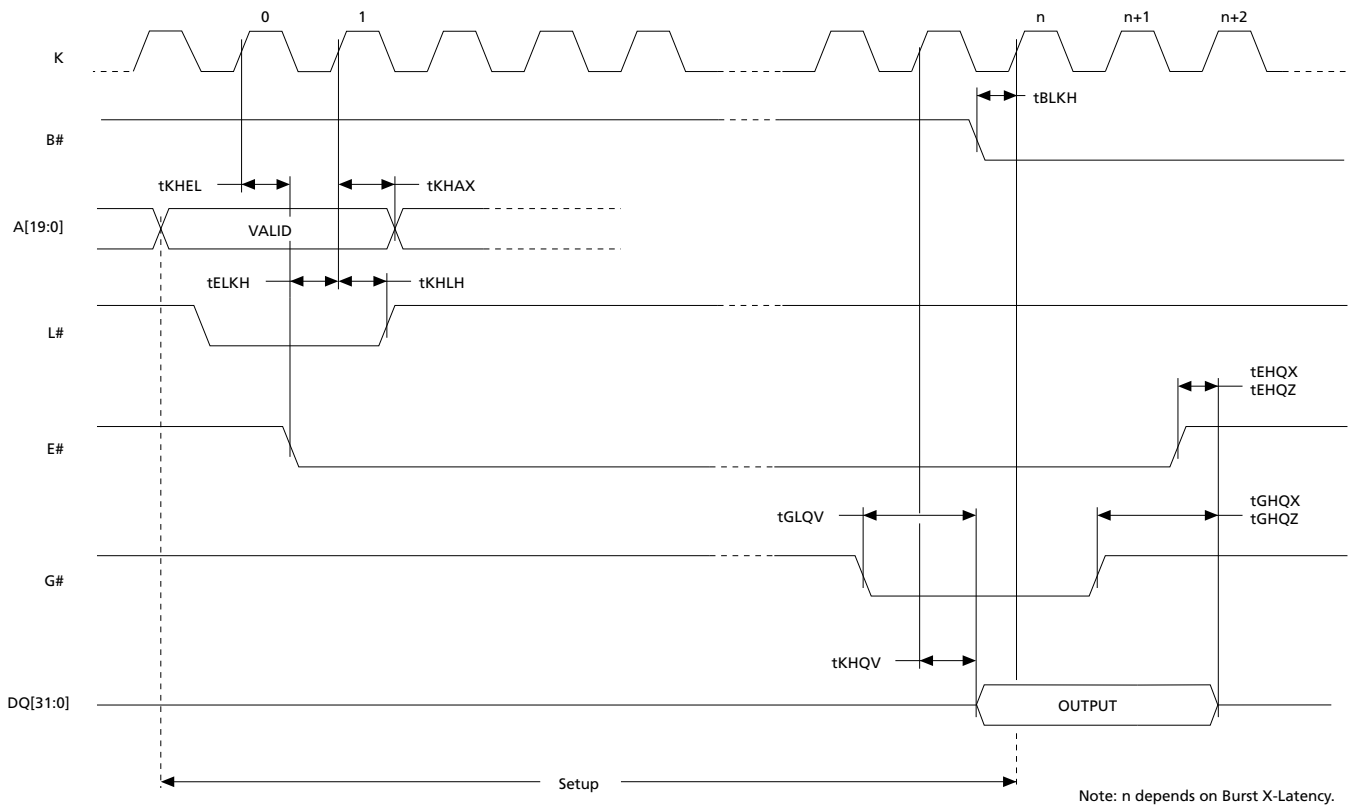

Figure 26: Synchronous Burst Read, Valid Address Transition Controlled (data valid from 'n' clock rising edge)

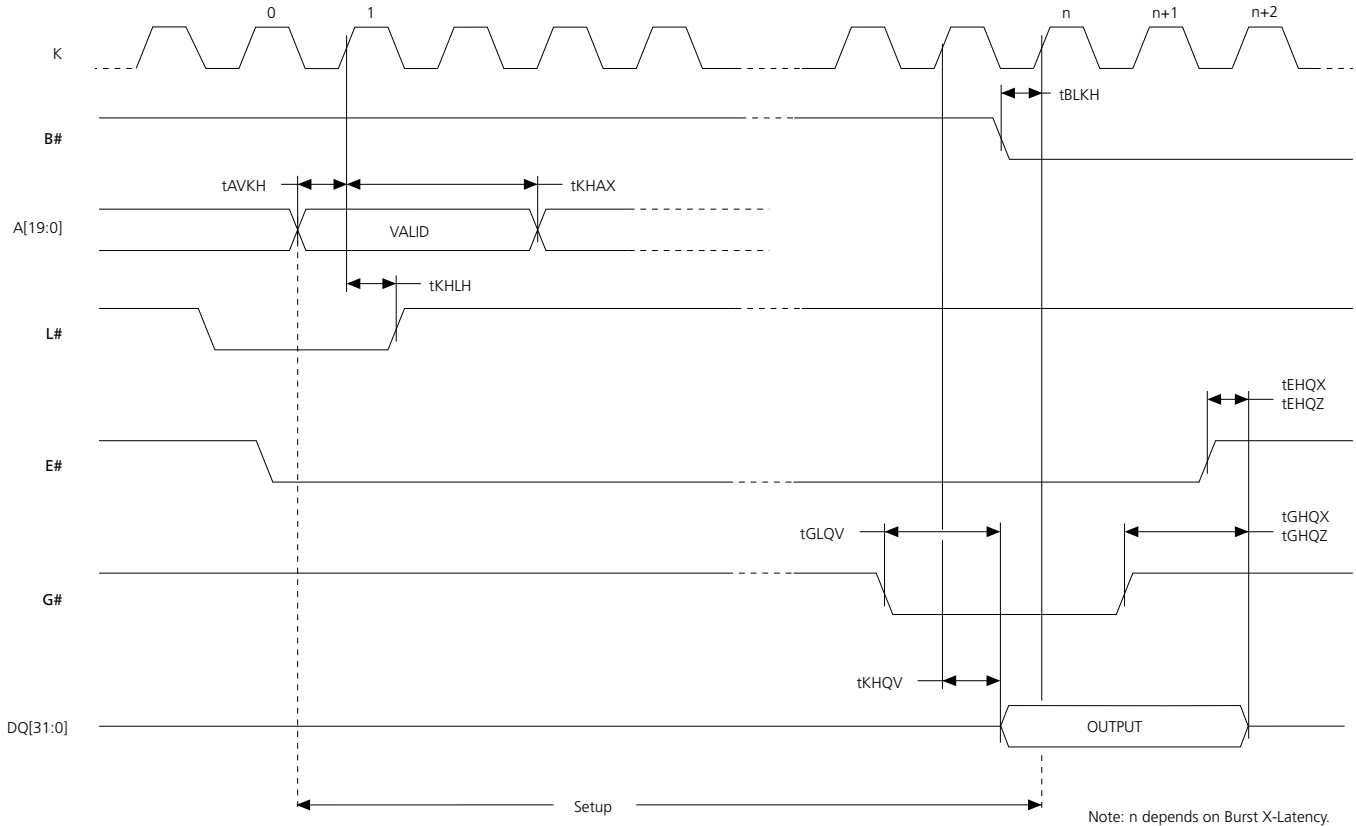

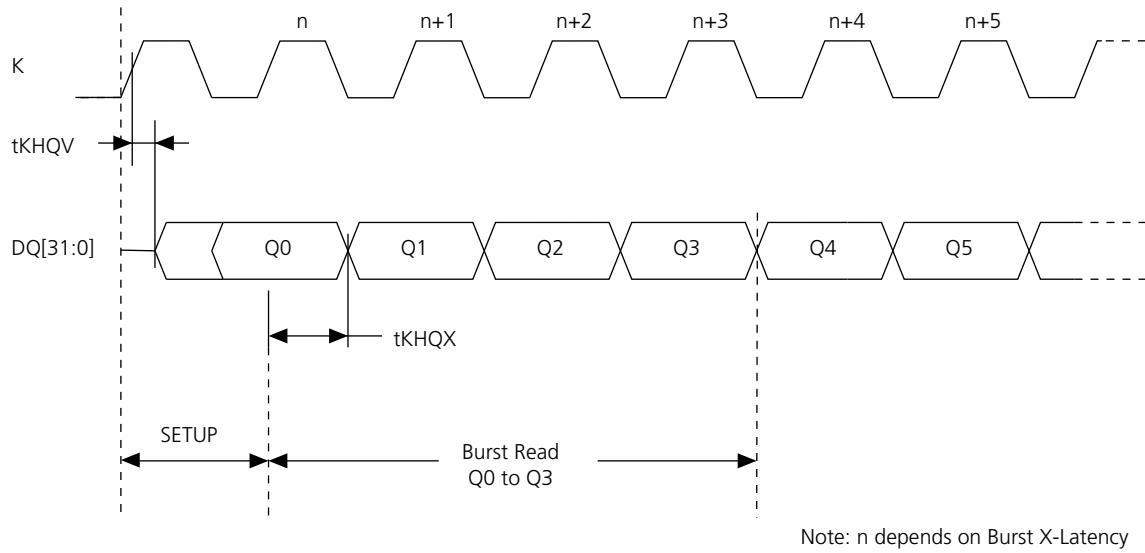

Figure 27: Synchronous Burst Read (data valid from 'n' clock rising edge)

Note: 1. For set up signals and timings see Synchronous Burst Read.

Figure 28: Synchronous Burst Read (valid data ready output)

- Notes: 1. Valid Data Ready = Valid Low during valid clock edge.
- 2. V= Valid output.
- 3. The internal timing of R follows DQ.

Figure 29: Synchronous Burst Read (Burst Address Advance)

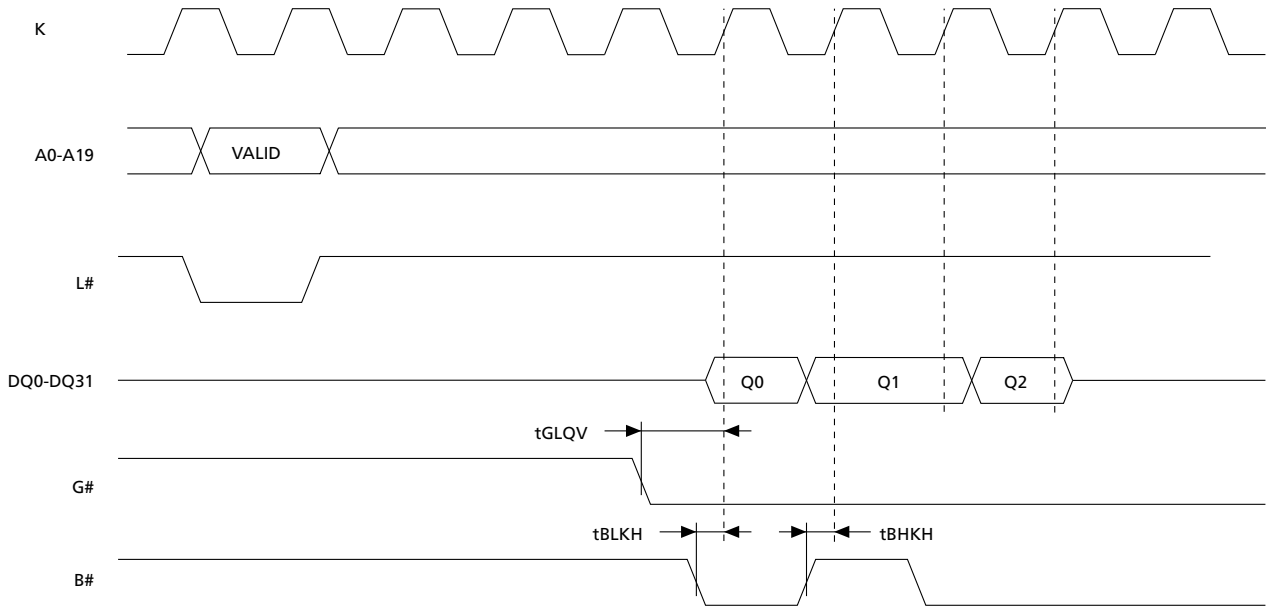

Figure 30: Clock Input AC waveform

Table 32: Synchronous Burst Read AC Characteristics

Notes apply to the entire table.

| Symbol | Parameter | Test condition | Max/Min | M58BWxxF | | Unit | |
|-------------------|--|---|----------|----------|------|------|----|
| | | | | 45ns | 55ns | | |
| f | Clock frequency | X-Latency = 3 | Max | 40 | 33 | MHz | |
| | | X-Latency = 4 | Max | 56 | 40 | MHz | |
| | | X-Latency = 5 or 6 | Max | 75 | 56 | MHz | |
| t _{AVKH} | Address valid to valid clock edge | E# = V _{IL} , L# = V _{IL} X-Latency = 3 | Min | 12 | 13 | ns | |
| | | E# = V _{IL} , L# = V _{IL} X-Latency = 4, 5, or 6 | Min | 6 | 7 | ns | |
| t _{KHKL} | Clock HIGH time | | Min | 6 | 6 | ns | |
| t _{KLKH} | Clock LOW time | | Min | 6 | 6 | ns | |
| t _{BHKH} | Burst address advance HIGH to valid clock edge | E# = V _{IL} , G# = V _{IL} , L# = V _{IH} | Min | 8 | 8 | ns | |
| t _{BLKH} | Burst address advance LOW to valid clock edge | E# = V _{IL} , G# = V _{IL} , L# = V _{IH} | Min | 8 | 8 | ns | |
| t _{ELKH} | Chip enable LOW to valid clock edge | L# = V _{IL} X-Latency = 3 | Min | 12 | 13 | ns | |
| | | L# = V _{IL} X-Latency = 4, 5, or 6 | Min | 6 | 7 | ns | |
| t _{GLQV} | Output enable LOW to output valid | E# = V _{IL} , L# = V _{IH} | Max | 15 | 15 | ns | |
| t _{KHAX} | Valid clock edge to address transition | E# = V _{IL} | Min | 5 | 5 | ns | |
| t _{KHEL} | Valid clock edge to chip enable LOW | L# = V _{IL} | Min | 0 | 0 | ns | |
| t _{KHLL} | Valid clock edge to latch enable LOW | E# = V _{IL} | Min | 0 | 0 | ns | |
| t _{KHLH} | Valid clock edge to latch enable HIGH | E# = V _{IL} | Min | 0 | 0 | ns | |
| t _{KHQX} | Valid clock edge to output transition | E# = V _{IL} , G# = V _{IL} , L# = V _{IH} | Min | 2 | 2 | ns | |
| t _{LLKH} | Latch enable LOW to valid clock edge | E# = V _{IL} X-Latency = 3 | Min | 12 | 13 | ns | |
| | | E# = V _{IL} X-Latency = 4, 5, or 6 | M58BW16F | Min | 6 | 5 | ns |
| | | | M58BW32F | Min | 6 | 7 | ns |
| t _{RLKH} | Valid data ready LOW to valid clock edge | E# = V _{IL} , G# = V _{IL} , L = V _{IH} | Min | 6 | 6 | ns | |
| t _{KHQV} | Valid clock edge to output valid | E# = V _{IL} , G# = V _{IL} , L# = V _{IH} | Max | 8 | 8 | ns | |

- Notes: 1. Data output should be read on the valid clock edge.
2. For other timings, see the Asynchronous Bus Read AC characteristics table.

AC and DC Power Characteristics

Figure 31: Power Supply Slope Specification

Table 33: Power Supply AC and DC Characteristics

| Symbol | Description | Min | Max | Unit |
|-----------|---|-------------|--------|---------|
| V_{DH} | Minimum value of power supply (V_{DD}) ¹ | $0.9V_{DD}$ | | V |
| V_{DHH} | Maximum value of power supply (V_{DD}) | | 3.6 | V |
| t_{VDH} | Time required from power supply to reach the V_{DH} value | 50 | 50,000 | μs |

Note: 1. This threshold is 90% of the minimum value allowed to V_{DD} .

Figure 32: Reset, Power-down, and Power-up AC Waveforms - Control Pins LOW

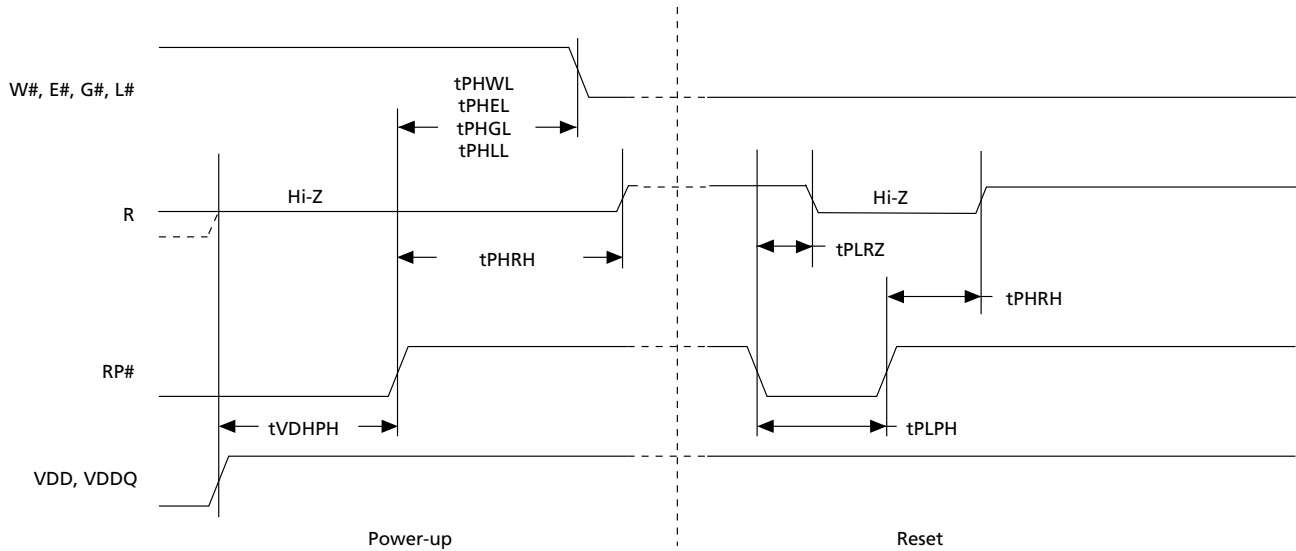

Figure 33: Reset, Power-down, and Power-up AC Waveforms - Control Pins Toggling

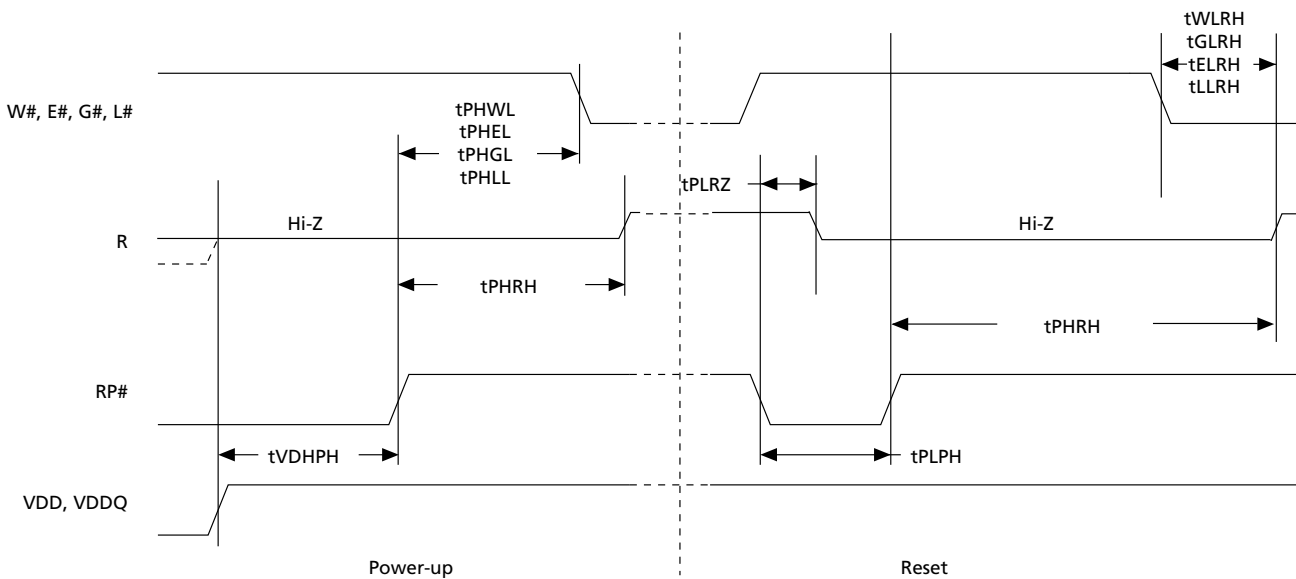

Table 34: Reset, Power-Down, and Power-Up AC Characteristics

| Symbol | Parameter | Min | Max | Unit |
|--------------|---|-----|-----|---------|
| t_{PHEL} | Reset/Power-down HIGH to chip enable LOW | 50 | | ns |
| t_{PPLL} | Reset/Power-down HIGH to latch enable LOW | 50 | | ns |
| t_{PHQV}^1 | Reset/Power-down HIGH to output valid | | 95 | ns |
| t_{PHWL} | Reset/Power-down HIGH to write enable LOW | 50 | | ns |
| t_{PHGL} | Reset/Power-down HIGH to output enable LOW | 50 | | ns |
| t_{PLPH} | Reset/Power-down LOW to reset/power-down HIGH | 100 | | ns |
| t_{PHRH}^1 | Reset/Power-down HIGH to valid data (Flash) ready HIGH | | 95 | ns |
| t_{VDPH} | Supply voltages HIGH to reset/power-down HIGH | 50 | | μ s |
| t_{PLRZ} | Reset/Power-down LOW to data ready (Flash) HIGH impedance | | 80 | ns |
| t_{WLRH} | Write enable LOW to data ready (Flash) HIGH impedance | | 80 | ns |
| t_{GLRH} | Output enable LOW to data ready HIGH impedance | | 80 | ns |
| t_{ELRH} | Chip enable LOW to data ready (Flash) HIGH impedance | | 80 | ns |
| t_{LLRH} | Latch enable LOW to data ready (Flash) HIGH impedance | | 80 | ns |

Note: 1. This time is $t_{PHEL} + t_{AVQV}$ or $t_{PHEL} + t_{ELQV}$.

Note: 1. All dimensions are in millimeters. Drawing is not to scale.

Revision History

Rev. D – 6/18

- Added Important Notes and Warnings section for further clarification aligning to industry standards

Rev. C – 5/16

- Updated Burst Configuration Register table in Bus Operations section

Rev. B – 12/15

- Updated DC Characteristics table

Rev. A – 1/13

- Micron rebrand initial release

8000 S. Federal Way, P.O. Box 6, Boise, ID 83707-0006, Tel: 208-368-4000
