

Micron Serial NOR Flash Memory

3V, Multiple I/O, 4KB Sector Erase

N25Q256A

Features

- SPI-compatible serial bus interface
- Double transfer rate (DTR) mode
- 2.7–3.6V single supply voltage
- 108 MHz (MAX) clock frequency supported for all protocols in single transfer rate (STR) mode
- 54 MHz (MAX) clock frequency supported for all protocols in DTR mode
- Dual/quad I/O instruction provides increased throughput up to 54 MB/s
- Supported protocols
 - Extended SPI, dual I/O, and quad I/O
 - DTR mode supported on all
- Execute-in-place (XIP) mode for all three protocols
 - Configurable via volatile or nonvolatile registers
 - Enables memory to work in XIP mode directly after power-on
- PROGRAM/ERASE SUSPEND operations
- Continuous read of entire memory via a single command
 - Fast read
 - Quad or dual output fast read
 - Quad or dual I/O fast read
- Flexible to fit application
 - Configurable number of dummy cycles
 - Output buffer configurable
- Software reset
- 3-byte and 4-byte addressability mode supported
- 64-byte, user-lockable, one-time programmable (OTP) dedicated area
- An additional reset pin is available on the following devices
 - N25Q256A83ESF40x, N25Q256A83E1240x, N25Q256A83ESFA0F
- Erase capability
 - Subsector erase 4KB uniform granularity blocks
 - Sector erase 64KB uniform granularity blocks
 - Full-chip erase
- Write protection
 - Software write protection applicable to every 64KB sector via volatile lock bit
 - Hardware write protection: protected area size defined by five nonvolatile bits (BP0, BP1, BP2, BP3, and TB)
 - Additional smart protections, available upon request
- Electronic signature
 - JEDEC-standard 2-byte signature (BA19h)
 - Unique ID of 17 read-only bytes including: additional extended device ID (EDID) to identify device factory options; customized factory data
- Minimum 100,000 ERASE cycles per sector
- More than 20 years data retention
- Packages JEDEC standard, all RoHS compliant
 - V-PDFN-8/8mm x 6mm (also known as SON, DFPN, MLP, MLF)
 - SOP2-16/300mils (also known as SO16W, SO16-Wide, SOIC-16)
 - T-PBGA-24b05/6mm x 8mm (also known as TBGA24)

Important Notes and Warnings

Micron Technology, Inc. ("Micron") reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions. This document supersedes and replaces all information supplied prior to the publication hereof. You may not rely on any information set forth in this document if you obtain the product described herein from any unauthorized distributor or other source not authorized by Micron.

Automotive Applications. Products are not designed or intended for use in automotive applications unless specifically designated by Micron as automotive-grade by their respective data sheets. Distributor and customer/distributor shall assume the sole risk and liability for and shall indemnify and hold Micron harmless against all claims, costs, damages, and expenses and reasonable attorneys' fees arising out of, directly or indirectly, any claim of product liability, personal injury, death, or property damage resulting directly or indirectly from any use of non-automotive-grade products in automotive applications. Customer/distributor shall ensure that the terms and conditions of sale between customer/distributor and any customer of distributor/customer (1) state that Micron products are not designed or intended for use in automotive applications unless specifically designated by Micron as automotive-grade by their respective data sheets and (2) require such customer of distributor/customer to indemnify and hold Micron harmless against all claims, costs, damages, and expenses and reasonable attorneys' fees arising out of, directly or indirectly, any claim of product liability, personal injury, death, or property damage resulting from any use of non-automotive-grade products in automotive applications.

Critical Applications. Products are not authorized for use in applications in which failure of the Micron component could result, directly or indirectly in death, personal injury, or severe property or environmental damage ("Critical Applications"). Customer must protect against death, personal injury, and severe property and environmental damage by incorporating safety design measures into customer's applications to ensure that failure of the Micron component will not result in such harms. Should customer or distributor purchase, use, or sell any Micron component for any critical application, customer and distributor shall indemnify and hold harmless Micron and its subsidiaries, subcontractors, and affiliates and the directors, officers, and employees of each against all claims, costs, damages, and expenses and reasonable attorneys' fees arising out of, directly or indirectly, any claim of product liability, personal injury, or death arising in any way out of such critical application, whether or not Micron or its subsidiaries, subcontractors, or affiliates were negligent in the design, manufacture, or warning of the Micron product.

Customer Responsibility. Customers are responsible for the design, manufacture, and operation of their systems, applications, and products using Micron products. ALL SEMICONDUCTOR PRODUCTS HAVE INHERENT FAILURE RATES AND LIMITED USEFUL LIVES. IT IS THE CUSTOMER'S SOLE RESPONSIBILITY TO DETERMINE WHETHER THE MICRON PRODUCT IS SUITABLE AND FIT FOR THE CUSTOMER'S SYSTEM, APPLICATION, OR PRODUCT. Customers must ensure that adequate design, manufacturing, and operating safeguards are included in customer's applications and products to eliminate the risk that personal injury, death, or severe property or environmental damages will result from failure of any semiconductor component.

Limited Warranty. In no event shall Micron be liable for any indirect, incidental, punitive, special or consequential damages (including without limitation lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort, warranty, breach of contract or other legal theory, unless explicitly stated in a written agreement executed by Micron's duly authorized representative.

Device Description

The N25Q is the first high-performance multiple input/output serial Flash memory device manufactured on 65nm NOR technology. It features execute-in-place (XIP) functionality, advanced write protection mechanisms, and a high-speed SPI-compatible bus interface. The innovative, high-performance, dual and quad input/output instructions enable double or quadruple the transfer bandwidth for READ and PROGRAM operations.

Features

The memory is organized as 512 (64KB) main sectors that are further divided into 16 subsectors each (8192 subsectors in total). The memory can be erased one 4KB subsector at a time, 64KB sectors at a time, or as a whole.

The memory can be write protected by software through volatile and nonvolatile protection features, depending on the application needs. The protection granularity is of 64KB (sector granularity) for volatile protections

The device has 64 one-time programmable (OTP) bytes that can be read and programmed with the READ OTP and PROGRAM OTP commands. These 64 bytes can also be permanently locked with a PROGRAM OTP command.

The device also has the ability to pause and resume PROGRAM and ERASE cycles by using dedicated PROGRAM/ERASE SUSPEND and RESUME instructions.

3-Byte Address and 4-Byte Address Modes

The device features 3-byte or 4-byte address modes to access memory beyond 128Mb.

When 4-byte address mode is enabled, all commands requiring an address must be entered and exited with a 4-byte address mode command: ENTER 4-BYTE ADDRESS MODE command and EXIT 4-BYTE ADDRESS MODE command. The 4-byte address mode can also be enabled through the nonvolatile configuration register. See Registers for more information.

Operating Protocols

The memory can be operated with three different protocols:

- Extended SPI (standard SPI protocol upgraded with dual and quad operations)
- Dual I/O SPI
- Quad I/O SPI

The standard SPI protocol is extended and enhanced by dual and quad operations. In addition, the dual SPI and quad SPI protocols improve the data access time and throughput of a single I/O device by transmitting commands, addresses, and data across two or four data lines.

Each protocol contains unique commands to perform READ operations in DTR mode. This enables high data throughput while running at lower clock frequencies.

XIP Mode

XIP mode requires only an address (no instruction) to output data, improving random access time and eliminating the need to shadow code onto RAM for fast execution.

All protocols support XIP operation. For flexibility, multiple XIP entry and exit methods are available. For applications that must enter XIP mode immediately after powering up, XIP mode can be set as the default mode through the nonvolatile configuration register bits.

Device Configurability

The N25Q family offers additional features that are configured through the nonvolatile configuration register for default and/or nonvolatile settings. Volatile settings can be configured through the volatile and volatile-enhanced configuration registers. These configurable features include the following:

- Number of dummy cycles for the fast READ commands
- Output buffer impedance
- SPI protocol types (extended SPI, DIO-SPI, or QIO-SPI)
- Required XIP mode
- Enabling/disabling HOLD (RESET function)
- Enabling/disabling wrap mode

Figure 1: Logic Diagram

Note: 1. Reset functionality is available in devices with a dedicated part number. See Part Number Ordering Information for more details.

Signal Assignments

Figure 2: 8-Lead, VDFPN8 – MLP8 (Top View)

- Notes:
1. On the underside of the MLP8 package, there is an exposed central pad that is pulled internally to V_{SS} and must not be connected to any other voltage or signal line on the PCB.
 2. Reset functionality is available in devices with a dedicated part number. See Part Number Ordering Information for complete package names and details.

Figure 3: 16-Lead, Plastic Small Outline – SO16 (Top View)

- Notes:
1. Reset functionality is available in devices with a dedicated part number. See Part Number Ordering Information for complete package names and details.
 2. Pin 3 is DNU, except for the N25Q256A83ESF40x and N25Q256A83ESFA0F devices, where it is used as RESET.

Figure 4: 24-Ball TBGA (Balls Down)

- Notes:
1. See Part Number Ordering Information for complete package names and details.
 2. Ball A4 is NC, except for the N25Q256A83E1240x device, where it is used as RESET.

Signal Descriptions

The signal description table below is a comprehensive list of signals for the N25 family devices. All signals listed may not be supported on this device. See Signal Assignments for information specific to this device.

Table 1: Signal Descriptions

| Symbol | Type | Description |
|--------|----------------|--|
| C | Input | Clock: Provides the timing of the serial interface. Commands, addresses, or data present at serial data inputs are latched on the rising edge of the clock. Data is shifted out on the falling edge of the clock. |
| S# | Input | Chip select: When S# is HIGH, the device is deselected and DQ1 is at High-Z. When in extended SPI mode, with the device deselected, DQ1 is tri-stated. Unless an internal PROGRAM, ERASE, or WRITE STATUS REGISTER cycle is in progress, the device enters standby power mode (not deep power-down mode). Driving S# LOW enables the device, placing it in the active power mode. After power-up, a falling edge on S# is required prior to the start of any command. |
| DQ0 | Input and I/O | Serial data: Transfers data serially into the device. It receives command codes, addresses, and the data to be programmed. Values are latched on the rising edge of the clock. DQ0 is used for input/output during the following operations: DUAL OUTPUT FAST READ, QUAD OUTPUT FAST READ, DUAL INPUT/OUTPUT FAST READ, and QUAD INPUT/OUTPUT FAST READ. When used for output, data is shifted out on the falling edge of the clock. In DIO-SPI, DQ0 always acts as an input/output. In QIO-SPI, DQ0 always acts as an input/output, with the exception of the PROGRAM or ERASE cycle performed with V _{pp} . The device temporarily enters the extended SPI protocol and then returns to QIO-SPI as soon as V _{pp} goes LOW. |
| DQ1 | Output and I/O | Serial data: Transfers data serially out of the device. Data is shifted out on the falling edge of the clock. DQ1 is used for input/output during the following operations: DUAL INPUT FAST PROGRAM, QUAD INPUT FAST PROGRAM, DUAL INPUT EXTENDED FAST PROGRAM, and QUAD INPUT EXTENDED FAST PROGRAM. When used for input, data is latched on the rising edge of the clock. In DIO-SPI, DQ1 always acts as an input/output. In QIO-SPI, DQ1 always acts as an input/output, with the exception of the PROGRAM or ERASE cycle performed with the enhanced program supply voltage (V _{pp}). In this case the device temporarily enters the extended SPI protocol and then returns to QIO-SPI as soon as V _{pp} goes LOW. |
| DQ2 | Input and I/O | DQ2: When in QIO-SPI mode or in extended SPI mode using QUAD FAST READ commands, the signal functions as DQ2, providing input/output. All data input drivers are always enabled except when used as an output. Micron recommends customers drive the data signals normally (to avoid unnecessary switching current) and float the signals before the memory device drives data on them. |
| DQ3 | Input and I/O | DQ3: When in quad SPI mode or in extended SPI mode using quad FAST READ commands, the signal functions as DQ3, providing input/output. HOLD# is disabled and RESET# is disabled if the device is selected. |
| RESET# | Control Input | RESET: This is a hardware RESET# signal. When RESET# is driven HIGH, the memory is in the normal operating mode. When RESET# is driven LOW, the memory enters reset mode and output is High-Z. If RESET# is driven LOW while an internal WRITE, PROGRAM, or ERASE operation is in progress, data may be lost. |

Table 1: Signal Descriptions (Continued)

| Symbol | Type | Description |
|----------|---------------|---|
| HOLD# | Control Input | <p>HOLD: Pauses any serial communications with the device without deselecting the device. DQ1 (output) is High-Z. DQ0 (input) and the clock are "Don't Care." To enable HOLD, the device must be selected with S# driven LOW.</p> <p>HOLD# is used for input/output during the following operations: QUAD OUTPUT FAST READ, QUAD INPUT/OUTPUT FAST READ, QUAD INPUT FAST PROGRAM, and QUAD INPUT EXTENDED FAST PROGRAM.</p> <p>In QIO-SPI, HOLD# acts as an I/O (DQ3 functionality), and the HOLD# functionality is disabled when the device is selected. When the device is deselected (S# is HIGH) in parts with RESET# functionality, it is possible to reset the device unless this functionality is not disabled by means of dedicated registers bits.</p> <p>The HOLD# functionality can be disabled using bit 4 of the NVCR or bit 4 of the VECR.</p> <p>On devices that include DTR mode capability, the HOLD# functionality is disabled as soon as a DTR operation is recognized.</p> |
| W# | Control Input | <p>Write protect: W# can be used as a protection control input or in QIO-SPI operations. When in extended SPI with single or dual commands, the WRITE PROTECT function is selectable by the voltage range applied to the signal. If voltage range is low (0V to V_{CC}), the signal acts as a write protection control input. The memory size protected against PROGRAM or ERASE operations is locked as specified in the status register block protect bits 3:0.</p> <p>W# is used as an input/output (DQ2 functionality) during QUAD INPUT FAST READ and QUAD INPUT/OUTPUT FAST READ operations and in QIO-SPI.</p> |
| V_{PP} | Power | <p>Supply voltage: If V_{PP} is in the voltage range of V_{PPH}, the signal acts as an additional power supply, as defined in the AC Measurement Conditions table.</p> <p>During QIFP, QIEFP, and QIO-SPI PROGRAM/ERASE operations, it is possible to use the additional V_{PP} power supply to speed up internal operations. However, to enable this functionality, it is necessary to set bit 3 of the VECR to 0.</p> <p>In this case, V_{PP} is used as an I/O until the end of the operation. After the last input data is shifted in, the application should apply V_{PP} voltage to V_{PP} within 200ms to speed up the internal operations. If the V_{PP} voltage is not applied within 200ms, the PROGRAM/ERASE operations start at standard speed.</p> <p>The default value of VECR bit 3 is 1, and the V_{PP} functionality for quad I/O modify operations is disabled.</p> |
| V_{CC} | Power | Device core power supply: Source voltage. |
| V_{SS} | Ground | Ground: Reference for the V_{CC} supply voltage. |
| DNU | – | Do not use. |
| NC | – | No connect. |

Memory Organization

Memory Configuration and Block Diagram

Each page of memory can be individually programmed. Bits are programmed from one through zero. The device is subsector, sector, or bulk-erasable, but not page-erasable. Bits are erased from zero through one. The memory is configured as 33,554,432 bytes (8 bits each); 512 sectors (64KB each); 8192 subsectors (4KB each); and 131,072 pages (256 bytes each); and 64 OTP bytes are located outside the main memory array.

Figure 5: Block Diagram

Memory Map – 256Mb Density

Table 2: Sectors[511:0]

| Sector | Subsector | Address Range | |
|--------|-----------|---------------|------------|
| | | Start | End |
| 511 | 8191 | 01FF F000h | 01FF FFFFh |
| | ⋮ | ⋮ | ⋮ |

| | 0 | 0000 0000h | 0000 0FFFh |

Device Protection

Table 3: Data Protection using Device Protocols

Note 1 applies to the entire table

| Protection by: | Description |
|-----------------------------------|--|
| Power-on reset and internal timer | Protects the device against inadvertent data changes while the power supply is outside the operating specification. |
| Command execution check | Ensures that the number of clock pulses is a multiple of one byte before executing a PROGRAM or ERASE command, or any command that writes to the device registers. |
| WRITE ENABLE operation | Ensures that commands modifying device data must be preceded by a WRITE ENABLE command, which sets the write enable latch bit in the status register. |

Note: 1. Extended, dual, and quad SPI protocol functionality ensures that device data is protected from excessive noise.

Table 4: Memory Sector Protection Truth Table

Note 1 applies to the entire table

| Sector Lock Register | | Memory Sector Protection Status |
|----------------------|-----------------------|--|
| Sector Lock Down Bit | Sector Write Lock Bit | |
| 0 | 0 | Sector unprotected from PROGRAM and ERASE operations. Protection status reversible. |
| 0 | 1 | Sector protected from PROGRAM and ERASE operations. Protection status reversible. |
| 1 | 0 | Sector unprotected from PROGRAM and ERASE operations. Protection status not reversible except by power cycle or reset. |
| 1 | 1 | Sector protected from PROGRAM and ERASE operations. Protection status not reversible except by power cycle or reset. |

Note: 1. Sector lock register bits are written to when the WRITE LOCK REGISTER command is executed. The command will not execute unless the sector lock down bit is cleared (see the WRITE LOCK REGISTER command). The sector lock register is programmed to have all protection registers activated at power-up.

Block Protection Areas

Table 5: Protected Area Sizes – Upper Area

Note 1 applies to the entire table

| Status Register Content | | | | | Memory Content | |
|-------------------------|-----|-----|-----|-----|----------------------|--------------------|
| Top/ Bottom Bit | BP3 | BP2 | BP1 | BP0 | Protected Area | Unprotected Area |
| 0 | 0 | 0 | 0 | 0 | None | All sectors |
| 0 | 0 | 0 | 0 | 1 | Sector 511 | Sectors (0 to 510) |
| 0 | 0 | 0 | 1 | 0 | Sectors (510 to 511) | Sectors (0 to 509) |
| 0 | 0 | 0 | 1 | 1 | Sectors (508 to 511) | Sectors (0 to 507) |
| 0 | 0 | 1 | 0 | 0 | Sectors (504 to 511) | Sectors (0 to 503) |
| 0 | 0 | 1 | 0 | 1 | Sectors (496 to 511) | Sectors (0 to 495) |
| 0 | 0 | 1 | 1 | 0 | Sectors (480 to 511) | Sectors (0 to 479) |
| 0 | 0 | 1 | 1 | 1 | Sectors (448 to 511) | Sectors (0 to 447) |
| 0 | 1 | 0 | 0 | 0 | Sectors (384 to 511) | Sectors (0 to 383) |
| 0 | 1 | 0 | 0 | 1 | Sectors (256 to 511) | Sectors (0 to 255) |
| 0 | 1 | 0 | 1 | 0 | All sectors | None |
| 0 | 1 | 0 | 1 | 1 | All sectors | None |
| 0 | 1 | 1 | 0 | 0 | All sectors | None |
| 0 | 1 | 1 | 0 | 1 | All sectors | None |
| 0 | 1 | 1 | 1 | 0 | All sectors | None |
| 0 | 1 | 1 | 1 | 1 | All sectors | None |

Note: 1. See the Status Register for details on the top/bottom bit and the BP 3:0 bits.

Table 6: Protected Area Sizes – Lower Area

Note 1 applies to the entire table

| Status Register Content | | | | | Memory Content | |
|-------------------------|-----|-----|-----|-----|--------------------|----------------------|
| Top/ Bottom Bit | BP3 | BP2 | BP1 | BP0 | Protected Area | Unprotected Area |
| 1 | 0 | 0 | 0 | 0 | None | All sectors |
| 1 | 0 | 0 | 0 | 1 | Sector 0 | Sectors (1 to 511) |
| 1 | 0 | 0 | 1 | 0 | Sectors (0 to 1) | Sectors (2 to 511) |
| 1 | 0 | 0 | 1 | 1 | Sectors (0 to 3) | Sectors (4 to 511) |
| 1 | 0 | 1 | 0 | 0 | Sectors (0 to 7) | Sectors (8 to 511) |
| 1 | 0 | 1 | 0 | 1 | Sectors (0 to 15) | Sectors (16 to 511) |
| 1 | 0 | 1 | 1 | 0 | Sectors (0 to 31) | Sectors (32 to 511) |
| 1 | 0 | 1 | 1 | 1 | Sectors (0 to 63) | Sectors (64 to 511) |
| 1 | 1 | 0 | 0 | 0 | Sectors (0 to 127) | Sectors (128 to 511) |

Table 6: Protected Area Sizes – Lower Area (Continued)

Note 1 applies to the entire table

| Status Register Content | | | | | Memory Content | |
|-------------------------|-----|-----|-----|-----|--------------------|----------------------|
| Top/ Bottom Bit | BP3 | BP2 | BP1 | BP0 | Protected Area | Unprotected Area |

| 1 | 1 | 1 | 1 | 0 | All sectors | None |
| 1 | 1 | 1 | 1 | 1 | All sectors | None |

Note: 1. See the Status Register for details on the top/bottom bit and the BP 3:0 bits.

Serial Peripheral Interface Modes

The device can be driven by a microcontroller while its serial peripheral interface is in either of the two modes shown here. The difference between the two modes is the clock polarity when the bus master is in standby mode and not transferring data. Input data is latched in on the rising edge of the clock, and output data is available from the falling edge of the clock.

Table 7: SPI Modes

Note 1 applies to the entire table

| SPI Modes | Clock Polarity |
|--------------------|---|
| CPOL = 0, CPHA = 0 | C remains at 0 for (CPOL = 0, CPHA = 0) |
| CPOL = 1, CPHA = 1 | C remains at 1 for (CPOL = 1, CPHA = 1) |

Note: 1. The listed SPI modes are supported in extended, dual, and quad SPI protocols.

Shown below is an example of three memory devices in extended SPI protocol in a simple connection to an MCU on an SPI bus. Because only one device is selected at a time, that one device drives DQ1, while the other devices are High-Z.

Resistors ensure the device is not selected if the bus master leaves S# High-Z. The bus master might enter a state in which all input/output is High-Z simultaneously, such as when the bus master is reset. Therefore, the serial clock must be connected to an external pull-down resistor so that S# is pulled HIGH while the serial clock is pulled LOW. This ensures that S# and the serial clock are not HIGH simultaneously and that ^tSHCH is met. The typical resistor value of 100kΩ, assuming that the time constant $R \times C_p$ (C_p = parasitic capacitance of the bus line), is shorter than the time the bus master leaves the SPI bus in High-Z.

Example: $C_p = 50\text{pF}$, that is $R \times C_p = 5\mu\text{s}$. The application must ensure that the bus master never leaves the SPI bus High-Z for a time period shorter than 5μs. W# and HOLD# should be driven either HIGH or LOW, as appropriate.

Figure 6: Bus Master and Memory Devices on the SPI Bus

Figure 7: SPI Modes

SPI Protocols

Table 8: Extended, Dual, and Quad SPI Protocols

| Protocol Name | Command Input | Address Input | Data Input/Output | Description |
|-------------------|---------------|--|--|---|
| Extended | DQ0 | Multiple DQ _n lines, depending on the command | Multiple DQ _n lines, depending on the command | Device default protocol from the factory. Additional commands extend the standard SPI protocol and enable address or data transmission on multiple DQ _n lines. |
| Dual | DQ[1:0] | DQ[1:0] | DQ[1:0] | <p>Volatile selectable: When the enhanced volatile configuration register bit 6 is set to 0 and bit 7 is set to 1, the device enters the dual SPI protocol immediately after the WRITE ENHANCED VOLATILE CONFIGURATION REGISTER command. The device returns to the default protocol after the next power-on. In addition, the device can return to default protocol using the rescue sequence or through new WRITE ENHANCED VOLATILE CONFIGURATION REGISTER command, without power-off or power-on.</p> <p>Nonvolatile selectable: When nonvolatile configuration register bit 2 is set, the device enters the dual SPI protocol after the next power-on. Once this register bit is set, the device defaults to the dual SPI protocol after all subsequent power-on sequences until the nonvolatile configuration register bit is reset to 1.</p> |
| Quad ¹ | DQ[3:0] | DQ[3:0] | DQ[3:0] | <p>Volatile selectable: When the enhanced volatile configuration register bit 7 is set to 0, the device enters the quad SPI protocol immediately after the WRITE ENHANCED VOLATILE CONFIGURATION REGISTER command. The device returns to the default protocol after the next power-on. In addition, the device can return to default protocol using the rescue sequence or through new WRITE ENHANCED VOLATILE CONFIGURATION REGISTER command, without power-off or power-on.</p> <p>Nonvolatile selectable: When nonvolatile configuration register bit 3 is set to 0, the device enters the quad SPI protocol after the next power-on. Once this register bit is set, the device defaults to the quad SPI protocol after all subsequent power-on sequences until the nonvolatile configuration register bit is reset to 1.</p> |

Note: 1. In quad SPI protocol, all command/address input and data I/O are transmitted on four lines except during a PROGRAM and ERASE cycle performed with V_{pp}. In this case, the device enters the extended SPI protocol to temporarily allow the application to perform a PROGRAM/ERASE SUSPEND operation or to check the write-in-progress bit in the status register or the program/erase controller bit in the flag status register. Then, when V_{pp} goes LOW, the device returns to the quad SPI protocol.

Nonvolatile and Volatile Registers

The device features the following volatile and nonvolatile registers that users can access to store device parameters and operating configurations:

- Status register
- Nonvolatile and volatile configuration registers
- Extended address register
- Enhanced volatile configuration register
- Flag status register
- Lock register

Note: The lock register is defined in READ LOCK REGISTER Command.

The working condition of memory is set by an internal configuration register that is not directly accessible to users. As shown below, parameters in the internal configuration register are loaded from the nonvolatile configuration register during each device boot phase or power-on reset. In this sense, then, the nonvolatile configuration register contains the default settings of memory.

Also, during the life of an application, each time a WRITE VOLATILE or ENHANCED VOLATILE CONFIGURATION REGISTER command executes to set configuration parameters in these respective registers, these new settings are copied to the internal configuration register. Therefore, memory settings can be changed in real time. However, at the next power-on reset, the memory boots according to the memory settings defined in the nonvolatile configuration register parameters.

Figure 8: Internal Configuration Register

Status Register

Table 9: Status Register Bit Definitions

Note 1 applies to entire table

| Bit | Name | Settings | Description | Notes |
|--------|--------------------------------------|--|---|-------|
| 7 | Status register write enable/disable | 0 = Enabled 1 = Disabled | Nonvolatile bit: Used with the W#/V _{pp} signal to enable or disable writing to the status register. | 3 |
| 5 | Top/bottom | 0 = Top 1 = Bottom | Nonvolatile bit: Determines whether the protected memory area defined by the block protect bits starts from the top or bottom of the memory array. | 4 |
| 6, 4:2 | Block protect 3–0 | See Protected Area Sizes – Upper Area and Lower Area tables in Device Protection | Nonvolatile bit: Defines memory to be software protected against PROGRAM or ERASE operations. When one or more block protect bits is set to 1, a designated memory area is protected from PROGRAM and ERASE operations. | 4 |
| 1 | Write enable latch | 0 = Cleared (Default) 1 = Set | Volatile bit: The device always powers up with this bit cleared to prevent inadvertent WRITE STATUS REGISTER, PROGRAM, or ERASE operations. To enable these operations, the WRITE ENABLE operation must be executed first to set this bit. | 2 |
| 0 | Write in progress | 0 = Ready 1 = Busy | Volatile bit: Indicates if one of the following command cycles is in progress: WRITE STATUS REGISTER WRITE NONVOLATILE CONFIGURATION REGISTER PROGRAM ERASE | 2 |

- Notes:
1. Bits can be read from or written to using READ STATUS REGISTER or WRITE STATUS REGISTER commands, respectively.
 2. Volatile bits are cleared to 0 by a power cycle or reset.
 3. The status register write enable/disable bit, combined with the W#/V_{pp} signal as described in the Signal Descriptions, provides hardware data protection for the device as follows: When the enable/disable bit is set to 1, and the W#/V_{pp} signal is driven LOW, the status register nonvolatile bits become read-only and the WRITE STATUS REGISTER operation will not execute. The only way to exit this hardware-protected mode is to drive W#/V_{pp} HIGH.
 4. See Protected Area Sizes tables. The BULK ERASE command is executed only if all bits are 0.

Nonvolatile and Volatile Configuration Registers

Table 10: Nonvolatile Configuration Register Bit Definitions

Note 1 applies to entire table

| Bit | Name | Settings | Description | Notes |
|-------|------------------------------|--|--|-------|
| 15:12 | Number of dummy clock cycles | 0000 (identical to 1111) 0001 0010 . . 1101 1110 1111 | Sets the number of dummy clock cycles subsequent to all FAST READ commands. The default setting targets the maximum allowed frequency and guarantees backward compatibility. | 2, 3 |
| 11:9 | XIP mode at power-on reset | 000 = XIP: Fast Read 001 = XIP: Dual Output Fast Read 010 = XIP: Dual I/O Fast Read 011 = XIP: Quad Output Fast Read 100 = XIP: Quad I/O Fast Read 101 = Reserved 110 = Reserved 111 = Disabled (Default) | Enables the device to operate in the selected XIP mode immediately after power-on reset. | |
| 8:6 | Output driver strength | 000 = Reserved 001 = 90 Ohms 010 = 60 Ohms 011 = 45 Ohms 100 = Reserved 101 = 20 Ohms 110 = 15 Ohms 111 = 30 (Default) | Optimizes impedance at $V_{CC}/2$ output voltage. | |
| 5 | Reserved | X | "Don't Care." | |
| 4 | Reset/hold | 0 = Disabled 1 = Enabled (Default) | Enables or disables hold or reset. (Available on dedicated part numbers.) | |
| 3 | Quad I/O protocol | 0 = Enabled 1 = Disabled (Default, Extended SPI protocol) | Enables or disables quad I/O protocol. | 4 |
| 2 | Dual I/O protocol | 0 = Enabled 1 = Disabled (Default, Extended SPI protocol) | Enables or disables dual I/O protocol. | 4 |
| 1 | 128Mb segment select | 0 = Upper 128Mb segment 1 = Lower 128Mb segment (Default) | Selects a 128Mb segment as default for 3B address operations. See also the extended address register. | |
| 0 | Address bytes | 0 = Enable 4B address 1 = Enable 3B address (Default) | Defines the number of address bytes for a command. | |

- Notes:
- Settings determine device memory configuration after power-on. The device ships from the factory with all bits erased to 1 (FFFFh). The register is read from or written to by READ NONVOLATILE CONFIGURATION REGISTER or WRITE NONVOLATILE CONFIGURATION REGISTER commands, respectively.
 - The 0000 and 1111 settings are identical in that they both define the default state, which is the maximum frequency of $f_c = 108$ MHz. This ensures backward compatibility.

3. If the number of dummy clock cycles is insufficient for the operating frequency, the memory reads wrong data. The number of cycles must be set according to and sufficient for the clock frequency, which varies by the type of FAST READ command, as shown in the Supported Clock Frequencies table.
4. If bits 2 and 3 are both set to 0, the device operates in quad I/O. When bits 2 or 3 are reset to 0, the device operates in quad I/O or dual I/O respectively, after the next power-on.

Table 11: Volatile Configuration Register Bit Definitions

Note 1 applies to entire table

| Bit | Name | Settings | Description | Notes |
|-----|------------------------------|--|--|-------|
| 7:4 | Number of dummy clock cycles | 0000 (identical to 1111) 0001 0010 . . 1101 1110 1111 | Sets the number of dummy clock cycles subsequent to all FAST READ commands. The default setting targets maximum allowed frequency and guarantees backward compatibility. | 2, 3 |
| 3 | XIP | 0 1 | Enables or disables XIP. For device part numbers with feature digit equal to 2 or 4, this bit is always "Don't Care," so the device operates in XIP mode without setting this bit. | |
| 2 | Reserved | x = Default | 0b = Fixed value. | |
| 1:0 | Wrap | 00 = 16-byte boundary aligned 01 = 32-byte boundary aligned 10 = 64-byte boundary aligned 11 = sequential (default) | 16-byte wrap: Output data wraps within an aligned 16-byte boundary starting from the 3-byte address issued after the command code. 32-byte wrap: Output data wraps within an aligned 32-byte boundary starting from the 3-byte address issued after the command code. 64-byte wrap: Output data wraps within an aligned 64-byte boundary starting from the 3-byte address issued after the command code. Continuous reading (default): All bytes are read sequentially. | 4 |

- Notes:
1. Settings determine the device memory configuration upon a change of those settings by the WRITE VOLATILE CONFIGURATION REGISTER command. The register is read from or written to by READ VOLATILE CONFIGURATION REGISTER or WRITE VOLATILE CONFIGURATION REGISTER commands respectively.
 2. The 0000 and 1111 settings are identical in that they both define the default state, which is the maximum frequency of $f_c = 108$ MHz. This ensures backward compatibility.
 3. If the number of dummy clock cycles is insufficient for the operating frequency, the memory reads wrong data. The number of cycles must be set according to and be sufficient for the clock frequency, which varies by the type of FAST READ command, as shown in the Supported Clock Frequencies table.
 4. See the Sequence of Bytes During Wrap table.

Table 12: Sequence of Bytes During Wrap

| Starting Address | 16-Byte Wrap | 32-Byte Wrap | 64-Byte Wrap |
|------------------|-----------------------------|-----------------------------|---------------------------|
| 0 | 0-1-2- ... -15-0-1- .. | 0-1-2- ... -31-0-1- .. | 0-1-2- ... -63-0-1- .. |
| 1 | 1-2- ... -15-0-1-2- .. | 1-2- ... -31-0-1-2- .. | 1-2- ... -63-0-1-2- .. |
| 15 | 15-0-1-2-3- ... -15-0-1- .. | 15-16-17- ... -31-0-1- .. | 15-16-17- ... -63-0-1- .. |
| 31 | 31-16-17- ... -31-16-17- .. | 31-0-1-2-3- ... -31-0-1- .. | 31-32-33- ... -63-0-1- .. |
| 63 | 63-48-49- ... -63-48-49- .. | 63-32-33- ... -63-32-33- .. | 63-0-1- ... -63-0-1- .. |

Table 13: Supported Clock Frequencies – STR

Note 1 applies to entire table

| Number of Dummy Clock Cycles | FAST READ | DUAL OUTPUT FAST READ | DUAL I/O FAST READ | QUAD OUTPUT FAST READ | QUAD I/O FAST READ |
|------------------------------|-----------|-----------------------|--------------------|-----------------------|--------------------|
| 1 | 90 | 80 | 50 | 43 | 30 |
| 2 | 100 | 90 | 70 | 60 | 40 |
| 3 | 108 | 100 | 80 | 75 | 50 |

| 5 | 108 | 108 | 100 | 100 | 70 |
| 6 | 108 | 108 | 105 | 105 | 80 |
| 7 | 108 | 108 | 108 | 108 | 86 |
| 8 | 108 | 108 | 108 | 108 | 95 |
| 9 | 108 | 108 | 108 | 108 | 105 |
| 10 | 108 | 108 | 108 | 108 | 108 |

Note: 1. Values are guaranteed by characterization and not 100% tested in production.

Table 14: Supported Clock Frequencies – DTR

| Number of Dummy Clock Cycles | FAST READ | DUAL OUTPUT FAST READ | DUAL I/O FAST READ | QUAD OUTPUT FAST READ | QUAD I/O FAST READ |
|------------------------------|-----------|-----------------------|--------------------|-----------------------|--------------------|
| 1 | 45 | 40 | 25 | 30 | 15 |
| 2 | 50 | 45 | 35 | 38 | 20 |
| 3 | 54 | 50 | 40 | 45 | 25 |
| 4 | 54 | 53 | 45 | 47 | 30 |
| 5 | 54 | 54 | 50 | 50 | 35 |
| 6 | 54 | 54 | 53 | 53 | 40 |
| 7 | 54 | 54 | 54 | 54 | 43 |
| 8 | 54 | 54 | 54 | 54 | 48 |
| 9 | 54 | 54 | 54 | 54 | 53 |
| 10 | 54 | 54 | 54 | 54 | 54 |

Extended Address Register

For devices whose A[MAX:MIN] equals A[23:0], the N25 family includes an extended address register that provides a fourth address byte A[31:24], enabling access to memory beyond 128Mb. Extended address register bit 0 is used to select the upper 128Mb segment or the lower 128Mb segment of the memory array.

Figure 9: Upper and Lower 128Mb Memory Array Segments

The PROGRAM and ERASE operations act upon the 128Mb segment selected in the extended address register.

The BULK ERASE operation erases the entire device.

The READ operation begins reading in the selected 128Mb segment, but is not bound by it. In a continuous READ, when the last byte of the segment is read, the next byte output is the first byte of the other segment as the operation wraps to 0000000h; Therefore, a download of the whole array is possible with one READ operation. The value of the extended address register does not change when a READ operation crosses the selected 128Mb boundary.

Table 15: Extended Address Register Bit Definitions

Note 1 applies to entire table

| Bit | Name | Settings | Description |
|-----|----------|--|---|
| 7 | A[31:25] | 0 = Reserved | - |
| 6 | | | |
| 5 | | | |
| 4 | | | |
| 3 | | | |
| 2 | | | |
| 1 | | | |
| 0 | A[24] | 0 = Lower 128Mb segment (default) 1 = Upper 128Mb segment | Enables 128Mb segmentation selection. The default setting for this bit is determined by the non-volatile configuration register bit 1. However, this setting can be changed with the WRITE EXTENDED ADDRESS REGISTER command. |

Note: 1. The extended address register is for an application that supports only 3-byte addressing. It extends the device's first three address bytes A[23:0] to a fourth address byte A[31:24] to enable memory access beyond 128Mb. The extended address register bit 0 enables

128Mb segmentation selection. If 4-byte addressing is enabled, extended address register settings are ignored.

Enhanced Volatile Configuration Register

Table 16: Enhanced Volatile Configuration Register Bit Definitions

Note 1 applies to entire table

| Bit | Name | Settings | Description | Notes |
|-----|-----------------------------|---|---|-------|
| 7 | Quad I/O protocol | 0 = Enabled 1 = Disabled (Default, extended SPI protocol) | Enables or disables quad I/O protocol. | 2 |
| 6 | Dual I/O protocol | 0 = Enabled 1 = Disabled (Default, extended SPI protocol) | Enables or disables dual I/O protocol. | 2 |
| 5 | Reserved | x = Default | 0b = Fixed value. | |
| 4 | Reset/hold | 0 = Disabled 1 = Enabled (Default) | Enables or disables hold or reset. (Available on dedicated part numbers.) | |
| 3 | V _{pp} accelerator | 0 = Enabled 1 = Disabled (Default) | Enables or disables V _{pp} acceleration for QUAD INPUT FAST PROGRAM and QUAD INPUT EXTENDED FAST PROGRAM OPERATIONS. | |
| 2:0 | Output driver strength | 000 = Reserved 001 = 90 Ohms 010 = 60 Ohms 011 = 45 Ohms 100 = Reserved 101 = 20 Ohms 110 = 15 Ohms 111 = 30 (Default) | Optimizes impedance at V _{CC} /2 output voltage. | |

- Notes:
- Settings determine the device memory configuration upon a change of those settings by the WRITE ENHANCED VOLATILE CONFIGURATION REGISTER command. The register is read from or written to in all protocols by READ ENHANCED VOLATILE CONFIGURATION REGISTER or WRITE ENHANCED VOLATILE CONFIGURATION REGISTER commands, respectively.
 - If bits 6 and 7 are both set to 0, the device operates in quad I/O. When either bit 6 or 7 is reset to 0, the device operates in quad I/O or dual I/O respectively following the next WRITE ENHANCED VOLATILE CONFIGURATION command.

Flag Status Register

Table 17: Flag Status Register Bit Definitions

Note 1 applies to entire table

| Bit | Name | Settings | Description | Notes |
|-----|-----------------------------|-----------------------|--|-------|
| 7 | Program or erase controller | 0 = Busy 1 = Ready | Status bit: Indicates whether a PROGRAM, ERASE, WRITE STATUS REGISTER, or WRITE NONVOLATILE CONFIGURATION command cycle is in progress. | 2, 3 |

Table 17: Flag Status Register Bit Definitions (Continued)

Note 1 applies to entire table

| Bit | Name | Settings | Description | Notes |
|-----|-----------------|--|--|-------|
| 6 | Erase suspend | 0 = Not in effect 1 = In effect | Status bit: Indicates whether an ERASE operation has been or is going to be suspended. | 3 |
| 5 | Erase | 0 = Clear 1 = Failure or protection error | Error bit: Indicates whether an ERASE operation has succeeded or failed. | 4, 5 |
| 4 | Program | 0 = Clear 1 = Failure or protection error | Error bit: An attempt to program a 0 to a 1 when $V_{PP} = V_{PPH}$ and the data pattern is a multiple of 64 bits. | 4, 5 |
| 3 | V_{PP} | 0 = Enabled 1 = Disabled (Default) | Error bit: Indicates an invalid voltage on V_{PP} during a PROGRAM or ERASE operation. | 4, 5 |
| 2 | Program suspend | 0 = Not in effect 1 = In effect | Status bit: Indicates whether a PROGRAM operation has been or is going to be suspended. | 3 |
| 1 | Protection | 0 = Clear 1 = Failure or protection error | Error bit: Indicates whether a PROGRAM operation has attempted to modify the protected array sector or access the locked OTP space. | 4, 5 |
| 0 | Addressing | 0 = 3 bytes addressing 1 = 4 bytes addressing | Status bit: Indicates whether 3-byte or 4-byte address mode is enabled. | 3 |

- Notes:
1. Register bits are read by READ STATUS REGISTER command. All bits are volatile.
 2. These program/erase controller settings apply only to PROGRAM or ERASE command cycles in progress; they do not apply to a WRITE command cycle in progress.
 3. Status bits are reset automatically.
 4. Error bits must be reset by CLEAR FLAG STATUS REGISTER command.
 5. Typical errors include operation failures and protection errors caused by issuing a command before the error bit has been reset to 0.

Command Definitions

Table 18: Command Set

Note 1 applies to entire table

| Command | Code | Extended | Dual I/O | Quad I/O | Data Bytes | Notes |
|---------------------------------------|-------------------|----------|----------|----------|------------|--------|
| RESET Operations | | | | | | |
| RESET ENABLE | 66h | Yes | Yes | Yes | 0 | 2 |
| RESET MEMORY | 99h | | | | | |
| IDENTIFICATION Operations | | | | | | |

| 4-BYTE ADDRESS MODE Operations | | | | | | |
| ENTER 4-BYTE ADDRESS MODE | B7h | Yes | Yes | Yes | 0 | 2, 16 |
| EXIT 4-BYTE ADDRESS MODE | E9h | | | | | |
| QUAD Operations | | | | | | |
| ENTER QUAD | 35h | Yes | Yes | Yes | 0 | 2, 14 |
| EXIT QUAD | F5h | | | | | 2, 14 |

- Notes:
1. Yes in the protocol columns indicates that the command is supported and has the same functionality and command sequence as other commands marked Yes.
 2. Address bytes = 0. Dummy clock cycles = 0.
 3. Address bytes = 3. Dummy clock cycles default = 8.
 4. Address bytes default = 3; address bytes = 4 (extended address). Dummy clock cycles = 0.
 5. Address bytes default = 3; address bytes = 4 (extended address). Dummy clock cycles default = 8. Dummy clock cycles default = 10 (when quad SPI protocol is enabled). Dummy clock cycles are configurable by the user.
 6. Address bytes default = 3; address bytes = 4 (extended address). Dummy clock cycles default = 6. Dummy clock cycles default = 8 when quad SPI protocol is enabled. Dummy clock cycles are configurable by the user.
 7. Address bytes default = 3; address bytes = 4 (extended address). Dummy clock cycles default = 8. Dummy clock cycles are configurable by the user.
 8. Address bytes = 4. Dummy clock cycles = 0.
 9. Address bytes = 4. Dummy clock cycles default = 8. Dummy clock cycles default = 10 (when quad SPI protocol is enabled). Dummy clock cycles are configurable by the user.
 10. Address bytes = 4. Dummy clock cycles default = 10. Dummy clock cycles is configurable by the user.
 11. When the device is in dual SPI protocol, the command can be entered with any of these three codes. The different codes enable compatibility between dual SPI and extended SPI protocols.
 12. When the device is in quad SPI protocol, the command can be entered with any of these three codes. The different codes enable compatibility between quad SPI and extended SPI protocols.
 13. The WRITE ENABLE command must be issued first before this command can be executed.
 14. This command is only for part numbers N25Q256A83ESF40x, N25Q256A83E1240x, and N25Q256A83ESFA0F.

15. The code 38h is valid only for part numbers N25Q256A83ESF40x, N25Q256A83E1240x, and N25Q256A83ESFA0F; the code 12h is valid for the other part numbers.
16. The WRITE ENABLE command must be issued first before this command can be executed. Not necessary for part numbers N25Q256A83ESF40x, N25Q256A83E1240x, and N25Q256A83ESFA0F.

READ REGISTER and WRITE REGISTER Operations

READ STATUS REGISTER or FLAG STATUS REGISTER Command

To initiate a READ STATUS REGISTER command, S# is driven LOW. For extended SPI protocol, the command code is input on DQ0, and output on DQ1. For dual SPI protocol, the command code is input on DQ[1:0], and output on DQ[1:0]. For quad SPI protocol, the command code is input on DQ[3:0], and is output on DQ[3:0]. The operation is terminated by driving S# HIGH at any time during data output.

The status register can be read continuously and at any time, including during a PROGRAM, ERASE, or WRITE operation.

The flag status register can be read continuously and at any time, including during an ERASE or WRITE operation.

If one of these operations is in progress, checking the write in progress bit or P/E controller bit is recommended before executing the command.

Figure 10: READ REGISTER Command

- Notes:
1. Supports all READ REGISTER commands except READ LOCK REGISTER.
 2. A READ NONVOLATILE CONFIGURATION REGISTER operation will output data starting from the least significant byte.

READ NONVOLATILE CONFIGURATION REGISTER Command

To execute a READ NONVOLATILE CONFIGURATION REGISTER command, S# is driven LOW. For extended SPI protocol, the command code is input on DQ0, and output on DQ1. For dual SPI protocol, the command code is input on DQ[1:0], and output on DQ[1:0]. For quad SPI protocol, the command code is input on DQ[3:0], and is output

on DQ[3:0]. The operation is terminated by driving S# HIGH at any time during data output.

The nonvolatile configuration register can be read continuously. After all 16 bits of the register have been read, a 0 is output. All reserved fields output a value of 1.

READ VOLATILE or ENHANCED VOLATILE CONFIGURATION REGISTER Command

To execute a READ VOLATILE CONFIGURATION REGISTER command or a READ ENHANCED VOLATILE CONFIGURATION REGISTER command, S# is driven LOW. For extended SPI protocol, the command code is input on DQ0, and output on DQ1. For dual SPI protocol, the command code is input on DQ[1:0], and output on DQ[1:0]. For quad SPI protocol, the command code is input on DQ[3:0], and is output on DQ[3:0]. The operation is terminated by driving S# HIGH at any time during data output.

When the register is read continuously, the same byte is output repeatedly.

READ EXTENDED ADDRESS REGISTER Command

To initiate a READ EXTENDED ADDRESS REGISTER command, S# is driven LOW. For extended SPI protocol, the command code is input on DQ0, and output on DQ1. For dual SPI protocol, the command code is input on DQ[1:0], and output on DQ[1:0]. For quad SPI protocol, the command code is input on DQ[3:0], and is output on DQ[3:0]. The operation is terminated by driving S# HIGH at any time during data output.

When the register is read continuously, the same byte is output repeatedly.

WRITE STATUS REGISTER Command

To issue a WRITE STATUS REGISTER command, the WRITE ENABLE command must be executed to set the write enable latch bit to 1. S# is driven LOW and held LOW until the eighth bit of the last data byte has been latched in, after which it must be driven HIGH. For extended SPI protocol, the command code is input on DQ0, followed by the data bytes. For dual SPI protocol, the command code is input on DQ[1:0], followed by the data bytes. For quad SPI protocol, the command code is input on DQ[3:0], followed by the data bytes. When S# is driven HIGH, the operation, which is self-timed, is initiated; its duration is t_W .

This command is used to write new values to status register bits 7:2, enabling software data protection. The status register can also be combined with the W#/V_{PP} signal to provide hardware data protection. The WRITE STATUS REGISTER command has no effect on status register bits 1:0.

When the operation is in progress, the write in progress bit is set to 1. The write enable latch bit is cleared to 0, whether the operation is successful or not. The status register and flag status register can be polled for the operation status. When the operation completes, the write in progress bit is cleared to 0, whether the operation is successful or not. If S# is not driven HIGH, the command is not executed, flag status register error bits are not set, and the write enable latch remains set to 1.

Figure 11: WRITE REGISTER Command

- Notes:
1. Supports all WRITE REGISTER commands except WRITE LOCK REGISTER.
 2. Waveform must be extended for each protocol, to 23 for extended, 11 for dual, and 5 for quad.
 3. A WRITE NONVOLATILE CONFIGURATION REGISTER operation requires data being sent starting from least significant byte.

WRITE NONVOLATILE CONFIGURATION REGISTER Command

To execute the WRITE NONVOLATILE CONFIGURATION REGISTER command, the WRITE ENABLE command must be executed to set the write enable latch bit to 1. S# is driven LOW and held LOW until the 16th bit of the last data byte has been latched in, after which it must be driven HIGH. For extended SPI protocol, the command code is input on DQ0, followed by two data bytes. For dual SPI protocol, the command code is input on DQ[1:0], followed by the data bytes. For quad SPI protocol, the command code is input on DQ[3:0], followed by the data bytes. When S# is driven HIGH, the operation, which is self-timed, is initiated; its duration is ^tNVCR.

When the operation is in progress, the write in progress bit is set to 1. The write enable latch bit is cleared to 0, whether the operation is successful or not. The status register and flag status register can be polled for the operation status. When the operation completes, the write in progress bit is cleared to 0, whether the operation is successful or not. If S# is not driven HIGH, the command is not executed, flag status register error bits are not set, and the write enable latch remains set to 1.

WRITE VOLATILE or ENHANCED VOLATILE CONFIGURATION REGISTER Command

To execute a WRITE VOLATILE CONFIGURATION REGISTER command or a WRITE ENHANCED VOLATILE CONFIGURATION REGISTER command, the WRITE ENABLE command must be executed to set the write enable latch bit to 1. S# is driven LOW and held LOW until the eighth bit of the last data byte has been latched in, after which it must be driven HIGH. For extended SPI protocol, the command code is input on DQ0, followed by the data bytes. For dual SPI protocol, the command code is input on DQ[1:0], followed by the data bytes. For quad SPI protocol, the command code is input on DQ[3:0], followed by the data bytes.

Because register bits are volatile, change to the bits is immediate. If S# is not driven HIGH, the command is not executed, flag status register error bits are not set, and the write enable latch remains set to 1. Reserved bits are not affected by this command.

WRITE EXTENDED ADDRESS REGISTER Command

To initiate a WRITE EXTENDED ADDRESS REGISTER command, the WRITE ENABLE command must be executed to set the write enable latch bit to 1.

Note: The WRITE ENABLE command is not necessary on line items that enable the additional RESET# pin.

S# is driven LOW and held LOW until the eighth bit of the last data byte has been latched in, after which it must be driven HIGH. The command code is input on DQ0, followed by the data bytes. For dual SPI protocol, the command code is input on DQ[1:0], followed by the data bytes. For quad SPI protocol, the command code is input on DQ[3:0], followed by the data bytes.

Because register bits are volatile, change to the bits is immediate. If S# is not driven HIGH, the command is not executed, the flag status register error bits are not set, and the write enable latch remains set to 1. Reserved bits are not affected by this command.

READ LOCK REGISTER Command

To execute the READ LOCK REGISTER command, S# is driven LOW. For extended SPI protocol, the command code is input on DQ0, followed by address bytes that point to a location in the sector. For dual SPI protocol, the command code is input on DQ[1:0]. For quad SPI protocol, the command code is input on DQ[3:0]. Each address bit is latched in during the rising edge of the clock. For extended SPI protocol, data is shifted out on DQ1 at a maximum frequency ^fC during the falling edge of the clock. For dual SPI protocol, data is shifted out on DQ[1:0], and for quad SPI protocol, data is shifted out on DQ[3:0]. The operation is terminated by driving S# HIGH at any time during data output.

When the register is read continuously, the same byte is output repeatedly. Any READ LOCK REGISTER command that is executed while an ERASE, PROGRAM, or WRITE cycle is in progress is rejected with no affect on the cycle in progress.

Table 19: Lock Register

Note 1 applies to entire table

| Bit | Name | Settings | Description |
|-----|------------------|----------------------------------|--|
| 7:2 | Reserved | 0 | Bit values are 0. |
| 1 | Sector lock down | 0 = Cleared (Default) 1 = Set | Volatile bit: the device always powers-up with this bit cleared, which means sector lock down and sector write lock bits can be set. When this bit set, neither of the lock register bits can be written to until the next power cycle. |

Table 19: Lock Register (Continued)

Note 1 applies to entire table

| Bit | Name | Settings | Description |
|-----|-------------------|----------------------------------|--|
| 0 | Sector write lock | 0 = Cleared (Default) 1 = Set | Volatile bit: the device always powers-up with this bit cleared, which means that PROGRAM and ERASE operations in this sector can be executed and sector content modified. When this bit is set, PROGRAM and ERASE operations in this sector will not be executed. |

Note: 1. Sector lock register bits 1:0 are written by the WRITE LOCK REGISTER command. The command will not execute unless the sector lock down bit is cleared.

Figure 12: READ LOCK REGISTER Command

Note: 1. For extended SPI protocol, $C_x = 7 + (A[MAX] + 1)$.
 For dual SPI protocol, $C_x = 3 + ((A[MAX] + 1)/2)$.
 For quad SPI protocol, $C_x = 1 + ((A[MAX] + 1)/4)$.

WRITE LOCK REGISTER Command

To initiate the WRITE LOCK REGISTER command, the WRITE ENABLE command must be executed to set the write enable latch bit to 1. S# is driven LOW and held LOW until the eighth bit of the last data byte has been latched in, after which it must be driven HIGH. The command code is input on DQn, followed by address bytes that point to a location in the sector, and then one data byte that contains the desired settings for lock register bits 0 and 1. Each address bit is latched in during the rising edge of the clock.

When execution is complete, the write enable latch bit is cleared within t_{SHSL2} and no error bits are set. Because lock register bits are volatile, change to the bits is immediate. WRITE LOCK REGISTER can be executed when an ERASE SUSPEND operation is in ef-

fect. If S# is not driven HIGH, the command is not executed, flag status register error bits are not set, and the write enable latch remains set to 1.

Figure 13: WRITE LOCK REGISTER Command

- Note: 1. For extended SPI protocol, $C_x = 7 + (A[MAX] + 1)$.
 For dual SPI protocol, $C_x = 3 + ((A[MAX] + 1)/2)$.
 For quad SPI protocol, $C_x = 1 + ((A[MAX] + 1)/4)$.

CLEAR FLAG STATUS REGISTER Command

To execute the CLEAR FLAG STATUS REGISTER command and reset the error bits (erase, program, and protection), S# is driven LOW. For extended SPI protocol, the command code is input on DQ0. For dual SPI protocol, the command code is input on DQ[1:0]. For quad SPI protocol, the command code is input on DQ[3:0]. The operation is terminated by driving S# HIGH at any time.

READ IDENTIFICATION Operations

READ ID and MULTIPLE I/O READ ID Commands

To execute the READ ID or MULTIPLE I/O READ ID commands, S# is driven LOW and the command code is input on DQ_n. The device outputs the information shown in the tables below. If an ERASE or PROGRAM cycle is in progress when the command is executed, the command is not decoded and the command cycle in progress is not affected. When S# is driven HIGH, the device goes to standby. The operation is terminated by driving S# HIGH at any time during data output.

Table 20: Data/Address Lines for READ ID and MULTIPLE I/O READ ID Commands

| Command Name | Data In | Data Out | Unique ID is Output | Extended | Dual | Quad |
|----------------------|---------|----------|---------------------|----------|------|------|
| READ ID | DQ0 | DQ0 | Yes | Yes | No | No |
| MULTIPLE I/O READ ID | DQ[3:0] | DQ[1:0] | No | No | Yes | Yes |

Note: 1. Yes in the protocol columns indicates that the command is supported and has the same functionality and command sequence as other commands marked Yes.

Table 21: Read ID Data Out

| Size (Bytes) | Name | Content Value | Assigned by |
|--------------|--|--|--------------|
| 1 | Manufacturer ID | 20h (selected by READ MANUFACTURER ID) | JEDEC |
| 2 | Device ID | | Manufacturer |
| | Memory Type | BAh | |
| | Memory Capacity | 19h (256Mb) | |
| 17 | Unique ID | | Factory |
| | 1 Byte: Length of data to follow | 10h | |
| | 2 Bytes: Extended device ID and device configuration information | ID and information such as uniform architecture, and HOLD or RESET functionality | |
| | 14 Bytes: Customized factory data | Optional | |

Note: 1. The 17 bytes of information in the unique ID is read by the READ ID command, but cannot be read by the MULTIPLE I/O READ ID command.

Table 22: Extended Device ID, First Byte

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|----------|----------|---|--|--|----------------------------|-------------------------------|-------|
| Reserved | Reserved | 1 = Alternate BP scheme 0 = Standard BP scheme | Volatile configuration register bit setting: 0 = Required 1 = Not required | HOLD#/RESET#: 0 = HOLD 1 = RESET | Addressing: 0 = by byte | Architecture: 00 = Uniform | |

Figure 14: READ ID and MULTIPLE I/O Read ID Commands

Note: 1. The READ ID command is represented by the extended SPI protocol timing shown first. The MULTIPLE I/O READ ID command is represented by the dual and quad SPI protocols as shown below extended SPI protocol.

READ SERIAL FLASH DISCOVERY PARAMETER Command

To execute READ SERIAL FLASH DISCOVERY PARAMETER command, S# is driven LOW. The command code is input on DQ0, followed by three address bytes and eight dummy clock cycles (address is always 3 bytes, even for 4-byte address mode). The device outputs the information starting from the specified address. When the 2048-byte boundary is reached, the data output wraps to address 0 of the serial Flash discovery parameter table. The operation is terminated by driving S# HIGH at any time during data output.

The operation always executes in continuous mode so the read burst wrap setting in the volatile configuration register does not apply.

Note: Data to be stored in the serial Flash discovery parameter area is still in the definition phase.

Table 23: Serial Flash Discovery Parameter Data Structure

Compliant with JEDEC standard JC-42.4 1775.03

| Description | | Address (Byte Mode) | Address (Bit) | Data |
|--|----------------|---------------------|---------------|------|

| Sector type 3 size (not present) | 51h | 7:0 | 00h |
| Sector type 4 size (not present) | 52h | 7:0 | 00h |
| Sector type 4 size (not present) | 53h | 7:0 | 00h |

READ MEMORY Operations

The device supports default reading and writing to an A[MAX:MIN] of A[23:0] (3-byte address).

Reading and writing to an A[MAX:MIN] of A[31:0] (4-byte address) is also supported. Selection of the 3-byte or 4-byte address range can be enabled in two ways: setting the nonvolatile configuration register or entering the ENABLE 4-BYTE ADDRESS MODE or EXIT 4-BYTE ADDRESS MODE commands. Further details for these settings and commands are in the respective register and command sections of the data sheet.

Note: When the device is set to the default address range of A[23:0], another method for enabling 4-byte addressing is through the extended address register. Details can be found in Nonvolatile and Volatile Registers.

3-Byte Address

To execute READ MEMORY commands, S# is driven LOW. The command code is input on DQ_n, followed by input on DQ_n of three address bytes. Each address bit is latched in during the rising edge of the clock. The addressed byte can be at any location, and the address automatically increments to the next address after each byte of data is shifted out; therefore, the entire memory can be read with a single command. The operation is terminated by driving S# HIGH at any time during data output.

Table 25: Command/Address/Data Lines for READ MEMORY Commands

Note 1 applies to entire table

| | Command Name | | | | | |
|------------------------------|--------------|------------|-----------------------|-----------------------------|-----------------------|-----------------------------|
| | READ | FAST READ | DUAL OUTPUT FAST READ | DUAL INPUT/OUTPUT FAST READ | QUAD OUTPUT FAST READ | QUAD INPUT/OUTPUT FAST READ |
| STR Mode | 03h | 0Bh | 3Bh | BBh | 6Bh | EBh |
| DTR Mode | - | 0Dh | 3Dh | BDh | 6Dh | EDh |
| Extended SPI Protocol | | | | | | |
| Supported | Yes | Yes | Yes | Yes | Yes | Yes |
| Command Input | DQ0 | DQ0 | DQ0 | DQ0 | DQ0 | DQ0 |
| Address Input | DQ0 | DQ0 | DQ0 | DQ[1:0] | DQ0 | DQ[3:0] |
| Data Output | DQ1 | DQ1 | DQ[1:0] | DQ[1:0] | DQ[3:0] | DQ[3:0] |
| Dual SPI Protocol | | | | | | |
| Supported | No | Yes | Yes | Yes | No | No |
| Command Input | - | DQ[1:0] | DQ[1:0] | DQ[1:0] | - | - |
| Address Input | - | DQ[1:0] | DQ[1:0] | DQ[1:0] | - | - |
| Data Output | - | DQ[1:0] | DQ[1:0] | DQ[1:0] | - | - |
| Quad SPI Protocol | | | | | | |
| Supported | No | Yes | No | No | Yes | Yes |
| Command Input | - | DQ[3:0] | - | - | DQ[3:0] | DQ[3:0] |
| Address Input | - | DQ[3:0] | - | - | DQ[3:0] | DQ[3:0] |

Table 25: Command/Address/Data Lines for READ MEMORY Commands (Continued)

Note 1 applies to entire table

| | Command Name | | | | | |
|-----------------|--------------|------------|-----------------------|-----------------------------|-----------------------|-----------------------------|
| | READ | FAST READ | DUAL OUTPUT FAST READ | DUAL INPUT/OUTPUT FAST READ | QUAD OUTPUT FAST READ | QUAD INPUT/OUTPUT FAST READ |
| STR Mode | 03h | 0Bh | 3Bh | BBh | 6Bh | EBh |
| DTR Mode | – | 0Dh | 3Dh | BDh | 6Dh | EDh |
| Data Output | – | DQ[3:0] | – | – | DQ[3:0] | DQ[3:0] |

- Notes:
1. Yes in the "Supported" row for each protocol indicates that the command in that column is supported; when supported, a command's functionality is identical for the entire column regardless of the protocol. For example, a FAST READ functions the same for all three protocols even though its data is input/output differently depending on the protocol.
 2. FAST READ is similar to READ, but requires dummy clock cycles following the address bytes and can operate at a higher frequency (f_C).

4-Byte Address

To execute 4-byte READ MEMORY commands, S# is driven LOW. The command code is input on DQ_n, followed by input on DQ_n of four address bytes. Each address bit is latched in during the rising edge of the clock. The addressed byte can be at any location, and the address automatically increments to the next address after each byte of data is shifted out; therefore, the entire memory can be read with a single command. The operation is terminated by driving S# HIGH at any time during data output.

Table 26: Command/Address/Data Lines for READ MEMORY Commands – 4-Byte Address

Notes 1 and 2 apply to entire table

| | Command Name (4-Byte Address) | | | | | |
|------------------------------|-------------------------------|-----------|-----------------------|-----------------------------|-----------------------|-----------------------------|
| | READ | FAST READ | DUAL OUTPUT FAST READ | DUAL INPUT/OUTPUT FAST READ | QUAD OUTPUT FAST READ | QUAD INPUT/OUTPUT FAST READ |
| STR Mode | 03h/13h | 0Bh/0Ch | 3Bh/3Ch | BBh/BCh | 6Bh/6Ch | EBh/ECh |
| DTR Mode | – | 0Dh | 3Dh | BDh | 6Dh | EDh |
| Extended SPI Protocol | | | | | | |
| Supported | Yes | Yes | Yes | Yes | Yes | Yes |
| Command Input | DQ0 | DQ0 | DQ0 | DQ0 | DQ0 | DQ0 |
| Address Input | DQ0 | DQ0 | DQ0 | DQ[1:0] | DQ0 | DQ[3:0] |
| Data Output | DQ1 | DQ1 | DQ[1:0] | DQ[1:0] | DQ[3:0] | DQ[3:0] |
| Dual SPI Protocol | | | | | | |
| Supported | No | Yes | Yes | Yes | No | No |
| Command Input | – | DQ[1:0] | DQ[1:0] | DQ[1:0] | – | – |
| Address Input | – | DQ[1:0] | DQ[1:0] | DQ[1:0] | – | – |
| Data Output | – | DQ[1:0] | DQ[1:0] | DQ[1:0] | – | – |
| Quad SPI Protocol | | | | | | |
| Supported | No | Yes | No | No | Yes | Yes |
| Command Input | – | DQ[3:0] | – | – | DQ[3:0] | DQ[3:0] |
| Address Input | – | DQ[3:0] | – | – | DQ[3:0] | DQ[3:0] |
| Data Output | – | DQ[3:0] | – | – | DQ[3:0] | DQ[3:0] |

- Notes:
1. Yes in the "Supported" row for each protocol indicates that the command in that column is supported; when supported, a command's functionality is identical for the entire column regardless of the protocol. For example, a FAST READ functions the same for all three protocols even though its data is input/output differently depending on the protocol.
 2. Command codes 13h, 0Ch, 3Ch, BCh, 6Ch, and ECh do not need to be set up in the addressing mode; they will work directly in 4-byte addressing mode.
 3. A 4-BYTE FAST READ command is similar to 4-BYTE READ operation, but requires dummy clock cycles following the address bytes and can operate at a higher frequency (f_C).

1. $C_x = 7 + (A[MAX] + 1) / 2$.
 2. Shown here is the QUAD OUTPUT FAST READ timing for the extended SPI protocol. The quad timing shown for the FAST READ command is the equivalent of the QUAD OUTPUT FAST READ timing for the quad SPI protocol.

Figure 25: QUAD INPUT/OUTPUT FAST READ Command – DTR

- Notes:
1. $C_x = 7 + (A[MAX] + 1) / 8$.
 2. Shown here is the QUAD INPUT/OUTPUT FAST READ timing for the extended SPI protocol. The quad timing shown for the FAST READ command is the equivalent of the QUAD INPUT/OUTPUT FAST READ timing for the quad SPI protocol.

PROGRAM Operations

PROGRAM commands are initiated by first executing the WRITE ENABLE command to set the write enable latch bit to 1. S# is then driven LOW and held LOW until the eighth bit of the last data byte has been latched in, after which it must be driven HIGH. The command code is input on DQ0, followed by input on DQ[n] of address bytes and at least one data byte. Each address bit is latched in during the rising edge of the clock. When S# is driven HIGH, the operation, which is self-timed, is initiated; its duration is t_{PP}.

If the bits of the least significant address, which is the starting address, are not all zero, all data transmitted beyond the end of the current page is programmed from the starting address of the same page. If the number of bytes sent to the device exceed the maximum page size, previously latched data is discarded and only the last maximum page-size number of data bytes are guaranteed to be programmed correctly within the same page. If the number of bytes sent to the device is less than the maximum page size, they are correctly programmed at the specified addresses without any effect on the other bytes of the same page.

When the operation is in progress, the write in progress bit is set to 1. The write enable latch bit is cleared to 0, whether the operation is successful or not. The status register and flag status register can be polled for the operation status. An operation can be paused or resumed by the PROGRAM/ERASE SUSPEND or PROGRAM/ERASE RESUME command, respectively. When the operation completes, the write in progress bit is cleared to 0.

If the operation times out, the write enable latch bit is reset and the program fail bit is set to 1. If S# is not driven HIGH, the command is not executed, flag status register error bits are not set, and the write enable latch remains set to 1. When a command is applied to a protected sector, the command is not executed, the write enable latch bit remains set to 1, and flag status register bits 1 and 4 are set.

Table 27: Data/Address Lines for PROGRAM Commands

Note 1 applies to entire table

| Command Name | Data In | Address In | Extended | Dual | Quad |
|----------------------------------|---------|------------|----------|------|------|
| PAGE PROGRAM | DQ0 | DQ0 | Yes | Yes | Yes |
| DUAL INPUT FAST PROGRAM | DQ[1:0] | DQ0 | Yes | Yes | No |
| EXTENDED DUAL INPUT FAST PROGRAM | DQ[1:0] | DQ[1:0] | Yes | Yes | No |
| QUAD INPUT FAST PROGRAM | DQ[3:0] | DQ0 | Yes | No | Yes |
| EXTENDED QUAD INPUT FAST PROGRAM | DQ[3:0] | DQ[3:0] | Yes | No | Yes |

Note: 1. Yes in the protocol columns indicates that the command is supported and has the same functionality and command sequence as other commands marked Yes.

Figure 26: PAGE PROGRAM Command

Note: 1. For extended SPI protocol, $C_x = 7 + (A[MAX] + 1)$.
 For dual SPI protocol, $C_x = 3 + (A[MAX] + 1)/2$.
 For quad SPI protocol, $C_x = 1 + (A[MAX] + 1)/4$.

Figure 27: DUAL INPUT FAST PROGRAM Command

Note: 1. For extended SPI protocol, $C_x = 7 + (A[MAX] + 1)$.
 For dual SPI protocol, $C_x = 3 + (A[MAX] + 1)/2$.

Figure 28: EXTENDED DUAL INPUT FAST PROGRAM Command

Figure 29: QUAD INPUT FAST PROGRAM Command

Figure 30: EXTENDED QUAD INPUT FAST PROGRAM Command

Note: 1. For extended SPI protocol, $C_x = 7 + (A[MAX] + 1)/4$.
 For quad SPI protocol, $C_x = 1 + (A[MAX] + 1)/4$.

WRITE Operations

WRITE ENABLE Command

The WRITE ENABLE operation sets the write enable latch bit. To execute a WRITE ENABLE command, S# is driven LOW and held LOW until the eighth bit of the command code has been latched in, after which it must be driven HIGH. The command code is input on DQ0 for extended SPI protocol, on DQ[1:0] for dual SPI protocol, and on DQ[3:0] for quad SPI protocol.

The write enable latch bit must be set before every PROGRAM, ERASE, WRITE, ENTER 4-BYTE ADDRESS MODE, and EXIT 4-BYTE ADDRESS MODE command. If S# is not driven HIGH after the command code has been latched in, the command is not executed, flag status register error bits are not set, and the write enable latch remains cleared to its default setting of 0.

WRITE DISABLE Command

The WRITE DISABLE operation clears the write enable latch bit. To execute a WRITE DISABLE command, S# is driven LOW and held LOW until the eighth bit of the command code has been latched in, after which it must be driven HIGH. The command code is input on DQ0 for extended SPI protocol, on DQ[1:0] for dual SPI protocol, and on DQ[3:0] for quad SPI protocol.

If S# is not driven HIGH after the command code has been latched in, the command is not executed, flag status register error bits are not set, and the write enable latch remains set to 1.

Figure 31: WRITE ENABLE and WRITE DISABLE Command Sequence

Note: 1. Shown here is the WRITE ENABLE command code, which is 06h or 0000 0110 binary. The WRITE DISABLE command sequence is identical, except the WRITE DISABLE command code is 04h or 0000 0100 binary.

ERASE Operations

SUBSECTOR ERASE Command

To execute the SUBSECTOR ERASE command and set the selected subsector bits set to FFh, the WRITE ENABLE command must be issued to set the write enable latch bit to 1. S# is driven LOW and held LOW until the eighth bit of the last data byte has been latched in, after which it must be driven HIGH. The command code is input on DQ0, followed by address bytes; any address within the subsector is valid. Each address bit is latched in during the rising edge of the clock. When S# is driven HIGH, the operation, which is self-timed, is initiated; its duration is ^tSSE. The operation can be suspended and resumed by the PROGRAM/ERASE SUSPEND and PROGRAM/ERASE RESUME commands, respectively.

If the write enable latch bit is not set, the device ignores the SUBSECTOR ERASE command and no error bits are set to indicate operation failure.

When the operation is in progress, the write in progress bit is set to 1. The write enable latch bit is cleared to 0, whether the operation is successful or not. The status register and flag status register can be polled for the operation status. When the operation completes, the write in progress bit is cleared to 0.

If the operation times out, the write enable latch bit is reset and the erase error bit is set to 1. If S# is not driven HIGH, the command is not executed, flag status register error bits are not set, and the write enable latch remains set to 1. When a command is applied to a protected subsector, the command is not executed. Instead, the write enable latch bit remains set to 1, and flag status register bits 1 and 5 are set.

SECTOR ERASE Command

To execute the SECTOR ERASE command (and set selected sector bits to FFh), the WRITE ENABLE command must be issued to set the write enable latch bit to 1. S# is driven LOW and held LOW until the eighth bit of the last data byte has been latched in, after which it must be driven HIGH. The command code is input on DQ0, followed by address bytes; any address within the sector is valid. Each address bit is latched in during the rising edge of the clock. When S# is driven HIGH, the operation, which is self-timed, is initiated; its duration is ^tSE. The operation can be suspended and resumed by the PROGRAM/ERASE SUSPEND and PROGRAM/ERASE RESUME commands, respectively.

If the write enable latch bit is not set, the device ignores the SECTOR ERASE command and no error bits are set to indicate operation failure.

When the operation is in progress, the write in progress bit is set to 1 and the write enable latch bit is cleared to 0, whether the operation is successful or not. The status register and flag status register can be polled for the operation status. When the operation completes, the write in progress bit is cleared to 0.

If the operation times out, the write enable latch bit is reset and erase error bit is set to 1. If S# is not driven HIGH, the command is not executed, flag status register error bits are not set, and the write enable latch remains set to 1. When a command is applied to a protected sector, the command is not executed. Instead, the write enable latch bit remains set to 1, and flag status register bits 1 and 5 are set.

Figure 32: SUBSECTOR and SECTOR ERASE Command

Note: 1. For extended SPI protocol, $C_x = 7 + (A[MAX] + 1)$.
 For dual SPI protocol, $C_x = 3 + (A[MAX] + 1)/2$.
 For quad SPI protocol, $C_x = 1 + (A[MAX] + 1)/4$.

BULK ERASE Command

To initiate the BULK ERASE command, the WRITE ENABLE command must be issued to set the write enable latch bit to 1. S# is driven LOW and held LOW until the eighth bit of the last data byte has been latched in, after which it must be driven HIGH. The command code is input on DQ0. When S# is driven HIGH, the operation, which is self-timed, is initiated; its duration is t_{BE}.

If the write enable latch bit is not set, the device ignores the SECTOR ERASE command and no error bits are set to indicate operation failure.

When the operation is in progress, the write in progress bit is set to 1 and the write enable latch bit is cleared to 0, whether the operation is successful or not. The status register and flag status register can be polled for the operation status. When the operation completes, the write in progress bit is cleared to 0.

If the operation times out, the write enable latch bit is reset and erase error bit is set to 1. If S# is not driven HIGH, the command is not executed, the flag status register error bits are not set, and the write enable latch remains set to 1.

The command is not executed if any sector is locked. Instead, the write enable latch bit remains set to 1, and flag status register bits 1 and 5 are set.

Figure 33: BULK ERASE Command

PROGRAM/ERASE SUSPEND Command

To initiate the PROGRAM/ERASE SUSPEND command, S# is driven LOW. The command code is input on DQ0. The operation is terminated by the PROGRAM/ERASE RESUME command.

PROGRAM/ERASE SUSPEND command enables the memory controller to interrupt and suspend an array PROGRAM or ERASE operation within the program/erase latency.

If a SUSPEND command is issued during a PROGRAM operation, then the flag status register bit 2 is set to 1. After erase/program latency time, the flag status register bit 7 is also set to 1, showing the device to be in a suspended state, waiting for any operation (see the Operations Allowed/Disallowed During Device States table).

If a SUSPEND command is issued during an ERASE operation, then the flag status register bit 6 is set to 1. After erase/program latency time, the flag status register bit 7 is also set to 1, showing that device to be in a suspended state, waiting for any operation (see the Operations Allowed/Disallowed During Device States table).

If the time remaining to complete the operation is less than the suspend latency, the device completes the operation and clears the flag status register bits 2 or 6, as applicable. Because the suspend state is volatile, if there is a power cycle, the suspend state information is lost and the flag status register powers up as 80h.

During an ERASE SUSPEND operation, a PROGRAM or READ operation is possible in any sector except the one in a suspended state. Reading from a sector that is in a suspended state will output indeterminate data. The device ignores a PROGRAM command to a sector that is in an ERASE SUSPEND state; it also sets to 1 the flag status register bit 4: program failure/protection error, and leaves the write enable latch bit unchanged. The WRITE LOCK REGISTER, WRITE VOLATILE CONFIGURATION REGISTER, and WRITE ENHANCED VOLATILE CONFIGURATION REGISTER commands are

allowed during an ERASE SUSPEND state. When the ERASE operation resumes, it does not check the new lock status of the WRITE LOCK REGISTER command.

During a PROGRAM SUSPEND operation, a READ operation is possible in any page except the one in a suspended state. Reading from a page that is in a suspended state will output indeterminate data. The commands allowed during a program suspend state include the WRITE VOLATILE CONFIGURATION REGISTER command and the WRITE ENHANCED VOLATILE CONFIGURATION REGISTER command.

It is possible to nest a PROGRAM/ERASE SUSPEND operation inside a PROGRAM/ERASE SUSPEND operation just once. Issue an ERASE command and suspend it. Then issue a PROGRAM command and suspend it also. With the two operations suspended, the next PROGRAM/ERASE RESUME command resumes the latter operation, and a second PROGRAM/ERASE RESUME command resumes the former (or first) operation.

Table 28: Suspend Parameters

| Parameter | Condition | Typ | Max | Units | Notes |
|----------------------------|--|-----|-----|-------|-------|
| Erase to suspend | Sector erase or erase resume to erase suspend | 700 | – | μs | 1 |
| Program to suspend | Program resume to program suspend | 5 | – | μs | 1 |
| Subsector erase to suspend | Subsector erase or subsector erase resume to erase suspend | 50 | – | μs | 1 |
| Suspend latency | Program | 7 | – | μs | 2 |
| Suspend latency | Subsector erase | 15 | – | μs | 2 |
| Suspend latency | Erase | 15 | – | μs | 3 |

- Notes:
1. Timing is not internally controlled.
 2. Any READ command accepted.
 3. Any command except the following are accepted: SECTOR, SUBSECTOR, or BULK ERASE; WRITE STATUS REGISTER; WRITE NONVOLATILE CONFIGURATION REGISTER; and PROGRAM OTP.

Table 29: Operations Allowed/Disallowed During Device States

Note 1 applies to entire table

| Operation | Standby State | Program or Erase State | Subsector Erase Suspend or Program Suspend State | Erase Suspend State | Notes |
|-----------|---------------|------------------------|--|---------------------|-------|
| READ | Yes | No | Yes | Yes | 2 |
| PROGRAM | Yes | No | No | Yes/No | 3 |
| ERASE | Yes | No | No | No | 4 |
| WRITE | Yes | No | No | No | 5 |
| WRITE | Yes | No | Yes | Yes | 6 |
| READ | Yes | Yes | Yes | Yes | 7 |
| SUSPEND | No | Yes | No | No | 8 |

- Notes:
1. The device can be in only one state at a time. Depending on the state of the device, some operations are allowed (Yes) and others are not (No). For example, when the device is in the standby state, all operations except SUSPEND are allowed in any sector. For all device states except the erase suspend state, if an operation is allowed or disallowed in one sector, it is allowed or disallowed in all other sectors. In the erase suspend state, a PROGRAM operation is allowed in any sector except the one in which an ERASE operation has been suspended.
 2. All READ operations except READ STATUS REGISTER and READ FLAG REGISTER. When issued to a sector or subsector that is simultaneously in an erase suspend state, the READ operation is accepted, but the data output is not guaranteed until the erase has completed.
 3. All PROGRAM operations except PROGRAM OTP. In the erase suspend state, a PROGRAM operation is allowed in any sector (Yes) except the sector (No) in which an ERASE operation has been suspended.
 4. Applies to the SECTOR ERASE or SUBSECTOR ERASE operation.
 5. Applies to the following operations: WRITE STATUS REGISTER, WRITE NONVOLATILE CONFIGURATION REGISTER, PROGRAM OTP, and BULK ERASE.
 6. Applies to the WRITE ENABLE/DISABLE, CLEAR FLAG STATUS REGISTER, WRITE EXTENDED ADDRESS REGISTER, WRITE LOCK REGISTER, ENTER or EXIT 4-BYTE ADDRESS MODE, WRITE VOLATILE or ENHANCED VOLATILE CONFIGURATION REGISTER operation.
 7. Applies to the READ STATUS REGISTER or READ FLAG STATUS REGISTER operation.
 8. Applies to the PROGRAM SUSPEND or ERASE SUSPEND operation.

PROGRAM/ERASE RESUME Command

To initiate the PROGRAM/ERASE RESUME command, S# is driven LOW. The command code is input on DQ0. The operation is terminated by driving S# HIGH.

When this command is executed, the status register write in progress bit is set to 1, and the flag status register program erase controller bit is set to 0. This command is ignored if the device is not in a suspended state.

RESET Operations

Table 30: Reset Command Set

| Command | Command Code (Binary) | Command Code (Hex) | Address Bytes |
|--------------|-----------------------|--------------------|---------------|
| RESET ENABLE | 0110 0110 | 66 | 0 |
| RESET MEMORY | 1001 1001 | 99 | 0 |

RESET ENABLE and RESET MEMORY Command

To reset the device, the RESET ENABLE command must be followed by the RESET MEMORY command. To execute each command, S# is driven LOW. The command code is input on DQ0. A minimum de-selection time of ^tSHSL2 must come between the RESET ENABLE and RESET MEMORY commands or a reset is not guaranteed. When these two commands are executed and S# is driven HIGH, the device enters a power-on reset condition. A time of ^tSHSL3 is required before the device can be re-selected by driving S# LOW. It is recommended that the device exit XIP mode before executing these two commands to initiate a reset.

If a reset is initiated while a WRITE, PROGRAM, or ERASE operation is in progress or suspended, the operation is aborted and data may be corrupted.

Figure 34: RESET ENABLE and RESET MEMORY Command

Note: 1. The number of lines and rate for transmission varies with extended, dual, or quad SPI.

RESET Conditions

All volatile lock bits, the volatile configuration register, the enhanced volatile configuration register, and the extended address register are reset to the power-on reset default condition. The power-on reset condition depends on settings in the nonvolatile configuration register.

ONE TIME PROGRAMMABLE Operations

READ OTP ARRAY Command

To initiate a READ OTP ARRAY command, $S\#$ is driven LOW. The command code is input on DQ0, followed by address bytes and dummy clock cycles. Each address bit is latched in during the rising edge of C. Data is shifted out on DQ1, beginning from the specified address and at a maximum frequency of f_C (MAX) on the falling edge of the clock. The address increments automatically to the next address after each byte of data is shifted out. There is no rollover mechanism; therefore, if read continuously, after location 0x64, the device continues to output data at location 0x64. The operation is terminated by driving $S\#$ HIGH at any time during data output.

Figure 35: READ OTP Command

- Note: 1. For extended SPI protocol, $C_x = 7 + (A[\text{MAX}] + 1)$.
 For dual SPI protocol, $C_x = 3 + (A[\text{MAX}] + 1)/2$.
 For quad SPI protocol, $C_x = 1 + (A[\text{MAX}] + 1)/4$.

PROGRAM OTP ARRAY Command

To initiate the PROGRAM OTP ARRAY command, the WRITE ENABLE command must be issued to set the write enable latch bit to 1; otherwise, the PROGRAM OTP ARRAY command is ignored and flag status register bits are not set. $S\#$ is driven LOW and held LOW until the eighth bit of the last data byte has been latched in, after which it must be driven HIGH. The command code is input on DQ0, followed by address bytes and at least one data byte. Each address bit is latched in during the rising edge of the clock. When $S\#$ is driven HIGH, the operation, which is self-timed, is initiated; its duration is t_{POTP} . There is no rollover mechanism; therefore, after a maximum of 65 bytes are latched in and subsequent bytes are discarded.

PROGRAM OTP ARRAY programs, at most, 64 bytes to the OTP memory area and one OTP control byte. When the operation is in progress, the write in progress bit is set to 1.

The write enable latch bit is cleared to 0, whether the operation is successful or not, and the status register and flag status register can be polled for the operation status. When the operation completes, the write in progress bit is cleared to 0.

If the operation times out, the write enable latch bit is reset and the program fail bit is set to 1. If S# is not driven HIGH, the command is not executed, flag status register error bits are not set, and the write enable latch remains set to 1.

The OTP control byte (byte 64) is used to permanently lock the OTP memory array.

Table 31: OTP Control Byte (Byte 64)

| Bit | Name | Settings | Description |
|-----|------------------|---|---|
| 0 | OTP control byte | 0 = Locked 1 = Unlocked (Default) | Used to permanently lock the 64B OTP array. When bit 0 = 1, the 64B OTP array can be programmed. When bit 0 = 0, the 64B OTP array is read only. Once bit 0 has been programmed to 0, it can no longer be changed to 1. PROGRAM OTP ARRAY is ignored, write enable latch bit remains set, and flag status register bits 1 and 4 are set. |

Figure 36: PROGRAM OTP Command

Note: 1. For extended SPI protocol, $C_x = 7 + (A[MAX] + 1)$.
 For dual SPI protocol, $C_x = 3 + (A[MAX] + 1)/2$.
 For quad SPI protocol, $C_x = 1 + (A[MAX] + 1)/4$.

ADDRESS MODE Operations – Enter and Exit 4-Byte Address Mode

ENTER or EXIT 4-BYTE ADDRESS MODE Command

Both ENTER 4-BYTE ADDRESS MODE and EXIT 4-BYTE ADDRESS MODE commands share the same requirements.

To enter or exit the 4-byte address mode, the WRITE ENABLE command must be executed to set the write enable latch bit to 1.

Note: The WRITE ENABLE command is not necessary for line items that enable the additional RESET# pin.

S# must be driven LOW. The command must be input on DQ n . The effect of the command is immediate; after the command has been executed, the write enable latch bit is cleared to 0.

The default address mode is three bytes, and the device returns to the default upon exiting the 4-byte address mode.

ENTER or EXIT QUAD Command

The ENTER or EXIT QUAD (QPI) command is only available for line items that enable the additional RESET# pin. To initiate this command, the WRITE ENABLE command must not be executed. S# must be driven LOW, and the command must be input on DQ n . The effect of the command is immediate.

XIP Mode

Execute-in-place (XIP) mode allows the memory to be read by sending an address to the device and then receiving the data on one, two, or four pins in parallel, depending on the customer requirements. XIP mode offers maximum flexibility to the application, saves instruction overhead, and reduces random access time.

Activate or Terminate XIP Using Volatile Configuration Register

Applications that boot in SPI and must switch to XIP use the volatile configuration register. XIP provides faster memory READ operations by requiring only an address to execute, rather than a command code and an address.

To activate XIP requires two steps. First, enable XIP by setting volatile configuration register bit 3 to 0. Next, drive the XIP confirmation bit to 0 during the next FAST READ operation. XIP is then active. Once in XIP, any command that occurs after S# is toggled requires only address bits to execute; a command code is not necessary, and device operations use the SPI protocol that is enabled. XIP is terminated by driving the XIP confirmation bit to 1. The device automatically resets volatile configuration register bit 3 to 1.

Note: For devices with basic XIP, indicated by a part number feature set digit of 2 or 4, it is not necessary to set the volatile configuration register bit 3 to 0 to enable XIP. Instead, it is enabled by setting the XIP confirmation bit to 0 during the first dummy clock cycle after any FAST READ command.

Activate or Terminate XIP Using Nonvolatile Configuration Register

Applications that must boot directly in XIP use the nonvolatile configuration register. To enable a device to power-up in XIP using the nonvolatile configuration register, set nonvolatile configuration register bits [11:9]. Settings vary according to protocol, as explained in the Nonvolatile Configuration Register section. Because the device boots directly in XIP, the confirmation bit is already set to 0, and after the next power cycle, XIP is active. Once in XIP, a command code is unnecessary, and device operations use the SPI protocol currently enabled. XIP is terminated by driving the XIP confirmation bit to 1.

Figure 37: XIP Mode Directly After Power-On

Note: 1. Xb is the XIP confirmation bit and should be set as follows: 0 to keep XIP state; 1 to exit XIP mode and return to standard read mode.

Confirmation Bit Settings Required to Activate or Terminate XIP

The XIP confirmation bit setting activates or terminates XIP after it has been enabled or disabled. This bit is the value on DQ0 during the first dummy clock cycle in the FAST READ operation. XIP requires at least one additional clock cycle to send the XIP confirmation bit to the memory on DQ0 during the first dummy clock cycle.

Table 32: XIP Confirmation Bit

| Bit Value | Description |
|-----------|---|
| 0 | Activates XIP: While this bit is 0, XIP remains activated. |
| 1 | Terminates XIP: When this bit is set to 1, XIP is terminated and the device returns to SPI. |

Table 33: Effects of Running XIP in Different Protocols

| Protocol | Effect | Notes |
|---------------------------|---|-------|
| Extended I/O, Dual I/O | In a device with a dedicated part number where RST# is enabled, a LOW pulse on RST# resets XIP and the device to the state it was in previous to the last power-up, as defined by the nonvolatile configuration register. | |
| Dual I/O | Values of DQ1 during the first dummy clock cycle are "Don't Care." | |
| Quad I/O | Values of DQ[3:1] during the first dummy clock cycle are "Don't Care." In a device with a dedicated part number where RST# is enabled, a LOW pulse on RST# resets XIP and the device to the state it was in previous to the last power-up, as defined by the nonvolatile configuration register. | 1 |

Note: 1. In a device with a dedicated part number, memory can be reset only when the device is deselected.

Terminating XIP After a Controller and Memory Reset

The system controller and the device can become out of synchronization if, during the life of the application, the system controller is reset without the device being reset. In such a case, the controller can reset the memory to power-on reset if the memory has reset functionality. (Reset is available in devices with a dedicated part number.)

If reset functionality is not available, has been disabled, or is not supported by the controller, the controller must execute the following sequence to terminate XIP in the memory device. In quad I/O protocol, drive DQ0 = 1 with S# held LOW for seven clock cycles; S# must driven HIGH before the eighth clock cycle. In dual I/O protocol, drive DQ0 = 1 with S# held LOW for 13 clock cycles; S# must driven HIGH before the fourteenth clock cycle. If the device is in extended protocol, drive DQ0 = 1 with S# held LOW for 25 clock cycles; S# must driven HIGH before the twenty-sixth clock cycle.

These sequences cause the controller to set the XIP confirmation bit to 1, thereby terminating XIP. However, it does not reset the device or interrupt PROGRAM/ERASE operations that may be in progress. After terminating XIP, the controller must execute RESET ENABLE and RESET MEMORY to implement a software reset and reset the device.

Power Up and Power Down

Power Up and Power Down Requirements

At power-up and power-down, the device must not be selected; that is, S# must follow the voltage applied on V_{CC} until V_{CC} reaches the correct values: $V_{CC,min}$ at power-up and V_{SS} at power-down.

To avoid data corruption and inadvertent WRITE operations during power-up, a power-on reset circuit is included. The logic inside the device is held to RESET while V_{CC} is less than the power-on reset threshold voltage shown here; all operations are disabled, and the device does not respond to any instruction. During a standard power-up phase, the device ignores all commands except READ STATUS REGISTER and READ FLAG STATUS REGISTER. These operations can be used to check the memory internal state. After power-up, the device is in standby power mode; the write enable latch bit is reset; the write in progress bit is reset; and the lock registers are configured as: (write lock bit, lock down bit) = (0,0).

Normal precautions must be taken for supply line decoupling to stabilize the V_{CC} supply. Each device in a system should have the V_{CC} line decoupled by a suitable capacitor (typically 100nF) close to the package pins. At power-down, when V_{CC} drops from the operating voltage to below the power-on-reset threshold voltage shown here, all operations are disabled and the device does not respond to any command.

Note: If power-down occurs while a WRITE, PROGRAM, or ERASE cycle is in progress, data corruption may result.

V_{PPH} must be applied only when V_{CC} is stable and in the $V_{CC,min}$ to $V_{CC,max}$ voltage range.

Figure 38: Power-Up Timing

Table 34: Power-Up Timing and V_{WI} Threshold

Note 1 applies to entire table

| Symbol | Parameter | Min | Max | Unit |
|-----------|---|-----|-----|---------|
| t_{VTR} | $V_{CC,min}$ to read | – | 150 | μs |
| t_{VTW} | $V_{CC,min}$ to device fully accessible | – | 150 | μs |
| V_{WI} | Write inhibit voltage | 1.5 | 2.5 | V |

Note: 1. Parameters listed are characterized only.

Power Loss Recovery Sequence

If a power loss occurs during a WRITE NONVOLATILE CONFIGURATION REGISTER command, after the next power-on, the device might begin in an undetermined state (XIP mode or an unnecessary protocol). If this occurs, until the next power-up, a recovery sequence must reset the device to a fixed state (extended SPI protocol without XIP). After the recovery sequence, the issue should be resolved definitively by running the WRITE NONVOLATILE CONFIGURATION REGISTER command again. The recovery sequence is composed of two parts that must be run in the correct order. During the entire sequence, t_{SHSL2} must be at least 50ns. The first part of the sequence is DQ0 (PAD DATA) and DQ3 (PAD HOLD) equal to 1 for the situations listed below:

- 7 clock cycles within S# LOW (S# becomes HIGH before 8th clock cycle)
- + 9 clock cycles within S# LOW (S# becomes HIGH before 10th clock cycle)
- + 13 clock cycles within S# LOW (S# becomes HIGH before 14th clock cycle)
- + 17 clock cycles within S# LOW (S# becomes HIGH before 18th clock cycle)
- + 25 clock cycles within S# LOW (S# becomes HIGH before 26th clock cycle)
- + 33 clock cycles within S# LOW (S# becomes HIGH before 34th clock cycle)

The second part of the sequence is exiting from dual or quad SPI protocol by using the following FFh sequence: DQ0 and DQ3 equal to 1 for 8 clock cycles within S# LOW; S# becomes HIGH before 9th clock cycle.

After this two-part sequence the extended SPI protocol is active.

Initial Delivery Status

The device is delivered as follows:

- Memory array erased: All bits are set to 1 (each byte contains FFh)
- Status register contains 00h (all status register bits are 0)
- Nonvolatile configuration register (NVCR) bits all erased (FFFFh)

AC Reset Specifications

Table 35: AC RESET Conditions

Note 1 applies to entire table

| Parameter | Symbol | Conditions | Min | Typ | Max | Unit |
|------------------------------|--------------|--|-----|-------------|-----|---------|
| Reset pulse width | t_{RLRH}^2 | | 50 | – | – | ns |
| Reset recovery time | t_{RHSL} | Device deselected (S# HIGH) and is in XIP mode | – | – | 40 | ns |
| | | Device deselected (S# HIGH) and is in standby mode | – | – | 40 | ns |
| | | Commands are being decoded, any READ operations are in progress or any WRITE operation to volatile registers are in progress | – | – | 40 | ns |
| | | Any device array PROGRAM/ERASE/SUSPEND/RESUME, PROGRAM OTP, NONVOLATILE SECTOR LOCK, and ERASE NONVOLATILE SECTOR LOCK ARRAY operations are in progress | – | – | 30 | μ s |
| | | While a WRITE STATUS REGISTER operation is in progress | – | t_W | – | ms |
| | | While a WRITE NONVOLATILE CONFIGURATION REGISTER operation is in progress | – | t_{WNVCR} | – | ms |
| | | On completion or suspension of a SUBSECTOR ERASE operation | – | t_{SSE} | – | s |
| Software reset recovery time | t_{SHSL3} | Device deselected (S# HIGH) and is in standby mode | – | – | 90 | ns |
| | | On completion of any device array PROGRAM/ERASE/SUSPEND/RESUME, SECTOR ERASE, PROGRAM OTP, PAGE PROGRAM, DUAL INPUT FAST PROGRAM, EXTENDED DUAL INPUT FAST PROGRAM, QUAD INPUT FAST PROGRAM, or EXTENDED QUAD INPUT FAST PROGRAM operation | – | – | 30 | μ s |
| | | On completion or suspension of a WRITE STATUS REGISTER operation | – | t_W | – | ms |
| | | On completion or suspension of a WRITE NONVOLATILE CONFIGURATION REGISTER operation | – | t_{WNVCR} | – | ms |
| | | On completion or suspension of a SUBSECTOR ERASE operation | – | t_{SSE} | – | s |
| S# deselect to reset valid | t_{SHRV} | Deselect to reset valid in quad output or in QIO-SPI | 2 | – | – | ns |

- Notes: 1. Values are guaranteed by characterization; not 100% tested.
2. The device reset is possible but not guaranteed if $t_{RLRH} < 50$ ns.

Absolute Ratings and Operating Conditions

Stresses greater than those listed may cause permanent damage to the device. This is a stress rating only. Exposure to absolute maximum rating for extended periods may adversely affect reliability. Stressing the device beyond the absolute maximum ratings may cause permanent damage.

Table 36: Absolute Ratings

| Symbol | Parameter | Min | Max | Units | Notes |
|-------------------|--|-------|-----------------------|-------|-------|
| T _{STG} | Storage temperature | -65 | 150 | °C | |
| T _{LEAD} | Lead temperature during soldering | - | See note 1 | °C | |
| V _{CC} | Supply voltage | -0.6 | 4.0 | V | |
| V _{PP} | Fast program/erase voltage | -0.2 | 10 | V | |
| V _{IO} | Input/output voltage with respect to ground | -0.6 | V _{CC} + 0.6 | V | 3, 4 |
| V _{ESD} | Electrostatic discharge voltage (human body model) | -2000 | 2000 | V | 2 |

- Notes:
1. Compliant with JEDEC Standard J-STD-020C (for small-body, Sn-Pb or Pb assembly), RoHS, and the European directive on Restrictions on Hazardous Substances (RoHS) 2002/95/EU.
 2. JEDEC Standard JESD22-A114A (C1 = 100pF, R1 = 1500Ω, R2 = 500Ω).
 3. During signal transitions, minimum voltage may undershoot to -1V for periods less than 10ns.
 4. During signal transitions, maximum voltage may overshoot to V_{CC} + 1V for periods less than 10ns.

Table 37: Operating Conditions

| Symbol | Parameter | Min | Max | Units |
|------------------|-----------------------------------|-----|-----|-------|
| V _{CC} | Supply voltage | 2.7 | 3.6 | V |
| V _{PPH} | Supply voltage on V _{PP} | 8.5 | 9.5 | V |
| T _A | Ambient operating temperature | -40 | 85 | °C |

Table 38: Input/Output Capacitance

Note 1 applies to entire table

| Symbol | Description | Test Condition | Min | Max | Units |
|---------------------|--|-----------------------|-----|-----|-------|
| C _{IN/OUT} | Input/output capacitance (DQ0/DQ1/DQ2/DQ3) | V _{OUT} = 0V | - | 8 | pF |
| C _{IN} | Input capacitance (other pins) | V _{IN} = 0V | - | 6 | pF |

- Note: 1. These parameters are sampled only, not 100% tested. T_A = 25°C at 54 MHz.

Table 39: AC Timing Input/Output Conditions

| Symbol | Description | Min | Max | Units | Notes |
|--------|----------------------------------|----------------------------|------------|-------|-------|
| C_L | Load capacitance | 30 | 30 | pF | 1 |
| - | Input rise and fall times | - | 5 | ns | |
| | Input pulse voltages | $0.2V_{CC}$ to $0.8V_{CC}$ | | V | 2 |
| | Input timing reference voltages | $0.3V_{CC}$ to $0.7V_{CC}$ | | V | |
| | Output timing reference voltages | $V_{CC}/2$ | $V_{CC}/2$ | V | |

- Notes: 1. Output buffers are configurable by user.
2. For quad/dual operations: 0V to V_{CC} .

Figure 46: AC Timing Input/Output Reference Levels

- Note: 1. $0.8V_{CC} = V_{CC}$ for dual/quad operations; $0.2V_{CC} = 0V$ for dual/quad operations.

DC Characteristics and Operating Conditions

Table 40: DC Current Characteristics and Operating Conditions

| Parameter | Symbol | Test Conditions | Min | Max | Unit |
|---|--|--|-----|---------|---------|
| Input leakage current | I_{LI} | | – | ± 2 | μA |
| Output leakage current | I_{LO} | | – | ± 2 | μA |
| Standby current | I_{CC1} | $S = V_{CC}, V_{IN} = V_{SS}$ or V_{CC} | – | 100 | μA |
| Standby current | I_{CC1} (automotive) ¹ | $S = V_{CC}, V_{IN} = V_{SS}$ or V_{CC} | – | 250 | μA |
| Operating current (fast-read extended I/O) | I_{CC3} | $C = 0.1V_{CC}/0.9V_{CC}$ at 108 MHz, DQ1 = open | – | 15 | mA |
| | | $C = 0.1V_{CC}/0.9V_{CC}$ at 54 MHz, DQ1 = open | – | 6 | mA |
| Operating current (fast-read dual I/O) | | $C = 0.1V_{CC}/0.9V_{CC}$ at 108 MHz | – | 18 | mA |
| Operating current (fast-read quad I/O) | | $C = 0.1V_{CC}/0.9V_{CC}$ at 108 MHz | – | 20 | mA |
| Operating current (program) | I_{CC4} | $S\# = V_{CC}$ | – | 20 | mA |
| Operating current (write status register) | I_{CC5} | $S\# = V_{CC}$ | – | 20 | mA |
| Operating current (erase) | I_{CC6} | $S\# = V_{CC}$ | – | 20 | mA |

Note: 1. Automotive temperature range = $-40^{\circ}C$ to $125^{\circ}C$; See also the Part Number Information table.

Table 41: DC Voltage Characteristics and Operating Conditions

| Parameter | Symbol | Conditions | Min | Max | Unit |
|---------------------|----------|----------------------|----------------|----------------|------|
| Input low voltage | V_{IL} | | –0.5 | $0.3V_{CC}$ | V |
| Input high voltage | V_{IH} | | $0.7V_{CC}$ | $V_{CC} + 0.4$ | V |
| Output low voltage | V_{OL} | $I_{OL} = 1.6mA$ | – | 0.4 | V |
| Output high voltage | V_{OH} | $I_{OH} = -100\mu A$ | $V_{CC} - 0.2$ | – | V |

AC Characteristics and Operating Conditions

Table 42: AC Characteristics and Operating Conditions

| Parameter | Symbol | Min | Typ ¹ | Max | Unit | Notes | |
|---|---------------------|-------------------|------------------|-----|------|-------|--|
| Clock frequency for all commands other than READ (SPI-ER, QIO-SPI protocol) | f _C | DC | – | 108 | MHz | | |

Table 42: AC Characteristics and Operating Conditions (Continued)

| Parameter | Symbol | Min | Typ ¹ | Max | Unit | Notes |
|---|--------------|-----|----------------------------------|-----|------|-------|
| WRITE VOLATILE CONFIGURATION REGISTER cycle time | t_{WVCR} | – | 40 | – | ns | |
| WRITE VOLATILE ENHANCED CONFIGURATION REGISTER cycle time | t_{WRVECR} | – | 40 | – | ns | |
| WRITE NONVOLATILE CONFIGURATION REGISTER cycle time | t_{WNVCR} | – | 0.2 | 3 | s | |
| WRITE EXTENDED ADDRESS REGISTER cycle time | t_{WREAR} | – | 40 | – | ns | |
| PAGE PROGRAM cycle time (256 bytes) | t_{PP} | – | 0.5 | 5 | ms | 7 |
| PAGE PROGRAM cycle time (n bytes) | | – | $\text{int}(n/8) \times 0.015^8$ | 5 | ms | 7 |
| PAGE PROGRAM cycle time, $V_{PP} = V_{PPH}$ (256 bytes) | | – | 0.4 | 5 | ms | 7 |
| PROGRAM OTP cycle time (64 bytes) | | – | 0.2 | – | ms | 7 |
| Subsector ERASE cycle time | t_{SSE} | – | 0.25 | 0.8 | s | |
| Sector ERASE cycle time | t_{SE} | – | 0.7 | 3 | s | |
| Sector ERASE cycle time (with $V_{PP} = V_{PPH}$) | | – | 0.6 | 3 | s | |
| Bulk ERASE cycle time | t_{BE} | – | 240 | 480 | s | |
| Bulk ERASE cycle time (with $V_{PP} = V_{PPH}$) | | – | 200 | 480 | s | |

- Notes:
1. Typical values given for $T_A = 25^\circ\text{C}$.
 2. $t_{CH} + t_{CL}$ must add up to $1/f_C$.
 3. Value guaranteed by characterization; not 100% tested.
 4. Expressed as a slew-rate.
 5. Only applicable as a constraint for a WRITE STATUS REGISTER command when STATUS REGISTER WRITE is set to 1.
 6. V_{PPH} should be kept at a valid level until the PROGRAM or ERASE operation has completed and its result (success or failure) is known.
 7. When using the PAGE PROGRAM command to program consecutive bytes, optimized timings are obtained with one sequence including all the bytes versus several sequences of only a few bytes ($1 < n < 256$).
 8. $\text{int}(A)$ corresponds to the upper integer part of A . For example $\text{int}(12/8) = 2$, $\text{int}(32/8) = 4$, $\text{int}(15.3) = 15$.

Part Number Ordering Information

Micron Serial NOR Flash devices are available in different configurations and densities. Verify valid part numbers by using Micron's part catalog search at micron.com. To compare features and specifications by device type, visit micron.com/products. Contact the factory for devices not found.

For more information on how to identify products and top-side marking by the process identification letter, refer to technical note TN-12-24, "Serial Flash Memory Device Marking for the M25P, M25PE, M25PX, and N25Q Product Families."

Table 43: Part Number Information

| Part Number Category | Category Details | Notes |
|---------------------------|---|-------|
| Device type | N25Q = Serial NOR Flash memory, Multiple Input/Output (Single, Dual, Quad I/O), XIP | |
| Density | 256 = 256Mb | |
| Technology | A = 65nm | |
| Feature set | 1 = Byte addressability; HOLD pin; Micron XIP | 1 |
| | 2 = Byte addressability; HOLD pin; Basic XIP | 1 |

Revision History

Rev. X – 06/18

- Added Important Notes and Warnings section for further clarification aligning to industry standards

Rev. W – 11/16

- Change data byte for Read and Write extended address register
- Added Initial Delivery Status

Rev. V – 05/16

- Changed Typ PAGE PROGRAM cycle time (n bytes)

Rev. U – 01/15

- Changed ICC1 (automotive) in the DC Current Characteristics and Operating Conditions table

Rev. T – 03/14

- In Command Set table, updated value for Quad I/O FAST READ – DTR from 3Dh to 6Dh

Rev. S – 11/13

- Added N25Q256A83ESFA0F

Rev. R – 09/13

- Corrected block protection tables

Rev. Q – 05/13

- Changed ICC1 (grade 3) to ICC1 (automotive) in the DC Current Characteristics and Operating Conditions table, and added a footnote
- Revised maximum temperature (–40°C to 125°C) in DC Characteristics and Operating Conditions table footnote

Rev. P – 01/13

- Updated the READ ID Operation figure in READ ID Operations
- Updated ERASE Operations
- Added link to part number chart in Part Number Ordering Information
- Updated part numbers in Features

Rev. O – 12/12

- Revised part numbers to selected notes in the Command Definitions table.

Rev. N – 11/12

- Typo fix in Command Set table in Command Definitions – Dual I/O FAST READ - DTR from DBh to BDh

Rev. M – 09/12

- Added clarification notes to Signal Assignments

Rev. L – 08/12

- Additional note to Command Set table in Command Definitions
- Corrections to Commands in Command Definitions

Rev. K – 07/12

- Added I_{CC1} (grade 3) to DC Characteristics and Operating Conditions
- Removed READ FLAG STATUS related notes from Command Definitions
- Added N25Q256A13EF8A0x, N25Q256A13ESFA0x, N25Q256A13ESFH0x, N25Q256A13E12A0x to Features

Rev. J – 06/12

- Typo fix in Supported Clock Frequencies – DTR table in Nonvolatile and Volatile Registers
- Updated ^tSSE specification in AC Reset Conditions table
- Added N25Q256A83ESF40x and N25Q256A83E1240x to Features
- Added RESET pin and functionality throughout

Rev. I – 01/12

- Updated DUAL INPUT/OUTPUT FAST READ - DTR third code and added note 11; added note 12 to QUAD INPUT/OUTPUT FAST READ - DTR in the Command Set table
- Updated V_{WI} min and max specs in the Power-Up Timing and V_{WI} Threshold table

Rev. H – 11/11

- Updated Supported Clock Frequencies – STR in Nonvolatile and Volatile Registers

Rev. G – 07/11

- Added double transfer rate (DTR) mode information

Rev. F – 07/11

- Miscellaneous edits, including correction of V-PDFN 8 x 6 package and clarification of feature set option 7.

Rev. E – 05/11

- Added W# to logic diagram in Device Description
- Cross-reference update to Status Register Bit Definitions table

- Added dummy clock and quad SPI protocol information to Command Definitions notes
- Corrected Manufacturer ID values
- Removed extraneous frequency requirement note from READ IDENTIFICATIONS Operations
- Corrected timing diagram notes in READ MEMORY Operations
- Corrected timing diagram notes in PROGRAM Operations
- Changed WIP = 1 to WIP = 0 in Power-Up Timing diagram in Power Up and Power Down

Rev. D – 05/11

- Micron rebrand

Rev. C – 11/10

- Added Reset Enable; Read Extended Address Register, Dual I/O; Reset Enable and Reset Memory, Dual I/O; Read Extended Address Register, Quad I/O; Reset Enable and Reset Memory, Quad I/O

Rev. B – 08/10

- Added information to clarify 4-Byte Address Mode; added reset information, including the Reset Enable figure and new rows the Reset Conditions table

Rev. A – 06/10

- Initial release
