## Low Power Consumption LDO ME6209 Series

## General Description

The ME6209 series are a group of positive voltage output，three－pin regulator，that provide a high current even when the input／output Voltage differential is small．Low power consumption and high accuracy is achieved through CMOS technology．They allow input voltages as high as 18 V ．

## Features

－Ultra low quiescent current：3．0uA（typ）
－High input voltage（up to 18 V ）
－Low dropout voltage ： $80 \mathrm{mV} @ l o u t=40 \mathrm{~mA}$

$$
\left(\mathrm{V}_{\text {OUT }}=3.3 \mathrm{~V}\right)
$$

－Output voltage accuracy：$\pm 2 \%$
－Maximum output current： 250 mA
（ within max．power dissipation， $\mathrm{V}_{\text {OUT }}=3.3 \mathrm{~V}$ ）
－Low temperature coefficient
－Package：SOT23－3，TO－92，SOT89－3

## Selection Guide

## Typical Application

－Cameras，video recorders
－Voltage regulator for microprocessor
－Voltage regulator for LAN cards
－Wireless communication equipment
－Audio／Video equipment

## Typical Application Circuit

## Pin Configuration

Pin Assignment
ME6209AXX

| Pin Number |  | Pin Name | Functions |
| :---: | :---: | :---: | :---: |
| SOT89－3／TO－92 | SOT23－3 |  |  |
| 1 | 1 | $\mathrm{~V}_{\text {SS }}$ | Ground |
| 2 | 3 | $\mathrm{~V}_{\text {IN }}$ | Input |
| 3 | 2 | $\mathrm{~V}_{\text {OUT }}$ | Output |

## Absolute Maximum Ratings

| Parameter |  | Symbol | Ratings | Units |
| :---: | :---: | :---: | :---: | :---: |
| Input Voltage |  | $\mathrm{V}_{\text {IN }}$ | 18 | V |
| Output Voltage |  | $\mathrm{V}_{\text {OUT }}$ | Vss－0．3～V $\mathrm{V}_{\text {IN }}+0.3$ | V |
| Output Current |  | lout | 500 | mA |
| Operating Temperature Range |  | TopR | $-40 \sim+85$ | ${ }^{\circ} \mathrm{C}$ |
| Storage Temperature Range |  | $\mathrm{T}_{\text {STG }}$ | $-40 \sim+125$ | ${ }^{\circ} \mathrm{C}$ |
| Power Dissipation | SOT89－3 | PD | 500 | mW |
|  | TO－92 |  | 500 |  |
|  | SOT23－3 |  | 300 |  |

## Block Diagram

## Electrical Characteristics

Note ：
1． $\mathrm{V}_{\text {Out }}(\mathrm{T})$ ：Specified Output Voltage
2． $\mathrm{V}_{\text {OUT }}(\mathrm{E})$ ：Effective Output Voltage（ie．The output voltage when＂ $\mathrm{V}_{\text {OUT }}(\mathrm{T})+1.0 \mathrm{~V}$＂is provided at the Vin pin while maintaining a certain Iout value．）
3． $\mathrm{V}_{\text {DIF }}: \mathrm{V}_{\text {IN } 1}-\mathrm{V}_{\text {OUT }}(\mathrm{E})$＇
$\mathrm{V}_{\text {IN1 }}$ ：The input voltage when $\mathrm{V}_{\text {Out }}(\mathrm{E})$＇appears as input voltage is gradually decreased．
$\mathrm{V}_{\text {OUt }}$（ E ）＇＝A voltage equal to $98 \%$ of the output voltage whenever an amply stabilized lout and $\left\{\mathrm{V}_{\text {OUT }}(\mathrm{T})+\right.$ 1.0 V \} is input.

## Precautions

－During the test，if AC／DC power supply and the ceramic chip capacitors collocation are used，there may be serious voltage spike phenomenon instantaneously．When the power supply access to 16 V ，the voltage is rushed to about 30 V instantaneously．Because of exceeding the limit voltage of chip，the chip is damaged．If you string a small resistance of 1 ohm in the input end during the test，the peak phenomenon can be avoided．
－In the test，there is serious burr phenomenon only when the AC／DC power is used with ceramic chip capacitors．But electrolytic capacitors and tantalum capacitance won＇t appear above phenomenon．Please be sure to pay attention to this point when you use AC／DC power．
－In normal use，when any type of capacitor is used with battery or the supply of fire power，the above phenomenon doesn＇t occur．
