

**Features**

August 2005

- 2.7 - 3.6 volt operation
- Complete DTMF receiver
- Low power consumption
- Internal gain setting amplifier
- Adjustable guard time
- Central office quality
- Power-down mode
- Inhibit mode
- Functionally compatible with Zarlink's MT8870D

**Ordering Information**

MT88L70AE	18 Pin PDIP	Tubes
MT88L70AS	18 Pin SOIC	Tubes

**Applications**

- Paging systems
- Repeater systems/mobile radio
- Credit card systems
- Remote control
- Personal computers
- Telephone answering machine

**Description**

The MT88L70 is a complete 3 Volt, DTMF receiver integrating both the bandsplit filter and digital decoder functions. The filter section uses switched capacitor techniques for high and low group filters; the decoder uses digital counting techniques to detect and decode all 16 DTMF tone-pairs into a 4-bit code. External component count is minimized by on chip provision of a differential input amplifier, clock oscillator and latched three-state bus interface.

**Figure 1 - Functional Block Diagram**

Figure 2 - Pin Connections

## Pin Description

Pin #		Name	Description
18	20		
1	1	IN+	<b>Non-Inverting Op-Amp (Input).</b>
2	2	IN-	<b>Inverting Op-Amp (Input).</b>
3	3	GS	<b>Gain Select.</b> Gives access to output of front end differential amplifier for connection of feedback resistor.
4	4	V <sub>Ref</sub>	<b>Reference Voltage (Output).</b> Nominally V <sub>DD</sub> /2 is used to bias inputs at mid-rail (see Figure 5 and Figure 6).
5	5	INH	<b>Inhibit (Input).</b> Logic high inhibits the detection of tones representing characters A, B, C and D. This pin input is internally pulled down.
6	6	PWDN	<b>Power Down (Input).</b> Active high. Powers down the device and inhibits the oscillator. This pin input is internally pulled down.
7	8	OSC1	<b>Clock (Input).</b>
8	9	OSC2	<b>Clock (Output).</b> A 3.579545 MHz crystal connected between pins OSC1 and OSC2 completes the internal oscillator circuit.
9	10	V <sub>SS</sub>	<b>Ground (Input).</b> 0 V typical.
10	11	TOE	<b>Three State Output Enable (Input).</b> Logic high enables the outputs Q1-Q4. This pin is pulled up internally.
11-14	12-15	Q1-Q4	<b>Three State Data (Output).</b> When enabled by TOE, provide the code corresponding to the last valid tone-pair received (see Table 1). When TOE is logic low, the data outputs are high impedance.
15	17	StD	<b>Delayed Steering (Output).</b> Presents a logic high when a received tone-pair has been registered and the output latch updated; returns to logic low when the voltage on St/GT falls below V <sub>TSt</sub> .
16	18	ESt	<b>Early Steering (Output).</b> Presents a logic high once the digital algorithm has detected a valid tone pair (signal condition). Any momentary loss of signal condition will cause ESt to return to a logic low.

## Pin Description

Pin #		Name	Description
18	20		
17	19	St/GT	<b>Steering Input/Guard time (Output) Bidirectional.</b> A voltage greater than $V_{TSt}$ detected at St causes the device to register the detected tone pair and update the output latch. A voltage less than $V_{TSt}$ frees the device to accept a new tone pair. The GT output acts to reset the external steering time-constant; its state is a function of ESt and the voltage on St.
18	20	$V_{DD}$	<b>Positive power supply (Input).</b> +3 V typical.
	7, 16	NC	No Connection.

## Functional Description

The MT88L70 monolithic DTMF receiver offers small size, low power consumption and high performance, with 3 volt operation. Its architecture consists of a bandsplit filter section, which separates the high and low group tones, followed by a digital counting section which verifies the frequency and duration of the received tones before passing the corresponding code to the output bus.

### Filter Section

Separation of the low-group and high group tones is achieved by applying the DTMF signal to the inputs of two sixth-order switched capacitor bandpass filters, the bandwidths of which correspond to the low and high group frequencies. The filter section also incorporates notches at 350 and 440 Hz for exceptional dial tone rejection. Each filter output is followed by a single order switched capacitor filter section which smooths the signals prior to limiting. Limiting is performed by high-gain comparators which are provided with hysteresis to prevent detection of unwanted low-level signals. The outputs of the comparators provide full rail logic swings at the frequencies of the incoming DTMF signals.

### Decoder Section

Following the filter section is a decoder employing digital counting techniques to determine the frequencies of the incoming tones and to verify that they correspond to standard DTMF frequencies. A complex averaging algorithm protects against tone simulation by extraneous signals such as voice while providing tolerance to small frequency deviations and variations. This averaging algorithm has been developed to ensure an optimum combination of immunity to talk-off and tolerance to the presence of interfering frequencies (third tones) and noise. When the detector recognizes the presence of two valid tones (this is referred to as the "signal condition" in some industry specifications) the "Early Steering" (ESt) output will go to an active state. Any subsequent loss of signal condition will cause ESt to assume an inactive state (see "Steering Circuit").

### Steering Circuit

Before registration of a decoded tone pair, the receiver checks for a valid signal duration (referred to as character recognition condition). This check is performed by an external RC time constant driven by ESt. A logic high on ESt causes  $v_c$  (see Figure 3) to rise as the capacitor discharges. Provided signal condition is maintained (ESt remains high) for the validation period ( $t_{GTP}$ ),  $v_c$  reaches the threshold ( $V_{TSt}$ ) of the steering logic to register the tone pair, latching its corresponding 4-bit code (see Table 1) into the output latch. At this point the GT output is activated and drives  $v_c$  to  $V_{DD}$ . GT continues to drive high as long as ESt remains high. Finally, after a short delay to allow the output latch to settle, the delayed steering output flag (StD) goes high, signalling that a received tone pair has been registered. The contents of the output latch are made available on the 4-bit output bus by raising the three state control input (TOE) to a logic high. The steering circuit works in reverse to validate the interdigit pause between signals. Thus, as well as rejecting signals too short to be considered valid, the receiver will tolerate signal interruptions (dropout) too short to be considered a valid pause. This facility, together with the capability of selecting

the steering time constants externally, allows the designer to tailor performance to meet a wide variety of system requirements.

Digit	TOE	INH	Est	Q <sub>4</sub>	Q <sub>3</sub>	Q <sub>2</sub>	Q <sub>1</sub>

**Table 1 - Functional Decode Table**

L=LOGIC LOW, H=LOGIC HIGH, Z=HIGH IMPEDANCE  
X = DON'T CARE

**Guard Time Adjustment**

In many situations not requiring selection of tone duration and interdigital pause, the simple steering circuit shown in Figure 3 is applicable. Component values are chosen according to the formula:

$$t_{REC} = t_{DP} + t_{GTP}$$

$$t_{ID} = t_{DA} + t_{GTA}$$

The value of  $t_{DP}$  is a device parameter (see Figure 7) and  $t_{REC}$  is the minimum signal duration to be recognized by the receiver. A value for C of 0.1  $\mu$ F is recommended for most applications, leaving R to be selected by the designer.

Figure 3 - Basic Steering Circuit

Different steering arrangements may be used to select independently the guard times for tone present ( $t_{GTP}$ ) and tone absent ( $t_{GTA}$ ). This may be necessary to meet system specifications which place both accept and reject limits on both tone duration and interdigital pause. Guard time adjustment also allows the designer to tailor system parameters such as talk off and noise immunity. Increasing  $t_{REC}$  improves talk-off performance since it reduces the probability that tones simulated by speech will maintain signal condition long enough to be registered. Alternatively, a relatively short  $t_{REC}$  with a long  $t_{DO}$  would be appropriate for extremely noisy environments where fast acquisition time and immunity to tone drop-outs are required. Design information for guard time adjustment is shown in Figure 4.

**Power-down and Inhibit Mode**

A logic high applied to pin 6 (PWDN) will power down the device to minimize the power consumption in a standby mode. It stops the oscillator and the functions of the filters.

Inhibit mode is enabled by a logic high input to the pin 5 (INH). It inhibits the detection of tones representing characters A, B, C, and D. The output code will remain the same as the previous detected code (see Table 1).

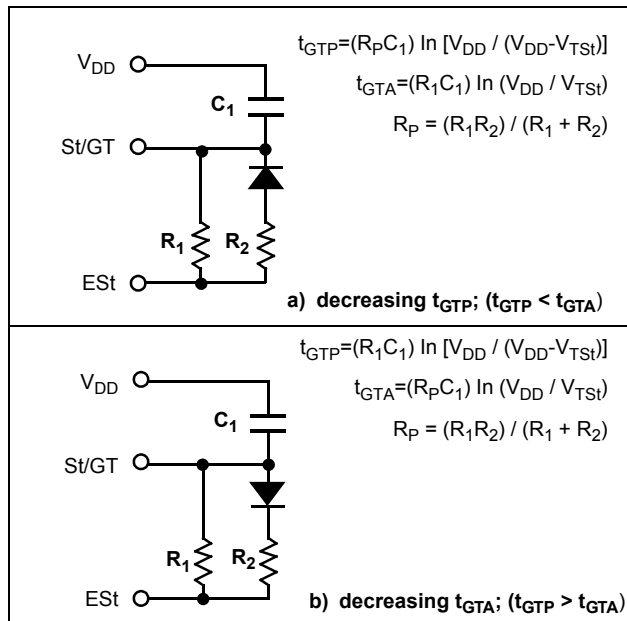

Figure 4 - Guard Time Adjustment

### Differential Input Configuration

The input arrangement of the MT88L70 provides a differential-input operational amplifier as well as a bias source ( $V_{Ref}$ ) which is used to bias the inputs at mid-rail. Provision is made for connection of a feedback resistor to the op-amp output (GS) for adjustment of gain. In a single-ended configuration, the input pins are connected as shown in Figure 6 with the op-amp connected for unity gain and  $V_{Ref}$  biasing the input at  $1/2V_{DD}$ . Figure 5 shows the differential configuration, which permits the adjustment of gain with the feedback resistor  $R_5$ .

Figure 5 - Differential Input Configuration

### Crystal Oscillator

The internal clock circuit is completed with the addition of an external 3.579545 MHz crystal and is connected as shown in Figure 6 (Single-ended Input Configuration).

**Applications**

A single-ended input configuration is shown in Figure 6. For applications with differential signal inputs the circuit shown in Figure 5 may be used.

**Figure 6 - Single-Ended Input Configuration**

**Absolute Maximum Ratings**<sup>†</sup>

	Parameter	Symbol	Min.	Max.	Units
1	DC Power Supply Voltage	$V_{DD}$		7	V
2	Voltage on any pin	$V_I$	$V_{SS}-0.3$	$V_{DD}+0.3$	V

<sup>‡</sup> Typical figures are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.

**\*NOTES**

1. dBm= decibels above or below a reference power of 1 mW into a 600 ohm load.
2. Digit sequence consists of all DTMF tones.
3. Tone duration= 40 ms, tone pause= 40 ms.
4. Signal condition consists of nominal DTMF frequencies.
5. Both tones in composite signal have an equal amplitude.
6. Tone pair is deviated by  $\pm 1.5\% \pm 2\text{ Hz}$ .
7. Bandwidth limited (3 kHz) Gaussian noise.
8. The precise dial tone frequencies are (350 Hz and 440 Hz)  $\pm 2\%$ .
9. For an error rate of better than 1 in 10,000.
10. Referenced to lowest level frequency component in DTMF signal.
11. Referenced to the minimum valid accept level.
12. Guaranteed by design and characterization.

**AC Electrical Characteristics** -  $V_{DD} = 3.0\text{ V} \pm 20\% / -10\%$ ,  $V_{SS} = 0\text{ V}$ ,  $-40^{\circ}\text{C} \leq T_o \leq +85^{\circ}\text{C}$ , using Test Circuit shown in Figure 6.

<sup>‡</sup> Typical figures are at 25°C and are for design aid only: not guaranteed and not subject to production testing.

**\*NOTES:**

- Used for guard-time calculation purposes only and tested at -4 dBm.
- These, user adjustable parameters, are not device specifications. The adjustable settings of these minimums and maximums are recommendations based upon network requirements.
- With valid tone present at input,  $t_{PU}$  equals time from PDWN going low until ESt going high.

**EXPLANATION OF EVENTS**

- A) TONE BURSTS DETECTED, TONE DURATION INVALID, OUTPUTS NOT UPDATED.
- B) TONE #n DETECTED, TONE DURATION VALID, TONE DECODED AND LATCHED IN OUTPUTS.
- C) END OF TONE #n DETECTED, TONE ABSENT DURATION VALID, OUTPUTS REMAIN LATCHED UNTIL NEXT VALID TONE.
- D) OUTPUTS SWITCHED TO HIGH IMPEDANCE STATE.
- E) TONE #n+1 DETECTED, TONE DURATION VALID, TONE DECODED AND LATCHED IN OUTPUTS (CURRENTLY HIGH IMPEDANCE).
- F) ACCEPTABLE DROPOUT OF TONE #n+1, TONE ABSENT DURATION INVALID, OUTPUTS REMAIN LATCHED.
- G) END OF TONE #n+1 DETECTED, TONE ABSENT DURATION VALID, OUTPUTS REMAIN LATCHED UNTIL NEXT VALID TONE.

**EXPLANATION OF SYMBOLS**

- $V_{in}$  DTMF COMPOSITE INPUT SIGNAL.
- $Est$  EARLY STEERING OUTPUT. INDICATES DETECTION OF VALID TONE FREQUENCIES.
- $St/GT$  STEERING INPUT/GUARD TIME OUTPUT. DRIVES EXTERNAL RC TIMING CIRCUIT.
- $Q_1-Q_4$  4-BIT DECODED TONE OUTPUT.
- $StD$  DELAYED STEERING OUTPUT. INDICATES THAT VALID FREQUENCIES HAVE BEEN PRESENT/ABSENT FOR THE REQUIRED GUARD TIME THUS CONSTITUTING A VALID SIGNAL.
- $TOE$  TONE OUTPUT ENABLE (INPUT). A LOW LEVEL SHIFTS  $Q_1-Q_4$  TO ITS HIGH IMPEDANCE STATE.
- $t_{\overline{REC}}$  MAXIMUM DTMF SIGNAL DURATION NOT DETECTED AS VALID.
- $t_{REC}$  MINIMUM DTMF SIGNAL DURATION REQUIRED FOR VALID RECOGNITION.
- $t_{ID}$  MINIMUM TIME BETWEEN VALID DTMF SIGNALS.
- $t_{DO}$  MAXIMUM ALLOWABLE DROP OUT DURING VALID DTMF SIGNAL.
- $t_{DP}$  TIME TO DETECT THE PRESENCE OF VALID DTMF SIGNALS.
- $t_{DA}$  TIME TO DETECT THE ABSENCE OF VALID DTMF SIGNALS.
- $t_{GTP}$  GUARD TIME, TONE PRESENT.
- $t_{GTA}$  GUARD TIME, TONE ABSENT.

Information relating to products and services furnished herein by Zarlink Semiconductor Inc. or its subsidiaries (collectively "Zarlink") is believed to be reliable. However, Zarlink assumes no liability for errors that may appear in this publication, or for liability otherwise arising from the application or use of any such information, product or service or for any infringement of patents or other intellectual property rights owned by third parties which may result from such application or use. Neither the supply of such information or purchase of product or service conveys any license, either express or implied, under patents or other intellectual property rights owned by Zarlink or licensed from third parties by Zarlink, whatsoever. Purchasers of products are also hereby notified that the use of product in certain ways or in combination with Zarlink, or non-Zarlink furnished goods or services may infringe patents or other intellectual property rights owned by Zarlink.

This publication is issued to provide information only and (unless agreed by Zarlink in writing) may not be used, applied or reproduced for any purpose nor form part of any order or contract nor to be regarded as a representation relating to the products or services concerned. The products, their specifications, services and other information appearing in this publication are subject to change by Zarlink without notice. No warranty or guarantee express or implied is made regarding the capability, performance or suitability of any product or service. Information concerning possible methods of use is provided as a guide only and does not constitute any guarantee that such methods of use will be satisfactory in a specific piece of equipment. It is the user's responsibility to fully determine the performance and suitability of any equipment using such information and to ensure that any publication or data used is up to date and has not been superseded. Manufacturing does not necessarily include testing of all functions or parameters. These products are not suitable for use in any medical products whose failure to perform may result in significant injury or death to the user. All products and materials are sold and services provided subject to Zarlink's conditions of sale which are available on request.

Purchase of Zarlink's I<sup>2</sup>C components conveys a licence under the Philips I<sup>2</sup>C Patent rights to use these components in and I<sup>2</sup>C System, provided that the system conforms to the I<sup>2</sup>C Standard Specification as defined by Philips.
