

MD7218 series is a high voltage (up to 18V) ultra-low quiescent current low dropout voltage regulator (LDO) manufactured in CMOS processes. It can deliver up to 1A of current while consuming only 1.6uA of quiescent current. It consists of a reference voltage generator, an error amplifier, a current foldback circuit, and a phase compensation circuit plus a driver transistor. The MD7218 series is designed specifically for applications where very-low  $I_Q$  is a critical parameter. This

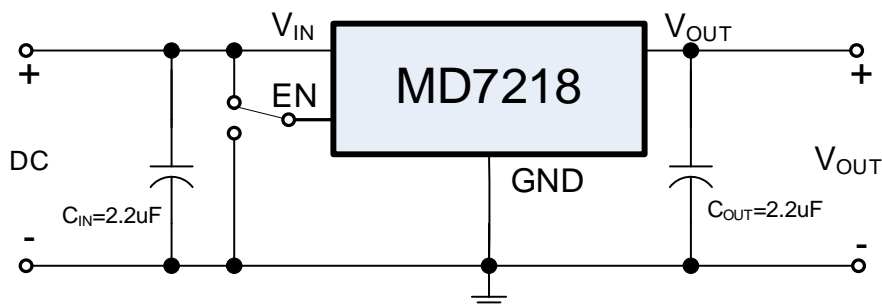

device maintains low quiescent current consumption even in dropout mode to further increase the battery life.

**■ Features:**

- Ultra-low Quiescent Current: 1.6uA
- Maximum Input Voltage: 18V
- Output Voltage Highly Accurate:  $\pm 2\%$
- Maximum Output Current: 1A
- Dropout Voltage: 1V@ $I_{OUT}=1A$
- Temperature Stability:  $\pm 50\text{ppm}/^\circ\text{C}$
- ON/OFF Logic = Enable High
- Protections Circuits: Current Limiter, Foldback, Thermal shutdown
- Output Capacitor: Low ESR Ceramic Capacitor Compatible

**■ Applications:**

- Smart wearer
- Long-life battery-powered devices
- Portable mobile devices, such as mobile phones, cameras, and so on
- Wireless communication equipment

**■ Typical Application:**

**Notes:**

1\* Customer can request to customize the output voltage ranged from 1.8V to 12V, if desired voltage is not found in the selections.

2\* Customer can request customization of package choice.

3\* Please pay attention to the MARKING of the product package type.

■ **Absolute Maximum Ratings** (Unless otherwise indicated:  $T_a=25^{\circ}\text{C}$ )

PARAMETER	SYMBOL	RATINGS		UNITS
Input Voltage	$V_{IN}$	-0.3 ~ 20		V
Output Voltage	$V_{OUT}$	$V_{SS}-0.3 \sim V_{IN}+0.3V$		
Power Dissipation	$P_D$	SOT89-3L	1000	mW

EN 'L' Level Current	$I_{ENL}$	$V_{IN} = 18V, V_{EN} = 0$		-0.1		0.1	
Over Temperature Protection	OTP	$I_{OUT} = 1mA$			150		$^\circ\text{C}$

Notes:

- $V_{OUT(S)}$ : Output voltage when  $V_{IN} = V_{OUT} + 2V, I_{OUT} = 1mA$ .
- $V_{DROP} = V_{IN1} - (V_{OUT(S)} \times 0.98)$  where  $V_{IN1}$  is the input voltage when  $V_{OUT} = V_{OUT(S)} \times 0.98$ .
- $I_{LIM}$ : Output current when  $V_{IN} = V_{OUT(S)} + 2V$  and  $V_{OUT} = 0.95 \times V_{OUT(S)}$ .
- PSRR was measured for  $V_{OUT(S)} = 3.3V$  and  $V_{IN} = 5.3V$ .
- $V_{OUT}$  pin should be shorted to GND pin, and the impedance between them is less than 0.1 ohm

■ Typical Performance Characteristics:

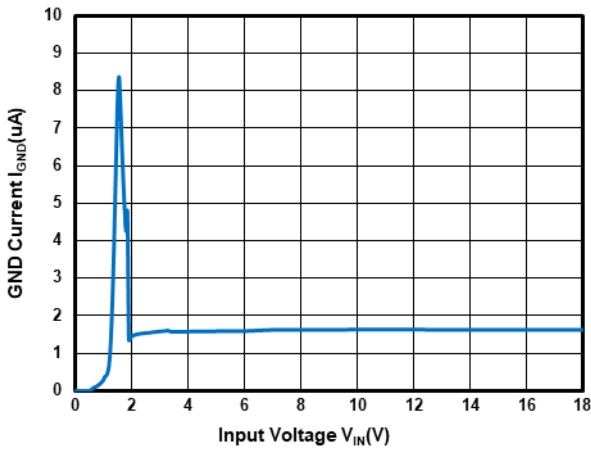

Test Conditions:  $V_{IN}=V_{OUT}+2.0V$ ,  $C_{IN}=2.2\mu F$ ,  $C_{OUT}=2.2\mu F$ , unless otherwise indicated.

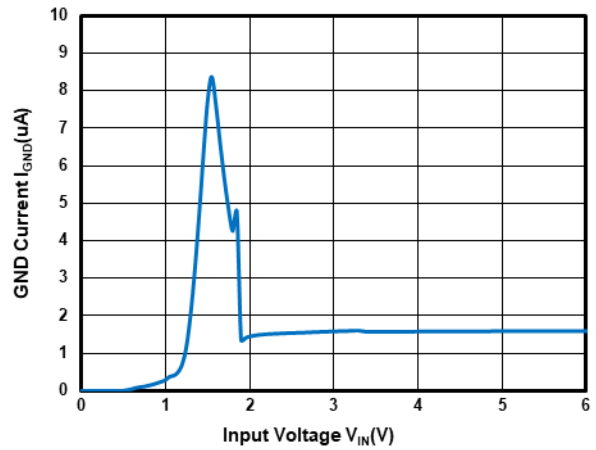

Output Voltage vs Temperature at  $V_{OUT}=3.3V$

GND Current vs Temperature at  $V_{OUT}=3.3V$

GND Current vs Input Voltage at  $V_{OUT}=3.3V$

GND Current vs Input Voltage at  $V_{OUT}=3.3V$

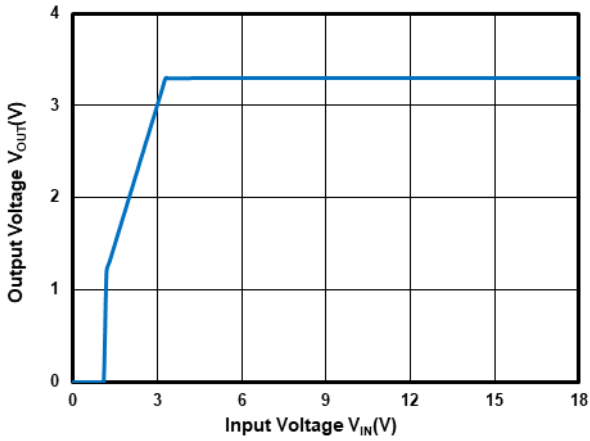

GND Current vs Output Current at  $V_{OUT}=3.3V$

Output Voltage vs Output Current at  $V_{OUT}=3.3V$

■ **Operational Explanation**

Output voltage control

The voltage divided by resistors R1 and R2 is compared with the internal reference voltage by the error amplifier. The amplifier output then drives the P-channel MOSFET connected to the  $V_{OUT}$  pin. The output voltage at the  $V_{OUT}$  pin is regulated by this negative feedback system. The current limit circuit and short protect circuit operate in relation to output current level. Further, the IC's internal circuitry can be in operation or shutdown modes controlled by the CE pin's signal.

■ **Pass transistor**

The pass transistor with low turn-on resistance used in MD7218 is a P-channel MOSFET. If the potential on  $V_{OUT}$  pin is higher than  $V_{IN}$ , it is possible that IC will be destroyed due to reverse current which is caused by parasitic diodes between  $V_{IN}$  and  $V_{OUT}$ . Therefore, the  $V_{OUT}$  pin potential exceeds  $V_{IN}+0.3V$  is not allowed.

■ **Current limit, over temperature protection**

The MD7218 series includes a combination of a fixed current limiter circuit which aid the operations of the current limiter and circuit protection. When the load current reaches the current limit level, the fixed current limiter circuit operates and output voltage drops. As a result of this drop in output voltage, the foldback circuit operates, output voltage drops further and output current decreases.

Special attention should be paid to that the product of the dropout voltage on the chip and the output current must be smaller than the heat dissipation. If power consumption on the chip is more than the heat dissipation, OTP will protect the chip from damaging due to over temperature.

■ **Notes:**

1. The input and output capacitors should be placed as close as possible to the IC.
2. If the impedance of the power supply is high, which is caused by forgetting installing input capacitor or installing too small value capacitor, the oscillation may occur.
3. Pay attention to the operation conditions of input and output voltage and load current, such that the power consumption in the IC should not exceed the allowable power consumption of the package even though the chip has short circuit protection.
4. IC has a built-in anti-static protection (ESD) circuit, but please do not add excessive stress to the IC.
