

PRODUCT DESCRIPTION

MD7672 series are highly accurate, low-noise, high power supply rejection ratio (PSRR), low-dropout voltage regulator (LDO) with high output current capability manufactured in CMOS processes. It can deliver up to 2A of current while consuming 40µA of quiescent current. Internal circuitry includes a reference voltage generator, an error amplifier, driver transistor, over-current protection circuit, short-circuit protection circuit, thermal shutdown circuit and a phase compensation circuit. The MD7672 operates by default as a fixed output voltage regulator (default output voltage: 5V) while usage of an external resistor divider allows adjustable out voltages as low as 0.7V. Additional features include enable function, power good flag and output noise reduction pin.

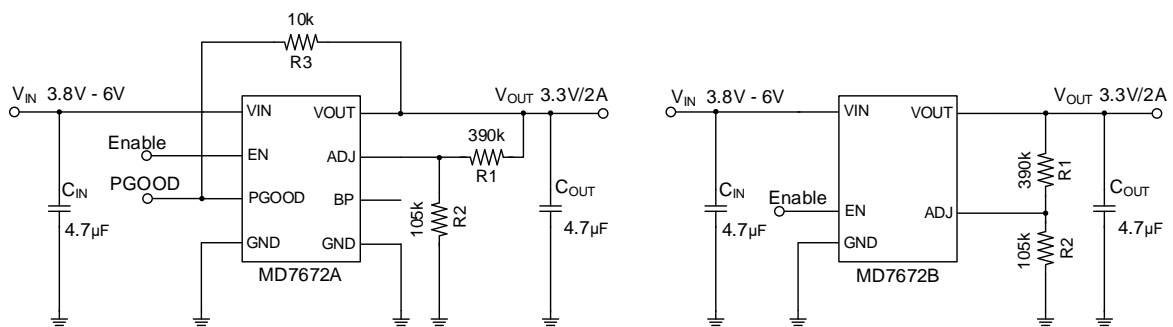

FEATURES

- Highly Accurate: ±2%
- Low Quiescent Current: 40µA
- Dropout Voltage: 250mV@2A
- Maximum Output Current: 2A
- Input Voltage Range: 2~6V
- Output Voltage Noise: 115µVrms@V_{OUT}=3.3V
- High PSRR: 70dB@1kHz
- Temperature Stability: ±50ppm/°C
- ON/OFF Logic = Enable High
- Power Good and Enable Functions
- Standby Current: 10nA
- C_{OUT} Discharge Circuit when EN Disable is Active
- Protections Circuits: Current Limit, Short Circuit, and Thermal Protections
- Output Capacitor: Low ESR Ceramic Capacitor Compatible
- RoHS compliant “Green”/Halogen Free 8-pin Exposed pad SOIC (ESOP8) and 4-pin TO252 packages

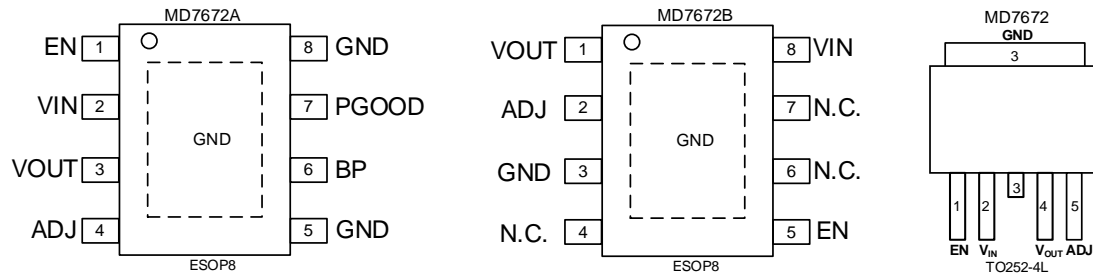

APPLICATIONS

- Smart wearer
- Long-life battery-powered devices
- Portable mobile devices, such as mobile phones, cameras, and so on
- Wireless communication equipment

BLOCK DIAGRAM**THEORY OF OPERATION**

The MD7672 is a low-dropout voltage regulator with low quiescent current, low noise and high PSRR. It can support load current up to 2A. It incorporates current-limit and thermal protection features.

SHUTDOWN

By connecting EN pin to GND, the MD7672 can be shutdown to reduce the supply current to 0.01 μ A (typ.). In this mode, the output voltage of MD7672 is equal to 0V.

CURRENT LIMIT and SHORT CIRCUIT PROTECTION

The MD7672 includes current limit protection feature, which monitors and controls the maximum output current. If the output is overloaded or shorted to ground, this can protect the device from being damaged. When output is shorted to ground, current limit will be adjusted to about 25% of the rated current limit to protect the device.

THERMAL PROTECTION

The MD7672 includes a thermal protection feature that protects the IC by turning off the pass transistor when the maximum junction temperature T_J exceed 175 $^{\circ}$ C.

POWER DISSIPATION

The power dissipation across the device can be calculated as:

$$P_D = I_{OUT} * (V_{IN} - V_{OUT})$$

The total junction temperature is calculated as:

$$T_J = T_A + (P_D * \theta_{JA})$$

where, T_J is the junction temperature, T_A is the ambient temperature and θ_{JA} is the thermal resistance between junction to ambient. There is a temperature rise associated with this power dissipated while operating in a given ambient temperature. If the calculated junction temperature exceeds maximum junction temperature specification, then the built-in thermal protection feature is triggered as described previously. To insure reliable performance, the maximum allowable power dissipation for a given ambient temperature must be considered and it can be calculated as follows:

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

2A 5V-Adjustable Low Dropout Voltage Regulator

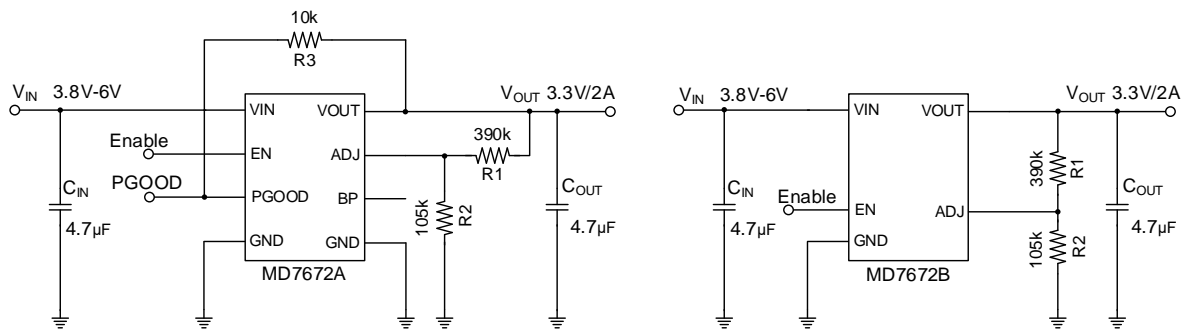

where, $T_{J(MAX)}$ is the maximum junction temperature, T_A is the ambient temperature and θ_{JA} is the thermal resistance between junction to ambient. In order to insure the best thermal flow, proper mounting of the IC is required.

INPUT & OUTPUT CAPACITORS

MD7672 is optimized for use with ceramic capacitors. In order to ensure stability of the device, please place an output ceramic capacitor of 4.7 μ F or bigger at the V_{OUT} pin and GND pin as close as possible. An input capacitor of 4.7 μ F is recommended. X5R or X7R ceramic capacitors are recommended as they have the best temperature and voltage characteristics. If the impedance of the power supply is high, which is caused by forgetting installing input capacitor or installing too small value capacitor, the oscillation may occur.

When large output current switching (>500mA) are required in the application, a greater value of input/output capacitors ($\geq 10 \mu$ F) would be recommended to ensure the device to operate smoothly.

TYPICAL APPLICATION SCHEMATIC

PROGRAMMING THE OUTPUT VOLTAGE

MD7672's internal feedback resistors set the output voltage V_{OUT} to 5V when the ADJ pin is connected to GND. Alternatively; the output voltage is adjustable via the external feedback resistor network R1 and R2 by calculating the following formula:

$$V_{OUT} = V_{REF} * \left(1 + \frac{R1}{R2}\right)$$

where, V_{REF} is the reference voltage set internally at 0.7V nominal.

NOISE BYPASS CAPACITOR (For MD7672A)

A 1 μ F bypass capacitor at BP pin can reduce output voltage noise. This pin can be left floating if it is unnecessary.

POWER-GOOD FUNCTION

The power-good circuit monitors the voltage at the feedback pin to indicate the status of the output voltage. When the output voltage falls below the PGOOD fall threshold voltage (PG_{LTH}), the PGOOD pin open-drain output engages and pulls the PGOOD pin close to GND. When the output voltage exceeds PGOOD rise threshold voltage (PG_{HTH}), the PGOOD pin becomes high impedance. By connecting a pullup resistor to external pullup supply voltage (default for V_{OUT}), any downstream device can receive power-good as a logic signal that can be used for sequencing. Make sure that the external pullup supply voltage results in a valid logic signal for the receiving device. Using a pullup resistor from 10 k Ω to 100 k Ω is recommended.

LAYOUT CONSIDERATION

1. Connect the bottom-side pad to a large ground plane for good thermal conductivity and to reduce the thermal resistance of the device.
2. The input Capacitor C_{IN} and output capacitor C_{OUT} must be placed as close as possible to the pins V_{IN} and V_{OUT} respectively.
3. Use short wires to connect the power supply to pins V_{IN} and GND on the board.

2A 5V-Adjustable Low Dropout Voltage Regulator**Notes on Use**

1. The input capacitor (C_{IN}) and the output capacitor (C_{OUT}) should be placed to the as close as possible with a shorter wiring.
2. If the impedance of the power supply is high, which is caused by forgetting installing input capacitor or installing too small value capacitor, the oscillation may occur.
3. Please pay attention to the operation conditions of input and output voltage and load current, such that the power consumption in the IC should not exceed the allowable power consumption of the package even though the chip has short circuit protection.

IC has a built-in anti-static protection (ESD) circuit, but please do not add excessive stress to the IC.
