▲ Low frequency cutoff determined by external coupling capacitors.  $f_U$  is the upper frequency limit for each model.

1. Permanent damage may occur if any of these limits are exceeded. These ratings are not intended for continuous normal operation.

2. Supply voltage must be connected to pin 3 through a bias resistor in order to prevent damage. See "Biasing MMIC Amplifiers" at [minicircuits.com/applications.shtml](http://minicircuits.com/applications.shtml). Reliability predictions are applicable at specified current and normal operating conditions.
