## Product Overview

Mini-Circuits SSG-15G-RC is a wideband synthesized signal generator operating over a frequency range of 10 MHz to 15 GHz. The signal generator is cased in a compact, rugged metal shielded package (5.1" x 3.6" x 1.0") and equipped with an SMA(F) 50Ω connector at the RF output port and starts immediately when power is applied.

Using the supplied software, the user can easily select one of several different output modes including multiple pulse modulation options, frequency sweep, and power sweep (up, down, or bidirectional).

The SSG-15G-RC can be controlled from almost any Windows or Linux PC, via USB interface, or any computer with a network interface via HTTP, Telnet or SSH. Included with the generator are a 6.6 ft. USB cable, two SMB-BNC cables for trigger and reference, and a 6V power adapter. See page 9 for all accessories and order options available.

<sup>1</sup> Frequency resolution is tested with 10 MHz external reference.<sup>2</sup> Settling time - transition time between 2 output states. During the transition, RF output is turned off to avoid transient outputs.<sup>3</sup> For sweep / hop sequences pre-loaded into internal memory (high speed mode).<sup>4</sup> Generator response time is Dwell time + Settling Time.<sup>5</sup> Dwell time - duration of each signal point in a Sweep or Hop sequence set by user. Default is minimum dwell time.<sup>6</sup> The generator is calibrated within typical power range, however performance is guaranteed only within power max/min limits.<sup>7</sup> At power steps below 0.5 dB increased non-monotonic behavior may be observed.<sup>8</sup> USB min communication time is based on the polling interval of the USB HID protocol(125 µs polling interval, 1024 bytes per packet), medium CPU load and no other high speed USB devices using the USB bus.
