EV6908-S-01A
High Efficiency Synchronous Rectification EV Board

## DESCRIPTION

The MP6908 is a low-drop diode emulator IC that, when combined with an external switch, replaces Schottky diodes in high-efficiency flyback converters. The MP6908 regulates the forward drop of an external synchronous rectifier (SR) MOSFET to about 40 mV , which switches off once the voltage becomes negative.
The MP6908 can generate its own supply voltage for battery charging applications with a low output voltage or high-side rectification applications. Programmable ringing detection circuitry prevents the MP6908 from turning on falsely during discontinuous conduction mode (DCM) and quasi-resonant operation.
EV6908-S-01A is the evaluation board for MP6908.

## FEATURES

- Wide Output Range down to 0 V
- No Need for Auxiliary Winding for High-Side or Low-Side Rectification
- Ringing Detection Prevents False Turn-On during DCM and Quasi-Resonant Operations
- Works with Standard and Logic Level SR MOSFETs
- Compatible with Energy Star
- -30ns Fast Turn-Off and Turn-On Delay
- $\sim 100 \mu \mathrm{~A}$ Quiescent Current
- Supports DCM, CCM, and Quasi-Resonant Operations
- Supports both High-Side and Low-Side Rectification
- TSOT23-6 Package Available

## APPLICATIONS

- USB PD Quick Chargers
- Adaptors
- Flyback Power Supplies with Very Low and/or Variable Output Voltage

## QUICK START GUIDE

1. Connect the VSS and VD pin into the flyback circuit to replace the freewheel diode.
2. Choose the supply voltage:

Connect HVC to VSS. The VDD will be supplied to 5V.
Connect HVC to a high voltage (level or switching). The VDD will be supplied to 9 V .
3. Turn the power supply on. The IC will start up and work as a freewheel diode automatically.
