# MP26101

## 2A, 24V Input, 1.1MHz, 1- or 2- Cell 4.1V/Cell Switching Li-Ion Battery Charger

### DESCRIPTION

The MP26101 is a monolithic switching charger for 1- or 2-cell Li-Ion battery packs. It has a built-in internal power MOSFET, and can output up to 2A of charge current with current mode control for fast loop response and easy compensation. The charge current can be programmed through an accurate sense resistor.

MP26101 regulates the charge current and charge voltage using two control loops to realize high-accuracy for both constant-current charge and constant-voltage charge.

Fault condition protection includes cycle-by-cycle current limiting and thermal shutdown. Other safety features include battery temperature monitoring, a charge status indicator, and a programmable timer to halt the charging cycle.

The MP26101 requires a minimal number of readily-available external components.

The MP26101 is available in 4mm×4mm 16-pin QFN package.

### FEATURES

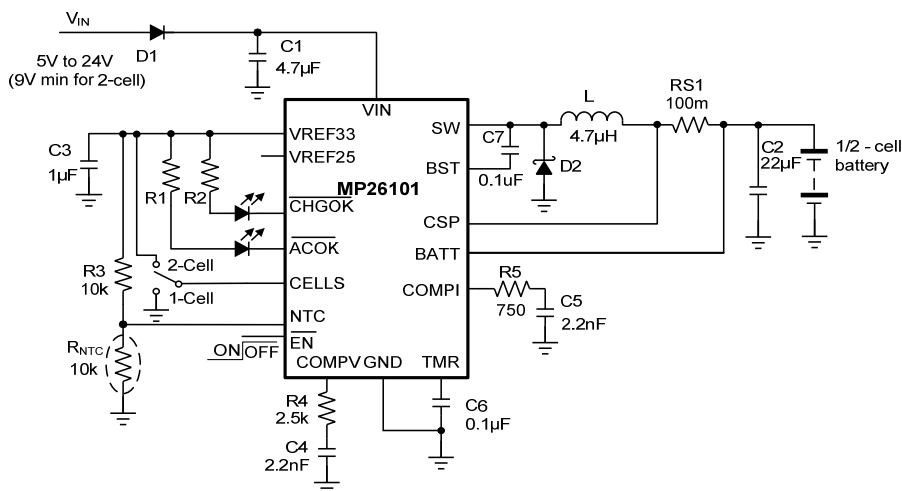

- Charges 1- or 2-cell Li-Ion battery packs
- 4.1V/Cell Charge Full Voltage
- 3.9V/Cell Auto-recharge Threshold
- Wide 5V to 24V Operating Input Range
- Up to 2A Programmable Charging Current
- ±0.75%  $V_{BATT}$  Accuracy
- 0.2Ω Internal Power MOSFET
- Up to 90% Efficiency
- Fixed 1.1MHz Frequency
- Preconditioning for Fully-Depleted Batteries
- Charging Status Indicator
- Input Supply and Battery Fault Indicator
- Thermal Shutdown
- Cycle-by-Cycle Over-Current Protection
- Battery Temperature Monitor and Protection

### APPLICATIONS

- Distributed Power Systems
- Chargers for 1-Cell or 2-Cell Li-Ion Batteries
- Smartphones
- Portable DVD Player

For MPS green status, please visit MPS website under Quality Assurance. "MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

### TYPICAL APPLICATION

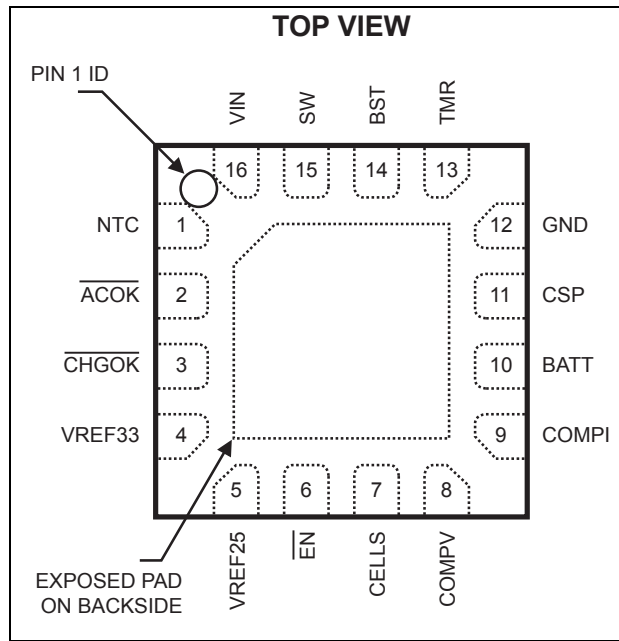

### ORDERING INFORMATION

Part Number*	Package	Top Marking
MP26101DR	QFN16 (4×4mm)	M26101

\* For Tape & Reel, add suffix-z (e.g. MP26101DR-Z);  
 For RoHS Compliant packaging, add suffix-LF (e.g. MP26101DR-LF-Z)

### PACKAGE REFERENCE

#### ABSOLUTE MAXIMUM RATINGS <sup>(1)</sup>

Supply Voltage $V_{IN}$ .....	26V
$V_{SW}$ .....	-0.3V to ( $V_{IN} + 0.3V$ )
$V_{BST}$ .....	$V_{SW} + 6V$
$V_{CSP}, V_{BATT},$ .....	-0.3V to +18V
All Other Pins .....	-0.3V to +6V
Continuous Power Dissipation ( $T_A = 25^\circ C$ ) <sup>(2)</sup>	2.7W
Junction Temperature .....	150°C
Lead Temperature .....	260°C
Storage Temperature.....	-65°C to +150°C

#### Recommended Operating Conditions <sup>(3)</sup>

Supply Voltage $V_{IN}$ .....	5V to 24V
Maximum Junction Temp. ( $T_J$ ) .....	125°C

<b>Thermal Resistance <sup>(4)</sup></b>	$\theta_{JA}$	$\theta_{JC}$
QFN16 (4×4mm).....	46.....	10 ... °C/W

#### Notes:

- 1) Exceeding these ratings may damage the device.
- 2) The maximum allowable power dissipation is a function of the maximum junction temperature  $T_J(MAX)$ , the junction-to-ambient thermal resistance  $\theta_{JA}$ , and the ambient temperature  $T_A$ . The maximum allowable continuous power dissipation at any ambient temperature is calculated by  $P_D(MAX) = (T_J(MAX) - T_A) / \theta_{JA}$ . Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- 3) The device is not guaranteed to function outside of its operating conditions.
- 4) Measured on JESD51-7 4-layer board.

## ELECTRICAL CHARACTERISTICS

$V_{IN} = 19V$ ,  $T_A = 25^{\circ}C$ ,  $CELLS=0V$ , unless otherwise noted.

Parameters	Symbol	Condition	Min	Typ	Max	Units
Terminal Battery Voltage	$V_{BATT}$	CELLS=0V	4.069	4.1	4.131	V
		CELLS= VREF33	8.139	8.2	8.262	
CSP, BATT Current	$I_{CSP}, I_{BATT}$	Charging disabled		1		$\mu A$
Switch On Resistance	$R_{DS(ON)}$			0.2		$\Omega$
Switch Leakage		$\overline{EN} = 4V, V_{SW} = 0V$		0	1	$\mu A$
Peak Current Limit		CC Mode <sup>(5)</sup>		3.8		A
		Trickle Mode		1.75		A
CC current	$I_{CC}$	RS1= 100m $\Omega$	1.8	2.0	2.2	A
Trickle charge current	$I_{TRICKLE}$			10%		$I_{CC}$
Trickle charge voltage threshold		CELLS=0V		2.87		V
		CELLS=3.3V		5.74		V
Trickle charge hysteresis				350		mV/cell
Termination current threshold	$I_{BF}$		5%	10%	15%	$I_{CC}$
Oscillator Frequency	$f_{SW}$	CELLS=0V, $V_{BATT} = 3.5V$		1.1		MHz
Fold-back Frequency		$V_{BATT} = 0V$		350		kHz
Maximum Duty Cycle			87			%
Maximum current Sense Voltage (CSP to BATT)	$V_{SENSE}$		170	200	230	mV
Minimum On Time <sup>(5)</sup>	$t_{ON}$			100		ns
Under Voltage Lockout Threshold Rising			3	3.2	3.4	V
Under Voltage Lockout Threshold Hysteresis				200	1000	mV
Open-drain sink current ( $\overline{ACOK}$ ), ( $\overline{CHGOK}$ )		$V_{DRAIN} = 0.3V$	5			mA
Dead-battery indicator		In trickle mode $C_{TMR}=0.1\mu F$		30		min
Termination delay		Time after $I_{BF}$ reached $C_{TMR}=0.1\mu F$		1		min
Recharge threshold at $V_{BATT}$	$V_{RECHG}$			3.9		V/cell
Recharge Hysteresis				100		mV/Cell
NTC Low Temp Rising Threshold		$R_{NTC}=NCP18XH103 (0^{\circ}C)$	70.5	73.5	76.5	%of VREF33
		Recovery Hysteresis		3		
NTC High Temp Falling Threshold		$R_{NTC}=NCP18XH103 (50^{\circ}C)$	27.5	29.5	31.5	%of VREF33
		Recovery Hysteresis		2		
VIN min head-room (reverse blocking)		$V_{IN} - V_{BATT}$		180		mV

**ELECTRICAL CHARACTERISTICS (continued)**

## PIN FUNCTIONS

Pin #	Name	Description
1	NTC	Thermistor Input. Connect a resistor from this pin to the pin VREF33 and the Thermistor from this pin to ground.
2	$\overline{\text{ACOK}}$	Valid Input Supply Indicator. A logic LOW indicates the presence of a valid input supply.
3	$\overline{\text{CHGOK}}$	Charging Completion Indicator. A logic LOW indicates charging operation. The pin will become an open drain once charging has completed or suspended.
4	VREF33	Internal Linear Regulator 3.3V Reference Output. Bypass to GND with a 1 $\mu$ F ceramic capacitor.
5	VREF25	Internal Linear Regulator 2.5V Reference Output. PLEASE KEEP THIS PIN FLOATING
6	$\overline{\text{EN}}$	On/Off Control Input.
7	CELLS	Command Input. Sets the number of li-ion cells. Connect this pin to VREF33 for 2-cell operation or ground the pin for 1-cell operation. Do not leave this pin floating.
8	COMPV	V-LOOP Compensation. Connect this pin to GND with a capacitor and a resistor.
9	COMPI	I-LOOP Compensation. Connect this pin to GND with a capacitor and a resistor.
10	BATT	Positive Battery Terminal.
11	CSP	Battery Current Sense Positive Input. Connect a resistor RS1 between CSP and BATT. The full charge current is: $I_{\text{CHG}}(\text{A}) = \frac{200\text{mV}}{\text{RS1}(\text{m}\Omega)}$ .
12	GND, Exposed Pad	Ground. This pin is the voltage reference for the regulated output voltage, and requires special layout considerations. This node should be placed outside of the switching diode (D2) to the input ground path to prevent switching current spikes from inducing voltage noise. Connect exposed pad to ground plane for optional thermal performance.
13	TMR	Set Time Constant. 0.1 $\mu$ A current charges and discharges the external cap.
14	BST	Bootstrap. Use a capacitor connected between BST and SW to drive the power switch's gate above the supply voltage..
15	SW	Switch Output.
16	VIN	Supply Voltage. The MP26101 operates from a 5V to 24V unregulated input to charge a 1- or 2-cell li-ion battery. Requires a capacitor to prevent large voltage spikes from appearing at the input.

## TYPICAL PERFORMANCE CHARACTERISTICS

$V_{IN}=19V$ ,  $C1=4.7\mu F$ ,  $C2=22\mu F$ ,  $L=4.7\mu H$ ,  $RS1=100m\Omega$ , Real Battery Load,  $T_A=25^\circ C$ , unless otherwise noted.

### FUNCTIONAL BLOCK DIAGRAM

Figure 1—Functional Block Diagram

## OPERATION

The MP26101 is a peak-current-mode controlled switching charger for 1- or 2-cell Li-Ion batteries.

Figure 1 shows the block diagram. At the beginning of a cycle, M1 is off. The COMP voltage is higher than the output of the current sense amplifier (A1) and the PWM comparator's output is low. The rising edge of the 1.1MHz CLK signal sets the RS flip-flop. Its output turns on M1 to connect the SW pin and inductor to the input supply.

A1 senses and amplifies the inductor current: The PWM comparator then compares the sum of this signal and the ramp compensator signal against the COMP signal. When the sum of the A1 output and the ramp compensator exceeds the COMP voltage, the RS flip-flop reset and turns M1 off. The external switching diode (D2) then conducts the inductor current. If the sum of the A1 output and the ramp compensator does not exceed the COMP voltage, then the falling edge of the CLK resets the flip-flop.

The MP26101 has two linear regulators, VREF33 and VREF25, that power the internal circuit. The 3.3V reference can power external circuitry as long as the current does not exceed 50mA. Add a 1µF bypass capacitor from VREF33 to GND to ensure stability. By comparison, the 2.5V reference regulator can not carry any significant load,.

For most applications, leave VREF25 floating without a bypass capacitor. Otherwise, connect a capacitor with a value less than 100pF.

### Charge Cycle (Mode Change: Trickle → Constant Current → Constant Voltage)

The MP26101 senses battery current through the amplified voltage drop across RS1 (Figure 1). The charging starts in trickle-charge mode (10% of the RS1-programmed current  $I_{CC}$ ) until the battery voltage reaches 2.87V/cell. If the charge stays in trickle-charging mode until the trickle-charge time limit, the device shuts down. Otherwise, the MP26101 operates in constant-current (CC) mode and regulates the output current to a level set by RS1. The COMPI voltage (regulated by the

amplifier GMI) determines the switching duty cycle .

When the battery voltage reaches the constant voltage (CV) mode threshold, the amplifier GMV regulates the COMPV pin and the duty cycle.

### Automatic Recharge

The charger will cease charging and the  $\overline{\text{CHGOK}}$  pin becomes an open drain output if the battery charging current drops below the termination threshold for more than one minute. If the battery voltage drops to 3.9V/Cell, the MP26101 automatically begins recharging the battery.

### Charger Status Indication

MP26101 has two open-drain status outputs,  $\overline{\text{CHGOK}}$  and  $\overline{\text{ACOK}}$  . The  $\overline{\text{ACOK}}$  pin pulls low when an input voltage is 300mV over the battery voltage and over the under voltage lockout threshold.  $\overline{\text{CHGOK}}$  indicates the status of the charge cycle. Table 1 describes the status of the charge cycle based on the  $\overline{\text{CHGOK}}$  and  $\overline{\text{ACOK}}$  outputs.

**Table 1—Charging Status Indication**

$\overline{\text{ACOK}}$	$\overline{\text{CHGOK}}$	Charger status
low	low	In charging
low	high	End of charge
high	high	Vin < UVLO, thermal shutdown, timer out, $\overline{\text{EN}}$ disable

### Timer Operation

MP26101 uses an internal timer to terminate charging. An external capacitor programs timer duration at the TMR pin.

The trickle mode charge time is:

$$t_{\text{TICKLE\_TMR}} = 30 \text{ min s} \times \frac{C_{\text{TMR}}}{0.1\mu\text{F}}$$

The total charge time is:

$$t_{\text{TOTAL\_TMR}} = 3 \text{ hours} \times \frac{C_{\text{TMR}}}{0.1\mu\text{F}}$$

### Negative Thermal Coefficient (NTC) Thermistor

The MP26101 has a built-in NTC resistance window comparator that allows MP26101 to measure the temperature through a thermistor in the battery pack that ensures that the battery operates under recommended conditions.

Connect an appropriate resistor from VREF33 to the NTC pin, and connect the thermistor from the NTC pin to GND. The voltage on the NTC pin is determined by the temperature-sensitive resistor divider. When the NTC voltage falls out of NTC window range, MP26101 will stop the charging. The charger will restart if the temperature goes back into NTC window range.

**Figure 2—Li-Ion Battery Charge Profile**

Figure 3— Normal Charging Operation Flow Chart

Figure 4— Fault Protection Flow Chart

## APPLICATION INFORMATION

### Setting the Charge Current

The sense resistor RS1 sets the charge current as per the following equation:

$$I_{\text{CHG}}(\text{A}) = \frac{200\text{mV}}{RS1(\text{m}\Omega)} \quad (1)$$

**Table2— $I_{\text{CHG}}$  Setting**

$I_{\text{CHG}}(\text{A})$	$RS(\text{m}\Omega)$
2	100
1.5	133
1	200
0.8	250
0.5	400

### Selecting the Inductor

Select an inductor with a typical value between 1 $\mu\text{H}$  and 10 $\mu\text{H}$  using the following equation.

$$L = \frac{V_{\text{OUT}} \times (V_{\text{IN}} - V_{\text{OUT}})}{V_{\text{IN}} \times \Delta I_L \times f_{\text{OSC}}} \quad (2)$$

Where  $\Delta I_L$  is the inductor ripple current.  $V_{\text{OUT}}$  is the battery voltage.

Choose an inductor current equal to approximately 30% of the maximum charge current, 2A. The maximum inductor peak current is:

$$I_{L(\text{MAX})} = I_{\text{LOAD}} + \frac{\Delta I_L}{2} \quad (3)$$

Under light load conditions below 100mA, use a larger inductance to improve efficiency. For most applications, chose an inductor with a DC resistance less than 200m $\Omega$ .

### NTC Function

As Figure 5 shows, the low temperature threshold and high temperature threshold are preset internally through a resistive divider set at 73.5%·VREF33 and 29.5%·VREF33. For a given NTC thermistor, we can select an appropriate R3 and an appropriate R6 to set the NTC window.

For example, using the NCP18XH103 thermistor,

At 0°C,  $R_{\text{NTC\_Cold}} = 27.445\text{k}$ ;

At 50°C,  $R_{\text{NTC\_Hot}} = 4.1601\text{k}$ .

Assuming that the NTC window is between 0°C

and 50°C, and given the following equations:

$$\frac{R6 // R_{\text{NTC\_Cold}}}{R3 + R6 // R_{\text{NTC\_Cold}}} = \frac{V_{\text{TH\_Low}}}{V_{\text{REF33}}} = 73.5\% \quad (4)$$

$$\frac{R6 // R_{\text{NTC\_Hot}}}{R3 + R6 // R_{\text{NTC\_Hot}}} = \frac{V_{\text{TH\_High}}}{V_{\text{REF33}}} = 29.5\% \quad (5)$$

$R3 = 9.63\text{k}$  and  $R6 = 505\text{k}$ . Simplifying, select  $R3=10\text{k}$  and leave R6 open to satisfy the specifications.

**Figure 5— NTC function block**

### Selecting the Input Capacitor

The input capacitor reduces the surge current drawn from the input and the switching noise from the device. Choose an input capacitor with a switching frequency impedance less than the input source impedance to prevent high-frequency switching current from flowing to the input. Use ceramic capacitors with X5R or X7R dielectrics with low ESR and small temperature coefficients. For most applications, use a 4.7 $\mu\text{F}$  capacitor.

### Selecting the Output Capacitor

The output capacitor limits the output voltage ripple and ensures regulator loop stability. The output capacitor impedance should be low at the switching frequency. Use ceramic capacitors with X5R or X7R dielectrics.

### PC Board Layout

Route the high frequency and high current paths (GND, IN and SW) to the device using short, direct, and wide traces. Place the input capacitor

as close as possible to the VIN and GND pins. Place the external feedback resistors next to the FB pin. Keep the switching node SW short and away from the feedback network.

### **USB Input Application**

Use the typical application circuit in Figure 6 for USB charging. Use one PMOS instead of the block diode D1 to limit the voltage drop, and to realize smaller minimum input charging to a single-cell battery. The charge current is set to be

1A to satisfy turbo USB or 5V<sub>IN</sub> Wall-Adapter requirements and to realize fast charging.

Figure 7 is the typical charging curve. The charge current cannot remain constant at the setting value during the operation at the constant current charging mode: It drops at the device's maximum duty. Use a lower charge current to extend the constant current charge duration. This feature makes the MP26101 suitable for USB charging.
