The D1U54P-W-650-12-HBxC series are very high efficiency 650 watt power factor corrected front end supplies with a 12V main output and a 12V Standby. An active (analogue) current share characteristic is provided to allow units to operate in parallel. The power supply may be hot plugged; recovers from overtemperature faults, and has status LEDs on the front panel in addition to hardware signal logic and PMBus™ status signals. The low profile 1U package and 21.4W/cubic inch power density make them ideal for delivering reliable, efficient power to networking equipment,

Power Output

90 to 264Vac

650W

FEATURES
650W output power
94% efficiency at 50% load
12V main output
12V standby output
1U height:
■ 2.15" x 9.0" x 1.57"
54.5mm x 228.6mm x 40mm
Full digital control
21.4 Watts per cubic inch density
N+1 redundancy capable, including hot plugging
 Active (analogue) current sharing on 12V main output; ORING FET
 Overvoltage, Overcurrent, Overtemperature protection
Internal cooling fan (variable speed)
■ PMBus [™] /I2C interface with status indicators
RoHS compliant
Two Year Warranty

Available now at: www.murata-ps.com/en/3d/acdc.html

INPUT CHARACTERISTICS

Parameter

Nominal						
Output Voltage	Parameter	Conditions	Min.	Тур.	Max.	Units
	Output Set Point Accuracy	50% load; Tamb =25°C	11.96	12.00	12.04	Vdc
12V	Line and Load Regulation	Setpoint; temperature; line and load	-1.0%		+1.0	%
	Ripple Voltage & Noise ^{1, 2}	20MHz Bandwidth			120	mV p-j
	Output Current Range		0		54.2	Α
	Load Capacitance		500		4000	μF
	Output Set Point Accuracy	50% load; Tamb = 25°C	11.96	12.00	12.04	
12VSB	Line and Load Regulation	Setpoint; temperature; line and load	11.7		12.3	Vdc
	Ripple Voltage & Noise ¹	20MHz Bandwidth			120	mV p-
	Output Current		0		2	A

Ripple and noise are measured with 0.1 µF of ceramic capacitance and 10 µF of tantalum capacitance on each of the power supply outputs. A short coaxial cable to the measurement 'scope input, is used.

Measurements assume the use of the minimum load capacitance as specified for the main 12V output and a minimum load of 5%.

Below 5% loading the overall voltage deviation shall be within ±500mV due to zero load "skip" cycle mode of operation.

54mm 1U Front End AC-DC Power Supply Converter

OUTPUT CHARACTERISTICS					
Parameter	Conditions	Min.	Тур.	Max.	Units
Startup Time	AC ramp up Note: Following a "turn off" of the 12V Main output (for any reason whatsoever) the output shall not be allowed to "turn on" again for 1sec (even if all necessary operating conditions are met).			3	S
Transient Response	Main 12V, 50% load step, 1A/µs di/dt			±5	%
Transient nesponse	12VSB, 50% load step, 1A/µs di/dt			500	μs
Current sharing accuracy (Main 12V output)	>10% load; (* percentage of full load)			±5*	%
Hot Swap Transients				±5	%
Holdup Time (Total Effective Hold Up - See Timing Waveforms)	Full AC Input Source Range; full load	12			ms

	ENVIRONMENTAL CHARACTERISTICS					
Parameter	Conditions	Min.	Тур.	Max.	Units	
Storage Temperature Range		-40		70	°C

EMISSIONS AND IMMUNITY		
Characteristic	Standard	Compliance
Input Current Harmonics	IEC/EN 61000-3-2	Complies
Voltage Fluctuation and Flicker	IEC/EN 61000-3-3	Complies
Conducted Emissions	FCC 47 CFR Part 15 CISPR 22/EN55022	Class A with 6dB margin
ESD Immunity	IEC/EN 61000-4-2	Level 4 criteria A
Radiated Field Immunity	IEC/EN 61000-4-3	Level 3 criteria B
Electrical Fast Transients/Burst Immunity	IEC/EN 61000-4-4	Level 3 criteria A
Surge Immunity	IEC/EN 61000-4-5	 6kV common mode and differential mode, unit shall fail safely[#]. 4kV common mode and differential mode, unit shall survive; the output may shut down and recover automatically (Criteria B) or require manual intervention (Criteria C)[#]. 2kV common and differential mode, unit passes criteria A (normal performance)*
RF Conducted Immunity	IEC/EN 61000-4-6	Level 3 criteria A
Magnetic Field Immunity	IEC/EN 61000-4-8	3 A/m criteria B
Voltage Dips, Interruptions	IEC/EN 61000-4-11	230Vin, 80% load, Phase 0°, Dip 100% Duration 10ms (A) 230Vin, 50% load, Phase 0°, Dip 100% Duration 20ms (VSB:A, V1:B)
		220Vin 100% load Phase 0° Din 100% Duration > 20mc (VSR V1·R)

230Vin, 100% load, Phase 0°, Dip 100% Duration > 20ms (VSB, V1:B) * Impedance is 2 ohms for ±2KV differential and common mode to comply with NEBS GR-1089 limits. Maximum load capacitance is required for these tests.

* Tests above ±2KV will be performed for information purposes to IEC/EN66100-4-5 with 12ohm impedance, differential & common mode.

LED NAME	LED MODE	LED STATE/OPERATION	DESCRIPTION
Input	ОК	Solid Green	Input voltage operating within normal specified range
Input	ov/uv warning	Blinking Green	Input voltage operating in: 1) overvoltage warning, or 2) undervoltage warning range
Input	OFF OR FAULT	Off	Input voltage operating: 1) above overvoltage range, or 2) below undervoltage range, or 3) not present
Output	POWER GOOD	Solid Green	Main output and standby output enabled with no power supply warning or fault detected
Output	STANDBY	Blinking Green	Standby output enabled with no power supply warning or fault detected
Output	WARNING	Blinking Amber	Power supply warning detected as per PMBus STATUS_X reporting bytes [•]

54mm 1U Front End AC-DC Power Supply Converter

*LED fault/warning operation follows PMBus fault/warning reporting status flags but will not be 'sticky'; (i.e. if the fault stimulus is removed, even though the actual fault/warning is still showing (still "sticky" and not cleared), the relevant LED will revert to normal (non -fault) operation.

STATUS AND CONTROL	SIGNALS		
Signal Name	I/O	Description	Interface Details
INPUT_OK (AC Source)	Output	The signal output is driven high when input source is available and within acceptable limits. The output is driven low to indicate loss of input power. There is a minimum of 1ms pre-warning time before the signal is driven low prior to the PWR_OK signal going low. The power supply must ensure that this interface signal provides accurate status when AC power is lost.	Pulled up internally via 10K to 3.3Vdc. A logic high >2.0Vdc A logic low <0.8Vdc Driven low by internal CMOS buffer (open drain output).
PW_OK (Output OK)	Output	The signal is asserted, driven high, by the power supply to indicate that all outputs are valid. If any of the outputs fail then this output will be hi-Z or driven low. The output is driven low to indicate that the Main output is outside of lower limit of regulation (11.4Vdc).	Pulled up internally via 10K to 3.3Vdc A logic high >2.0Vdc A logic low <0.8Vdc Driven low by internal CMOS buffer (open drain output).
SMB_ALERT (FAULT/WARNING)	Output	The signal output is driven low to indicate that the power supply has detected a warning or fault and is intended to alert the system. This output must be driven high when the power is operating correctly (within specified limits). The signal will revert to a high level when the warning/fault stimulus (that caused the alert) is removed.	Pulled up internally via 10K to 3.3Vdc. A logic high >2.0Vdc A logic low <0.8Vdc Driven low by internal CMOS buffer (open drain output).
PRESENT_L (Power Supply Absent)	Output	The signal is used to detect the presence (installed) of a PSU by the host system. The signal is connected to PSU logic SGND within the power module.	Passive connection to +VSB_Return. A logic low <0.8Vdc
PS_ON (Power Supply Enable/Disable	Input	This signal is pulled up internally to the internal housekeeping supply (within the power supply). The power supply main 12Vdc output will be enabled when this signal is pulled low to +VSB_Return. In the low state the signal input shall not source more than 1mA of current. The 12Vdc output will be disabled when the input is driven higher than 2.4V, or open circuited. Cycling this signal shall clear latched fault conditions.	Pulled up internally via 10K to 3.3Vdc. A logic high >2.0Vdc A logic low <0.8Vdc Input is via CMOS Schmitt trigger buffer.
PS_KILL	Input	This signal is used during hot swap to disable the main output during hot swap extraction. The input is pulled up internally to the internal housekeeping supply (within the power supply). The signal is provided on a short (lagging pin) and should be connected to +VSB_Return.	A logic high >2.0Vdc A logic low <0.8Vdc Input is via CMOS Schmitt trigger
ADDR (Address Select)	Input	An analogue input that is used to set the address of the internal slave devices (EEPROM and microprocessor) used for digital communications. Connection of a suitable resistor to +VSB_Return, in conjunction with an internal resistor divider chain, will configure the required address.	DC voltage between the limits of 0 and +3.3Vdc.
SCL (Serial Clock)	Both	A serial clock line compatible with PMBus [™] Power Systems Management Protocol Part 1 – General Requirements Rev 1.1. No additional internal capacitance is added that would affect the speed of the bus. The signal is provided with a series isolator device to disconnect the internal power supply bus in the event that the power module is unpowered.	V⊫ is 0.8V maximum Vo∟ is 0.4V maximum when sinking 3mA V⊮ is 2.1V minimum
SDA (Serial Data)	Both	A serial data line compatible with PMBus [™] Power Systems Management Protocol Part 1 – General Requirements Rev 1.1. The signal is provided with a series isolator device to disconnect the internal power supply bus in the event that the power module is unpowered,	V⊫ is 0.8V maximum Vo∟ is 0.4V maximum when sinking 3mA V⊮ is 2.1V minimum
V1_SENSE V1SENSE_RTN	Input	Remote sense connections intended to be connected at and sense the voltage at the point of load. The voltage sense will interact with the internal module regulation loop to compensate for voltage drops due to connection resistance between the output connector and the load. If remote sense compensation is not required then the voltage can be configured for local sense by: 1. V1_SENSE directly connected to power blades 6 to 10 (inclusive) 2. V1_SENSE_RTN directly connected to power blades 1 to 5 (inclusive)	Compensation for a up to 0.12Vdc total connection drop (output and return connections).
ISHARE	Bi- Directional Analogue Bus	The current sharing signal is connected between sharing units (forming an ISHARE bus). It is an input and/or an output (bi-directional analogue bus) as the voltage on the line controls the current share between sharing units. A power supply will respond to a change in this voltage but a power supply can also change the voltage depending on the load drawn from it. On a single unit the voltage on the pin (and the common ISHARE bus would read 8VDC at 100% load (module capability). For two identical units sharing the same 100% load this would read 4VDC for perfect current sharing (i.e. 50% module load capability per unit).	Analogue voltage: +8V maximum; 10K to +12V_RTN

A1, B1, C1,

D1. E1

+VSB Outputs can be tied together for redundancy but total combined output power must not exceed the rated standby power. The +VSB output has an internal ORING 3. MOSFET for additional redundancy/internal short protection.

VSB

Load

- The current sharing pin B5 is connected between sharing units (forming an ISHARE bus). It is an input and/or an output (bi-directional analogue bus) as the voltage on the 4. line controls the current share between sharing units. A power supply will respond to a change in this voltage but a power supply can also change the voltage depending on the load drawn from it. On a single unit the voltage on the pin (and the common ISHARE bus would read 8VDC at 100% load. For two units sharing the same load this would read 4VDC for perfect current sharing (i.e. 50% load per unit).
- The load for both the main 12V and the VSB rails at initial startup shall not be allowed to exceed the capability of a single unit. The load can be increased after a delay of 5. 3sec (minimum), to allow all sharing units to achieve steady state regulation.

MECHANICAL DIMENSIONS

54mm 1U Front End AC-DC Power Supply Converter
