### DESCRIPTION

The PQC250 series switching power supplies utilize advanced component and circuit technologies to deliver high efficiency and low power dissipation, in both operational and standby operation, in a compact 3.0" x 5.0" x 1.40" package. Designed for industrial, medical, computing, communications, telecom, consumer, and other OEM applications, and deployable in 1U customer enclosures. All models offer universal AC input capability with active power factor correction (PFC) and compliance to worldwide safety and EMC standards.

Output De-Rating at 70°C is for horizontal orientation with component side up only. Please refer to ACAN-77 for details

29V model available, consult with factory for more information

See Part Number Structure for "yyy" options refer to: Part Number Options Guide Max capacitance limit does not apply to constant current "C" option

INPUT CHARACTERISTICS					
Parameter	Conditions	Min	Nom	Max	Units
Input Voltage AC Operating Range	Single Phase	90	100/240	264	Vac
Input Frequency		47	50/60	63	Hz
Turn-on input voltage	Input rising	75		90	Vac
Turn-off input voltage	Input falling	65		80	Vac
DC input <sup>1, 2</sup>		127		300	
DC Input		260		400	
	Vin = 115V <sub>AC</sub> ; Full Load		2.5		Arms
Maximum input current	$^{2}$ Vin = 127-300Vdc			2.7	Adc
	$^{2}$ Vin = 260-400Vdc			1.5	Adc
Inrush Current	230V <sub>AC</sub> ,Cold start, 25°C;		30		Apk
Power Factor	At 115Vac, full load	0.95			W/VA
Hold-up Time	90V <sub>AC</sub> ; Full Load	16			msec
Efficiency @ 230V <sub>AC</sub> for PQC250-48	20% Full Load		88.5		
model.	50% Full Load		94		%
mouel.	100% Full Load		95		
No Load Input Power Consumption	$(PS_ON = OFF; Aux (V2) = OA)$			< 0.5	W

Consult with factory for details and availability

wedical certification applies only to Ac input models.
OUTPUT CHARACTERISTICS

OUTPUT CHARACTERISTICS						
Parameter	Conditions	Min	Nom	Max	Units	
Line Load Degulation	Main (V1) Output <sup>1</sup>			±1	%	
Line, Load Regulation	Aux (V2) Output			±5	70	
Minimum Load Capability	Stable Operation	0			Α	
Output Ripple	Zero to Full Load <sup>2</sup>			1%	mVpp	

<sup>&</sup>lt;sup>1</sup>Zero load output voltage may exceed the regulation window however will not cause OVP to engage or PWROK to change to low state. 200mA min. load current is

<sup>2</sup> Ripple and noise are measured with 0.1uF ceramic capacitor and 10uF tantalum capacitor. A short coaxial cable with 50 ohm termination is used

AUXILIARY OUTPUT CHARACTERISTICS (ALL MODELS)					
Auxiliary Output	Aux Output Voltage	Load Current	Load Capacitance	Line, Load, Cross Regulation	Ripple Voltage & Noise
Aux (V2)	5V	0 to 0.5A	0 to 220µF	± 5%	120mVpp

### **FEATURES**

- Industry leading MTBF
- Certified to IEC 60601 Ed.3 medical (2 x MOPP Pri-Sec; 1 x MOPP Pri-Chassis Ground), AC input models.
- IEC 60950-1 compliant
- IEC 60335-1 Certificate
- Designed to comply with IEC60601-1-2 4<sup>th</sup> Edition EMC Standard Requirements<sup>1</sup>
- 250W Convection, 100Vac to 264Vac +50C operation
- Very low no load standby power; designed to meet ENERGY STAR® Program Requirements for Single Voltage External AC-DC Power Supplies
- True zero load operation of the Main (V1) output; no minimum load requirements
- Constant Current overload protection option<sup>3</sup>
- 3" x 5" industry standard footprint
- Optional DC input capability
- High efficiency 94% typical
- Remote sense, main output
- Universal AC input with active PFC
- Less than 1U high
- RoHS compliant
- Active inrush protection
- Compatibility with MVAC250 Series products<sup>2</sup>
- Droop current share, output Terminal block option
- Two-vear warrantv
- When deployed in the End User equipment
- <sup>2</sup> Fan output of MVAC250 series not available on this product series

<sup>3</sup> Select voltage variants

Voltage dips, interruptions	IEC/EN 61000-4-11	Level 3, Criterion B

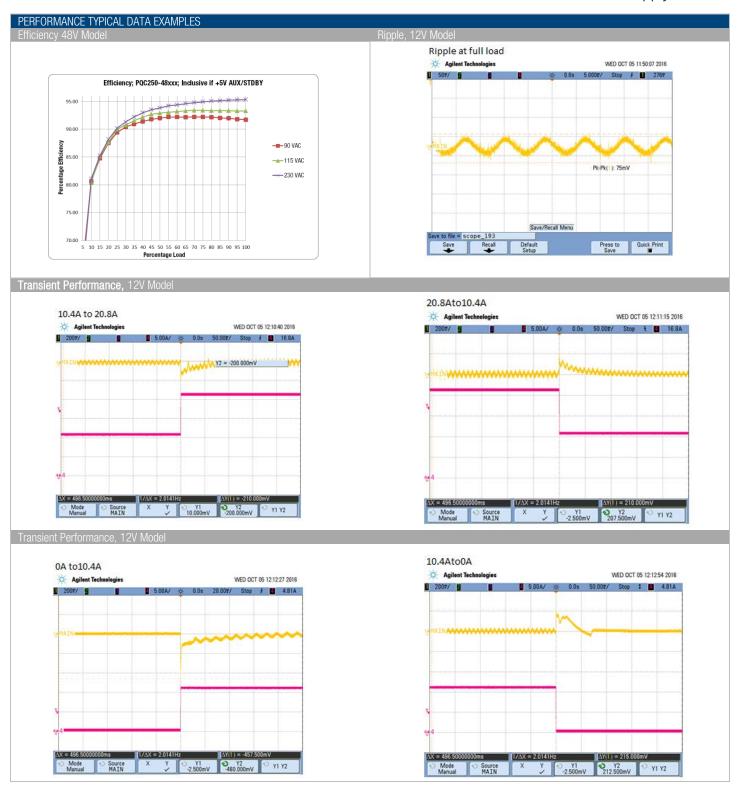

<sup>&</sup>lt;sup>1</sup>Designed to comply with IEC60601-1-2 4th Edition EMC Standard Requirements

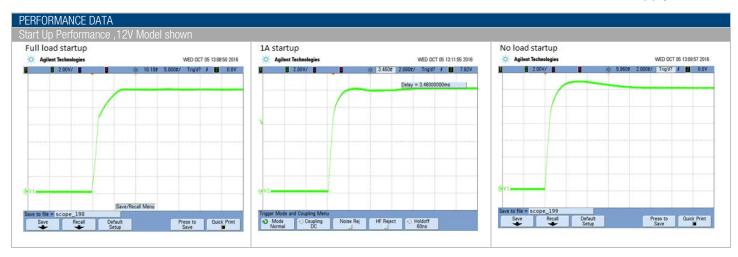

#### **EMI CONSIDERATIONS**

For optimum EMI performance, the power supply should be mounted to a metal plate grounded to all 4 mounting holes of the power supply. To comply with safety standards, this plate must be properly grounded to protective earth (see mechanical dimension notes). Pre-compliance testing has shown the stand-alone power supply to comply with EN55022 class B radiated emissions with a metal enclosure with grounded base plate. See PQC-COVER for details - testing was based on adding a toroid, Fair-Rite#5961004901 with five turns of both of the output leads. Radiated emission results vary with system enclosure and cable routing paths.

STATUS AND CONTROL SIGNALS					
Parameter	Models	Conditions			
PS ON	All Models (Except as noted)	This pin must be pulled low (sink current $>2mA$ ) to $+5V\_AUX\_RTN$ (connector J3 Pin 8) to (enable) turn on the main output. The $+5V\_AUX$ output is independent of the PS $\_ON$ signal, and comes up automatically when the input AC or input DC voltage is applied within their specified operating ranges.			
Connector J3 Pin 4	"C" Option Models	This pin can be left unterminated (or alternatively pulled high to +5V_AUX; Connector J3 Pin 1) to (enable) turn on the main output. The +5V_AUX output is independent of the PS_ON signal, and comes up automatically when the input AC or input DC voltage is applied (within their respective specified operating ranges).  If it is desired to turn off the Main Output (during normal operation) then this pin can be pulled "low" (sink current >2mA) to +5V_AUX_RTN.			
PWR_OK Connector J3 Pin 2		Open collector logic goes high 40-100ms after the main output is within regulation; it goes low at least 2msecs before loss of regulation. Internal 10K pull up to +5V_AUX is provided. Applications using the PWR_OK signal should maintain a minimum load of 5W on the main output.			

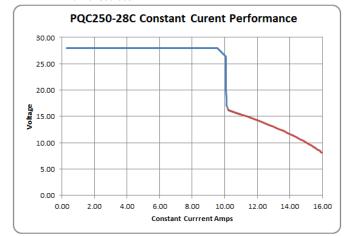

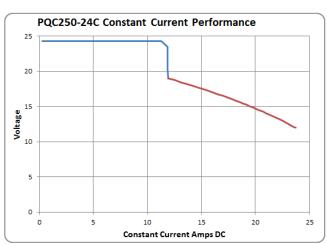

### CONSTANT CURRENT OVERLOAD PERFORMANCE DATA: PQC250-xxC VARIANTS

The "C" option variant provides an overload (abnormal) Constant Current (CC) characteristic as shown in the following curves. This option will enable the PQC250 to successfully operate (at initial startup or during normal operation) in applications experiencing (large current) transient loads such as:

- Large capacitive loads
- Incandescent (i.e. halogen) lamps
- Inductive loads (motors and solenoids)
- LED driver sources

- 1. Curves generated for the PQC250-xxC variants by subjecting output to an incremental load (constant resistance) equivalent to 1Adc increments between 0A and 50A dc.
- 2. The resultant curve shows current limited to a constant "brick wall" shown by the blue portion of the curves.
- 3. If the load current is further incremented the current is still limited but will "tail" and result in the red portion of the curves. End Users should be aware of the potential magnitude of the "current tail" and rate their track/trace and/or interconnection cables accordingly.
- 4. If the overload (abnormal) current is maintained above maximum load for an extended period then internal over temperature protection may (will) shut down the output to prevent potential thermal overstress of components and maintain safe and reliable operation.

### THERMAL CONSIDERATIONS

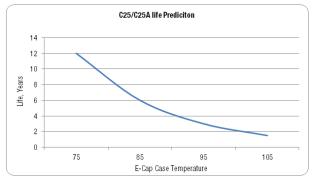

System thermal management is critical to the performance and reliability of the PQC250 series power supplies. Performance <u>derating curves</u> are provided which can be used as a guideline for what can be achieved in a system configuration with controlled airflow at various input voltage conditions.

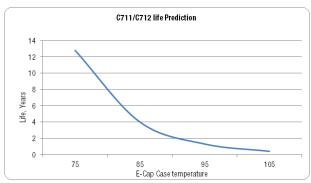

The product is designed to provide 250W using natural convection cooling when mounted horizontally with un-obstructed convection current airflow flow at room temperature. At elevated temperature the power supply data is taken while it is surrounded by a large vented enclosure to minimize forced cross flows inherent in the elevated temperature test.

The product is capable of operation when mounted in other orientations; operational/derating curves shall be provided to show the effect of such mounting. See ACAN-77 for additional details

### Capacitor case temperature and Mounting Orientation:

The power supply can operate in any orientation; however, the power supply contains overtemperature protection that will shut off the output as the temperature of the power supply heatsinks approach the limt specified in the <u>protection table</u>. Additionally, life expectantcy of the power supply is inversely proportional to the case temperature of electrolytic capacitors <u>C25</u>, <u>C25A</u>, <u>C711</u> & <u>C712</u>. The designer of the system in which this power supply is deployed should consider this relationship to ensure optium product life. The following charts illustrate this relationship:

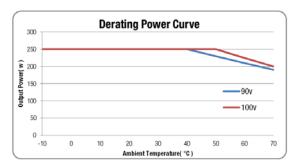

The PQC250 Series will also benefit from the provision of forced cooling airflow (generated by an external host system fan). This will enable operation at potentially higher local surrounding ambient temperatures.

Please refer to ACAN-78 for additional details

Derating Curve vs. Temperature (based on horizontal mounting. PTH components facing up. natural convection)

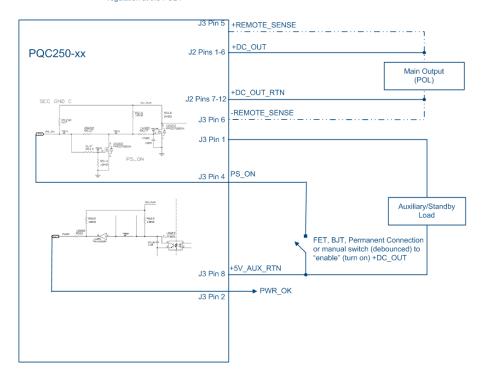

Derating curves are provided to indicate operation at varying input voltages with respect to temperature. See <u>ACAN-77</u> for more details Link <u>Back to Thermal Considerations</u>; <u>Ordering Guide</u>

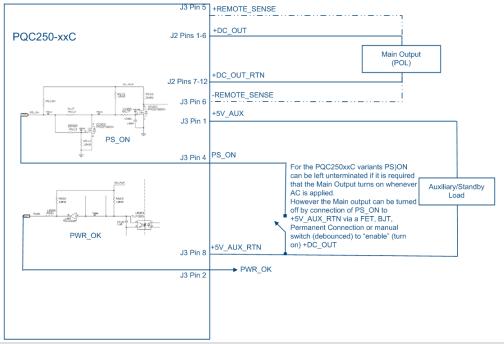

## WIRING DIAGRAM FOR OUTPUT PQC250-xx

Dotted lines show optional remote sense connections, that can be extended to the Point of Load (POL) which can be some physical distance from the power module output connector (J2). The intent is to compensate for any voltage drop in the cables to the to maintain voltage regulation at the POI.

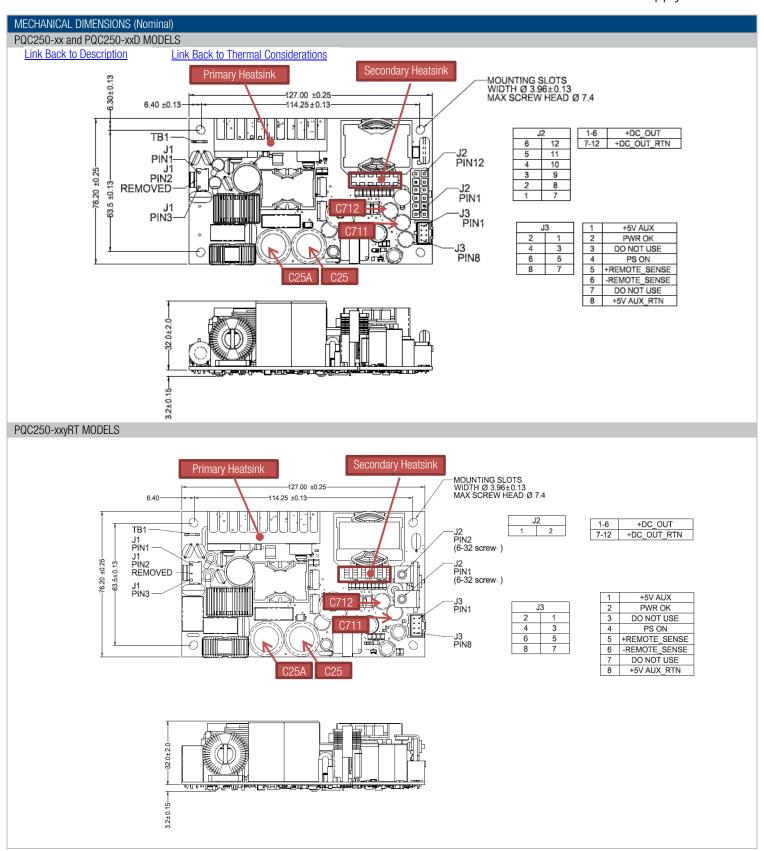

### PQC250-xxC

Dotted lines show optional remote sense connections, that can be extended to the Point of Load (POL) which can be some physical distance from the power module output connector (J2). The intent is to compensate for any voltage drop in the cables to the to maintain voltage regulation at the POL.

Note: For parallel (current share) operation it is required to connect the sharing power supplies in parallel (+DC out connected together and DC out Return connected together on sharing power supplies. Since each output has an identical "droop" share characteristic then each output will intrinsically share the total load current. See <u>ACAN-78</u> for more details.

## 250W 3" x 5" Convection Cooled AC-DC Power Supply Converter

### SAFETY CONSIDERATIONS

- 3. Protective bonding conductor from the end product protective earthing terminal must be tied to TB1. For optimum EMI performance, while maintaining Class I safety isolation all 4 mounting holes must be tied to the end product protective earthing terminal. To maintain Class II safety isolation mounting holes MTG1 and MTG2 need to be isolated from protective earth and should use standoffs of non-conductive material.
- 4. This power supply requires mounting standoffs of minimum 6mm in height. If there is risk of chassis deformation or shorter standoff height is required, an appropriate insulator must be used under the power supply with adequate extension beyond the outline of the power supply. In all cases, the applicable safety standards must be applied to ensure proper creepage and clearance requirements are met.
- 5. The primary heatsink is considered a live primary circuit, and should not be touched. It is recommended that the primary heatsink be kept at least
- 6. This product is subject to the following operating requirements and the Life and Safety Critical Application Sales Policy: http://www.murata-ps.com/requirements/
- 7. Used only in non-tropical conditions.
