1. Introduction

CTU-D device series is OEM miniature RFID card reader operating at frequency of 125 kHz.

Main features:

- Support of Unique, Q5, Hitag-1, Hitag-S or HID transponders,
- built-in antenna
- card memory with build-in lock driver,
- lots of communication interfaces type, depend on version (see table below)
- Built-in relay and buzzer
- Built-in push-button for reset to default settings
- 2 configurable inputs/outputs
- Two-state outputs control
- Read-out of two-state input
- changeable format of sending ID
- Data password protected
- Software update via RS-232 interface using *NEFIR* program

| CTU-D reader series | | | | | | | | | | | | |
|---------------------|------|-------------|--------------|----------|--------------|------------|--------|-----------|-----|-----|---------|-------|
| Module type | GPIO | Card memory | Event memory | Relay | Power supply | INTERFACES | | | | | | |

* - standard version, rest of version for special order

2. General specification

| Supported functionality depending on transponder / card type: | | | |
|---|--------------------|--|-----------------------------------|
| Transponder type | ID number read-out | Full write and read-out of memory blocks | Supported by internal lock driver |
| Unique | YES | - | - |
| Q5 | YES | YES | - |
| HID | YES | - | - |
| HITAG | YES | YES | NO |

| CTU-Dxx module parameters | |
|---|--|
| Supply voltage (D2R i D4R model) | 7-16 V |
| Supply voltage (D5R model) | 4,5 - 5,5 V |
| Max. supply current | 120 mA |
| Rated operation radio frequency of module | 125kHz |
| Working temperature | -20°C - +65°C |
| Max. relay current | 2A |
| Appr. read distance for Unique | 11 cm |
| Appr. read distance for Hitag | 12 cm |
| Appr. read distance for HID | 7 cm |
| Max. output current for GPIO | 20mA |
| Transmission parameters for RS232/RS485/RSTTL | 2400, 4800, 9600, 19200, 38400, 57600, 115200 bps, 8 data bits, 1 stop bit, no parity compliant with „Netronix Protocol” |
| Address on I ² C bus | 0xC0 |
| 1WIRE family code,address (configurable) | 0x01,0x01 |
| WIEGAND number of bits | 37 |

3. Dimension, terminal description

Rys.2 top side view

| Pin no. | Description |
|---------|---|
| 1 | RS232RX, RS485B, RSTTL_RX, 1WIRE, MOSI, SDA |
| 2 | RS232TX, RS485A, RSTTL_TX, MISO |
| 3 | SCK, SCL |
| 4 | CS |
| 5 | MCLR |
| 6 | GND |
| 7 | VCC |
| 8 | GPIO 1 |
| 9 | GPIO 2 |
| 10 | GND |
| 11 | NC |
| 12 | NC |
| 13 | RELAY 1 |
| 14 | RELAY 2 |

4. Module settings by on-board switch

Two function of build-in switch:

- configure to factory settings – press button for 8 seconds
- change interface and RFID transponder type – press button in schematic:

| STEP | Number of press | 1 | 2 | 3 | 4 | 5 | 6 |
|------|------------------------------|---|-----------|-----|---------|-------|-------|
| 1 | MENU1-transponder selection | - | Unique | Q5 | Hitag | HID | MULTI |
| 2 | Double beep | | | | | | |
| 3 | MENU2 – interface selection* | - | RS232/485 | SPI | WIEGAND | 1WIRE | I2C |
| 4 | Triple beep | | | | | | |

* - type of interface depends on CTU-D model

5. Transmission protocols

5.1. RS-232/485 transmission protocol

In this data sheet RS-232/485 protocol has been confined to descriptions of commands, responses and their parameters. Header and CRC control sum exist always and are compliant with full “Netronix Protocol” document.

Command frame:

| | | | |
|--------|---------------|--------------------------|-----|
| Header | C_CommandName | Response_parameters1...n | CRC |
|--------|---------------|--------------------------|-----|

Response frame:

| | | | | |
|--------|-----------------|--------------------------|---------------|-----|
| Header | C_CommandName+1 | Response_parametrers...m | OperationCode | CRC |
|--------|-----------------|--------------------------|---------------|-----|

RS protocol operation can be tested by means of development tools including free of charge “FRAMER” software”.

5.2. Protocol for I²C transmission

5.2.1. Data exchange algorithm

A module configured depending on table showed on point 4. operates in I²C interface mode in following sequences:

1. Master (external device) writes command with parameters if necessary into slave device (CTU module)
- 2 The command is performed (immediately after receiving byte sent quantity declared in frame)

3. Master device reads response, its parameters and operation code. In case of receiving busy byte 0xCB, repeat attempt to read the response after ca. 1 ms (commands connected with write to/and read from transponders can last up to 100 ms).

We write inquiry-command to CTU module:

The „number of bytes” field must contain information on byte quantity sent directly “command” fields and “parameters”.

We have then:

5.2.2. Timings

Module sends and receives data at 400 kHz clock frequency considering timings showed below.

| Param. No. | Sym. | Characteristic | Min. | Max. | Units |
|------------|---------|--|----------|------|-------|
| 1 | FCLK | Clock Frequency | — | 400 | kHz |
| 2 | THIGH | Clock High Time | 600 | — | ns |
| 3 | TLOW | Clock Low Time | 1300 | — | ns |
| 4 | TR | SDA and SCL Rise Time (Note 1) | — | 300 | ns |
| 5 | TF | SDA and SCL Fall Time | — | 300 | ns |
| 6 | THD:STA | Start Condition Hold Time | 600 | — | ns |
| 7 | TSU:STA | Start Condition Setup Time | 600 | — | ns |
| 8 | THD:DAT | Data Input Hold Time | 0 | — | ns |
| 9 | TSU:DAT | Data Input Setup Time | 100 | — | ns |
| 10 | TSU:STO | Stop Condition Setup Time | 600 | — | ns |
| 11 | TSU:WP | WP Setup Time | 600 | — | ns |
| 12 | THD:WP | WP Hold Time | 1300 | — | ns |
| 13 | TAA | Output Valid from Clock (Note 2) | — | 900 | ns |
| 14 | TBUF | Bus free time: Time the bus must be free before a new transmission can start | 1300 | — | ns |
| 15 | TOF | Output Fall Time from VIH Minimum to VIL Maximum | 20+0.1CB | 250 | ns |

Note 2: Reader keeps in low state first clock pulse of each byte sent until proper state is placed on SDA line.

5.3. Protocol for 1WIRE (Dallas) bus.

| Family code | ID1...ID5 | Address | CRC |
|-------------|-----------|---------|---------|
| 1 byte | 5 bytes | 1 byte | 1 bytet |

ID1...5 – unique ID number of transponder

CRC_DAL- check sum of data send

The format conforms 1-WIRE Dallas (e.g.. DS1990A). It means, that described module could be used as a replacement of DS1990A drop. During operation, a module tries to read-out transponder periodically. If it fails (no successful read-out), module does not response for pulses sent from 1-WIRE master unit. Bus does not "see" the module, which corresponds with lack of reader applying, it means applying the DS1990A drop to drop reader. If module reads out the transponder, the module starts to send data via 1-WIRE bus.

Calculate the CRC value

According to DS1990A specification C value is calculated from equation $x^8+x^5+x^4+1$ with initial value equal to 0x00. The CRC is calculated on basis of all frame bytes excluding the last one.

An example of CRC value calculation procedure written in C language

```

unsigned char CalcCRCDallas(unsigned char *SourceAdr)
{
    unsigned char i,k,ln,CRC=0;
    for(i=0;i<7;i++)
    {
        ln=*SourceAdr;
        for(k=0;k<8;k++)
        {
            if((ln^CRC)&1) CRC=((CRC^0x18)>>1)|0x80;
            else CRC=CRC>>1;
            ln>>=1;
        }
        SourceAdr++;
    }
    return(CRC);
}

```

where *SourceAdr is beginning flag of data buffer

5.4. Wiegand protocol

The format conforms WIEGAND protocol specification for N bits. During operation, a module tries to read-out transponder periodically. If it fails (no successful read-out), module does not send data (bus does not "see" the module). If module reads out the transponder, the module starts to send data via Wiegand bus.

Pulse sequence from left to right.

Total number of pulses (level L) is equal to N. The first being bit sent complements up to parity the bits from first half of total bits. The last bit N complements up to non-parity the bits from second half of bits being sent.

It means, that two bits out of N bits assure the transmission correctness. Information is being sent is written by means bits 2 to N-1, it gives N information bits.

Check sums for bit sequence:

for even N:

EXXXXXXXXXXXXXXXXYYYYYYYYYYYYYO

or for odd N:

EXXXXXXXXXXXXXXXXXXXXX.....
.....YYYYYYYYYYYYYYYYYO

Where:

E = bit complementing up to parity

O = bit complementing up to non-parity

X = mask for parity calculation

Y = mask for non-parity calculation

6. Communication protocol commands

6.1. Commands for communication with transponders

6.1.1. Selecting the transponder type

Command frame:

| | |
|----------------------|-----------------------|
| C_SetTransponderType | TransponderType, GAIN |
|----------------------|-----------------------|

Where:

| Parameter name | Parameter description | Value range |
|----------------------|---|--|
| C_SetTransponderType | Command of transponder type changing | 0x02 |
| TransponderType | Transponder type we want exchange data with | 0x01 – Unique 0x02 – Q5 0x03 – HITAG 0x04 – HID |
| GAIN | Gain of RFID receive circuit (recommended values 0x1 or 0x2) | 0x0-0x3 |

Response frame:

| | | |
|-------------------------|--|----------------|
| C_SetTransponderType +1 | | Operation Code |
|-------------------------|--|----------------|

6.1.2. On/off switching of reader field

Command frame:

| | | | |
|--------|----------------------|-------|-----|
| Header | C_TurnOnAntennaPower | State | CRC |
|--------|----------------------|-------|-----|

Where:

| Parameter name | Parameter description | Value range |
|----------------------|----------------------------------|---|
| C_TurnOnAntennaPower | On/off switching of reader field | 0x10 |
| State | On state | 0x00 – switching the field off 0x01 – switching the field on |

Response frame:

| | | | | |
|--------|-------------------------|--|----------------|-----|
| Header | C_TurnOnAntennaPower +1 | | Operation Code | CRC |
|--------|-------------------------|--|----------------|-----|

6.1.3. Reading the ID card unique number

Command frame:

| | |
|----------|--|
| C_Select | |
|----------|--|

Where:

| Parameter name | Parameter description | Value range |
|----------------|-----------------------|-------------|
| C_Select | Odczyt ID | 0x12 |

Response frame:

| | | |
|-------------|--------------------------|----------------|
| C_Select +1 | Coll, TType, ID1.....IDn | Operation Code |
|-------------|--------------------------|----------------|

Where:

| Parameter name | Parameter description | Meaning |
|----------------|---|---|
| Coll | Information on collision (HITAG transponders only) | 0 – no collision 1 – collision of two or more transponders |
| TType | Information on transponder type, to whom the red ID number concerns | 1 - Unique, Q5 3 - HITAG 4 - HID |
| ID1...IDn | Unique number of transponder | ID1 – LSB, IDn – MSB |

6.2. Commands for communication with Q5 transponders

After selecting the type Q5 transponder with C_SetTransponderType command, we have new commands at disposal, which will be used for two-way communication.

6.2.1. Writing the ID-Unique number to Q5 transponder

Command frame:

| | |
|---------------|------------------|
| C_UniqueWrite | Unique1..5, lock |
|---------------|------------------|

Where:

| Parameter name | Parameter description | Value range |
|----------------|----------------------------------|----------------------------------|
| C_UniqueWrite | Command of id-unique write | 0x08 |
| Unique1..5 | 5 bytes of ID number | 0x00-0xff |
| lock | ID programming with rewrite lock | 0 – without lock 1- with lock |

Response frame:

| | | |
|------------------|--|----------------|
| C_UniqueWrite +1 | | Operation Code |
|------------------|--|----------------|

Note: The Q5 type transponders do not have verification function of correct ID number write. Getting proper code of operation does not guarantee correct assign of ID number. Make sure, that ID number has been assigned correctly reading the number with C_Select command.

6.2.2. Reading the sector of Q5 transponder

Command frame:

| | |
|-------------|-------------------------|
| C_ReadBlock | SectorNo,[Password1..4] |
|-------------|-------------------------|

Where:

| Parameter name | Parameter description | Value range |
|----------------|---|-------------|
| C_ReadBlock | Sector read command | 0x1E |
| SectorNo | Read sector number | 0x00-0x07 |
| Password | Option –if sector which is being red is 4-byte password protected | 0x00-0xff |

Response frame:

| | | |
|----------------|--|----------------|
| C_ReadBlock +1 | | Operation Code |
|----------------|--|----------------|

6.2.3. Writing the sector of Q5 transponder

Command frame:

| | |
|--------------|---|
| C_WriteBlock | SectorNo, Data1..4, Lock,[Password1..4] |
|--------------|---|

Where:

| Parameter name | Parameter description | Value range |
|----------------|--|----------------------------------|
| C_WriteBlock | Sector write command | 0x1C |
| SectorNo | Write sector number | 0x00-0xff |
| Data1..4 | 4 bytes of data | 0x00-0x07 |
| lock | Programming the sector with rewrite lock | 0 – without lock 1- with lock |
| Password1..4 | Option – if we want to protect a sector with 4-byte password | 0x00-0xff |

Response frame:

| | | |
|-----------------|--|----------------|
| C_WriteBlock +1 | | Operation Code |
|-----------------|--|----------------|

Note: The Q5 type transponders do not have verification function of correct data write into sectors. Getting proper code of operation does not guarantee correct write. Make sure, that data has been written correctly reading it with C_ReadBlock command.

6.3. Commands for communication with HITAG transponders

6.3.1. Reading the page of HITAG transponder

Command frame:

| | |
|-------------|--------|
| C_ReadBlock | PageNo |
|-------------|--------|

Where:

| Parameter name | Parameter description | Value range |
|----------------|-----------------------|-------------|
| C_ReadBlock | Page read command | 0x1E |
| PageNo | Read page number | 0x00-0x3f |

Response frame:

| | | |
|----------------|--|----------------|
| C_ReadBlock +1 | | Operation Code |
|----------------|--|----------------|

6.3.2. Writing the page to HITAG transponder

Command frame:

| | |
|--------------|-------------------|
| C_WriteBlock | PageNo, Data1...4 |
|--------------|-------------------|

Where:

| Parameter name | Parameter description | Value range |
|----------------|------------------------------------|-------------|
| C_WriteBlock | Sector read command | 0x1C |
| PageNo | Read page number | 0x00-0x3f |
| Data1..4 | 4 bytes of data which is being red | 0x00-0xff |

Response frame:

| | | |
|-----------------|--|----------------|
| C_WriteBlock +1 | | Operation Code |
|-----------------|--|----------------|

6.4. Reader inputs and outputs

Reader has inputs and outputs which are configurable. Inputs are controlled directly from microcontroller outputs. Output load current is up to 20 mA.

6.4.1. Writing the output state

Command frame:

| | |
|----------------|-------------|
| C_WriteOutputs | IONo, State |
|----------------|-------------|

Where:

| Parameter name | Parameter description | Value range |
|----------------|---|--|
| C_WriteOutputs | Output state write | 0x70 |
| IONo | I/O port number. The port should be configured as an output | 0x1..0x7 dla UW-U4R 0x1..0xC dla UW-U4G |
| State | Requested output state | 0x00 or 0x01 |

Response frame:

| | | |
|-------------------|--|----------------|
| C_WriteOutputs +1 | | Operation Code |
|-------------------|--|----------------|

6.4.2. Reading the input state

Command frame:

| | |
|--------------|------|
| C_ReadInputs | IONo |
|--------------|------|

Where:

| Parameter name | Parameter description | Value range |
|----------------|--|--|
| C_ReadInputs | Input state read-out | 0x72 |
| IONo | I/O port number. Should be configured as an input. | 0x0..0x7 dla UW-U4R 0x0..0xC dla UW-U4G |

Response frame:

| | | |
|-----------------|-----------------|----------------|
| C_ReadInputs +1 | State,[COUNTER] | Operation Code |
|-----------------|-----------------|----------------|

Where:

| Parameter name | Parameter description | Value range |
|----------------|---------------------------------------|-------------|
| State | Input state which has been read | |
| Counter | Counter state for counter type input. | |

6.4.3. Writing the settings to any port

Command frame:

| | | | |
|--------|---------------|-------------------------|-----|
| Header | C_SetIOConfig | IONo, IOConfigData1...n | CRC |
|--------|---------------|-------------------------|-----|

If we set a port as output, IOConfigData1...n parameters are as below:

Dir, ConfByte1, TypeOfOutput, Hold-up, 0Time, 1Time

Where:

| Parameter name | Parameter description | Value range |
|----------------|--|--|
| C_SetIOConfig | Writing the configuration of every port | 0x50 |
| IONo | I/O port number, which is to be configured | 0x0..0x4 |
| Dir | Port direction | 0x00 – output |
| ConfByte1 | One byte in which: BIT0 assigns output type as normally open or normally closed. BIT 1 determines reaction method of each output as sensitive for simulation changing (slope sensitive) or as sensitive for simulation state (state sensitive). BIT3:2 determines operation method of output referring to trigger signal state. | ConfByte1 Bit 0 0-Normally closed 1-Normally open ConfByte1 Bit 1 0-level sensitive 1-slope sensitive ConfByte1 Bit 3:2 00 – rectangular wave generator 01- directly 10 – output state change |
| TypeOfOutput | Source of driving signal | 0x00 – permanently off 0x01 – permanently on 0x02 – driven via serial interface 0x03 – driven via serial with automatic reset(edge emulation) 0x04 – driven by internal access control mechanism ACM. This output is driven in case of applying the card to reader, which is written into internal card base. 0x05 – set in case of applying freely selected card to reader. |
| Hold-up | Time of maintaining the on state after actuation stopped. This time is specified as: Hold-up x 100 ms During “hold-up” time, it is possible to configure the output, which is able to generate rectangular wave. By means of following parameters are configured “Logic 1” time and “Logic 0” time: | |
| 0Time | Logic 0 time | |
| 1Time | Logic 1 time | |

If we set a port as a input, IOConfigData1...n parameters would be as below:

Dir, Triger, TypeOfInput, Delay,

Where:

| Parameter name | Parameter description | Value range |
|----------------|--|----------------|
| C_SetIOConfig | Writing the configuration of freely selected port. | 0x50 |
| IONo | I/O port number, which is to be configured. | 0x00,0x01,0x07 |
| Dir | Port direction | 0x01 – input |
| TypeOfInput | Input type | 0x03 |
| Delay | Delay | 0x00 |

6.4.4. Reading-out the configuration of freely selected port

Command frame:

| | | | |
|--------|---------------|------|-----|
| Header | C_GetIOConfig | IONo | CRC |
|--------|---------------|------|-----|

Where:

| Parameter name | Parameter description | Value range |
|----------------|--|-------------|
| C_GetIOConfig | Reading-out the configuration of freely selected port. | 0x52 |
| IONo | I/O port number, which configuration is to be red-out. | 0x00...0x05 |

Response frame:

| | | | | |
|--------|------------------|-------------------|---------------|-----|
| Header | C_GetIOConfig +1 | IOConfigData1...n | OperationCode | CRC |
|--------|------------------|-------------------|---------------|-----|

Where:

| Parameter name | Parameter description | Value range |
|-------------------|--|-------------|
| IOConfigData1...n | This is the same, as in case of configuration write. | |

Some I/O of CTU-D reader has no possibility to toggle port direction.
To accomplish proper configuration, input proper direction option to given port.

| LIST OF EXISTING PORTS, WHICH CAN BE DRIVEN IN UW-M4R | | | |
|---|--------------|-------------|--|
| Port number | Direction | Description | |
| 0 | input/output | GPIO1 | |
| 1 | input/output | GPIO 2 | |
| 2 | output | RELAY | |
| 3 | output | BUZZER | |

Response frame:

| | | | | |
|--------|------------------|--|---------------|-----|
| Header | C_SetIOConfig +1 | | OperationCode | CRC |
|--------|------------------|--|---------------|-----|

6.5. Access password

6.5.1. Logging to reader

Command frame:

| | | | | |
|--------|-------------|----------------|--|-----|
| Header | C_LoginUser | Data1...n, 0x0 | | CRC |
|--------|-------------|----------------|--|-----|

Where:

| Parameter name | Parameter description | Value range |
|----------------|--|--|
| C_LoginUser | Logging to reader | 0xb2 |
| Data1...n | This is any byte string | Any from range: 0x01...0xff. String length, which can be 0 to 8 bytes |
| 0x00 | Logic Zero, which terminates a string. | 0x00 |

Response frame:

| | | | | |
|--------|---------------|--|---------------|-----|
| Header | C_LoginUser+1 | | OperationCode | CRC |
|--------|---------------|--|---------------|-----|

6.5.2. Changing the password

Command frame:

| | | | | |
|--------|-------------------|----------------|--|-----|
| Header | C_ChangeLoginUser | Data1...n, 0x0 | | CRC |
|--------|-------------------|----------------|--|-----|

Where:

| Parameter name | Parameter description | Value range |
|-------------------|---|--|
| C_ChangeLoginUser | Password change | 0xb4 |
| Data1...n | This is any byte string, which will form valid access password. | Any from range: 0x01...0xff. String length, which can be 0 to 8 bytes |
| 0x00 | Logic Zero, which terminates a string. | 0x00 |

If =0x00, a reader will not be protected by password. At any moment, there is possible to set new password later on, to protect the reader by it.

Response frame:

| | | | | |
|--------|---------------------|--|---------------|-----|
| Header | C_ChangeLoginUser+1 | | OperationCode | CRC |
|--------|---------------------|--|---------------|-----|

6.5.3. Logging out of the reader

This command sets latest password as an invalid.

Command frame:

| | | | |
|--------|--------------|--|-----|
| Header | C_LogoutUser | | CRC |
|--------|--------------|--|-----|

| Parameter name | Parameter description | Value range |
|----------------|----------------------------|-------------|
| C_LogoutUser | Logging out of the reader. | 0xd6 |

Response frame:

| | | | | |
|--------|-----------------|--|---------------|-----|
| Header | C_LogoutUser +1 | | OperationCode | CRC |
|--------|-----------------|--|---------------|-----|

6.6. Operating the transponder internal memory

6.6.1. Reading-out the transponder number from memory

Command frame:

| | | | |
|--------|------------------|------------|-----|
| Header | C_CardMemoryRead | AdrL, AdrH | CRC |
|--------|------------------|------------|-----|

Where:

| Parameter name | Parameter description | Value range |
|------------------|---|-----------------|
| C_CardMemoryRead | Read-out of transponder number from memory. | 0x20 |
| AdrL, AdrH | Younger and older byte respectively. | 0x0000...0x01fd |

Response frame:

| | | | | |
|--------|--------------------|------------------------|---------------|-----|
| Header | C_CardMemoryRead+1 | ID1(L)...ID5(H), Right | OperationCode | CRC |
|--------|--------------------|------------------------|---------------|-----|

Where:

| Parameter name | Parameter description | Value range |
|-----------------|------------------------------------|-------------|
| ID1(L)...ID5(H) | Five bytes of transponder number | |
| Right | Access rights to given transponder | 0x01 |

6.6.2. Writing the transponder name to memory

Command frame:

| | | | |
|--------|-------------------|------------------------------------|-----|
| Header | C_CardMemoryWrite | AdrL, AdrH, ID1(L)...ID5(H), Right | CRC |
|--------|-------------------|------------------------------------|-----|

Where:

| Parameter name | Parameter description | Value range |
|-------------------|---|-------------------|
| C_CardMemoryWrite | Write of transponder number into memory. | 0x22 |
| AdrL, AdrH | Younger and older byte respectively | 0x00...0x01fd |
| ID1(L)...ID5(H) | Five bytes of transponder number | Any of five bytes |
| Right | Access rights or function performed by transponder. | 0x01 |

Response frame:

| | | | |
|--------|---------------------|---------------|-----|
| Header | C_CardMemoryWrite+1 | OperationCode | CRC |
|--------|---------------------|---------------|-----|

Where:

6.7. Operating the built-in access control

6.7.1. Writing the configuration of access control

Command frame:

| | | | |
|--------|---------------------------|------|-----|
| Header | C_AccesControlConfigWrite | Mode | CRC |
|--------|---------------------------|------|-----|

Where:

| Parameter name | Parameter description | Value range |
|---------------------------|--|---|
| C_AccesControlConfigWrite | Write of access control configuration. | 0x74 |
| Mode | Operation mode of control access module. | 0x00 – module disabled 0x01 – module enabled |

Response frame:

| | | | |
|--------|-----------------------------|---------------|-----|
| Header | C_AccesControlConfigWrite+1 | OperationCode | CRC |
|--------|-----------------------------|---------------|-----|

6.7.2. Reading-out the configuration of access control

Command frame:

| | | |
|--------|--------------------------|-----|
| Header | C_AccesControlConfigRead | CRC |
|--------|--------------------------|-----|

Where:

| Parameter name | Parameter description | Value range |
|--------------------------|---|-------------|
| C_AccesControlConfigRead | Read-out of access control configuration. | 0x76 |

Response frame:

| | | | | |
|--------|----------------------------|------|---------------|-----|
| Header | C_AccesControlConfigRead+1 | Mode | OperationCode | CRC |
|--------|----------------------------|------|---------------|-----|

Where:

| Parameter name | Parameter description | Value range |
|----------------|--|---|
| Mode | Operation mode of access control module. | 0x00 – module disabled 0x01 – module enabled |

6.7.3. Writing the “automatic read” configuration

This command sets operation method of automatic device, reading the unique transponder number UID.

The reader described below makes possible to hold-on operation of automatic device for a while, in case of suitable transmission via serial interface.

If the reader will operate in mixed mode i.e.:

- automatic reading device UID is enabled and:
- master device (computer, controller) communicates with reader or with transponders via reader,

it is required, to configure the reader correctly, so in case of communication with a reader or transponder, automatic reading device would hold-on its operation.

Command frame:

| | | | |
|--------|-----------------------|--|-----|
| Header | C_SetAutoReaderConfig | ATrig, AMode, AOfflineTime, ASerial, Abuzz, Amulti | CRC |
|--------|-----------------------|--|-----|

Where:

| Parameter name | Parameter description | Value range |
|------------------------|---|--|
| C_SetAutoReader Config | Writing the automatic device configuration. | 0x58 |
| ATrig | Defines, when automatic reading device UID will operate. | 0-automatic device disabled permanently 1-automatic device enabled permanently 2=enabled automatically in case of transmission lack on interface for a time longer than AOfflineTime 3=enabled automatically, in case of no recall of communication commands with transponder for a time longer than AOfflineTime |
| AOfflineTime | Lack of transmission time on interface bus $T = AofflineTime * [100ms]$ Lack of transmission can concern to any commands (Atrig=2), or commands for communication with transponder (Atrig=3). | 0x00...0xff |

| | | |
|----------|--|--|
| | Commands for communication with transponder: C_TurnOnAntennaPower C_Select | |
| A Serial | Automatic sending the UID transponder number, after reading it automatically from transponder. | 0-never 1-for the first applying the transponder only 2-sends all |
| AMode | Selection the format of sending number 8 bits: MSB LSB R R H CR R E I A | R Reserved, always 0 |
| | | CR=1 Number which is ended with line end mark CR+LF |
| | | E=1 information extended with cards umber in filed and card type |
| | | I=1 Number in reversed order |
| | | A=1 H=0 Number sent in ASCII format |
| | | A=0 H=0 Number sent in Nertonix format |
| | | A=0 H=1 Number sent in binary format |
| ABuzz | Automatic indication of reading by means of buzzer, after automatic UID read-out from transponder. | 0-never 1-for the first applying the transponder only 2-indicates all |
| AMulti | Multi type of transponders read mode | 0 – read a only selected by CSetTransponderType command trasponder type 0xff – read all known transponder types |

Response frame:

| | | | |
|--------|--------------------------|---------------|-----|
| Header | C_SetAutoReaderConfig +1 | OperationCode | CRC |
|--------|--------------------------|---------------|-----|

6.7.4. Reading-out the configuration of automatic device

Command frame:

| | | |
|--------|-----------------------|-----|
| Header | C_GetAutoReaderConfig | CRC |
|--------|-----------------------|-----|

Where:

| Parameter name | Parameter description | Value range |
|-----------------------|---|-------------|
| C_GetAutoReaderConfig | Read-out of automatic device configuration. | 0x5a |

Response frame:

| Header | C_GetAutoReader Config +1 | ATrig, AOfflineTime, ASerial, Abuzz, Amulti | OperationCode | CRC |
|--------|---------------------------|---|---------------|-----|
| | | | | |

Where:

The meaning of response parameters is the same as described before.

6.7.5. Setting the date and time

Following setting has no influence for reader operation today.

Command frame:

| Header | C_SetRtc | Year, Month, Day, Hour, Minute, Second | CRC |
|--------|----------|--|-----|
| | | | |

Where:

| Parameter name | Parameter description | Value range |
|----------------|-----------------------|-------------|
| C_SetRtc | Date and time set-up | 0xb8 |
| Year | year | 0...99 |
| Month | month | 1...12 |
| Day | day | 1...31 |
| Hour | hour | 0...23 |
| Minute | minute | 0...59 |
| Second | second | 0...59 |

Response frame:

| Header | C_SetRtc +1 | OperationCode | CRC |
|--------|-------------|---------------|-----|
| | | | |

6.7.6. Reading-out the date and time

Command frame:

| Header | C_GetRtc | CRC |
|--------|----------|-----|
| | | |

Where:

| Parameter name | Parameter description | Value range |
|----------------|---------------------------|-------------|
| C_GetRtc | Read-out of date and time | 0xb6 |

Response frame:

| Header | C_GetRtc+1 | Year, Month, Day, Hour, Minute, Second | OperationCode | CRC |
|--------|------------|--|---------------|-----|
| | | | | |

Where:

The meaning of response parameters is the same as described before.

6.8. Configuring the UART serial interface

6.8.1. Writing the configuration of serial port

Command:

| | | | |
|--|----------------------|---------------------|--|
| | C_SetInterfaceConfig | Mode, Adr, Baudrate | |
|--|----------------------|---------------------|--|

Where:

| Parameter name | Parameter description | Value range |
|----------------------|--------------------------------------|--|
| C_SetInterfaceConfig | Serial interface configuration write | 0x54 |
| Mode | | 0x01 |
| Adr | Address on RS-485 bus | 0x01...0xfe |
| Baudrate | Data baud rate on RS-485 bus | 0x01=2400 bps 0x02=4800 bps 0x03=9600 bps 0x04=19200 bps 0x05=38400 bps 0x06=57600 bps 0x07=115200 bps |

Response:

| | | | | |
|--|-------------------------|--|---------------|--|
| | C_SetInterfaceConfig +1 | | OperationCode | |
|--|-------------------------|--|---------------|--|

6.8.2. Reading the configuration of serial interface

Command:

| | | | |
|--|----------------------|--|--|
| | C_GetInterfaceConfig | | |
|--|----------------------|--|--|

Where:

| Parameter name | Parameter description | Value range |
|----------------------|---|-------------|
| C_GetInterfaceConfig | Serial interface configuration read-out | 0x56 |

Odpowiedź:

| | | | | |
|--|-------------------------|---------------------|---------------|--|
| | C_GetInterfaceConfig +1 | Mode, Adr, Baudrate | OperationCode | |
|--|-------------------------|---------------------|---------------|--|

Where:

The meaning of response parameters is the same as described before.

6.9. Managing the events

The CTU-DxxM series readers has equipped with event memory of capacity 4400 records. Reason of event can be operation related to card or state changing on reader outputs. The readers does not have RTC clock with battery back-up. After supply failure, clock is reset to defaults: date: 1 January 2000, time: 00:00:00. Event counter is not reset.

6.9.1. Setting the event recorder

Command frame:

| | | | |
|--------|----------------|-------------------|-----|
| Header | C_SetEventTrig | CardTrig, IO1Trig | CRC |
|--------|----------------|-------------------|-----|

Wherein:

| Parameter name | Parameter description | Value range |
|-------------------------------|---|-------------|
| C_SetEventTrig 0x7C | Setting the event masking | 0x7C |
| CardTrig | Masking the events related to card (see below) | 0x00 - 0xFF |
| In1Trig-In4Trig | Masking the events related to inputs (see below) | 0x00-0xFF |

Response frame:

| | | | | |
|--------|------------------|--|---------------|-----|
| Header | C_SetEventTrig+1 | | OperationCode | CRC |
|--------|------------------|--|---------------|-----|

Masking byte of events related to card

| Bit 8 | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 |
|---------|---------------|--------------|-------------|---------|-------------|-------------------|------------------|
| Reserve | Out of memory | Card removal | Card adding | Reserve | Master card | Outside base card | Inside base card |

E.g. byte 0x25(00100101) means that events will be written in case of:

- *inside base card has been red-out,*
- *card written as master has been written,*
- *inside base card has been removed*

Masking bytes related to inputs state change

| Byte | Bit 8 | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 |
|---------|--------|--------|--------|--------|--------|--------|--------|--------|
| IO1Trig | IO[3]F | IO[3]R | IO[2]F | IO[2]R | IO[1]F | IO[1]R | IO[0]F | IO[0]R |

Bits IO[n]R denote reaction to the input **n** positive slope,
Bits IO[n]F denote reaction to the input **n** negative slope

E.g. In4Trig-In1Trig configuration byte sequence: **0x00,0x31,0x40,0x08**, causes, that events will be written in case of:

- Any state change of input with index 10 occurs
- Positive slope appears on input with index 8
- Positive slope appears on input with index 7
- Negative slope appears on input with index 1

During configuring the event triggers, decide which port is configured as an input. Do not configure events for those I/O's, which are outputs.

To guarantee correctness of event write process, time between two subsequent triggers must be longer than 20 ms.

6.9.2. Reading the event recorder

Command frame:

| | | | |
|--------|----------------|--|-----|
| Header | C_GetEventTrig | | CRC |
|--------|----------------|--|-----|

Wherein:

| Parameter name | Parameter description | Value range |
|-------------------------------|---|-------------|
| C_GetEventTrig 0x7E | Reading the configuration of event recorder | 0x7E |

Response frame:

| | | | | |
|--------|------------------|-------------------|---------------|-----|
| Header | C_GetEventTrig+1 | CardTrig, In1Trig | OperationCode | CRC |
|--------|------------------|-------------------|---------------|-----|

6.9.3. Reading the counters related to event memory.

Command frame:

| | | | |
|--------|-----------------|--|-----|
| Header | C_GetEventParam | | CRC |
|--------|-----------------|--|-----|

Wherein:

| Parameter name | Parameter description | Value range |
|--------------------------------|---|-------------|
| C_GetEventParam 0x78 | Reading the configuration of event recorder | 0x78 |

Response frame:

| | | | | |
|--------|-------------------|--|---------------|-----|
| Header | C_GetEventParam+1 | CapL, CapH, PointerL, PointerH, TotB3, TotB2, TotB1, TotB0 | OperationCode | CRC |
|--------|-------------------|--|---------------|-----|

CapH:CapL – two-byte value, which defines event memory capacity.

PointerH:PointerL – two-byte value, which marks from first free event.

TotB3:TotB2:TotB1:TotB0 – four-byte value, which defines number of events recorded from the moment of counter reset.

Events are recorded in sequence from index 0 up to Cap-1. In the moment memory gets full, the counter is being “overturned”, and older inputs are overwritten.

Example:

If using C_GetEventParam command, we have read that event memory capacity is 4400 inputs; the total value of input events is 5678. For instance, if we want to read the event with no. 5600, event index event of interest will be $5678-4400=1278$.

If we want to read the last event, we can use Pointer value. The last event index will be $Pointer-1$.

6.9.4. Reading the events

Command frame:

| | | | |
|--------|------------|--------------|-----|
| Header | C_GetEvent | EvNoL, EvNoH | CRC |
|--------|------------|--------------|-----|

Wherein:

| Parameter name | Parameter description | Value range |
|---------------------------|----------------------------|-------------|
| C_GetEvent 0x7a | Reading the event | 0x7a |
| EvNoL,EvNoH | LSB and MSB of event index | |

Response frame:

| | | | | |
|--------|--------------|--|---------------|-----|
| Header | C_GetEvent+1 | YY,MM,DD, hh,mm,ss,type, B1,B2,B3,B4,B5 | OperationCode | CRC |
|--------|--------------|--|---------------|-----|

YY,MM,DD – year, month, day of event occurrence

hh,mm,ss - hour, minute, second of event occurrence

type - event type

Depending on value “type” the 8-th bit of byte, there are distinguished two assignments:

| Bit8 | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 |
|-----------|---------------|----------|----------|----------|--------|--------------|-------------|
| 0 – card | Out of memory | Removed | Added | reserved | Master | Outside base | Inside base |
| 1 -inputs | reserved | reserved | reserved | N4 | N2 | N1 | N0 |

N4:N0 –number of input, on which event trigger signal appeared.

- If given event was related to card, the B1-B5 bytes comprise card ID number.

| B1 | B2 | B3 | B4 | B5 |
|------|------|------|------|---------------|
| UID1 | UID2 | UID3 | UID4 | UID5 (Unique) |

- If event is related to input change, B1-B5 bytes comprise information regarding input state, and have format:

| B1 | | | | B2 | B3 | B4 | B5 |
|-----|-----|-----|-----|----------|----------|----------|----------|
| IO0 | IO1 | IO2 | IO3 | Reserved | Reserved | Reserved | Reserved |

6.10. Other commands

6.10.1. Remote reset of reader

Command frame:

| | | | |
|--------|---------|--|-----|
| Header | C_Reset | | CRC |
|--------|---------|--|-----|

Where:

| Parameter name | Parameter description | Value range |
|----------------|-----------------------|-------------|
| C_Reset | Remote reader reset | 0xd0 |

Response frame:

| | | | | |
|--------|------------|--|---------------|-----|
| Header | C_Reset +1 | | OperationCode | CRC |
|--------|------------|--|---------------|-----|

6.10.2. Reading-out the reader software

Command frame:

| | | | |
|--------|-------------------|--|-----|
| Header | C_FirmwareVersion | | CRC |
|--------|-------------------|--|-----|

Where:

| Parameter name | Parameter description | Value range |
|-------------------|-------------------------------------|-------------|
| C_FirmwareVersion | Read-out of reader software version | 0xfe |

Response frame:

| | | | | |
|--------|---------------------|-------------|---------------|-----|
| Header | C_FirmwareVersion+1 | Data1.....n | OperationCode | CRC |
|--------|---------------------|-------------|---------------|-----|

Where:

Data1...n is sequence of dots, which are written as an ASCII codes.

6.10.3. Change buzzer volume

Use this command to set and store setting in EEPROM memory.

Command frame:

| | | | |
|--------|----------------|--------|-----|
| Header | C_BuzzerConfig | volume | CRC |
|--------|----------------|--------|-----|

Gdzie:

| Parameter name | Parameter description | Value range |
|----------------|-----------------------|-------------|
| C_BuzzerConfig | | 0xD8 |
| volume | Buzzer volume value | 0x00-0x0a |

Response frame:

| | | | | |
|--------|------------------|--|---------------|-----|
| Header | C_BuzzerConfig+1 | | OperationCode | CRC |
|--------|------------------|--|---------------|-----|

6.11. Code meanings in response frames

| Operation code name | Description | Value |
|---------------------|--|-------|
| OC_Error | Error | 0x00 |
| OC_ParityError | Parity error | 0x01 |
| OC_RangeError | Parameter range error | 0x02 |
| OC_LengthError | Data quantity error | 0x03 |
| OC_ParameterError | Parameter error | 0x04 |
| OC_Busy | Internal modules are busy at the moment. | 0x05 |
| OC_NoACKFromSlave | No internal communication | 0x22 |
| OC_CommandUnknown | Unknown command | 0x07 |
| OC_WrongPassword | Wrong password or last password terminated i.e. automatic LogOut occurred. | 0x09 |
| OC_NoCard | No transponder | 0x0a |
| OC_BadFormat | Wrong data format. | 0x18 |
| OC_FrameError | Transmission error. Noise occurrence possible. | 0x19 |
| OC_NoAnswer | No response from transponder. | 0x1E |
| OC_TimeOut | Operation time out. No transponder in reader field possible. | 0x16 |
| OC_Successful | Operation completed successfully. | 0xff |

7. Mechanism of Master ID

Master ID mechanism is based on principle the quick adding/removing of user card to/out of reader memory by means of „master card”.

If you want to register a card as a „master card”, it is required to clear card memory first by means of reset function to factory defaults.

After clearing the memory, apply selected card to module, whenever you like. This moment, the card becomes “master card”. It is impossible to remove or add the master card by means of other card.

If you want to register a card as a “user card”, apply “master card” to reader first, and next during five seconds, apply registered card.

If you want to remove “user card” from memory, apply “master card” to reader first, and next during five seconds apply card which is being removed.

After applying to a reader the “user card”, the reader enables electric output, which has been programmed as a controlled by internal access control mechanism.

8 . Reset to default settings

To restore default settings, connect reset terminal with ground for 2 s or longer. During restoring the defaults following reader parameters are fixed:

| Parameter name or functionality | Value or setting |
|--|---|
| Address on serial bus | 0x01 |
| Baud rate on serial bus | 9600 bps |
| Access password | 0x0 - no password |
| Port 0 | Common purpose input |
| Port 1 | Common purpose input |
| Port 2 | lock "on" indication |
| Port 3 | lock "on" indication |
| Gain of RFID receive circuit | 1 |
| "Autoreader" configuration | 0x2,0x14,0x1,0x1,0x01,0xff |
| Transponder type | Unique |
| Whole internal memory of transponders with Master card | 0xff 0xff 0xff 0xff 0xff means "memory cleared" |
