

CEC1702 UFO Target

The CEC1702 has the unique CEC1702 chip from Microchip which features a Cortex M4F. This device contains extensive hardware cryptographic accelerators, including public key accelerators.

This device requires at minimum a JTAG programmer, but as it does not contain internal flash you also may need a SPI flash programmer if you wish to program the on-board SPI flash memory.

The baseboard is designed to allow various measurements to be performed, including on both the device during regular operation as well as during the loading process.

CW308 UFO Baseboard REQUIRED for use!
Programmer REQUIRED for use!

Product Highlights

Microchip CEC1702 target device.

SPI Flash chip includes bidirectional buffer to allow (a) programming of on-board SPI flash chip with external programmer, (b) sniffing SPI traffic without loading data lines, and (c) triggering on SPI traffic.

Example implementation of firmware projects that run on this device, including use of cryptographic AES accelerator.

Documentation on some of the unique features of the CEC1702 including the odd fuse requirements can be found on the wiki.

It is required to use a JTAG debugger for this device to simplify development and debug - we highly recommend an Arm JTAG programmer such as a Segger J-Link. If you wish to program the on-board SPI flash memory (the device has no FLASH memory itself) a SPI programmer is required. See wiki for full details and pinout.

Full design files are available under an open-source license.

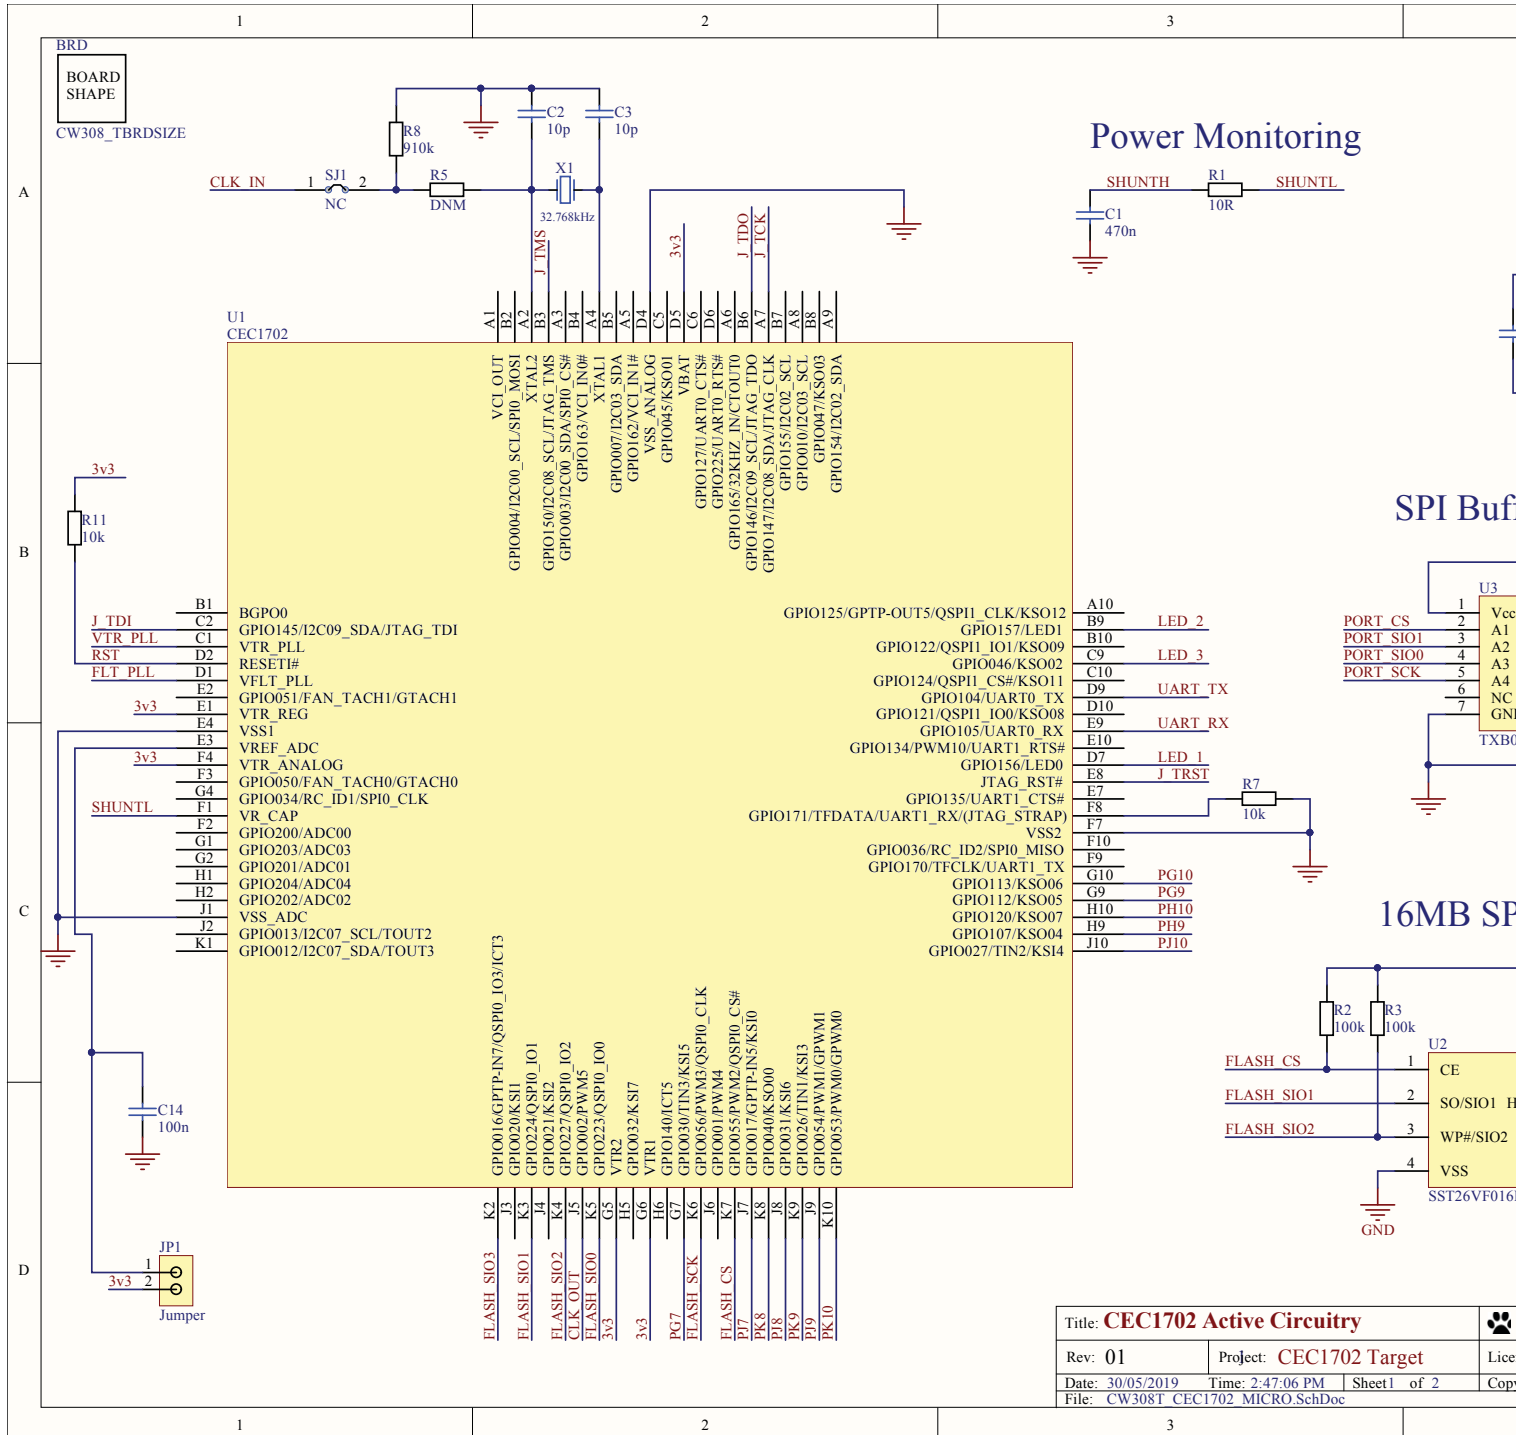

Ordering Summary

NAE-CW308T-CEC1702 Microchip CEC1702 UFO Target Board.
