# DUAL STEPPER MOTOR DRIVER

■ GENERAL DESCRIPTION

The NJM3772 is a stepper motor driver, which circuit is especially developed for use in microstepping applications in conjunction with the matching dual DAC (Digital-to-Analog Converter) NJU39610.

The NJM3772 contains a clock oscillator, which is common for both driver channels, a set of comparators and flip-flops implementing the switching control, and two H-bridges with internal recirculation diodes. Voltage supply requirements are +5 V for logic and +10 to +45V for the motor. Maximum output current is 1000mA per channel.

■ PACKAGE OUTLINE
NJM3772D2   NJM3772FM2

■ FEATURES

• Dual chopper driver

• 1000mA continuous output current per channel

• Specially matched to the Dual DAC NJU39610

• Packages   DIP22 / PLCC28

## ■ BLOCK DIAGRAM

■ **PIN DESCRIPTION**

PLCC	DIP	Symbol	Description
1-3, 9, 13-17 28	5, 6 17, 18	GND	Ground and negative supply. Note: these pins are used thermally for heat-sinking. Make sure that all ground pins are soldered onto a suitably large copper ground plane for efficient heat sinking.
4	8	M_{A2}	Motor output A, channel 2. Motor current flows from M_{A2} to M_{B2} when $Phase_2$ is HIGH.
5	9	V_{BB2}	Collector of upper output transistor, channel 2. For lowest possible power dissipation, connect a series resistor R_{B2} to V_{MM2}. See Applications information, External components.
6	10	E_2	Common emitter, channel 2. This pin connects to a sensing resistor R_S to ground.
7	11	M_{B2}	Motor output B, channel 2. Motor current flows from M_{A2} to M_{B2} when $Phase_2$ is HIGH.
8	12	M_{B1}	Motor output B, channel 1. Motor current flows from M_{A1} to M_{B1} when $Phase_1$ is HIGH.
10	13	E_1	Common emitter, channel 1. This pin connects to a sensing resistor R_S to ground.
11	14	V_{BB1}	Collector of upper output transistor, channel 1. For lowest possible power dissipation, connect a series resistor R_{B1} to V_{MM1}. See Applications information, External components.
12	15	M_{A1}	Motor output A, channel 1. Motor current flows from M_{A1} to M_{B1} when $Phase_1$ is HIGH.
18	16	V_{MM1}	Motor supply voltage, channel 1, +10 to +40 V. V_{MM1} and V_{MM2} should be connected together.
19	19	$Phase_1$	Controls the direction of motor current at outputs M_{A1} and M_{B1}. Motor current flows from M_{A1} to M_{B1} when $Phase_1$ is HIGH.
20	20	V_{R1}	Reference voltage, channel 1. Controls the threshold voltage for the comparator and hence the output current.
21	21	C_1	Comparator input channel 1. This input senses the instantaneous voltage across the sensing resistor, filtered by an RC network. The threshold voltage for the comparator is $V_{CH1} = 0.18 \cdot V_{R1}$ [V], i.e. 450 mV at V_{R1} = 2.5 V.
22	22	V_{CC}	Logic voltage supply, nominally +5 V.
23	1	RC	Clock oscillator RC pin. Connect a 15 kohm resistor to V_{CC} and a 3300 pF capacitor to ground to obtain the nominal switching frequency of 26.5 kHz.
24	2	C_2	Comparator input channel 2. This input senses the instantaneous voltage across the sensing resistor, filtered by an RC network. The threshold voltage for the comparator is $V_{CH2} = 0.18 \cdot V_{R2}$ [V], i.e. 450 mV at V_{R2} = 2.5 V.
25	3	V_{R2}	Reference voltage, channel 2. Controls the threshold voltage for the comparator and hence the output current.
26	4	$Phase_2$	Controls the direction of motor current at outputs M_{A2} and M_{B2}. Motor current flows from M_{A2} to M_{B2} when $Phase_2$ is HIGH.
27	7	V_{MM2}	Motor supply voltage, channel 2, +10 to +40 V. V_{MM1} and V_{MM2} should be connected together.

■ **FUNCTIONAL DESCRIPTION**

Each channel of the NJM3772 consists of the following sections: an output H-bridge with four transistors, capable of driving up to 1000 mA continuous current to the motor winding; a logic section that controls the output transistors; an S-R flip-flop; and a comparator. The clock-oscillator is common to both channels.

Constant current control is achieved by switching the output current to the windings. This is done by sensing the peak current through the winding via a current-sensing resistor R_S, effectively connected in series with the motor winding during the turn-on period. As the current increases, a voltage develops across the sensing resistor, which is fed back to the comparator. At the predetermined level, defined by the voltage at the reference input V_R, the comparator resets the flip-flop, which turns off the output transistors. The current decreases until the clock oscillator triggers the flip-flop, which turns on the output transistors again, and the cycle is repeated.

The current paths during turn-on, turn-off and phase shift are shown in figure 3. Note that the upper recirculation diodes are connected to the circuit externally.
Figure 3. Output stage with current paths during turn-on, turn-off and phase shift.

■ ABSOLUTE MAXIMUM RATINGS

Parameter	Pin no. DIP package	Symbol	Min	Max	Unit
Voltage					
Logic supply	22	V_{CC}	0	7	V
Motor supply	7, 16	V_{MM}	0	45	V

■ THERMAL CHARACTERISTICS

Parameter	Symbol	Conditions	Min	Typ	Max	Unit
Thermal resistance	Rth_{J-GND}	DIP package	-	11	-	°C/W
	Rth_{J-A}	DIP package. Note 2	-	40	-	°C/W
	Rth_{J-GND}	PLCC package	-	9	-	°C/W
	Rth_{J-A}	PLCC package. Note 2	-	35	-	°C/W

Notes
1. All voltages are with respect to ground. Currents are positive into, negative out of specified terminal
2. All ground pins soldered onto a 20 cm^2 PCB copper area with free air convection, T_A = +25°C
3. Not covered by final test program
4. Switching duty cycle D = 30%, f_s = 26.5 kHz
5. External resistors R_B for lowering of saturation voltage

■ APPLICATIONS INFORMATION

Current control

The output current to the motor winding is determined by the voltage at the reference input and the sensing resistor, R_S.

Chopping frequency, winding inductance and supply voltage also affect the current, but to much less extent.

The peak current through the sensing resistor (and motor winding) can be expressed as:

$$I_{M,peak} = 0.18 \cdot (V_R / R_S) [A]$$

i.e., with a recommended value of

0.47 ohm for the sensing resistor R_S, a 2.5 V reference voltage will produce an output current of approximately 960 mA.

To improve noise immunity on the V_R input, the control range may be increased to 5 V if R_S is correspondingly changed to 1 ohm.
Figure 6. Typical stepper motor driver application with NJM3772
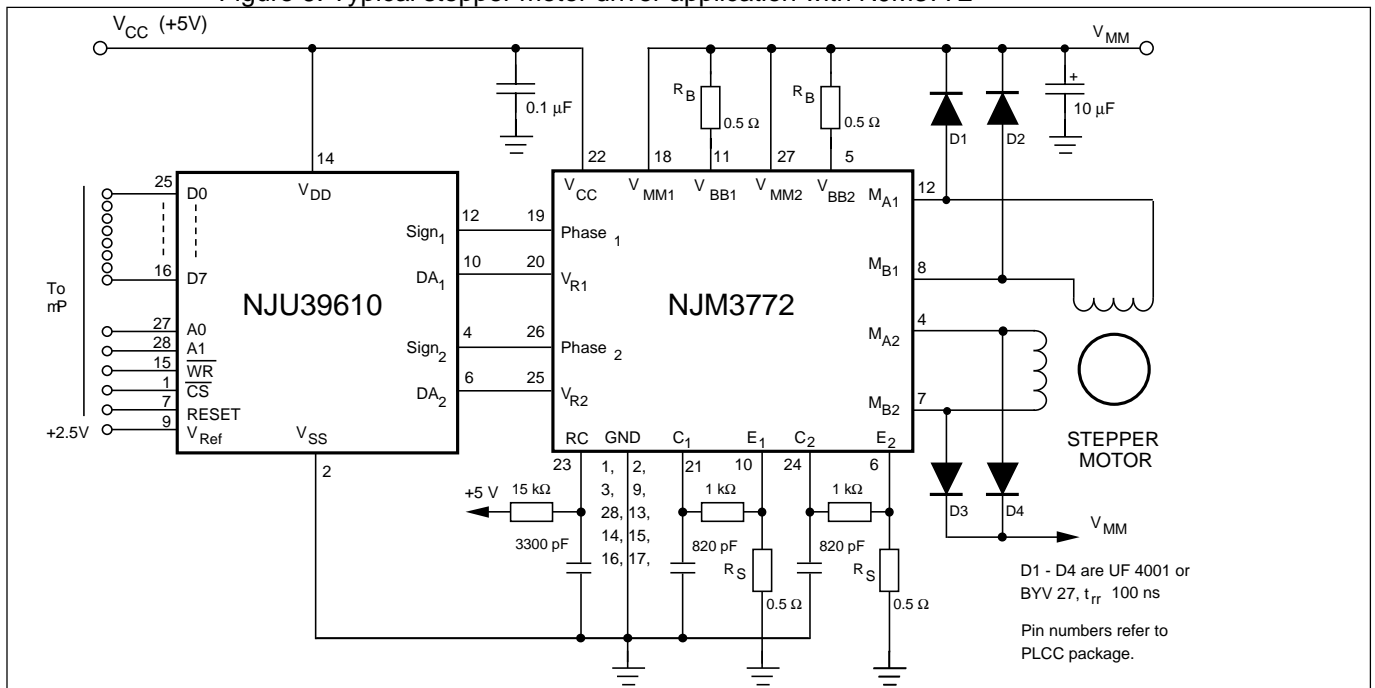

Figure 7. Microstepping system with NJU39610 and NJM3772

External components

The NJM3772 exhibits substantially less power dissipation than most other comparable stepper motor driver ICs on the market. This has been achieved by creating an external voltage drop in series with the upper transistor in the output H-bridge, see figure 3. The voltage drop reduces the collector-emitter saturation voltage of the internal transistor, which can greatly reduce power dissipation of the IC itself. The series resistor, designated R_B, shall be selected for about 0.5 V voltage drop at the maximum output current. In an application with an output current of 1000 mA (peak), a 0.47 ohm,
^{1}/2 W resistor is the best choice.

In low current applications where power dissipation is not a critical factor, the R_B resistor can of course be omitted, and the V_{MM} and V_{BB} pins (pins 5, 11, 18, 27) can all be connected directly to the motor supply voltage V_{MM}.

Contributing to the low power dissipation is the fact that the upper recirculation diodes in the output H- bridge are connected externally to the circuit. These diodes shall be of fast type, with a t_{rr} of less than 100 ns. Common types are UF4001 or BYV27.

A low pass filter in series with the comparator input prevents erroneous switching due to switching transients. The recommended filter component values, 1 kohm and 820 pF, are suitable for a wide range of motors and operational conditions.

Since the low-pass filtering action introduces a small delay of the signal to the comparator, peak voltage across the sensing resistor, and hence the peak motor current, will reach a slightly higher level than than what is defined by the comparator threshold, V_{CH}, set by the reference input V_R (V_{CH} = 450 mV at V_R = 2.5 V).

The time constant of the low-pass filter may therefore be reduced to minimize the delay and optimize low-current performance. Increasing the time constant may result in unstable switching. The time constant should be adjusted by changing the C_C value.

The frequency of the clock oscillator is set by the R_T-C_T timing components at the RC pin. The recommended values result in a clock frequency (= switching frequency) of 26.5 kHz. A lower frequency will result in higher current ripple, but may improve low-current level linearity. A higher clock frequency reduces current ripple, but increases the switching losses in the IC and possibly the iron losses in the motor. If the clock frequency needs to be changed, the C_T capacitor value should be adjusted. The recommended R_T resistor value is 15 kohm.

The sensing resistor R_S, should be selected for maximum motor current. The relationship between peak motor current, reference voltage and the value of R_S is described under Current control above. Be sure not to exceed the maximum output current which is 1200 mA peak when only one channel is activated. Or recommended output current, which is 1000 mA peak, when both channels is activated.

Motor selection

The NJM3772 is designed for two-phase bipolar stepper motors, i.e., motors that have only one winding per phase.

The chopping principle of the NJM3772 is based on a constant frequency and a varying duty cycle. This scheme imposes certain restrictions on motor selection. Unstable chopping can occur if the chopping duty cycle exceeds approximately 50%. See figure 5 for definitions. To avoid this, it is necessary to choose a motor with a low winding resistance and inductance, i.e. windings with a few turns.

It is not possible to use a motor that is rated for the same voltage as the actual supply voltage. Only rated current needs to be considered. Typical motors to be used together with the NJM3772 have a voltage rating of 1 to 6 V, while the supply voltage usually ranges from 12 to 40 V.

Low inductance, especially in combination with a high supply voltage, enables high stepping rates. However, to give the same torque capability at low speed, a reduced number of turns in the winding must be compensated by a higher current. A compromise has to be made.

Choose a motor with the lowest possible winding resistance that still gives the required torque, and use as high supply voltage as possible, without exceeding the maximum recommended 40 V. Check that the chopping duty cycle does not exceed 50% at maximum current.

Phase inputs.

A logic HIGH on a Phase input gives a current flowing from pin M_A into pin M_B. A logic LOW gives a current flow in the opposite direction. A time delay prevents cross conduction in the H-bridge when changing the Phase input.

Heat sinking.

Soldering the batwing ground leads onto a copper ground plane of 20 cm^2 (approx. 1.8" x 1.8"), copper foil thickness 35 μm, permits the circuit to operate with 750 mA output current, both channels driving, at ambient temperatures up to 70°C. Consult figures 8, 9, 10 and 11 in order to determine the necessary copper ground plane area for heat sinking at higher current levels.

Thermal shutdown.

The circuit is equipped with a thermal shutdown function that turns the output off at chip temperatures above 160°C. Normal operation is resumed when the temperature has decreased.

Operating temperature.

The max recommended operating temperature is 125°C. This gives an estimated lifelength of about 5 years at continuous drive, A change of ±10° would increase/decrease the lifelength of the circuit about 5 years.
