

High Quality Audio Dual Operational Amplifier

■GENERAL DESCRIPTION

The NJM8801 is a high quality audio dual operational Amplifier with bipolar technology, strikes a balance between "MUSES technology" and mass-production technique.

The original process tuning and the assembly technology, based on MUSES technology, make excellent sound and absorbing cost increases.

The characteristics like Low noise ($4.5\text{nV}/\sqrt{\text{Hz}}$), Wide Bandwidth (15MHz) and low distortion (0.0005%) suitable for audio preamplifiers, active filters, and line amplifiers.

NJM8801 packages are SOP8 JEDEC 150 mil and small SSOP8 with copper frame.

■PACKAGE OUTLINE

NJM8801E
(SOP8 JEDEC 150 mil)

■FEATURES

- Operating Voltage $\pm 2\text{V}$ to $\pm 18\text{V}$
- Low Noise Voltage $4.5\text{nV}/\sqrt{\text{Hz}}$ typ.
 $0.8\mu\text{V}_{\text{rms}}$ typ. (RIAA)
- Low Distortion 0.0005% typ.
- Wide GB 15MHz typ.
- Slew Rate $5\text{V}/\mu\text{s}$ typ.
- Input Offset Voltage 0.3mV typ. 3mV max.
- Input Bias Current 100nA typ. 500nA max.
- Voltage Gain 110dB typ.
- Bipolar Technology
- Package Outline SOP8 JEDEC 150 mil, SSOP8-A3 (copper frame)

■PIN CONFIGURATION

- PIN FUNCTION**
1. A OUTPUT
 2. A -INPUT
 3. A +INPUT
 4. V-
 5. B +INPUT
 6. B -INPUT
 7. B OUTPUT
 8. V+

■Application Notes

●Package Power, Power Dissipation and Output Power

IC is heated by own operation and possibly gets damage when the junction power exceeds the acceptable value called Power Dissipation P_D . The dependence P_D on ambient temperature is shown in Fig 1. The plots are depended on following two points. The first is P_D on ambient temperature 25°C, which is the maximum power dissipation. The second is 0W, which means that the IC cannot radiate any more. Conforming the maximum junction temperature T_{jmax} to the storage temperature T_{stg} derives this point. Fig.1 is drawn by connecting those points and conforming the P_D lower than 25°C to it on 25°C. The P_D is shown following formula as a function of the ambient temperature between those points.

$$\text{Dissipation Power } P_D = \frac{T_{jmax} - T_a}{\theta_{ja}} \text{ [W]} \quad (T_a=25^\circ\text{C to } T_a=T_{jmax})$$

Where, θ_{ja} is heat thermal resistance which depends on parameters such as package material, frame material and so on. Therefore, P_D is different in each package.

While, the actual measurement of dissipation power on IC is obtained using following equation.

$$(\text{Actual Dissipation Power}) = (\text{Supply Voltage } V \times I) - (\text{Output Power } P_o)$$

This IC should be operated in lower than P_D of the actual dissipation power.

To sustain the steady state operation, take account of the Dissipation Power and thermal design.
