## Multi Power Supply IC with Amplifier for LCD

NO.EA-301-160107

## OUTLINE

The R1293K is a multi power supply IC dedicated for mid-size TFT LCD panels. The R1293K consists of a PWM control step-up DC/DC converter, an LDO regulator, a VCOM amplifier and six GAMMA amplifiers. The output noise can be reduced by SEL pin. (SEL pin "H": normal mode, SEL pin "L": low noise mode.) The MOSFET for step-up DC/DC converter is built-in and, low power operation is realized by standby mode. The package is 4 mm square $\mathrm{QFN}(P L P) 0404-32$.

## FEATURES

## Step-up DC/DC converter part

- Input Voltage Range ................................................................2.2V to 5.5V (Vin_dc pin)
- Adjustable Output Voltage Range with external resistors..................... up to 16 V
- Feedback Voltage ............................................................................ 1.0V
- Feedback Voltage Accuracy...................................................................................
- Adjustable Oscillator Frequency with external resistors for RT pin $\cdots \cdots 300 \mathrm{kHz}$ to 1 MHz
- Adjustable Phase compensation with external components
- Internal Soft Start Time

TYP. 10ms

- Adjustable Soft Start Time with external capacitors for DTC pin
- Oscillator Maximum Duty Cycle

Set with external resistors for
DTC pin (Limit TYP. 90\%)

- UVLO detector threshold

TYP. 1.9V

- Internal 2A/16V capability Nch MOSFET Driver.................................TYP. $0.2 \Omega$
- Built-in Peak Current Limit Circuit
- Short Protection with timer latch function (Adjustable delay time with external capacitors for Delay pin)

## LDO part

- Input Voltage Range
2.2V to 5.5 V (Vin_ldo pin)
- Output Voltage Range 1.8 V to 2.5 V (Selectable / 0.1V Step)
- Output Voltage Accuracy $\pm 1.0 \%$
- Maximum Output Current

Min. 350mA guaranteed

- Ripple Rejection....................................................................................... 65db (Frequency $=1 \mathrm{kHz}$ )
- Built-in Fold-back Protection Circuit.............................................TYP. 70 mA (Current at short mode)

Buffer Amplifier part

- Output Current Range for VCOM Amplifier............................................................. to 100 mA
- Output Current Range for GAMMA Amplifier........................................................ to 10mA

Others

- Built-in Thermal Shutdown Circuit
- Stand-by function by ENB pin
- Package...................................................................................................................

## APPLICATIONS

- Power sources of the medium and small sized TFT LCD panels

R1293K Block Diagram

## SELECTION GUIDE

The output voltage (Vout) for the ICs is a user-selectabe option.

Selection Guide

| Product Name | Package | Quantity per Reel | Pb Free | Halogen Free |
| :--- | :---: | :---: | :---: | :---: |
| R1293Kxx1A-E2 | QFN(PLP)0404-32 | $2,000 \mathrm{pcs}$ | Yes | Yes |

xx : Designation of the LDO output voltage (Vout)
Vout can be set within the range of 1.8 V to 2.5 V in 0.1 V steps.

## PIN CONFIGURATION

## R1293K

NO.EA-301-160107

## PIN DESCRIPTIONS

## R1293K Pin Description

| Pin No | Symbol | Description | Notes |
| :---: | :---: | :---: | :---: |
| 1 | PGND | Power GND Pin | Make the PGND pin a short-circuit with the GND pin. |
| 2 | PGND | Power GND Pin | Make the PGND pin a short-circuit with the GND pin. |
| 3 | Vo_ldo | LDO Output Pin |  |
| 4 | Vin_ldo | LDO Power Input Pin | Input 2.2V to 5.5 V to $\mathrm{Vin}_{\text {_lo. }}$. <br> Make Vin_ldo a short-circuit with the Vin_dc pin. |
| 5 | IN_GM1 ${ }^{*}{ }^{1}$ | GAMMA1 Input Pin |  |
| 6 | IN_GM2 ${ }^{* 1}$ | GAMMA2 Input Pin |  |
| 7 | IN_GM3 ${ }^{*}{ }^{\text {a }}$ | GAMMA3 Input Pin |  |
| 8 | IN -Gm4 ${ }^{*}{ }^{1}$ | GAMMA4 Input Pin |  |
| 9 | IN_Gm5 ${ }^{* 1}$ | GAMMA5 Input Pin |  |
| 10 | IN_Gm6* ${ }^{*}$ | GAMMA6 Input Pin |  |
| 11 | Vo_gm1 | GAMMA1 Output Pin |  |
| 12 | Vo_gm2 | GAMMA2 Output Pin |  |
| 13 | Vo_gm3 | GAMMA3 Output Pin |  |
| 14 | Vo_gm4 | GAMMA4 Output Pin |  |
| 15 | Vo_gm5 | GAMMA5 Output Pin |  |
| 16 | Vo_gm6 | GAMMA6 Output Pin |  |
| 17 | GND | GND Pin |  |
| 18 | Vbuff | Buffer Amplifier Power Source Pin | Connect the $\mathrm{V}_{\text {buff }}$ pin to Boost Output. |
| 19 | IN_com ${ }^{* 1}$ | VCOM Input Pin |  |
| 20 | Vo_com | VCOM Output Pin |  |
| 21 | GND | GND Pin |  |
| 22 | RT | Oscillator Frequency Setting Pin | Connect a resistor to the RT pin to set the operation frequency. |
| 23 | DTC | Maxduty/ Soft-start Time Setting Pin | By adding a resistor, the Maxduty limit can be set; otherwise the Maxduty limit will be the preset value set inside the ICs. <br> By adding a capacitor, Maxduty can start from 0 which means startup-time can be set longer. |
| 24 | SEL ${ }^{* 1}$ | Noise Reduction Level Selection Pin | "L" Input: Low Noise Mode <br> "H" Input: Normal Mode |

| Pin No | Symbol | Description | Notes |
| :---: | :---: | :--- | :--- |
| 25 | DELAY | Short-circuit Protection Delay <br> Time Setting Pin | By adding a capacitor, the DELAY pin can set <br> a protection delay time. |
| 26 | ENB $^{* 1}$ | Chip Enable Pin <br> (DC/DC or Buffer Amplifier) | "L" Input: Active |
| 27 | $V_{\text {FB }}$ | DC/ DC Feedback Pin |  |
| 28 | AMPOUT | DC/ DC Phase Compensation <br> Pin |  |
| 29 | GND | GND Pin | Input voltage should be 2.2V to 5.5V. <br> Make the VIN_Dc pin a short-circuit with the <br> VIN_LDo pin. |
| 30 | VIN_DC | DC/ DC Power Source Pin |  |
| 31 | Lx | DC/ DC Switching Pin |  |
| 32 | Lx | DC/ DC Switching Pin |  |

The exposed tab on the bottom of the package enhances thermal performance and is electrically connected to GND(substrate level). It is recommended that the exposed tab be connected to the ground plane on the board otherwise be left open.
${ }^{\star 1}$ Do not leave the $\operatorname{IN} \_$ям1 to $\operatorname{IN}$ _ямя, $\operatorname{IN}$ _сом, SEL and ENB pins open.

## ABSOLUTE MAXIMAM RATINGS

${ }^{{ }^{*}}$ For more information about the Power Dissipation, please refer to PACKAGE INFORMATION.

## ABSOLUTE MAXIMUM RATINGS

Electronic and mechanical stress momentarily exceeded absolute maximum ratings may cause the permanent damages and may degrade the life time and safety for both device and system using the device in the field. The functional operation at or over these absolute maximum ratings is not assured.

## RECOMMENDED OPERATING CONDITIONS (ELECTRICAL CHARACTERISTICS)

All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if when they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

## ELECTRICAL CHARACTERISTICS

$\mathrm{V}_{\text {IN_DC }}=3.6 \mathrm{~V}, \mathrm{Ta}=25^{\circ} \mathrm{C}$ unless otherwise noted.

## TECHNICAL NOTES

## Output Voltage Setting (DCI DC)

Vout controls the $\mathrm{V}_{\mathrm{FB}}$ pin voltage to maintain $\mathrm{V}_{\mathrm{FB}}=1.0 \mathrm{~V}$. Vout can be set using R 1 and R 2 in the following equation. Vout voltage should be set between 5 V to 16 V . Also, the sum of R1 and R2 should be equal or less than $500 \mathrm{k} \Omega$.
$\mathbf{V}_{\text {out }}=\mathbf{V}_{\text {FB }} \mathbf{X}(\mathbf{R 1}+\mathbf{R} \mathbf{2}) / \mathbf{R} \mathbf{2}$

## Phase Compensation Setting (DC/ DC)

A 180 degree phase shift may be caused by the inductor (L1) and the capacitor ( $\mathrm{C}_{01}$ ). The phase shift reduces phase margin and stability of the system. Thus, it is necessary to keep a leading phase margin. In the following equation, the pole is made by L 1 and $\mathrm{C}_{01}$.
Fpole $\sim 1 /\{2 \times \pi \times \sqrt{ }(L 1 \times$ Coi $)\}$

The phase compensation and the system gain can be set by using R4, C3 and C2. Please refer to Typical Application (P.10,11) for positioning and setting value examples. In the following equation, the zero is made by R4 and C3.

## Fzero ~ 1 / ( $2 \times \pi \times R 4 \times$ C3)

When selecting the values for R4 and C3, please consider that the cutoff frequency of zero should be approximately equal to the cutoff frequency of pole.
For example, if $L 1=10 \mu \mathrm{H}$ and $\mathrm{C}_{01}=10 \mu \mathrm{~F}$, the cutoff frequency of pole is approximately 16 kHz .

The gain can be set by the resistance ratio of R4 and RT which is the combined resistance of R1 and R2 ( $R T=R 1 x R 2 /(R 1+R 2)$ ). If $R 4$ is larger than $R T$, the gain becomes high. The high gain improves the response characteristic; however, the extremely high gain decreases stability of the operation. It is important to select an appropriate value for R4. In the following equation, zero is made by R1 and C2.

## Fzero ~ 1 I ( $\mathbf{~} \times \pi \times R 1 \times \mathrm{C} 2$ )

Set the cutoff frequency of zero lower than the cutoff frequency of pole.

## Reduction of Feedback Voltage Noise (DC/ DC)

If the system noise is large, it may wrap around the $V_{F B} p i n$ and causes unstable operation. In this case, set R1 and R2 resistance values lower to reduce the noise entering the $V_{F B}$ pin. Or, place R3 with $1 k \Omega$ to $5 k \Omega$ to reduce the noise entering the $\mathrm{V}_{\mathrm{FB}}$ pin as shown in Typical Application (P.10,11).

## Input Voltage Setting (DCI DC and LDO)

The input voltage ranges of the $\mathrm{V}_{\mathrm{IN}}$ do and $\mathrm{V}_{\mathrm{I} \_\_ \text {Ldo }}$ pins are from 2.2 V to 5.5 V . Place a bypass capacitor between $\mathrm{V}_{\mathrm{IN}}$ and GND. Use Boost Output as the input voltage for the Vbuff pin.

## R1293K

NO.EA-301-160107

## Oscillator Frequency Setting (DC/ DC)

By connecting R6 to the the RT pin, fosc can be set in the range of 300 kHz to 1 MHz . R6 can be calculated by inserting a desired oscillator frequency value into fosc in the following equation.

```
R6 = 19.128 x 10 ^ 9/ Fosc - 3443
```

Example: Oscillator Frequency 700 kHz
$R 6=19.128 \times 10^{\wedge} 9 /\left(700 \times 10^{\wedge} 3\right)-3443=23883 \approx 24 \mathrm{k} \Omega$

## Maxduty and Maxduty Soft-start Adjustment (DCI DC)

Maxduty is preset to $90 \%$ (Typ.); however, it can be set lower by adding R5 to the DTC pin. Maxduty is determined by R6 and R5 as shown in the equation below. The preset Maxduty is compared with the Maxduty set by the DTC pin, and the lower Maxduty will be selected.

Example: R6=24k $\Omega$, R5 $=110 \mathrm{k} \Omega$
Maxduty $=(0.3267 \times 110000-0.6285 \times 24000+2367) / 24000+3550)$

$$
\approx 0.843 \rightarrow 84.3 \%
$$

By adding $C_{\text {dTc }}$ to the DTC pin, Maxduty can increase gradually and the inrush current can be controlled. (Maxduty Soft-start). After start-up, Maxduty after t-time (Maxduty (t)) can be calculated by the follwoing equation.

$$
\operatorname{Maxduty}(\mathrm{t})=\xrightarrow{0.3267 \times R 5 \times[1-\operatorname{EXP}(-t / \operatorname{Cdтс} \times R 5)]-0.6285 \times R 6+2367}
$$

$$
R 6+3550
$$

## Example: $\mathrm{R} 6=24 \mathrm{k} \Omega, \mathrm{R} 5=110 \mathrm{k} \Omega, \mathrm{C}_{\mathrm{DTC}}=0.047 \mu \mathrm{~F}$ to $0.47 \mu \mathrm{~F}$

## Typical Application with

 RT Pin/ DTC Pin

When using Maxduty soft-start, it is recommended that latch protection delay time (tdLY) be set $t_{\text {dLy }}>6 \times(R 5 \times$ Cdtc). tdly should be longer than the soft-start time.

## Overcurrent Protection (DC/ DC)

The overcurrent protection circuit monitors the Nch-swich current and immediately turns off if the Nch-switch current reaches the current limit. Nch-switch turns on every internal refernce clock cycle and turns off if the Nch-switch current reaches the current limit again.

## Short Current Protection/ Protection Delay Time Setting (DC/ DC)

If Boost Output drops and causes the VFB voltage drop to $85 \%$ of the preset value, the IC recognizes a shortcircuit and starts to charge C 1 . If the short-circuit condition persists for a certain period of time and the DELAY pin voltage rechaes Voly, the latch-type protection circuit shuts down Boost Output. toly can be set by C1 shown in the following equations.
$t_{D L Y}=C \times V_{D L Y} / l_{D L Y}$
To release latch state, make $\mathrm{V}_{\text {woc }}$ voltage below the UVLO detector threshold and then restart, or set ENB "H" once and then set it back to "L".

## Undervoltage Lock Out (DC/ DC)

If the $\mathrm{V}_{\text {wioc }}$ pin voltage becomes equal or lower than UVLO detector threshold, the UVLO circuit immediately disables the switching output.

## Thermal Shutdown (LDO and Buffer AMP)

Thermal shutdown circuit detects overheating of the IC and turns off VCOM Output, GAMMA Output, and LDO Outputs to reset the IC if the junction temperature becomes more than the detector threshold. If the causes of overheating are removed and the junction temperature decreases to the release temperature, the IC restarts.

## Standby Mode (DCI DC and Buffer AMP)

By setting the ENB pin "H", DC/ DC and Buffer AMP go into Standby mode and the output shuts down. LDO is always-on and outputs voltage.

## SEL Pin Mode Switching (DC/ DC)

By setting the SEL pin voltage "L", the switching speed of a built-in MOSFET shifts to moderate mode to reduce the influences of noise to external parts. The SEL pin voltage operates in normal mode when " H ".

## Diode, Inductor and Capacitor Selections (DC/ DC, LDO and Buffer AMP)

Efficiency and stability of system can be affected by the following conditions. Spike voltage may be generated by the influence of an inductor when Nch MOSFET turns off. Therefore, diodes, inductors and capacitors should not exceed the voltage tolerance of the capacitor connected to Vout or their respected rated values (voltage, current and power). Please refer to Operation of DC/ DC Converter and Output Current (P.15). Choose the diode with low forward voltage (schottky diode), small reverse current and fast switching speed.

## R1293K

NO.EA-301-160107

## Operation of DCI DC Converter and Output Current

Figure 1. Basic Circuit

Figure 2. The inductor current (IL) flowing through the inductor (L)

There are two operation modes in the PWM step-up DC/ DC converter: continuous mode and discontinuous mode. When a transistor is in the On-state, the voltage to be applied to $L$ is described as Vin. An increase in the inductor current (i1) can be written as follows:
$\Delta \mathrm{i} 1=\mathrm{V}_{\mathrm{IN}} \times$ ton $/ \mathrm{L}$
Formula 1

In the step-up circuit, the energy accumulated during the On-state is transferred into the capacitor even in the Off-state. A decrease in the inductor current (i2) can be written as follows:
$\Delta i 2=\left(\right.$ Vout $\left.-\mathrm{VIN}^{\mathrm{IN}}\right) \times$ topen $/ \mathrm{L}$.

In the PWM switching control, i1 and i2 become continuous when topen=toff, which is called continuous mode.

When the IC is in the continuous mode and operates in steady-state conditions, the variations of i1 and i2 are same:

V IN $\times$ ton $/ \mathrm{L}=\left(\right.$ Vout $\left.-\mathrm{V}_{\text {IN }}\right) \times$ toff $/ \mathrm{L}$

Formula 3

Therefore, the duty cycle in the continuous mode is:

Duty $=$ ton $/($ ton + toff $)=($ Vout - Vin $) /$ Vout.
Formula 4

When topen=toff, the average of IL is:

IL (Ave.) $=\mathrm{V}_{\mathrm{IN}} \times \operatorname{ton} /(2 \times \mathrm{L})$
Formula 5

If the input voltage $\left(\mathrm{V}_{\text {IN }}\right)$ is equal to Vout, the output current (lout) is:
lout $=$ Vin $^{2} \times$ ton $/(2 \times L \times$ Vout $)$
Formula 6

If lout is larger than Formula 6, the IC switches to the continuous mode.

ILmax flowing through $L$ is:

ILmax $=$ lout $\times$ Vout $/ \mathrm{V}_{\text {IN }}+\mathrm{V}_{\text {IN }} \times \operatorname{ton} /(2 \times \mathrm{L})$

ILmax $=$ lout $\times$ Vout $/ \mathrm{V}_{\text {IN }}+\mathrm{V}_{\text {In }} \times \mathrm{T} \times\left(\mathrm{V}_{\text {out }}-\mathrm{V}_{\text {IN }}\right) /\left(2 \times \mathrm{L} \times \mathrm{V}_{\text {out }}\right)$.
Formula 8

As a result, ILmax becomes larger compared to lout.

When considering the input and output conditions or selecting the external parts, please pay attention to ILmax.

The above calculations are based on the ideal operation of the ICs in the continuous mode. They do not include the losses caused by the external parts or $L x$ switch. The actual maximum output current will be $50 \%$ to $80 \%$ of the above calculation results. Especially, if IL is large or $V_{I N}$ is low, it may cause the switching losses. As for Vout, please consider $\mathrm{V}_{\mathrm{F}}$ of the diode (approximately 0.8 V ).

1. The products and the product specifications described in this document are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to Ricoh sales representatives for the latest information thereon.
2. The materials in this document may not be copied or otherwise reproduced in whole or in part without prior written consent of Ricoh.
3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.
4. The technical information described in this document shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under Ricoh's or any third party's intellectual property rights or any other rights.
5. The products listed in this document are intended and designed for use as general electronic components in standard applications (office equipment, telecommunication equipment, measuring instruments, consumer electronic products, amusement equipment etc.). Those customers intending to use a product in an application requiring extreme quality and reliability, for example, in a highly specific application where the failure or misoperation of the product could result in human injury or death (aircraft, spacevehicle, nuclear reactor control system, traffic control system, automotive and transportation equipment, combustion equipment, safety devices, life support system etc.) should first contact us.
6. We are making our continuous effort to improve the quality and reliability of our products, but semiconductor products are likely to fail with certain probability. In order to prevent any injury to persons or damages to property resulting from such failure, customers should be careful enough to incorporate safety measures in their design, such as redundancy feature, fire containment feature and fail-safe feature. We do not assume any liability or responsibility for any loss or damage arising from misuse or inappropriate use of the products.
7. Anti-radiation design is not implemented in the products described in this document.
8. The X-ray exposure can influence functions and characteristics of the products. Confirm the product functions and characteristics in the evaluation stage.
9. WLCSP products should be used in light shielded environments. The light exposure can influence functions and characteristics of the products under operation or storage.
10. There can be variation in the marking when different AOI (Automated Optical Inspection) equipment is used. In the case of recognizing the marking characteristic with AOI, please contact Ricoh sales or our distributor before attempting to use AOI.
11. Please contact Ricoh sales representatives should you have any questions or comments concerning the products or the technical information.

Ricoh is committed to reducing the environmental loading materials in electrical devices with a view to contributing to the protection of human health and the environment.
Ricoh has been providing RoHS compliant products since April 1, 2006 and Halogen-free products since April 1, 2012
