

## 3 to 5 Serial Cell Li-Ion or Li-Polymer Battery Protection IC

NO.EA-322-210618

### OUTLINE

The R5436T is an overcharge, overdischarge and overcurrent protection IC for Li-ion or Li-polymer secondary battery. Overcharge, Overdischarge, Charge Overcurrent and Discharge Overcurrent for 3 to 5 serial cells can be detected. By cascade connection using the R5436T, it is also possible to protect 6-serial or more cells rechargeable battery pack. The R5436T provides a cell-balancing function to equalize imbalance between cells, and it provides an open-wire detection to detect a broken wire between a battery and the circuit board. The open-wire detection is optionally selectable.

### FEATURES

- High Voltage Tolerant Process  
Absolute Maximum Ratings ..... 30 V
- Low Supply Current  
Normal operation with using 5 cells ..... Typ. 12.0  $\mu$ A  
Standby ..... Typ. 6.0  $\mu$ A
- High-accuracy Voltage Detection  
Overcharge detection voltage ( $V_{DET1n}^{(1)}$ ) ..... 3.6 V to 4.5 V (in 5 mV steps)  
Overcharge detection voltage accuracy .....  $\pm 0.025$  V ( $T_a = 25^\circ\text{C}$ )  
Overdischarge detection voltage ( $V_{DET2n}^{(1)}$ ) ..... 2.0 V to 3.2 V (in 5 mV steps)  
Overdischarge detection voltage accuracy .....  $\pm 2.5\%$   
Discharge overcurrent detection voltage1 ( $V_{DET31}^{(2)}$ ) ..... 0.05 V to 0.25 V (in 10 mV steps)  
Discharge overcurrent detection voltage accuracy ..... Standard spec:  $\pm 20$ mV  
High standard spec <sup>(3)</sup>:  $\pm 15$  mV ( $V_{DET31} \leq 0.15$ V) /  
 $\pm 20$  mV ( $V_{DET31} > 0.15$ V)  
  
Discharge overcurrent detection voltage2 ( $V_{DET32}$ ) .....  $V_{DET31} \times 3$   
Discharge overcurrent detection voltage2 accuracy ..... Standard:  $\pm 50$ mV  
High standard spec:  $\pm 25$  mV ( $V_{DET31} \leq 0.10$ V) /  
 $\pm 50$  mV ( $V_{DET31} > 0.10$ V)  
  
Short-circuit detection voltage<sup>(4)</sup> ..... 0.25 V to 1.0 V (in 20 mV steps)  
Charge overcurrent detection voltage ( $V_{DET4}$ ) .....  $-0.05$  V /  $-0.1$  V /  $-0.2$  V  
Charge overcurrent detection voltage accuracy ..... Standard spec:  $\pm 30$  mV  
High standard spec:  $\pm 15$  mV ( $V_{DET4} = -0.05$ V /  $-0.1$ V) /  
 $\pm 30$  mV ( $V_{DET4} = -0.2$ V)  
  
Overcharge release voltage .....  $V_{DET1n} - 0.1$ V to  $V_{DET1n} - 0.4$ V (in 10mV steps)  
Overdischarge release voltage .....  $V_{DET2n} + 0.0$ V to  $V_{DET2n} + 0.7$ V (in 50mV steps)  
-provided, max.value is 3.2V.  
  
Cell-balancing detection voltage ( $V_{CBDn}^{(1)}$ ) ..... 3.45V to 4.45V (in 5 mV steps)  
Cell-balancing release voltage .....  $V_{CBDn} - 0.0$ V to  $V_{CBDn} - 0.4$ V (in 10mV steps)

<sup>(1)</sup>  $V_{DET1n}, V_{CBDn}$ :  $n = 1, 2, 3, 4, 5$

<sup>(2)</sup> Set to meet the following equation:  $(3 \times V_{DET31} + 0.05 < 0.8 \times V_{SHORT})$ .

<sup>(3)</sup> High standard spec: with improved accuracy for  $V_{DET31} / V_{DET32} / V_{DET4}$

<sup>(4)</sup>  $V_{DET32}$  is not detected when  $V_{DET32}$  is higher than  $V_{SHORT}$ .

- Each Detection DelayTime
  - Overcharge detection delay time ..... 1.0 sec
  - Overdischarge detection delay time settable by external capacitor
  - Discharge overcurrent detection delay time 1/2 settable by external capacitor
  - Charge overcurrent detection delay time ..... 8 ms
  - Short-circuit detection delay time ..... 330  $\mu$ s
- Zero Voltage Charging ..... Available
- Overcharge Release Voltage Condition ..... Voltage release type
- Overdischarge Release Voltage Condition ..... Latch type / Voltage release type
- 3 to 5 Cells Selectable Battery Protection
- Delay Time Shortening Function
- Selectable Broken-wire Detection ..... Typ.1.25 s
- External NTC temperature protection function
- Package ..... TSSOP-28 (JEDEC: 173 MIL)

## APPLICATIONS

- Li-ion/Li-polymer battery protection for electric tool and electric bicycle, etc.

## SELECTION GUIDE

In the R5436T, the set voltage, the delay time, and the optional function can be designated.

### Selection Guide

Product Name	Package	Quantity per Reel	Pb Free	Halogen Free
R5436Txxx* $\$$ -E2-FF	TSSOP-28	3,000 pcs	Yes	Yes

xxx: Specify a combination of the following set voltages. Refer to *Product Code List* for details.

$V_{DET1n}^{(1)}$ : 3.6 V to 4.5 V in 5 mV steps

$V_{REL1n}^{(1)}$ :  $V_{DET1n} - 0.1$  V to  $V_{DET1n} - 0.4$  V in 10 mV steps

$V_{CBDn}^{(1)}$ : 3.45 V to 4.45 V in 5mV steps

$V_{CBRn}^{(1)}$ :  $V_{CBDn} - 0.0$  V to  $V_{CBDn} - 0.4$  V in 10 mV steps

$V_{DET2n}^{(1)}$ : 2.0 V to 3.2 V in 5 mV steps

$V_{REL2n}^{(1)}$ :  $V_{DET2n} + 0.0$  V to  $V_{DET2n} + 0.7$  V in 50 mV steps (Max. 3.2 V)

$V_{DET31}$ : 0.05 V to 0.25 V in 10 mV steps

$V_{DET32}$ : Fixed to three times  $V_{DET31}$

$V_{SHORT}$ : 0.25 V to 1.0 V in 20 mV steps

$V_{DET4}$ :  $-0.05$  V /  $-0.1$  V /  $-0.2$  V

\*: Specify a combination of the following each detection delay time.

Code	$t_{VDET1}$ [s]	$t_{VDET2}$ [ms]	$t_{VDET31}$ [ms]	$t_{VDET32}$ [ms]	$t_{VDET4}$ [ms]	$t_{SHORT}$ [ $\mu$ s]
B	1.0	$3.60 \times C_{CT1}$ [nF]	$3.00 \times C_{CT2}$ [nF]	$t_{VDET31}/6$	8	330

$\$$ : Specify a combination of the optional functions.

Code	Overcharge Released Type	Overdischarge Released Type	0 V Charging	Open-wire Detection
A	Voltage Release	Latch	Available	Available
B	Voltage Release	Voltage Release	Available	Unavailable

<sup>(1)</sup>  $V_{DET1n}, V_{REL1n}, V_{CBDn}, V_{CBRn}, V_{DET2n}, V_{REL2n}$ : n = 1, 2, 3, 4, 5

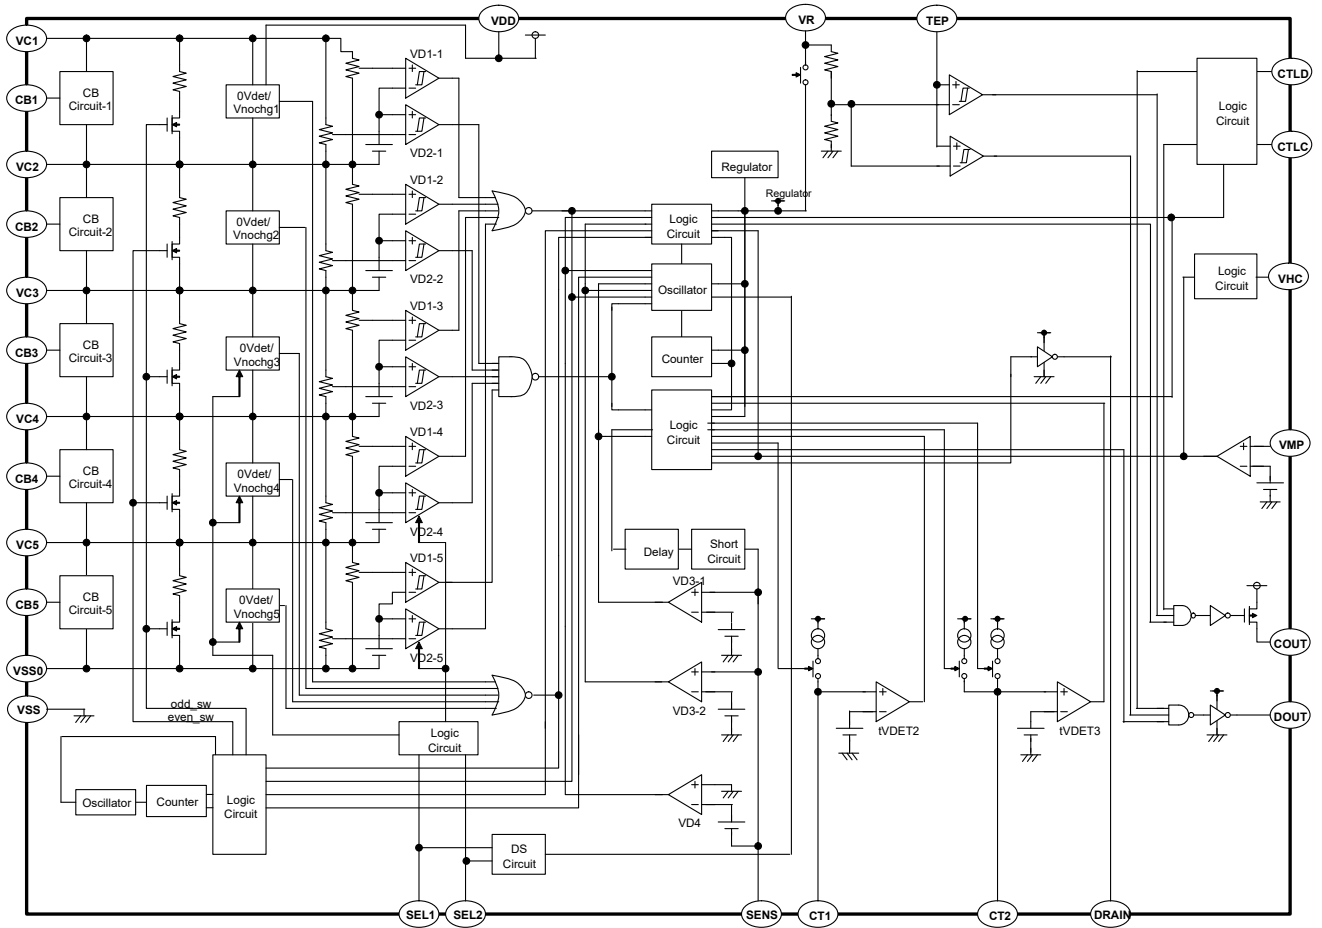

## Product Code List

The product code is determined by the combination of the set voltages (Overcharge Detection Voltage:  $V_{DET1n}$ , Overcharge Release Voltage:  $V_{REL1n}$ , Cell-balancing Detection Voltage:  $V_{CBDn}$ , Cell-balancing Release Voltage:  $V_{CBRn}$ , Overdischarge Detection Voltage:  $V_{DET2n}$ , Overdischarge Release Voltage:  $V_{REL2n}$ , Discharge Overcurrent Detection Voltage 1/2:  $V_{DET31} / V_{DET32}$ , Short-circuit Detection Voltage:  $V_{SHORT}$ , Charge Overcurrent Detection Voltage:  $V_{DET4}$ ), the delay time code, and the optional function code.

Product Name (Product Code)	Set Voltage (V)									
	$V_{DET1n}$	$V_{REL1n}$	$V_{CBDn}$	$V_{CBRn}$	$V_{DET2n}$	$V_{REL2n}$	$V_{DET31}$	$V_{DET32}$	$V_{SHORT}$	$V_{DET4}$

## PIN DESCRIPTIONS

**R5436T (TSSOP-28) Pin Configuration**

### R5436T Pin Description

Pin No.	Symbol	Description
1	CTLC	COUt control pin
2	CTLD	DOUt control pin
3	COUt	Overcharge detection output pin, Pch. open-drain output
4	VMP	Charger negative input pin
5	DRAIN	FET's gate connection pin for discharge overcurrent release voltage
6	DOUt	Overdischarge detection output pin, CMOS output
7	VHC	Transmission pin for VMP input signal
8	SENS	Current sense pin
9	VR	Internal VR output pin
10	TEP	Temperature protection input pin
11	VSS	Ground pin for the IC
12	CT1	Capacitor (C <sub>CT1</sub> ) connection pin for setting t <sub>VDET2</sub>
13	CT2	Capacitor (C <sub>CT2</sub> ) connection pin for setting t <sub>VDET3</sub>
14	SEL1	3- / 4- / 5-cell selectable pins
15	SEL2	
16	VSS0	Negative terminal for CELL5
17	CB5	Cell balance control pin for CELL5
18	VC5	Positive terminal for CELL5
19	CB4	Cell balance control pin for CELL4
20	VC4	Positive terminal for CELL4
21	CB3	Cell balance control pin for CELL3
22	VC3	Positive terminal for CELL3
23	CB2	Cell balance control pin for CELL2
24	VC2	Positive terminal for CELL2
25	CB1	Cell balance control pin for CELL1
26	NC	No Connection
27	VC1	Positive terminal for CELL1
28	VDD	VDD pin

**ABSOLUTE MAXIMUM RATINGS**(Ta = 25°C, V<sub>SS</sub> = 0 V)

Symbol	Parameter	Rating	Unit
V <sub>DD</sub>	Supply voltage	-0.3 to 30	V
V <sub>C1</sub>	CELL1 positive input pin voltage	V <sub>C2</sub> -0.3 to V <sub>C2</sub> +6.5	V

V <sub>CB5</sub>	CB5 pin output voltage	-0.3 to 6.5	V
V <sub>VHC</sub>	VHC pin output voltage	V <sub>DD</sub> -3 to V <sub>DD</sub> +5	V
V <sub>VR</sub>	VR pin output voltage	-0.3 to V <sub>VR</sub> +0.3	V
P <sub>D</sub>	Power Dissipation	Refer to Appendix "Power Dissipation"	
T <sub>j</sub>	Junction Temperature Range	-40 to 125	°C
T <sub>stg</sub>	Storage Temperature Range	-55 to 125	°C

**ABSOLUTE MAXIMUM RATINGS**

Electronic and mechanical stress momentarily exceeded absolute maximum ratings may cause permanent damage and may degrade the lifetime and safety for both device and system using the device in the field. The functional operation at or over these absolute maximum ratings is not assured.

**RECOMMENDED OPERATING CONDITION**

<b>Symbol</b>	<b>Parameter</b>	<b>Rating</b>	<b>Unit</b>
V <sub>DD</sub>	Operating Input Voltage	2.5 to 25	V
T <sub>a</sub>	Operating Temperature Range	-40 to 85	°C

**RECOMMENDED OPERATING CONDITIONS**

All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

## ELECTRICAL CHARACTERISTICS

$V_{CELLn} = CELLn$  (EX.  $V_{CELL1}$  is a voltage difference between VC1 and VC2)

$n = 1, 2, 3, 4, 5$ , unless otherwise noted.

### R5436TxxxBA / R5436TxxxBB Electrical Characteristics

## **THEORY OF OPERATION**

### **Overcharge Detection: VD1-n (n = 1, 2, 3, 4, 5)**

During charging, the device supervises the voltage between VC1 and VC2 pins (the CELL1 voltage), the voltage between VC2 and VC3 pins (the CELL2 voltage), the voltage between VC3 and VC4 pins (the CELL3 voltage), the voltage between VC4 and VC5 pins (the CELL4 voltage), and the voltage between VC5 and VSS0 pins (the CELL5 voltage). If at least one of the cells' voltage becomes more than the overcharge detection voltage, the overcharge is detected, and COUT pin connected to an external pull-down resistor becomes "Hi-z", and it makes the external Nch.FET turn off. Then, the charging stops.

After detecting the overcharge, when all the cell voltage become lower than the overcharge detection voltage by connecting a load, COUT pin becomes "High", and it makes the external Nch. FET turn on, and the charging restarts. Even If all the cell voltage become lower than the overcharge release voltage with no load, COUT pin becomes "High" and the charging is available.

The device has internal fixed output delay times for overcharge detection and overcharge release. When the output delay time passes while any one of cell voltages is more than the overcharge detection voltage, the overcharge is detected. However, all cell voltage becomes lower than the overcharge detection voltage within the overcharge detection delay time, even if any one of cells' voltage becomes more than the overcharge detection voltage, the overcharge is not detected.

Besides, after detecting the overcharge, any one of their cell voltages becomes more than the overcharge release voltage within the overcharge release delay time, even if all the cell voltage becomes lower than the overcharge release voltage, the device does not release from the overcharge.

### **Overdischarge Detection: VD2-n (n = 1, 2, 3, 4, 5)**

During discharging, the device supervises the voltage between VC1 and VC2 pins (the CELL1 voltage), the voltage between VC2 and VC3 pins (the CELL2 voltage), the voltage between VC3 and VC4 pins (the CELL3 voltage), the voltage between VC4 and VC5 pins (the CELL4 voltage), and the voltage between VC5 and VSS0 pins (the CELL5 voltage). If at least one of the cells' voltage becomes less than the overdischarge detection voltage, the overdischarge is detected, and DOUT pin becomes "Low", and it makes the external Nch.FET turn off. Then, the discharging stops.

The release condition from the overdischarge detection is different depending on optional functions. One is the latch type, after detecting the overdischarge, when the battery becomes higher than the overdischarge release voltage by connecting a charger, DOUT pin becomes "High". And, the other is the voltage release type, when the cell voltage becomes higher than the overdischarge release voltage, the device releases from the overdischarge even if the charger is not connected, and DOUT pin becomes "High".

An output delay time for overdischarge detection is settable by the external capacitor ( $C_{CT1}$ ) connected to CT1 pin. When the output delay time passes while any one of each cell voltage is lower than the overdischarge detection voltage, the overdischarge is detected. However, all cell voltage becomes higher than the overdischarge detection voltage within the overdischarge detection delay time even if any one of cells' voltage becomes lower than the overdischarge detection voltage, the overdischarge is not detected. An output delay time for overdischarge release is fixed internally.

After detecting the overdischarge, the device stops unnecessary circuits to reduce the consumption current to a minimum when VMP pin becomes “High”. DOUT pin, which is CMOS output, outputs the internal regulator’s voltage (about 12 V) at “High” level and outputs VSS pin voltage at “Low” level.

### **Discharge Overcurrent Detection: VD3-n (n = 1, 2) and Short-circuit Detection**

During discharging, the device supervises SENS pin voltage ( $V_{\text{SENS}}$ ).

The discharge overcurrent is detected when SENS pin voltage ( $V_{\text{SENS}}$ ) becomes in between the discharge overcurrent detection voltage ( $V_{\text{DET3n}}$ ) and the short-circuit detection voltage ( $V_{\text{SHORT}}$ ) owing to a large load, and the short-circuit is detected when  $V_{\text{SENS}}$  becomes more than  $V_{\text{SHORT}}$ . Then, to prevent from flowing large current to circuits, DOUT pin is set to “Low” and the external FET is turned OFF.

The device has two detection threshold to detect the discharge overcurrent. Each detection threshold has the output delay time each other. The discharge overcurrent detection delay time 2 ( $t_{\text{VDET32}}$ ) is set to be shorter than the discharge overcurrent detection delay time 1 ( $t_{\text{VDET31}}$ ). An output delay time for discharge overcurrent detection is settable by the external capacitor ( $C_{\text{CT2}}$ ) connected to CT2 pin. When  $V_{\text{SENS}}$  becomes lower than  $V_{\text{DET3n}}$  within the output delay time even if  $V_{\text{SENS}}$  is in between  $V_{\text{DET3x}}$  and  $V_{\text{SHORT}}$ , the discharge overcurrent is not detected. The output delay times for discharge overcurrent release and short-circuit are fixed internally.

Connect an external resistor for discharge overcurrent release among each drain of the external FETs connected to DRAIN, COUT, and DOUT pins. After detecting the discharge overcurrent, or the short-circuit, turn ON the external FET connected to DRAIN pin, and connect a resistor for overcurrent release to VSS. When load is released and opened after detecting the discharge overcurrent or the short-circuit, The VMP pin voltage ( $V_{\text{VMP}}$ ) is pulled-down to VSS via the resistor for the overcurrent release, and  $V_{\text{VMP}}$  becomes less than  $V_{\text{REL3}}$ . After a certain delay time, the discharge overcurrent detection state or the short-circuit detection state is released. When the discharge overcurrent detection is released, the external FET connected to DRAIN pin is turned OFF, and the resistor for the overcurrent release is disconnected from VSS.

### **Charge Overcurrent Detection: VD4**

During charging or discharging, the device supervises SENS pin voltage ( $V_{\text{SENS}}$ ). When a large current flows by charging with an inappropriate charger, SENS pin voltage becomes less than the charge overcurrent detection voltage, and the charge overcurrent is detected. COUT pin with the external pull-down resistor becomes “Hi-z”. And, tuning OFF the external FET can prevent from flowing large current to circuits.

When SENS pin voltage ( $V_{\text{SENS}}$ ) becomes higher than  $V_{\text{DET4}}$  within the output delay time even if  $V_{\text{SENS}}$  becomes lower than the charge overcurrent detection voltage, the charge overcurrent is not detected. The output delay times for charge overcurrent detection and charge overcurrent release are fixed internally.

To release from the charge overcurrent, connect a load without the charger, and VMP pin voltage has to become higher than the charge overcurrent release voltage over the charge overcurrent release delay time.

Overcharge / Charge Overcurrent Operation Timing Chart

Overdischarge / Discharge Overcurrent / Short-circuit Operation Timing Chart

## Standby Mode

This device can change from normal mode to standby mode when overdischarge is detected and VMP pin voltage ( $V_{VMP}$ ) becomes higher than  $V_{STB}$ . In the standby mode, the device stops unnecessary circuits to reduce the consumption current to a minimum. At that time, VR pin output voltage becomes equal to the  $V_{SS}$  level. And, this device can return to the normal mode when  $V_{VMP}$  becomes lower than  $V_{STB}$  by connecting a charger.

## Cell Imbalance

When any one of CELLS detects an overcharge and either one detects an overdischarge, COUT pin becomes “Hi-z” and DOUT pin becomes “Low”.

## SEL1 and SEL2 Pins

SEL1 and SEL2 pins are switching-control pins to select among 3- / 4- / 5-cell protection. When using for the 4-cell protection, connecting SEL1 pin to VSS and the SEL2 pin to VDD is required to stop the 5<sup>th</sup> cell protection circuit and shut signals. The overdischarge is not detected when VC5 pin is shortened to VSS0.

When using for the 3-cell protection, likewise, connecting SEL1 pin to VDD and SEL2 pin to VSS is required to stop the 5<sup>th</sup> and 4<sup>th</sup> cells protection circuits and shut signals. The overdischarge is not detected when VC4 and VC5 pins are shortened to VSS0. SEL1 / SEL2 pin must be fixed to VDD / VSS when using the 3- / 4- / 5-cell protection. Setting SEL1 and SEL2 pins can select disabling/enabling the open-wire detection<sup>(1)</sup> and the shorten mode 1/2. Refer to the following table for details of the operation mode.

## Operation Modes

Input Voltage <sup>(2)</sup>		Operation Mode
SEL1 Pin	SEL2 Pin	
High	High	Enable the 5-cell protection mode
Low	High	Enable the 4-cell protection mode
High	Low	Enable the 3-cell protection mode
Low	Low	Disable the open-wire detection mode for 5-cell protection
Low	Middle	Disable the open-wire detection mode for 4-cell protection
Middle	Low	Disable the open-wire detection mode for 3-cell protection
Middle	Middle	Enable the delay time shorten mode 1 (approx.1/70) for 5-cell protection
Middle	High	Enable the delay time shorten mode 2 (approx.4 ms) for 5-cell protection
High	Middle	Enable the open-wire detecting test for 5-cell protection

<sup>(1)</sup> R5436TxxxBB does not support the open-wire detection.

<sup>(2)</sup> “High”: VDD level, “Middle”:  $(VDD/2-0.5)$  V to  $(VDD-3)$  V, “Low”: VSS level

## CTLC and CTLD Pins

When using cascade connection, the R5436T can transfer each state of overcharge, overdischarge, and open-wire detections by connecting between COUT and CTLC pins and between DOUT and CTLD pins. When not using it, CTLC and CTLD pins must be connected to VSS.

When CTLC / CTLD pin voltage is higher than the value of “High” threshold voltage 1 ( $V_{CTLC1H} / V_{CTLD1H}$ ), or when CTLC / CTLD pin voltage is lower than the value of “High” threshold voltage 2 ( $V_{CTLC2H} / V_{CTLD2H}$ ), COUT / DOUT pin becomes “High” after normal operation. By applying a voltage of between  $V_{CTLC1H}$  and  $V_{CTLC2H}$  to CTLC pin, COUT pin with an external pull-down resistor becomes “Hi-z” forcedly. And, by applying a voltage of between  $V_{CTLD1H}$  and  $V_{CTLD2H}$  to CTLD pin, DOUT pin with an external pull-down resistor becomes “Low” forcedly. Don't make CTLC and CTLD pins open. The following table indicates a relationship between the control pins (CTLC and CTLD) and the state of the external FETs for COUT and DOUT pins.

### External FET's state by CTLx pins

CTLC / CTLD pins	External FET for COUT / DOUT pins
$2V_{DD}$ to $V_{CTLC1H} / V_{CTLD1H}$	ON (Normal operation)
$V_{CTLC1H} / V_{CTLD1H}$ to $V_{CTLC2H} / V_{CTLD2H}$	Forced OFF
$V_{SS}$ to $V_{CTLC2H} / V_{CTLD2H}$	ON (Normal operation)

When  $V_{DD} = 17\text{ V}$  (Refer to “Electrical Characteristics”),

$V_{CTLC1H} / V_{CTLD1H}$ : Typ. 18.1 V

$V_{CTLC2H} / V_{CTLD2H}$ : Typ. 16.1 V

## CT1 and CT2 Pins

CT1 and CT2 pins are used for setting each output delay time of the overdischarge detection ( $t_{VDET2}$ ), and the discharge overcurrent detection 1/2 ( $t_{VDET31} / t_{VDET32}$ ) by connecting external capacitors  $C_{CT1}$  and  $C_{CT2}$ .

$t_{VDET2}$  can be set with CT1 pin.  $t_{VDET31}$  and  $t_{VDET32}$  can be set with CT2 pin. Each delay time can be calculated by following Equation 1:

$$CV = i\Delta t \dots \dots \dots \text{Equation 1}$$

- Delay time ( $t_{VDET2}$ ) setting with external capacitor ( $C_{CT1}$ )

By substitution of Equation1,

$$t_{VDET2} = C_{CT1} \times V_{DCT1} / I_{CT1} \dots \dots \dots \text{Equation 2}$$

If  $C_{CT1} = 33 \text{ nF}$ ,  $V_{DCT1} = 1.8 \text{ V}$ ,  $I_{CT1} = 500 \text{ nA}$  (Refer to “*Electrical Characteristics*”).

When substituting values to Equation 2,  $t_{VDET2}$  is as follow;

$$\begin{aligned} t_{VDET2} &= 33 \text{ nF} \times 1.8 \text{ V} / 500 \text{ nA} \\ &= 118.8 \text{ ms} \end{aligned}$$

- Delay time ( $t_{VDET31}$ ,  $t_{VDET32}$ ) setting with external capacitor ( $C_{CT2}$ )

By substitution of Equation1,

$$t_{VDET31} = C_{CT2} \times V_{DCT2} / I_{CT2} \dots \dots \dots \text{Equation 3}$$

$$t_{VDET32} = t_{VDET31} / 6 \dots \dots \dots \text{Equation 4}$$

If  $C_{CT1} = 3.3 \text{ nF}$ ,  $V_{DCT1} = 1.5 \text{ V}$ ,  $I_{CT1} = 500 \text{ nA}$  (Refer to “*Electrical Characteristics*”).

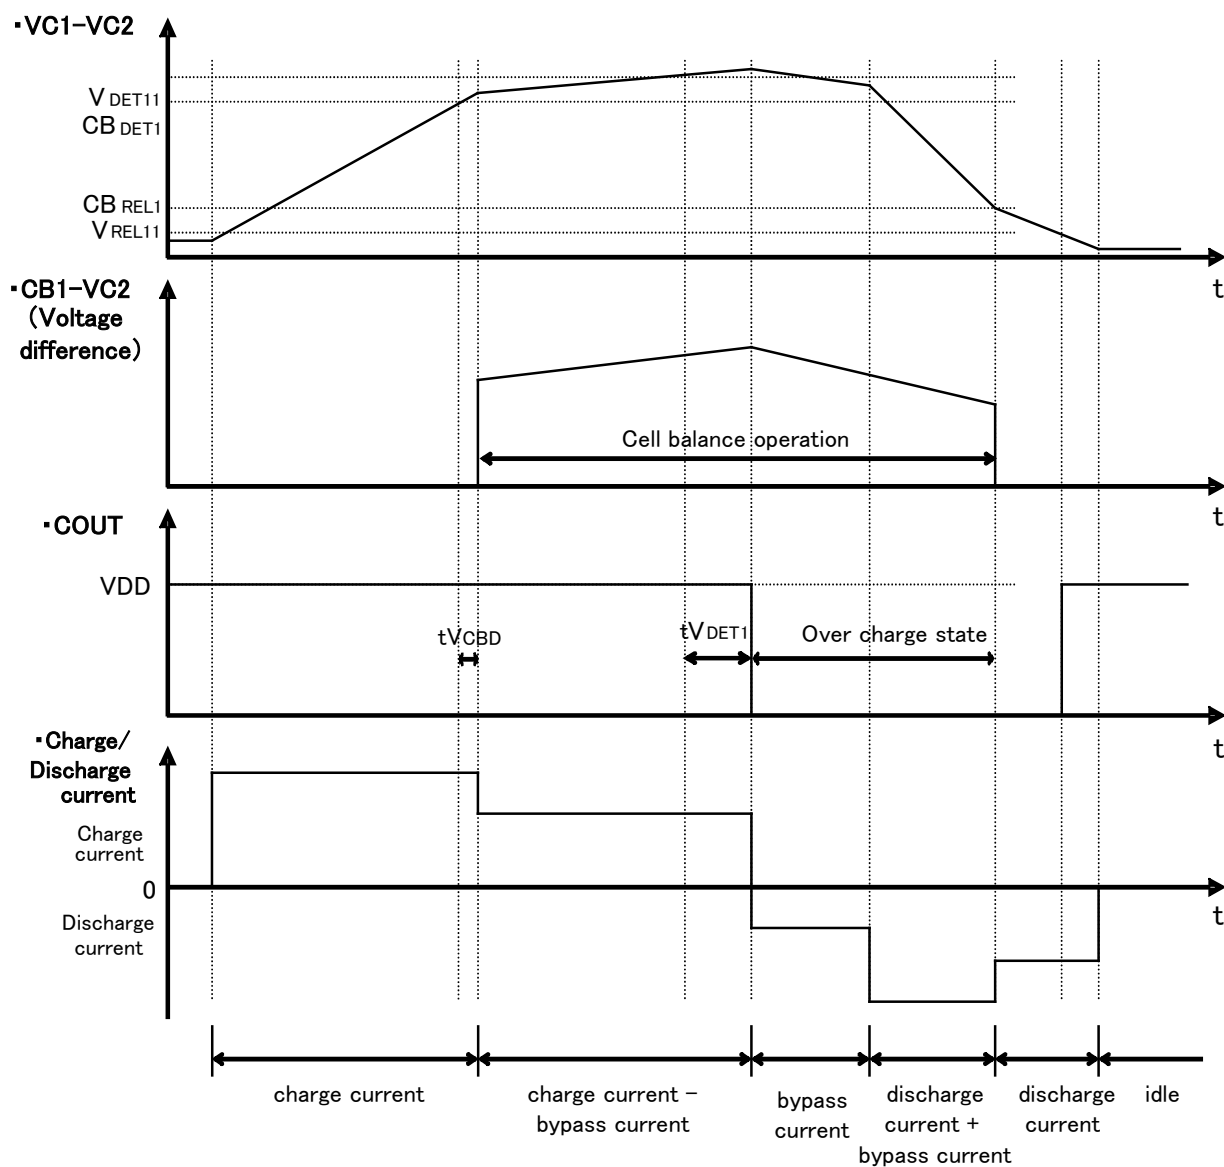

When substituting values to Equation 3 / Equation 4,  $t_{VDET31}$  and  $t_{VDET32}$  are as follow;

$$\begin{aligned} t_{VDET31} &= 3.3 \text{ nF} \times 1.5 \text{ V} / 500 \text{ nA} \\ &= 9.9 \text{ ms} \\ t_{VDET32} &= 9.9 \text{ ms} / 6 \\ &= 1.65 \text{ ms} \end{aligned}$$

## Cell Balance Function

When the cell voltage exceeds the cell balance detection voltage ( $V_{CBDn}$ ,  $n=1,2,3,4,5$ ),  $CBn$  pin become “High” by cell balancing. By turning ON an external Nch. FET for cell balance, a current flows through the discharge path in parallel with the cell in order to reduce the charging current or to discharge the cell voltage. And, when the cell voltage is less than the cell balance release voltage ( $V_{CBRn}$ ,  $n=1,2,3,4,5$ ),  $CBn$  pin become

“Low” after the cell balancing is released, and the external Nch. FET is turned OFF. When not using this function, CBn pin must be open.

CELL1 Balancing Timing Chart

CELL1/2 Balancing Timing Chart

**Open-wire Detection (R5436TxxxBA only)**

When using the 5-cell protection, the voltage of VDD (= VC1) becomes lower than VC2 voltage if the connection between the battery and VDD (= VC1) is open. And, the voltage of VSS (= VSS0) becomes higher than VC5 voltage if the connection between the battery and VSS (= VSS0) is open. The voltage variation is detected as "Open-wire". When the open-wire is detected, COUT becomes "HI-z" and DOUT becomes "Low". But, if VC1 or VSS0 line is cut off when each VC1 and VSS0 pins are connected with separate lines, only DOUT pin will become "Low". Likewise, as for an open-wire detection between VDD and VSS pins, if VDD or VSS line is cut off, COUT pin will become "Hi-z" and DOUT pin will become "Low".

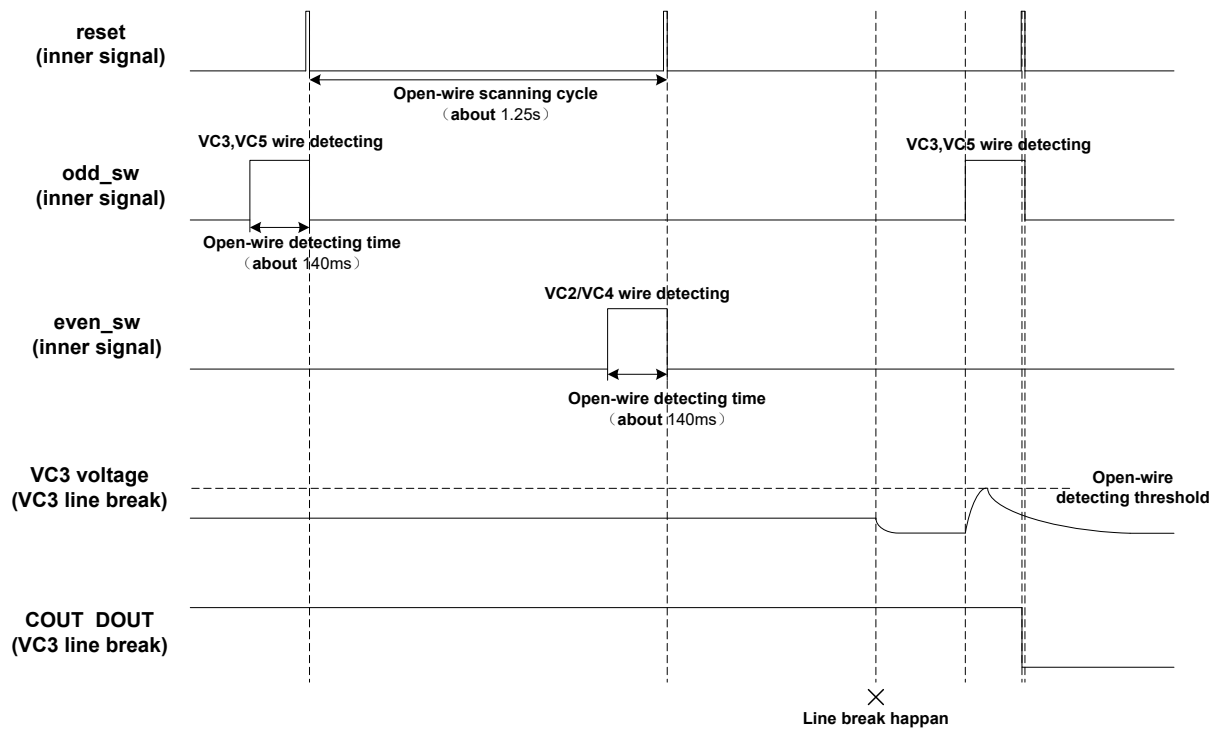

Open-wire detection for VC2, VC3, VC4, and VC5 is performed at interval of 1.25 seconds. The cell switch for VC1, VC3, and VC5 and the cell switch for VC2 and VC4 are alternately turned ON by even\_sw and odd\_sw signals. The internal impedance between pins, which are turned the switch ON, is lowered for about 140 ms. If not detecting the open-wire, this cycle will exit and the next cycle will start. If detecting the open-wire, the VC voltage will be shifted according to the difference of the internal impedance caused by turning ON either of two switches. This voltage change is detected during the delay time of 0.5 ms or more, the open-wire detection works. Then, COUT pin becomes "Hi-z" and DOUT pin becomes "Low". By applying a certain voltage to SEL1 and SEL2 pins, the open-wire detection for VC2, VC3, VC4, and VC5 is disabled. The open-wire detection is disabled even when this device is in standby mode - but the open-wire detection for VDD and VSS lines is enabled.

When using the 10-cell protection, if VSS of the higher-voltage device and VDD of the lower-voltage device in cascade connection are connected with the battery's line, an open-wire in this line cannot be detected.

**[Limitations of Open-wire detection for VC2, VC3, VC4, and VC5]**

When using the open-wire detection for VC2, VC3, VC4, and VC5, confirm the limitations below:

- The cycle time of open-wire detection is 1.25 second, and the open-wire detection is performed for 140 ms in each cycle. The device controls these internal-set times.
- When the battery voltage is lower even when this device is not in standby, an open-wire might not be detected due to some factors: the device's distribution, the cell balancing in the battery, the operating environment, the characteristics of the external components, etc.
- During the overcharge detection delay time, the device does not shift to the open-wire detection until the overcharge detection is finished. The overcharge detection does not start even if the battery voltage is higher than the overcharge detection voltage. After the completion of the open-wire detection, the overcharge detection will start if the battery voltage is more than the overcharge detection voltage. That is, the overcharge detection delay time increases for the time required for the open-wire detection.
- Likewise, the device does not shift to the open-wire detection during the overdischarge detection delay time, and the device does not start the overdischarge detection when the battery voltage is less than the overdischarge detection voltage during the open-wire detection. But, after the completion of the open-wire detection, the overdischarge detection delay time increases for the time required for the open-wire detection.

Open-wire Detection Timing Chart

### Temperature Protection by External NTC

The temperature protection is realized with VR and TEP pins. VR pin supplies a source voltage to be divided by a series of resistors of  $R_{TEP}$  and NTC. The divided voltage becomes an input to TEP pin.

When rising of the temperature under the NTC's supervising, TEP pin voltage, which is the divided voltage, rises depending on a reduction of the NTC resistance value. When the delay time ( $t_{T\_DET}$ ) has passed while holding the divided voltage being higher than the temperature protection detection voltage ( $V_{T\_DET}$ ), the temperature protection will function, and changing COUT pin to "Hi-z" and DOUT pin to "Low" can stop charging/ discharging. After the temperature falling, the delay time ( $t_{T\_REL}$ ) has passed while holding the divided voltage being lower than the temperature protection release voltage ( $V_{T\_REL}$ ), COUT and DOUT pins return "High", and charging / discharging is available.

VR pin cannot supply a large current because of supplying a source voltage for the voltage divider. In standby mode, the temperature protection stops since VR pin becomes "Low" to reduce the consumption current. When using the temperature protection at desired temperature, each resistance value of NTC and  $R_{TEP}$  can be calculated by following Equation:

$$\frac{R_{TEP}}{R_{TEP} + R_{NTC}} \times VR = \frac{20}{21} \times VR$$

$$R_{TEP} = 20 R_{NTC}$$

For example, when using the following requirements:

NTC resistor: SNS104B24B24360FE1L050ET

Available temperature for protection: 65°C

$R_{NTC} = 17.63 \text{ k}\Omega$  (at 65°C)

Then,

$$\begin{aligned} R_{TEP} &= 20 \times R_{NTC} \\ &= 352.6 \text{ (k}\Omega\text{)} \end{aligned}$$

As a result, choose a nearest value and normal type resistance:  $R_{TEP}=348\text{k}\Omega$ .

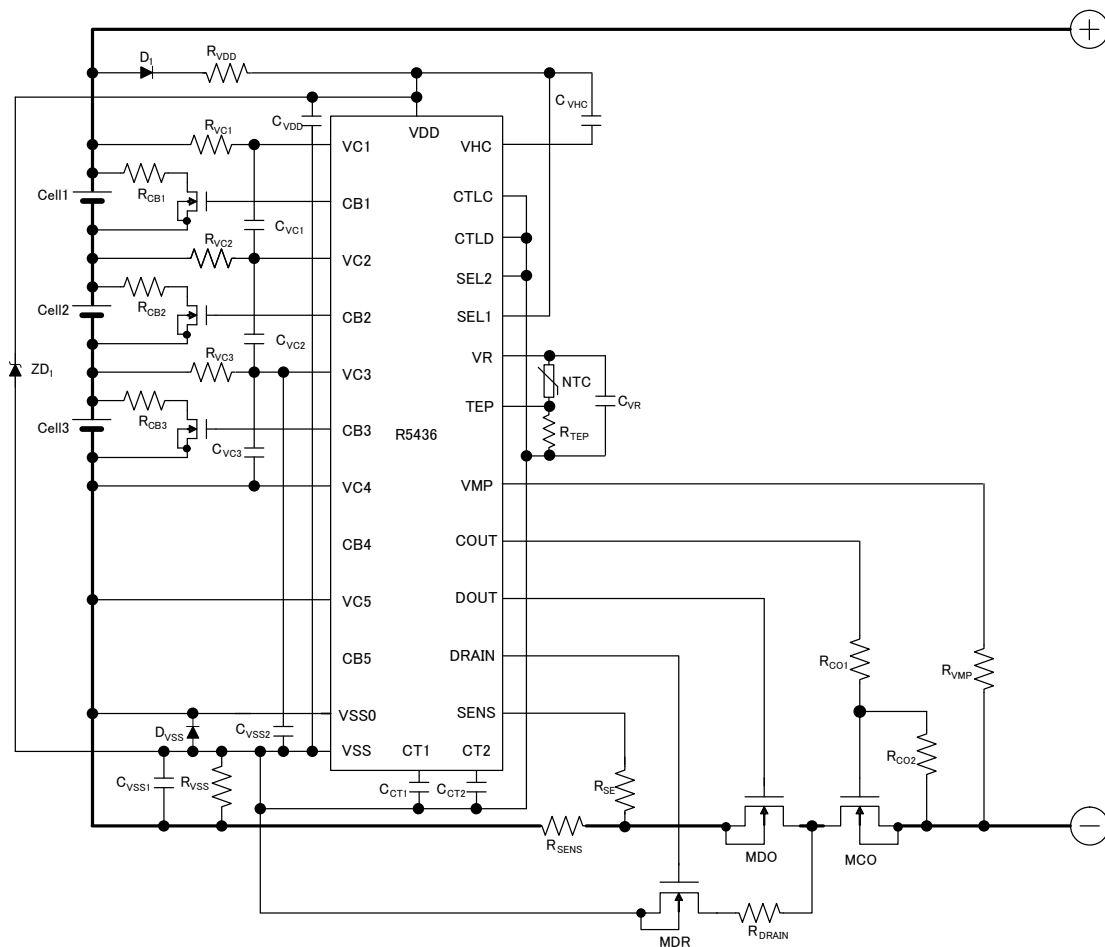

## APPLICATION INFORMATION

For battery pack assembly, it is recommended to start with the VSS connection, followed by the (+) terminal of the lowest cell in ascending voltage order.

## Component Selection Guide

- The typical application circuit diagrams are just examples. The operation in application circuits is not guaranteed. Be sure to perform a sufficient evaluation with the external components under the actual usage conditions for selection.
- Be careful not to apply the overvoltage and the overcurrent which exceed the rating to the protection IC and external components. Especially, select an FET with enough current capacity to endure the large current because a large current might flow through the FET during the time between an overcharge detection a blown fuse.

## Technical Notes for External Components

**【1】** The voltage fluctuation is stabilized with R<sub>V<sub>DD</sub></sub> and C<sub>V<sub>DD</sub></sub>. If a small R<sub>V<sub>DD</sub></sub> is set, in the case of the large transient may happen to the cell voltage, by the flowing current, the IC may be unstable. If a large R<sub>V<sub>DD</sub></sub> is set, by the consumption current of the IC itself, the voltage difference between V<sub>DD</sub> pin and VC1 pin is generated, and unexpected operation may result. Therefore, the appropriate value range of R<sub>V<sub>DD</sub></sub> is from 330Ω to 1kΩ. To make a stable operation of the IC, the appropriate value range of C<sub>V<sub>DD</sub></sub> is from 0.1μF to 1.0μF.

<sup>(1)</sup> Refer to “*Technical Notes for External Components*” for details.

- 【2】  $R_{VCxx}$ ,  $C_{VCxx}$  stabilize the voltage fluctuation. If large  $R_{VCxx}$  is set, the detector threshold will be high because of the internal conduction current of the IC. The operation error of open-wire detector function may happen easily by the distribution of the ICs or environment. If small  $R_{VCxx}$  is set, the effect by noise will be large. Therefore, the appropriate value range of  $R_{VCxx}$  is from  $330\Omega$  to  $1k\Omega$ . To make stable operation, use  $0.1\mu F$  as  $C_{VCxx}$ .
- 【3】 When the cell balance function is necessary,  $R_{CBxx}$  must be chosen carefully with considering the bypass current, and consumption power by the bypass current, and the external MOSFET. Especially, if a small resistance (to set the large bypass current) is set, fully evaluation is necessary. If a large resistance (to set the small bypass current) is set, the time for cell balance will be long.
- 【4】 When the cascade connection is used, if short circuit is happened, by the short current and the  $R_{SENS}$  enlarges the voltage, and as a result, if the voltage of SENS pin becomes larger than the VDD of the IC, during the short circuit output delay time, the current flows into SENS pin. Therefore, if a small  $R_{SE}$  is set, a large current may flow into SENS pin. If a large  $R_{SE}$  is set, the over-current detector threshold may shift. Therefore, the appropriate value is around  $10k\Omega$ .
- 【5】 Choose appropriate values for  $R_{DRAIN}$ ,  $R_{CO1}$ , and  $R_{CO2}$  to satisfy the next equation, otherwise, the release from excess discharge current and short may be impossible.

$$R_{DRAIN} < V_{REL3} \times (R_{CO1} + R_{CO2}) / V_{DD}$$

If small  $R_{CO1}$  or  $R_{CO2}$  is set, when the output of  $C_{OUT}$  is "H", the consumption current of protection circuit board increases. If large  $R_{CO1}$  or  $R_{CO2}$  is set, when the output of  $C_{OUT}$  is "Hi-z", the speed for pull-down the gate of the charge FET becomes slow and turning off the FET will be slow. Dividing between the "Hi-z" output and the resistance might be not enough to turn OFF the charge FET. If a small  $R_{DRAIN}$  is set, when the excess discharge current and short circuit is detected, the large current may flow until the load is removed.

- 【6】 When the cascade connection is used, if  $D_{OUT}$  turns off,  $V_{MP}$  pin is pulled up via  $R_{VMP}$  to the top cell. In this case, the current flows via  $R_{VMP}$  and the internal diode, therefore, appropriate value must be chosen (usually  $M\Omega$  level). If the cascade connection is not used, around  $10k\Omega$  is acceptable.
- 【7】 Set  $R_{UCO}$  to satisfy  $R_{UCO} = R_{CO1} + R_{CO2}$ . If an extremely large resistance is set, when the output of  $C_{OUT}$  is "Hi-Z", by the dividing resistance,  $CTLC$  pin may not be pulled down. If a small resistance is used, when the output of  $C_{OUT}$  is "H", the consumption current via  $R_{UCO}$  increases.
- 【8】 If a too small  $C_{CT2}$  is set, excess discharge current detector output delay time 2 becomes shorter than the short circuit output delay time. Therefore, use a capacitor with  $0.0022\mu F$  or more.

- 【9】 To make a stable VR output, it should connect a 1.0 $\mu$ F capacitor to VR pin.
- 【10】 Considering the break-down of the resistors and capacitors to stabilize the fluctuation of the voltage, to avoid that the high voltage is directly forced to the IC, adding a zener diode is our recommendation. Connect the zener diode between VDD pin of the IC and VSS pin directly. (Refer to the typical application circuits.) Zener diode MM1Z30\_0.5W\_30V\_J\_SOD-123\_EIC is recommended.
- 【11】 When the cascade connection is used, the lower side IC can transfer the VMP signal to upper side IC through VHC pin by pulling up VHC pin to the upper side IC's VC5 level through RVHC. The recommended value of RVHC is 5M $\Omega$ . If the upper side IC works at 4-cell protection mode, VHC pin should be pulled up to upper side IC's VC4 level. If the upper side IC works at 3-cell protection mode, VHC pin should be pulled up to upper side IC's VC3 level.
- 【12】 The temperature protection function is realized by the voltage divider between a resistor of R<sub>TEP</sub> and an NTC thermistor. R<sub>TEP</sub> is equal to 20 times R<sub>NTC</sub> at the desired protecting temperature. Choose an NTC thermistor with a high resistance capability to reduce the IC consumption current since VR pin cannot supply a large current. Using the high-accuracy thermistor and resistor can be realized more high-accuracy temperature protection.
- 【13】 As for the charge control FET (MCO) and the discharge control FET (MDO), be sure to perform a sufficient consideration of their maximum voltage tolerance, current rating, maximum power consumption and peak consumption when short-circuit.
- 【14】 As for the pull-down FET (MDR), be sure to perform a sufficient consideration to its maximum voltage tolerance.
- 【15】 Schottky Diode (SBD<sub>VSS</sub>) is required to prevent VSS pin voltage from being larger than VSS0 pin voltage.
- 【16】 Diode (D<sub>x</sub>) is required to prevent a drop in the VDD pin voltage (V<sub>DD</sub>), along with the battery voltage drop.
- 【17】 C<sub>CTLD</sub> and R<sub>CTLD</sub> make CTLD pin's transmission stable.
- 【18】 C<sub>VHC</sub> makes VHC pin signal stable.

The power dissipation of the package is dependent on PCB material, layout, and environmental conditions. The following measurement conditions are based on JEDEC STD.51.

**Measurement Conditions**

Item	Measurement Conditions
Environment	Mounting on Board (Wind Velocity = 0 m/s)
Board Material	Glass Cloth Epoxy Plastic (Four-Layer Board)
Board Dimensions	76.2 mm × 114.3 mm × 1.6 mm
Copper Ratio	Outer Layers (First and Fourth Layers): Less than 10% of 60 mm Square Inner Layers (Second and Third Layers): 100% of 74.2 mm Square
Through-holes	φ 0.85 mm × 44 pcs

**Measurement Result**

(Ta = 25°C, Tjmax = 125°C)

	Measurement Result
Power Dissipation	1250 mW
Thermal Resistance	$\theta_{ja} = (125 - 25^\circ\text{C}) / 1.25 \text{ W} = 80^\circ\text{C/W}$ $\theta_{jc} = 25^\circ\text{C/W}$

**Power Dissipation vs. Ambient Temperature**

**Measurement Board Pattern**

1. The products and the product specifications described in this document are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to our sales representatives for the latest information thereon.
2. The materials in this document may not be copied or otherwise reproduced in whole or in part without prior written consent of our company.
3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.
4. The technical information described in this document shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under our company's or any third party's intellectual property rights or any other rights.
5. The products listed in this document are intended and designed for use as general electronic components in standard applications (office equipment, telecommunication equipment, measuring instruments, consumer electronic products, amusement equipment etc.). Those customers intending to use a product in an application requiring extreme quality and reliability, for example, in a highly specific application where the failure or misoperation of the product could result in human injury or death (aircraft, spacevehicle, nuclear reactor control system, traffic control system, automotive and transportation equipment, combustion equipment, safety devices, life support system etc.) should first contact us.
6. We are making our continuous effort to improve the quality and reliability of our products, but semiconductor products are likely to fail with certain probability. In order to prevent any injury to persons or damages to property resulting from such failure, customers should be careful enough to incorporate safety measures in their design, such as redundancy feature, fire containment feature and fail-safe feature. We do not assume any liability or responsibility for any loss or damage arising from misuse or inappropriate use of the products.
7. Anti-radiation design is not implemented in the products described in this document.
8. The X-ray exposure can influence functions and characteristics of the products. Confirm the product functions and characteristics in the evaluation stage.
9. WLCSP products should be used in light shielded environments. The light exposure can influence functions and characteristics of the products under operation or storage.
10. There can be variation in the marking when different AOI (Automated Optical Inspection) equipment is used. In the case of recognizing the marking characteristic with AOI, please contact our sales or our distributor before attempting to use AOI.
11. Please contact our sales representatives should you have any questions or comments concerning the products or the technical information.
