

POWER MANAGEMENT SYSTEM DEVICE

RN5T568 Series

Datasheet

Version.1.00

2020.02.05

RICOH

RICOH Electronic Devices Co., Ltd.

1. Outline

This IC is the power management IC for GPS-PND/STB/POS/Panel Computer and so on. It integrates four high-efficiency step-down DCDC converters, seven low dropout regulators, power control logic, I2C-Bus Interface, voltage detections, thermal shut-down, etc.

2. Features

●System

- ✓ I2C-Bus interface @3.4MHz and 400kHz
- ✓ Detector function (System/IO, UVLO, DETVSB)
- ✓ Thermal shutdown function
- ✓ Watchdog timer
- ✓ Power on key input for System's power up
- ✓ Power on reset output for CPU
- ✓ Flexible power-on/off sequence by OTP
- ✓ Flexible DCDCx and LDOx default-on/off control by OTP

●High Efficiency Step-down DC/DC Converters

- ✓ DC/DC1 0.6-3.5V Max. 3000mA
- ✓ DC/DC2 0.6-3.5V Max. 3000mA
- ✓ DC/DC3 0.6-3.5V Max. 2000mA
- ✓ DC/DC4 0.6-3.5V Max. 2000mA
- ✓ Soft-start circuit

●Low Drop Voltage Regulators

- ✓ LDO1 0.9-3.5V Max. 300mA
- ✓ LDO2 0.9-3.5V Max. 300mA
- ✓ LDO3 0.6-3.5V Max. 300mA
- ✓ LDO4 0.9-3.5V Max. 200mA
- ✓ LDO5 0.9-3.5V Max. 200mA
- ✓ LDORTC1 1.2-3.5V Max. 30mA (Always-on, For coin battery)
- ✓ LDORTC2 0.9-3.5V Max. 10mA (Always-on)
- ✓ Overcurrent Protection and Short circuit Protection.

●4ch-GPIO

- ✓ Supports interrupt function (level/edge) for input signals
- ✓ Outputs power-on signal for external devices
- ✓ Power on/off input for System's power up/down
- ✓ DCDCx and LDOx can be controlled by external input
- ✓ GPIO2 can output LDORTC2
- ✓ GPIO0 and GPIO1 have maximum 15mA sink for LED.
- ✓ GPIOx have Output C32KOUT of internal clock for external devices.

●Interrupt Controller (INTC)

- Package QFN0707-48 (0.5mm pitch)
- Process CMOS

3. Block Diagram

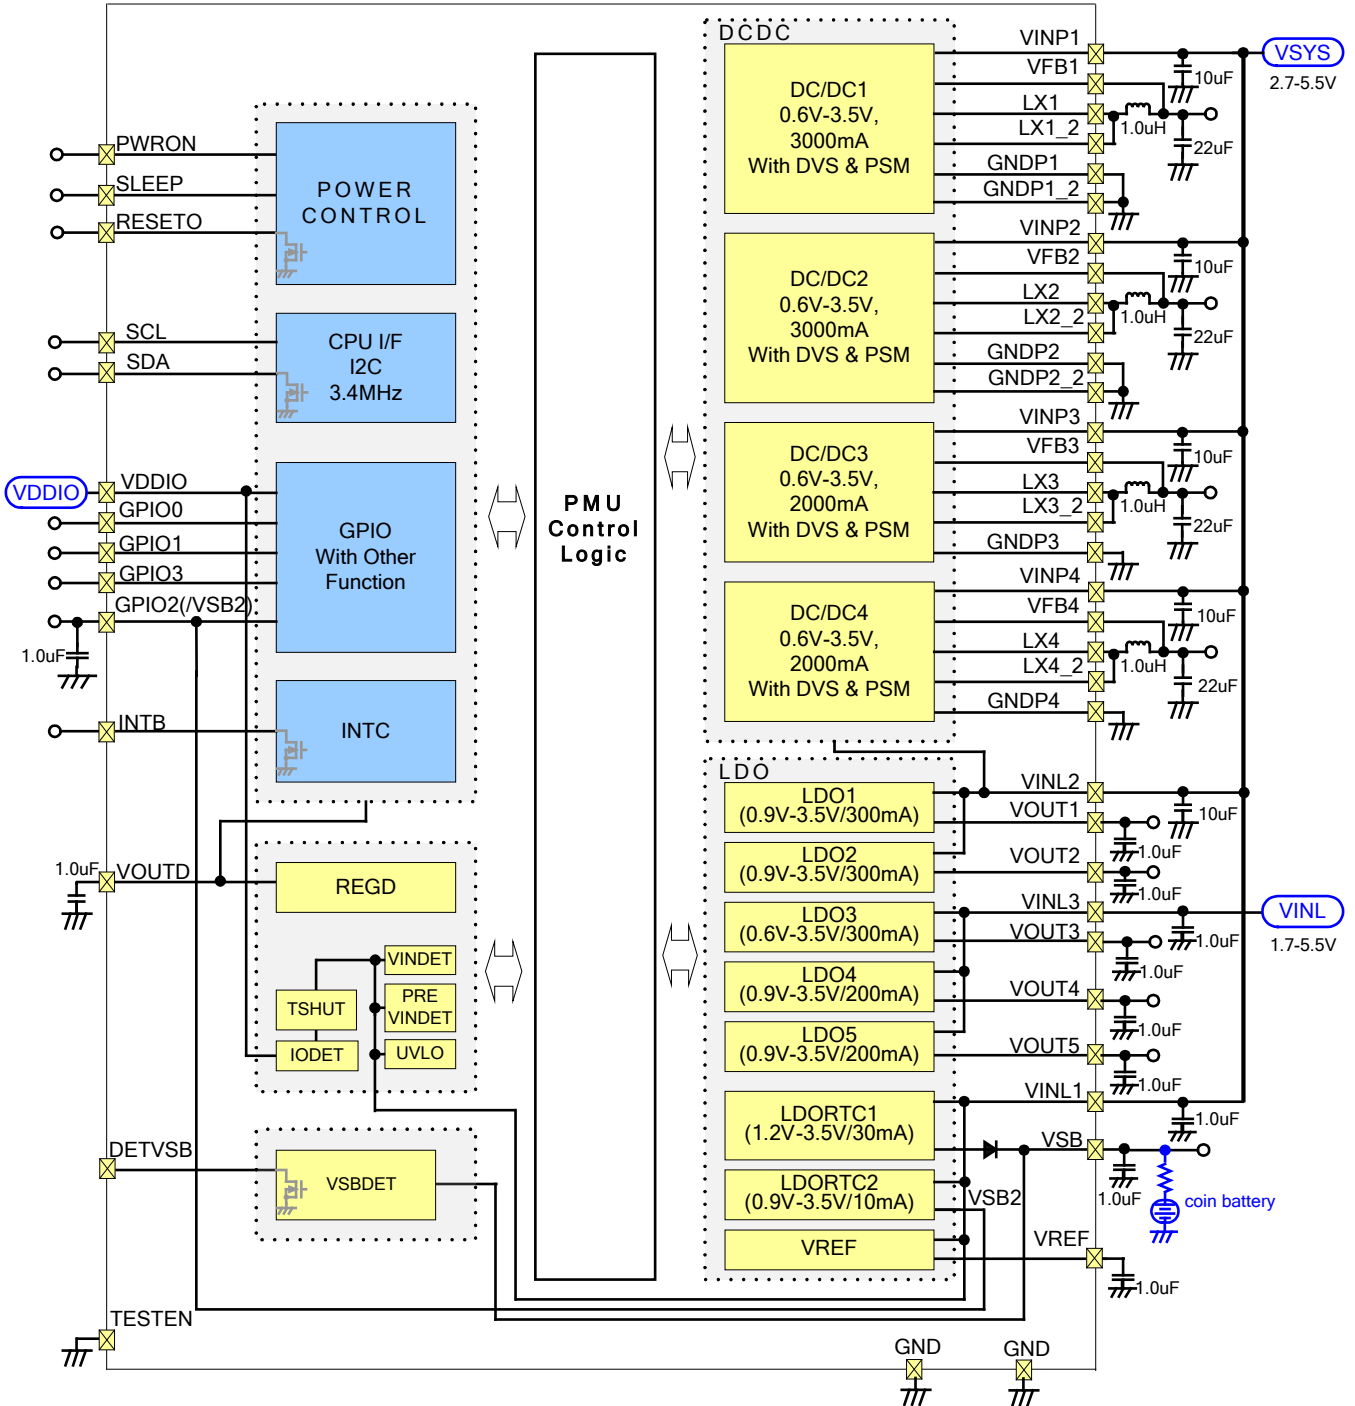

Fig. 3-1 Block Diagram

4. Electrical Characteristics

4.1 Absolute Maximum Ratings

Exposure to the condition exceeded absolute maximum ratings may cause the permanent damages and affect the reliability and safety of both device and systems using the device. The functional operations cannot be guaranteed beyond specified values in the recommended conditions.

Symbol	Parameter	Condition	Min.	Max.	Unit
V _{PS1}	Power Supply Voltage 1	VINP1-4 and VINL1-3 pins	-0.3	6.0	V
V _{PS2}	Power Supply Voltage 2	VDDIO pin	-0.3	4.5	V
V _{INPUT}	Input Voltage Range	PWRON and SLEEP pins	-0.3	VINL1 + 0.3	V
		SDA and SCL pins	-0.3	4.5	V
		GPIO0-1 pins	-0.3	VINL1 + 0.3 / VDDIO + 0.3	V
		GPIO2-3 pins	-0.3	VINL1 + 0.3	V
V _{OUTPUT}	Output Voltage Range	RESETO, INTB and GPIO2-3 pins	-0.3	VINL1 + 0.3	V
		GPIO0-1 pins	-0.3	VINL1 + 0.3 / VDDIO + 0.3	V
		DETVSB pin	-0.3	VSB ⁽¹⁾ + 0.3	V
T _{stg}	Storage Temperature	—	-55	125	°C
P _D	Package Dissipation	Refer to Appendix "Power Dissipation"			

Table 4-1 Absolute Maximum Ratings

4.2 Recommendation of Operating Conditions

Symbol	Parameter	Condition	Min	Typ	Max	Unit
V _{SYS}	Power Supply Voltage	VINP1-4 and VINL1-2 pin ⁽²⁾	2.7	3.6	5.5	V
V _{INL}	Power Supply Voltage	VINL3 pin ⁽³⁾	1.7	3.6	5.5	V
V _{DDIO}	Power Supply Voltage	VDDIO pin (V _{SYS} > V _{DDIO})	1.7	1.8	3.4	V
V _{SB}	Power Supply Voltage	VSB pin	1.45	3.1	3.4	V
GND	Ground	GND		0		V
T _a	Temperature of Operation	-	-40		85	°C

Table 4-2 Recommendation of Operating Conditions

⁽¹⁾ VSB: LDORTC1_Output or Coin Battery

⁽²⁾ VINP1-4 and VINL2 must be equal to VINL1. However, if POWROFF state, VINP1-4 and VINL2 is possible to power-off (Only Parts Mode and then Input pin level must be GND).

⁽³⁾ VINL3 must be less than or equal to VINL1.

4.3 I/O Electrical Characteristics

Symbol	Parameter	Condition	Min	Typ	Max	Unit
<i>VINL1 NMOS Input Pin: PWRON, SLEEP, GPIO0, GPIO1, GPIO2, GPIO3</i>						
VIL	Low level input voltage				0.4	V
VIH	High level input voltage		1.4		VINL1	V
<i>VINL1 Nch Open Drain Output Pin: RESET0</i>						
VOL	Low level output voltage	$I_{OUT} = 2mA$			0.4	V
Vto	Tolerant				VINL1	V
<i>VINL1 CMOS Input / Output Pin: GPIO0, GPIO1, GPIO2, GPIO3</i>						
VIL	Low level input voltage				VINL1*0.2	V
VIH	High level input voltage		VINL1*0.8		VINL1	V
VOL	Low level output voltage	$I_{OUT} = 4mA$			0.4	V
VOH	High level output voltage	$I_{OUT} = -4mA$	VINL1-0.4			V
<i>VINL1 Nch Open Drain Output Pin: INTB, GPIO0, GPIO1, GPIO2, GPIO3</i>						
VOL	Low level output voltage	$I_{OUT} = 4mA$			0.4	V
Vto	Tolerant				VINL1	V
<i>VINL1 Nch Open Drain Output Pin: GPIO0, GPIO1 (for LED)</i>						
VOL	Low level output voltage	$I_{OUT} = 15mA$			0.4	V
Vto	Tolerant				VINL1	V
<i>VSB Nch Open Drain Output Pin: DETVSB</i>						
VOL	Low level output voltage	$I_{OUT} = 1mA$			0.2	V
Vto	Tolerant				VSB	V
<i>Voutd⁽¹⁾ Cmos Input Pin (Schmitt Input): SCL</i>						
VIL	Low level input voltage				VOUTD *0.3	V
VIH	High level input voltage		VOUTD *0.7		3.4	V
ΔVI	Hysteresis		VOUTD *0.1			V
<i>VOUTD⁽¹⁾ CMOS Input / Output Pin (Schmitt Input / Nch Open Drain Output): SDA</i>						
VIL	Low level input voltage				VOUTD *0.3	V
VIH	High level input voltage		VOUTD *0.7		3.4	V
ΔVI	Hysteresis		VOUTD *0.1			V
VOL	Low level output voltage	$I_{OUT} = 3mA$			0.4	V
<i>VDDIO CMOS Input / Output Pin: GPIO0, GPIO1</i>						
VIL	Low level input voltage				VDDIO*0.2	V
VIH	High level input voltage		VDDIO*0.8		VDDIO	V
VOL	Low level output voltage	$I_{OUT} = 4mA$			0.4	V
VOH	High level output voltage	$I_{OUT} = -4mA$	VDDIO-0.4			V

41	VOUTD	Capacitor connection for built-in regulator	O	A			
42	GND	GND for logic circuit / analog circuit / IO, etc	—	G			
43	GPIO0	General purpose I/O	I/O	D	(4)	(4)	(4)
44	GPIO1						
45	VDDIO	Power supply for CPU interface	—	P			
46	SDA	I ² C-but data input / output	I/O	D	I	—	Schmitt, NOD
47	SCL	I ² C-but data clock input	I	D	I	—	CMOS
48	TESTEN	For TEST (Connected to GND)	I	D	I	PD	CMOS Schmitt

Table 5-1 Pin Description

(1) I: Input, O: Output

(2) A: Analog, D: Digital, P: Power, G: Ground

(3) Reset State: RESETO = Low

(4) GP00-GP03: "Input" or "Output" is selectable by OTP. Input / Output type (CMOS or NMOS or Analog or Nch Open Drain Output) is selectable by OTP. Refer to the chapter of GPIO for details.

6. Power Control

This PMU has the power-on/off sequence that can be flexibly set by OTP. The default on/off, timing, and voltage of DCDCx and LDOx are programmable. In addition, GPIO0-GPIO3 pins output the power-on/off signal to external LDO/DCDC by the setting of OTP.

6.1 State Machine Diagram

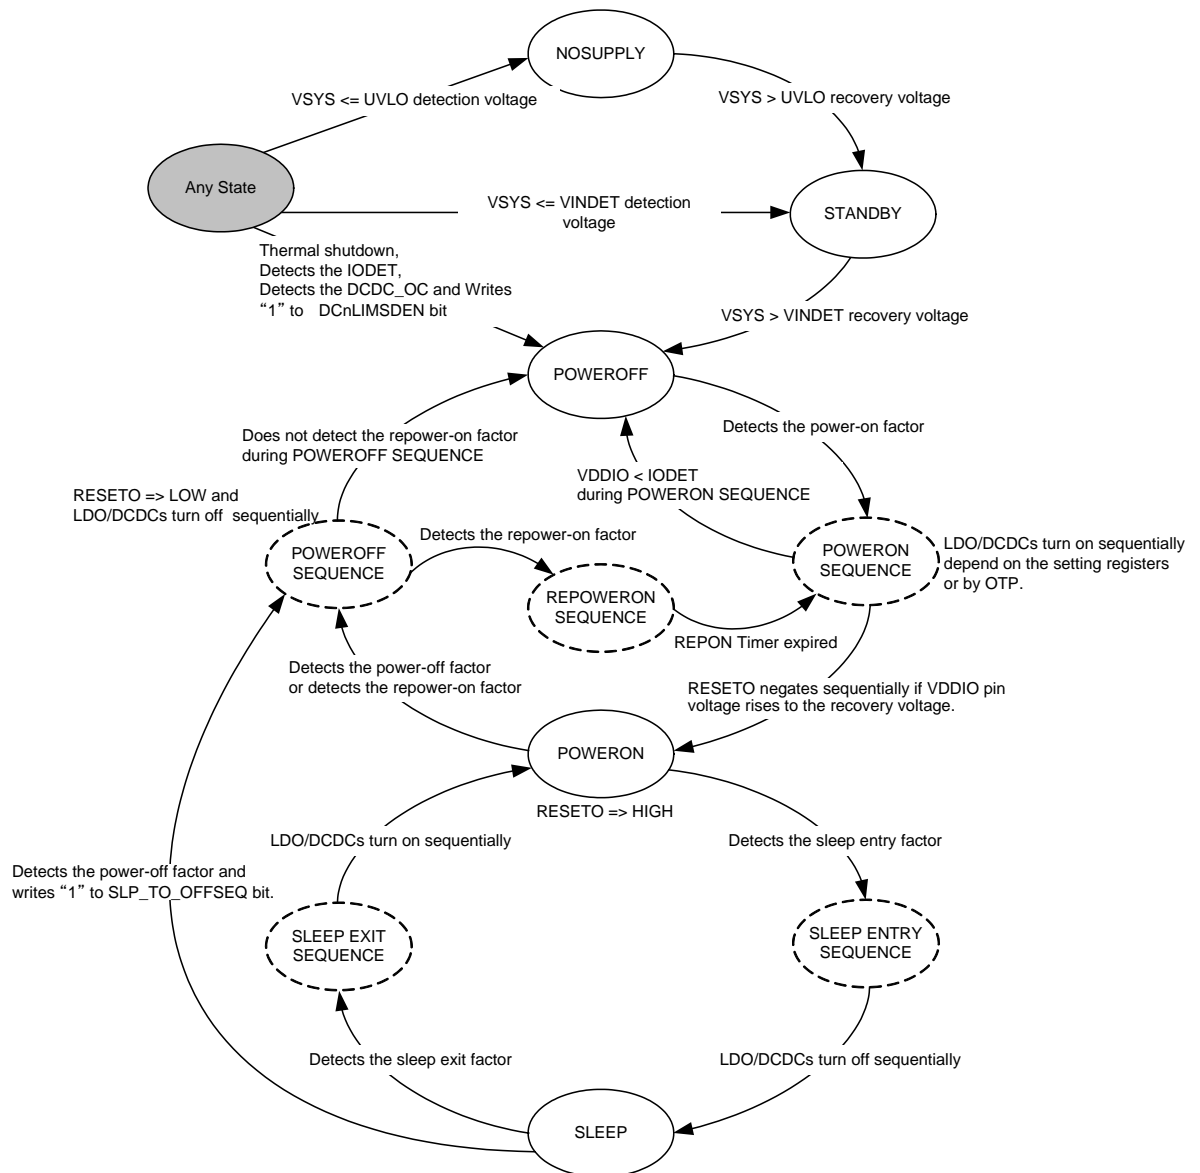

Fig. 6-1 Power Control State Machine Diagram

6.2 State Machine Description

The state machine will step through the following statuses:

NOSUPPLY

The power supply to VSYS falls below the UVLO detection voltage.

STANDBY

The power supply to VSYS rises above the UVLO recovery voltage, followed by LDORTC1 turns on.

POWEROFF

The power supply to VSYS rises above the VINDET recovery voltage. This PMU is always monitoring the power-on factor, and if the factor is detected, it will start the power-on sequence.

POWERON SEQUENCE

LDO/DCDCs turn on sequentially according to a pre-programmed order by OTP. And RESETO will be pulled up high sequentially if VDDIO pin voltage rises to the recovery voltage. Even if VDDIO pin voltage falls below the IODET detection voltage during POWERON SEQUENCE state, it will change to POWEROFF state.

POWERON

RESETO is pulled up high. CPU can control this PMU through some control pins or I2C Interface. In this state, this PMU is always monitoring the power-off or the repower-on factors.

POWEROFF SEQUENCE

This PMU will change to this state by detecting the power-off factor in POWERON state. In this state, RESETO pin is output low level and all LDO/DCDCs turn off sequentially in reverse order of power-on sequence.

REPOWERON SEQUENCE

This PMU will change to this state by detecting the repower-on factor. RESETO pin is output low level, and all LDO/DCDCs turn off sequentially in reverse order of power-on sequence. After turn-off is completed, repower-on timer starts, and it will change to POWERON SEQUENCE state when repower-on timer expired.

SLEEP ENTRY / EXIT SEQUENCE

This PMU will change to this state by detecting the deep sleep entry/exit factor. LDO/DCDCs turn off/on sequentially and enter or exit SLEEP. Refer to SLEEP ENTRY / EXIT SEQUENCE section.

SLEEP

This PMU will change to this state through SLEEP ENTRY SEQUENCE. In this state, it operates the low power consumption.

Shutdown

If this PMU detects conditions shown below, this PMU will change to NOSUPPLY state or STANDBY state or POWEROFF state regardless of the current state

- Low input voltage under the UVLO detection voltage
- Low input voltage under the VINDET detection voltage
- Low input voltage under the IODET detection voltage

(Shutdown operation is disabled during POWERON/OFF and REPOWERON SEQUENCE.)

- Abnormal temperature

- Over current of DCDCx

(Shutdown operation is disabled during POWERON/OFF SEQUENCE.)

6.3 Power-on Sequence

This PMU's power is turned on by detecting the power-on factor at the POWEROFF state. The default settings of the resources as shown below are programmable. The slot duration can be selected in 0.5ms and 2ms by OTP.

[Controllable Resources]

DCDC1-4, LDO1-5, RESETO, PSO0-3(GPIO0-3)

[Power-on Factor]

PWRON ⁽¹⁾: High level input more than certain time to PWRON pin.

ON_EXTIN(GPIO*): High input to ON_EXTIN pin.

Note: This PMU powers on/off according to the on/off sequence. The interrupt is output when these pins are asserted. The power-on/off history is stored by the history register.

Fig. 6-2 Power-on Sequence

Note*1: Always On is VREF/REGD. Only LDORTC2 default on/off is programmable by OTP.

LDORTC1 power-on timing is programmable either always-on or power-on sequence on by OTP.

Note*2: Initial values of register can be configured by OTP. (0sec/100us/20ms/128ms/1sec/2sec/3sec)

Note*3: DCDCx/LDOx/GPIOx power-on timing is programmable by OTP. (S0 to S14)

RESETO release timing is programmable by OTP. (S0 to S15)

Selected slot of DCDCx/LDOx/GPIOx must be set before RESETO release slot.

Note*4: RESETO has extra time (0sec/32ms/64ms/128ms) by OTP when it is programmed S15.

(1) PWRON polarity is programmable by OTP.

6.4 Power-Off Sequence

This PMU's power is turn off by detecting the power-off factor at the POWERON or SLEEP state.

[Power-off Factor]

- Long power on key press: High level input more than certain time to PWRON pin.
- Watchdog timer: The internal watchdog timer expires.
- <SWPWROFF> register: The CPU writes a dedicated register.
- N_OE(GPIO*): High level input more than certain time to N_OE pin.
- PSHOLD(GPIO*): Low input to PSHOLD pin.

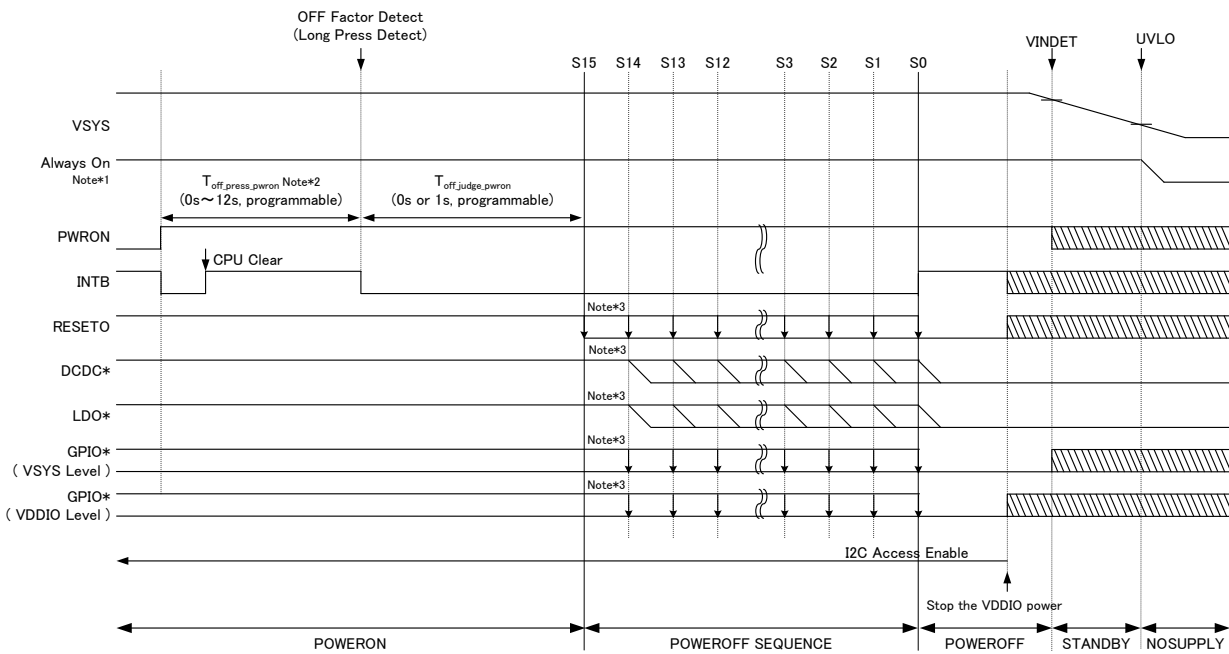

Fig. 6-3 Power-off Sequence

Note*1: Always On is VREF/REGD. Only LDORTC2 default on/off is programmable by OTP.

LDORTC1 power-on timing is programmable either always-on or power-on sequence on by OTP.

Note*2: This value can be selected by register. (0sec/1sec/2sec/4sec/6sec/8sec/10sec/12sec)

Note*3: The power-off timing reverse order of the power-on sequence.

Selected slot of DCDCx / LDOx / GPIOx must set after RESETO assert slot.

6.5 Sleep Entry / Exit Sequence

This PMU is changed to the SLEEP state by detecting the sleep-entry factor at the PWRON and PWRON SEQUENCE state.

The state change timing of some resources as shown below is programmable.

[Controllable resources]

- Active/Sleep Control: DCDC1-4, LDO1-5, PSO0-3(GPIO0-3)
- Output Voltage Control: DCDC1-4, LDO1-5

And, this PMU is changed to the PWRON state by detecting the Sleep-exit factor at the SLEEP state.

The state change timing of some resources is performed in reverse order of the sleep-entry sequence.

[Sleep-entry factor]

- SLEEP: High input to SLEEP pin.
- <SLPENT> register: The CPU writes a dedicated register.

[Sleep-exit factor]

- SLEEP: Low input to SLEEP pin.
- <SLPEXIT> register: The CPU writes a dedicated register.

Sleep Sequence

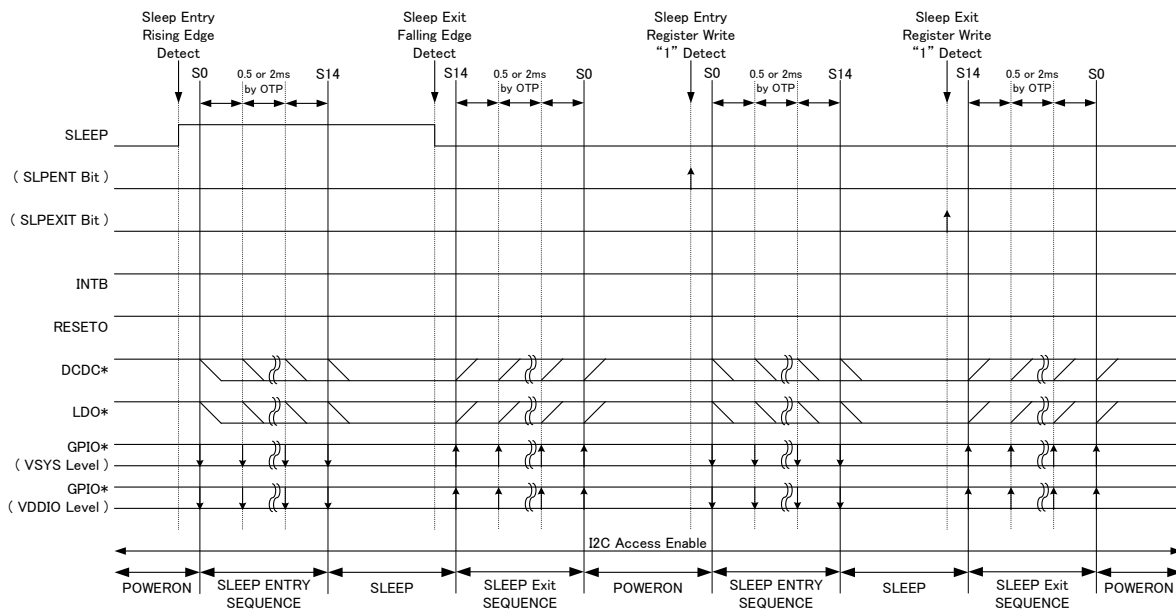

Fig. 6-4 Sleep Entry / Exit Sequence

This PMU is changed to the PWROFF SEQUENCE state by detecting PWRON long press at the SLEEP state. It is necessary to write the <SLP_TO_OFFSEQ> register in advance. The state change timing of some resources is performed in reverse order of the power-on sequence.

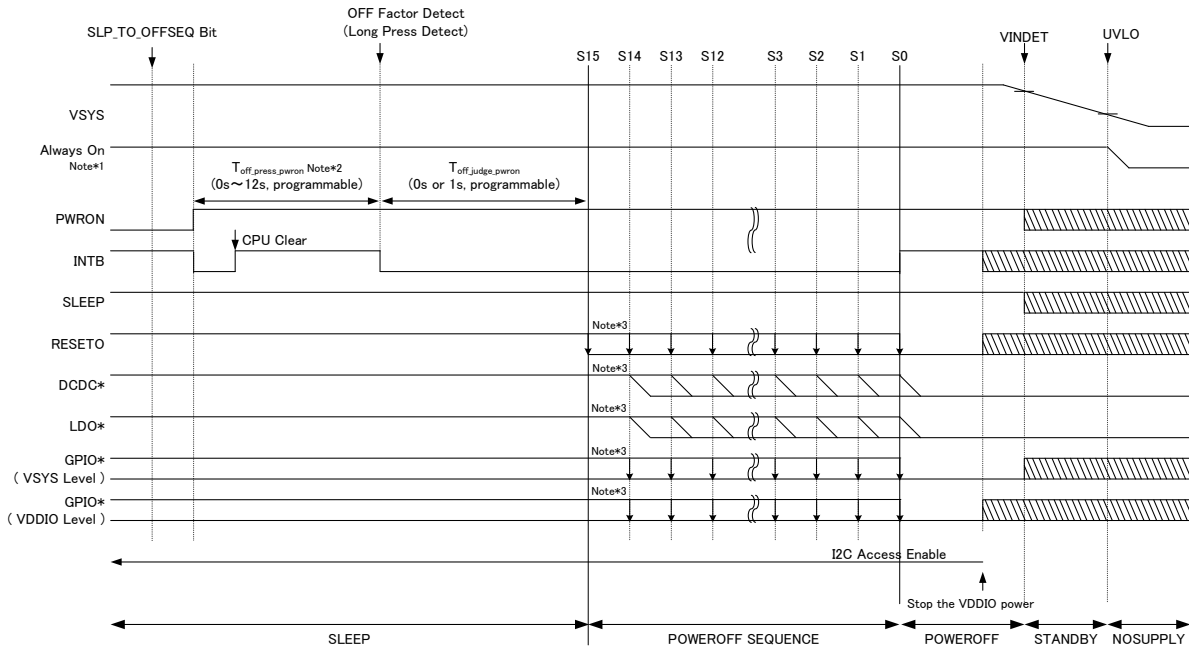

Fig. 6-5 Sleep to Power-off Sequence

Note*1: Always On is VREF/REGD. Only LDORTC2 default on/off is programmable by OTP.

LDORTC1 power-on timing is programmable either always-on or power-on sequence on by OTP.

Note*2: This value can be selected by register. (0sec/1sec/2sec/4sec/6sec/8sec/10sec/12sec)

Note*3: The power-off timing is in reverse order of the power-on sequence.

6.6 Repower-on Sequence

Once the repower-on factor is detected, this PMU executes the power-on sequence after executing the power-off sequence without the power-on factor. This PMU does not change to POWERON state, when VDDIO pin voltage falls below the IODET detection voltage or repower-on timer is not expired. repower-on timer is selectable 10ms~1s. It is the waiting time for the all regulator’s output capacitor to discharge.

[Repower-on Factor]

- Long power on key press: High level input more than certain time to PWRON pin.
- Watchdog timer: The internal watchdog timer expires.
- <SWPWROFF> register: The CPU writes a dedicated register.
- N_OE(GPIO*): High level input more than certain time to N_OE pin.
- HRESET(GPIO*): High level input to HRESET pin.
After power off by detecting HRESET, this PMU repower-on regardless of setting value of REPWRON bit.

The state transition time from finishing the repower-on sequence to POWERON SEQUENCE state can be controlled by repower-on timer.

Fig. 6-6 Repower-on Sequence

Note*1: Always On is VREF/REGD. Only LDORTC2 default on/off is programmable by OTP.

LDORTC1 power-on timing is programmable either always-on or power-on sequence on by OTP.

Note*2: The power-off timing reverse order of the power-on sequence.

Note*3: DCDCx/LDOx/GPIOx power-on timing is programmable by OTP (S0 to S14).

Note*4: RESETO has extra time (0/32/64/128ms) by OTP when it is programmed S15.

6.7 Shutdown Factor

The following factors trigger a shutdown, and each state is transited to NOSUPPLY State/STANDBY State/POWEROFF State.

The transition to POWERON State is enabled when each recovery condition for each shutdown factor is met.

	Shutdown Factor	State of Transition	Recovery Condition from Shutdown
1	UVLO detection	NOSUPPLY	UVLO release
2	VINDET detection	STANDBY	VINDET release
3	Temperature's abnormal detection	POWEROFF	Temperature's normal detection
4	DCDCx current limit detection ⁽¹⁾	POWEROFF	DCDCx current normal detection
5	IODET (VDDIO monitor) detection ⁽²⁾	POWEROFF	IODET release

Table 6-1 Shutdown Factor & Recovery Condition

6.8 Shutdown Sequence

This PMU is forcibly powered off when the shutdown factor is detected. All LDO/DCDCs are turned off at once. Until the shutdown condition is recovered, this PMU does not accept the power-on factors. For the reset condition of register, refer to the register map.

6.8.1 Shutdown Sequence (VINDET, UVLO)

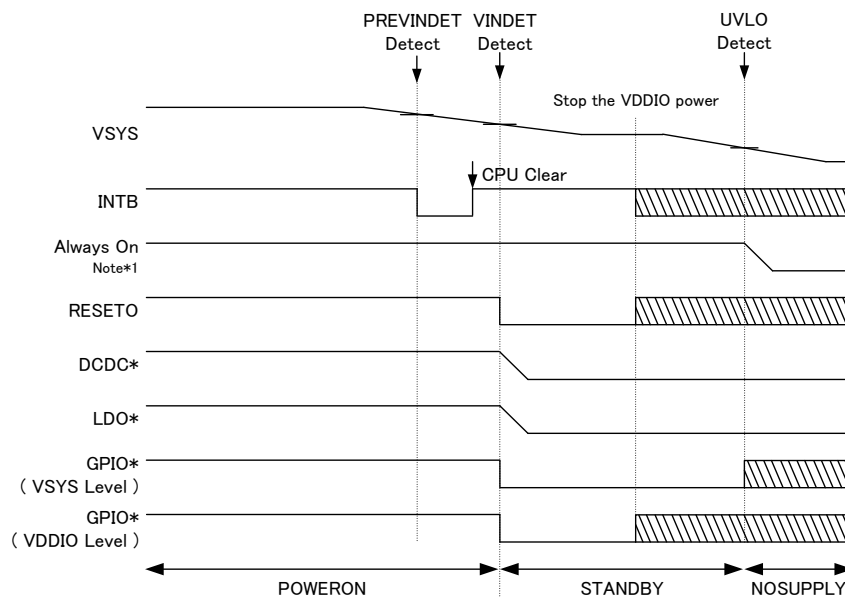

Fig. 6-7 Shutdown Sequence (VINDET, UVLO detection)

Note*1: Always On is VREF/REGD. Only LDORTC2 default on/off is programmable by OTP.

LDORTC1 power-on timing is programmable either always-on or power-on sequence on by OTP.

⁽¹⁾ This PMU shuts down if over-current continues for 2ms. Shutdown operation is disabled during POWERON/OFF SEQUENCE.

⁽²⁾ Shutdown operation is disabled during POWERON/OFF SEQUENCE, REPOWERON SEQUENCE.

6.8.2 Shutdown Sequence (Abnormal temperature)

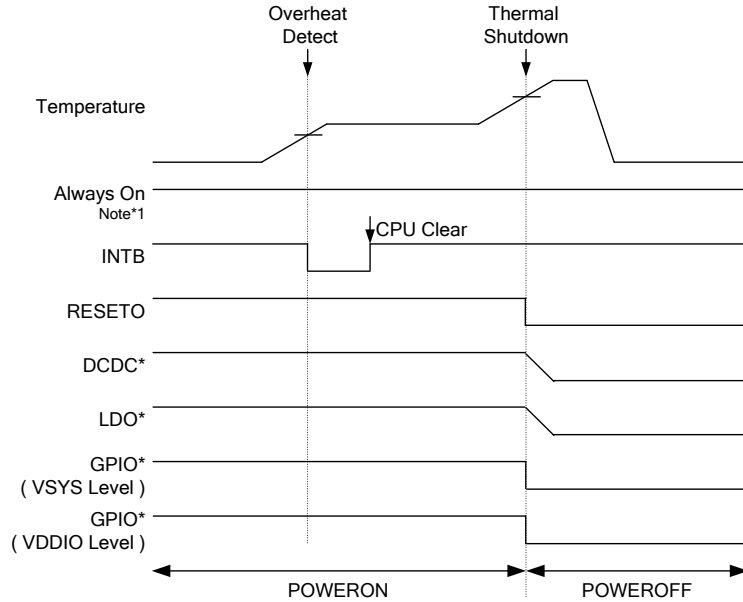

Fig. 6-8 Shutdown Sequence (Abnormal temperature)

Note*1: Always On is VREF/REGD. Only LDORTC2 default on/off is programmable by OTP.
 LDORTC1 power-on timing is programmable either always-on or power-on sequence on by OTP.

6.8.3 Shutdown Sequence (IODET)

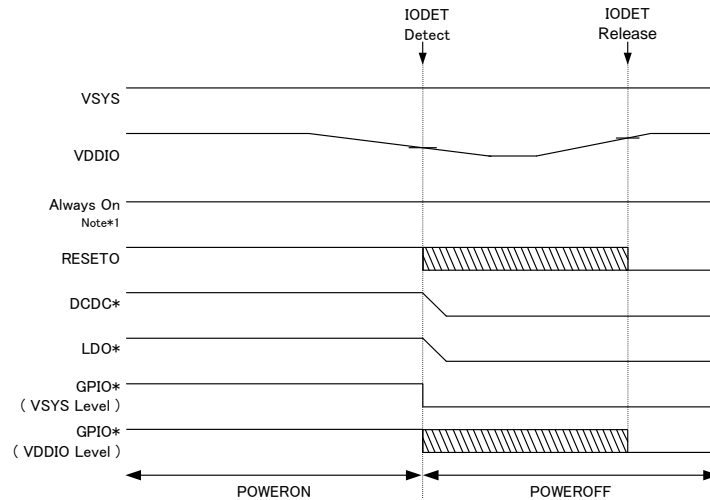

Fig. 6-9 Shutdown Sequence (IODET)

Note*1: Always On is VREF/REGD. Only LDORTC2 default on/off is programmable by OTP.
 LDORTC1 power-on timing is programmable either always-on or power-on sequence on by OTP.

Note*2: IODET is invalid when VDDIO is not selected as the power supply of both GPIO0 and GPIO1.

6.8.4 Shutdown Sequence (DCDCx Current Limit Detection)

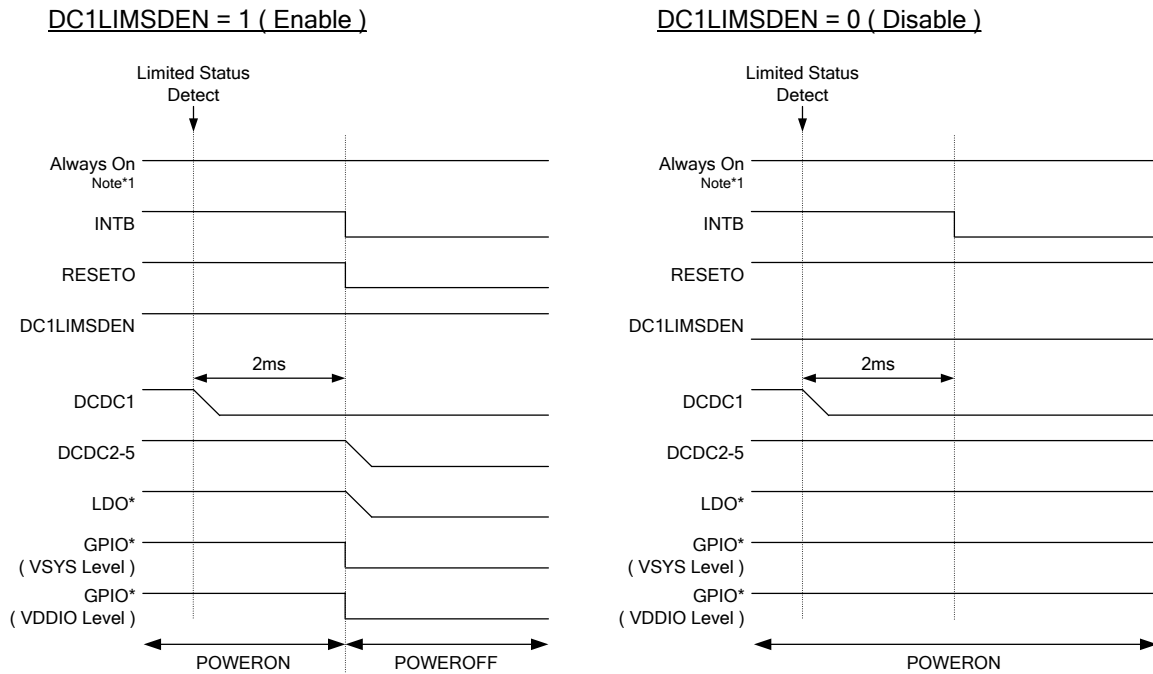

Fig. 6-10 Shutdown Sequence (DCDC1 current limit detection)

Note*1: Always On is VREF/REGD. Only LDORTC2 default on/off is programmable by OTP.
 LDORTC1 power-on timing is programmable either always-on or power-on sequence on by OTP.

6.9 Power-on/off History

This PMU has the register which monitors the power-on/off factor. After this PMU powers on, CPU can recognize the power-on factor and power-off factor by reading PONHIS register and POFFHIS register.

The power-on factors as below are stored when the power-on sequence starts:

PWRON / ON_EXTIN(GPIO*) / HRESET(GPIO*)

The power-off /repower-on factors stored when the power-off sequence starts:

Long power on key press / Watchdog / SWPWROFF / N_OE(GPIO*) / PSHOLD(GPIO*) / HRESET(GPIO*)

The shutdown factors as below are stored immediately before the power-off:

TSHUT / VINDET / IODET / DCDC current limit

The repower-on factors as below are stored when the power-off sequence is finished:

Repower-on

6.10 Watchdog Timer Function

This PMU integrates a watchdog timer in order to power off the system when the CPU becomes hung-up. If the CPU does not access the WATCHDOG register until the watchdog timer expired, this PMU output interrupt. And then if the CPU does not clear the interrupt within 1sec, this PMU is transition to POWEROFF SEQUENCE.

A watchdog timer expiring time is programmable from 1 to 128 seconds with a default value of 128 seconds by dedicated register. Software cannot disable a watchdog function except special sample for R&D.

6.11 Power Control Block Interrupt Request

Power control block provides the interrupt requests to INTC block by the following pin input change or the transition state detection:

- PWRON pin input
 - Outputs the interrupt when PWRON pin input signal changes (See next section).
Selectable both-edge/level interrupt type (Default level).
 - Outputs 2nd interrupt after PWRON pin input signal changes (See next section).
The interrupt is falling-edge type. If it is not cleared, this PMU powers off.
- Abnormal temperature detection
 - Outputs the interrupt when overheat detection circuit detects the abnormal temperature.
Selectable both-edge/level interrupt type (Default level).
- Watchdog timer overflow
 - Outputs the interrupt when the watchdog timer expires.
- PREVINDET (Pre detection)
 - Outputs the interrupt when PREVINDET detects the pre detection voltage.
Selectable both-edge/level interrupt type (Default level).

The initial state of all the interrupt request signals from power control block is disabled. It is necessary to set the interrupt enable bit of each interrupt factor if the interrupt request output to INTC block is permitted. Even if the interrupt output is disabled, CPU can read each interrupt factor by PWRIRQ register.

For the details of interrupt, refer to the interrupt controller (INTC).

6.12 PWRON Long Press Operation

This PMU can output two interrupts by changing the PWRON pin input signal during POWERON state. If CPU does not clear the 2nd interrupt, this PMU changes to the POWEROFF state.

For other detailed operations, refer to the appendix.

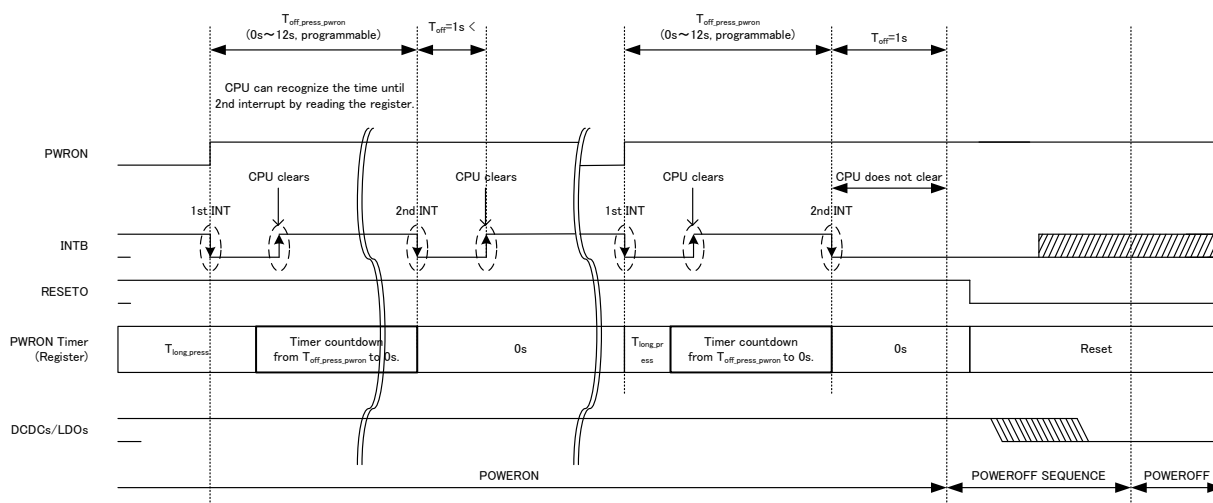

Fig. 6-11 PWRON Long Press Operation

6.13 Power-on Signal Output by GPIO0-3

This PMU can output the power-on signal from GPIO0-3 pin. This function is selected by OTP. The signals output by GPIO0-3 are asserted sequentially according to a pre-programmed order by OTP. For example, these signals are used for operating external regulators. On SLEEP Entry / Exit sequence, these signals are programmable by the register.

6.14 Voltage Detector

■ UVLO

Symbol	Parameter	Condition	MIN	TYP	MAX	Unit
V _{RELEASE}	UVLO Threshold Voltage	VINL1 Voltage Rising		2.30		V
V _{DETECT}	UVLO Threshold Voltage	VINL1 Voltage Falling	-10%	2.20	+10%	V
V _{HYS}	UVLO Hysteresis			100		mV

•VINL1 < V_{DETECT}: Transition to NOSUPPLY state.

■ VINDET

Symbol	Parameter	Condition	MIN	TYP	MAX	Unit
$V_{RELEASE}$	VINDET Threshold Voltage	VINL1 Voltage Rising		2.90		V
$V_{DETECT}^{(1)}$	VINDET Threshold Voltage	VINL1 Voltage Falling	-3%	2.70	+3%	V
V_{HYS}	VINDET Hysteresis			200		mV

•VINL1 < V_{DETECT} : Transition to STANDBY state or NOSUPPLY state.

■ PREVINDET

Symbol	Parameter	Condition	MIN	TYP	MAX	Unit
$V_{RELEASE}$	PREVINDET Threshold Voltage	VINL1 Voltage Rising		2.85		V
$V_{DETECT}^{(1)}$	PREVINDET Threshold Voltage	VINL1 Voltage Falling	-3%	2.80	+3%	V
V_{HYS}	PREVINDET Hysteresis			50		mV

•VINL1 < V_{DETECT} : Generate interrupt to INTB.

■ IODET

Symbol	Parameter	Condition	MIN	TYP	MAX	Unit
$V_{RELEASE}$	IODET Threshold Voltage	VDDIO Voltage Rising		1.65		V
$V_{DETECT}^{(1)}$	IODET Threshold Voltage	VDDIO Voltage Falling	-3%	1.60	+3%	V
V_{HYS}	IODET Hysteresis			50		mV

■ VSBDET

Symbol	Parameter	Condition	MIN	TYP	MAX	Unit
$V_{RELEASE}$	VSBDET Threshold Voltage	VSB Voltage Rising		2.8		V
V_{DETECT}	VSBDET Threshold Voltage	VSB Voltage Falling	2.13	2.3	2.47	V
V_{HYS}	VSBDET Hysteresis			500		mV

After VSB output (LDORTC1) rises, DETVSB signal turns to "H" after 400ms from the detection voltage is detected. DETVSB is Nch Open-drain output pin.

Fig. 6-12 Voltage Detection timing

⁽¹⁾ V_{DETECT} is selected by OTP and register.

6.15 Overheat Detection Block

■ Overheat Detection

Symbol	Parameter	Condition	MIN	TYP	MAX	Unit
T _{DETECT}	Detection Temperature	-	-	135 125 115 105	-	°C
T _{RECOVER}	Recover Temperature	-	T _{DETECT} -20			°C

•Chip Temperature > T_{DETECT}: Generate interrupt to INTB.

•T_{DETECT} is selected by OTP and register.

■ Thermal Shutdown

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
T _{DETECT}	Detection Temperature	-	-	140	-	°C
T _{RECOVER}	Recover Temperature	-	110			°C

•Chip Temperature > T_{DETECT}: Transition to POWEROFF state.

8. MODE

This PMU has two Modes selected by OTP.

MODE	Pin					
	GPIO0	GPIO1	GPIO2	GPIO3	SLEEP	PWRON
Normal	selectable				SLEEP	PWRON
Parts	DCDC1 EXON	DCDC2 EXON	DCDC3 EXON	DCDC4EXON and LDO3EXON	LDO1EXON and LDO4EXON	LDO2EXON and LDO5EXON

Table 8-1 Modes and function of pins

8.1 Normal MODE

The function of GPIO[3:0] pins ⁽¹⁾ can be respectively selected by OTP.

The function of SLEEP and PWRON pins are respectively decided SLEEP and PWRON.

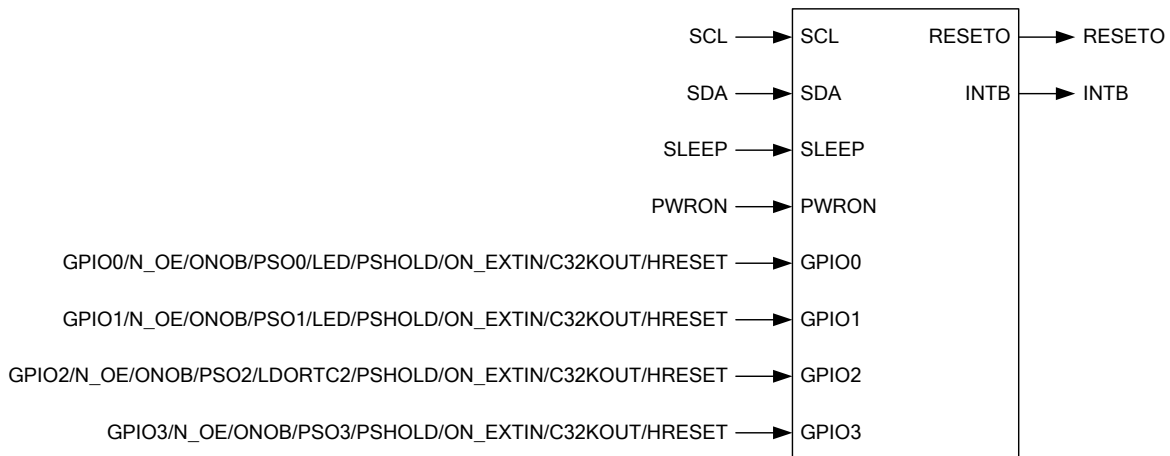

Fig. 8-1 The function of pins in Normal mode

⁽¹⁾ For details of the function of GPIO* pins, refer to GPIO.

8.2 Parts MODE

ON/OFF of DCDC1-4 and LDO1-5 can be controlled by pin.
 GPIO0 pin can control ON/OFF of DCDC1.
 GPIO1 pin can control ON/OFF of DCDC2.
 GPIO2 pin can control ON/OFF of DCDC3.
 GPIO3 pin can control ON/OFF of DCDC4 and LDO3.
 SLEEP pin can control ON/OFF of LDO1 and LDO4.
 PWRON pin can control ON/OFF of LDO2 and LDO5.

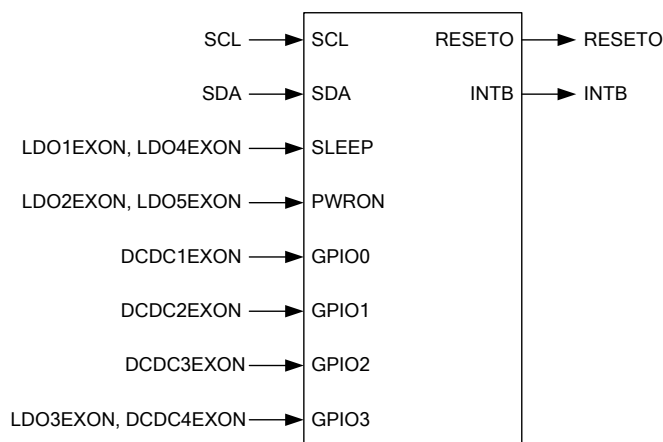

Fig. 8-2 The function of pins in Parts mode

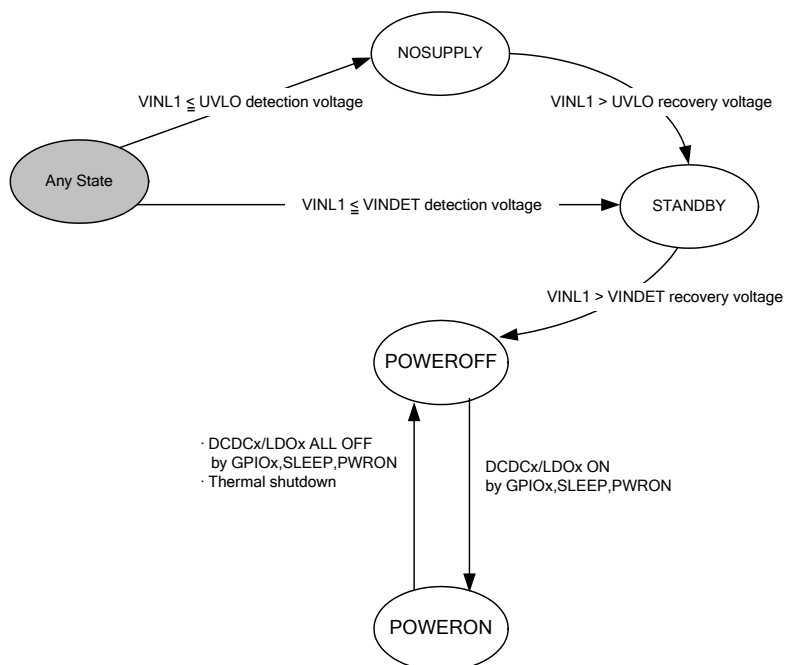

Fig. 8-3 State Machine Diagram in Parts mode

Fig. 8-1 Power On/Off function in Parts mode

Note*: Each resource turns off by writing the enable bit (LDO*EN/DC*EN bit) to "0".

LDO1-5EN bits: bit [4:0] in address 44h

DC1-4EN bits: bit [0] in address 2Ch / 2Eh / 30h / 32h

9. GPIO

This PMU supports four channels of general-purpose input/output. GPIO0-3 pins have the function selected by OTP as shown below.

Name	Function	Input ⁽¹⁾⁽²⁾	Output ⁽¹⁾⁽²⁾	Power ⁽³⁾	GPIO			
					0	1	2	3
N_OE	External power off	N	-	VSYS	√	√	√	√
GPIO0	General purpose I/O	C or N	C or N	VSYS or VDDIO	√	-	-	-
GPIO1	General purpose I/O	C or N	C or N	VSYS or VDDIO	-	√	-	-
GPIO2	General purpose I/O	C or N	C or N	VSYS	-	-	√	-
GPIO3	General purpose I/O	C or N	C or N	VSYS	-	-	-	√
ONOB	PWRON pin monitor	-	N	VSYS	√	√	√	√
PSO0	Power-on signal output function	-	C or N	VSYS or VDDIO	√	-	-	-
PSO1	Power-on signal output function	-	C or N	VSYS or VDDIO	-	√	-	-
PSO2	Power-on signal output function	-	C or N	VSYS	-	-	√	-
PSO3	Power-on signal output function	-	C or N	VSYS	-	-	-	√
LDORTC2	LDORTC2 output	-	A	-	-	-	√	-
LED	LED function	-	N	VSYS	√	√	-	-
PSHOLD	PSHOLD (power-on hold) function	N	-	VSYS	√	√	√	√
ON_EXTIN	External input for on factor	N	-	VSYS	√	√	√	√
**EXON	External LDO*/DCDC* on/off input	N	-	VSYS	⁽⁴⁾	⁽⁴⁾	⁽⁴⁾	⁽⁴⁾
C32KOUT	32 kHz clock output function	-	C or N	VSYS or VDDIO	√	√	√	√
HRESET	Hard RESET input	N	-	VSYS	√	√	√	√

Table 9-1 The function of GPIO0-3 pins

N OE function (GPIO0-3 pins)

Power-off factor.

Programmable polarity of input signal by OTP.

⁽¹⁾ Explanation of column of "Input" and "Output":

A: Analog Output, C: CMOS Input/Output, N: NMOS Input (VSYS only)/ Nch Open Drain Output

⁽²⁾ CMOS or Nch is selectable by OTP.

⁽³⁾ VSYS or VDDIO is selectable by OTP.

⁽⁴⁾ Refer to the chapter of Mode.

GPIO function (GPIO0-3 pins)

Can be controlled the direction by IOSEL register (output or input).

Output mode: Each output circuit is programmed CMOS or Nch open drain by OTP.

Input mode: Programmable polarity of input signal by OTP.

Programmable interrupt detection, edge or level by GPEDGE1,2 register.

(For the details of interrupt, refer to the interrupt controller and GPIO).

ONOB function (GPIO0-3 pins)

Output Low when PWRON pin is pressed.

PSO function (GPIO0-3 pins)

Power-on signal output function.

Programmable output timing in the POWERON/POWEROFF sequence by OTP.

Programmable output timing in SLEEP_ENTRY/EXIT sequence by the register.

LDORTC2 output function (GPIO2 pins)

Output LDORTC2.

LED function (GPIO0-1 pins)

Programmable Power On/Off mode or Register mode by register.

Programmable type of flicker ⁽¹⁾ by register in Register mode.

Mode	Power State	Type of Flicker
Power On/Off Mode	Power On	Always Turn-on
	Power Off	Always Turn-off
Register Mode	Power On	Depend on GP*_LEDFUNC register

Table 9-2 Type of flicker

PSHOLD input function (GPIO0-3 pins)

Power-on hold and power-off factor.

Hold power-on even if power-on factor de-asserts, when PSHOLD asserts less than 500ms since RESET0 is released ⁽²⁾.

Power-off when PSHOLD de-asserts in power-on ⁽²⁾.

Programmable polarity of input signal by OTP.

⁽¹⁾ For details of type of flicker by register, refer to GP*_LEDMODE register.

⁽²⁾ For details of power-on/power-off by PSHOLD, refer to Appendix.

ON_EXTIN input function (GPIO0-3 pins)

Power-on factor.

Programmable polarity of input signal by OTP.

**EXON input function (GPIO0-3 pins)

DCDC1-4, LDO1-5 on/off control signals.

Refer to the chapter of Mode.

32 kHz clock output function (GPIO0-3 pins)

Output 32 kHz clock.

HRESET function (GPIO0-3 pins)

Reset (Power Off - Repower ON) factor.

Programmable polarity of input signal by OTP.

10. I²C-Bus Interface

This PMU uses I²C-Bus system for CPU connection through two wires. Connection and transfer system of I²C-Bus are described in the following sections.

10.1 I²C-Bus Operation

Within the procedure of I²C-Bus, unique situations arise which are defined as start and stop conditions.

Fig. 10-1 I²C-Bus Data Transmission

An "H" to "L" transition on SDA line while SCL is "H" indicates a start condition. An "L" to "H" transition on SDA line while SCL is "H" defines a stop condition. Start and stop conditions are always generated by master. (Refer to the figure below). The bus is busy after start condition. The bus is free again a certain time after the stop condition.

Fig. 10-2 I²C-Bus Start and Stop Condition

10.2 AC Characteristics of I²C-Bus

Fast-mode Operating Conditions (unless otherwise specified): V_{OUTD} = 1.8V, Ta = 25 °C, C_B⁽¹⁾ = 400pF max

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
f _{SCL}	SCL Clock Frequency	—			400	kHz
t _{BUF}	Bus Free Time Between a Precedent and Start		1.3		-	μs
t _{LOW}	SCL Clock "L" Time		1.3		-	μs
t _{HIGH}	SCL Clock "H" Time		0.6		-	μs
t _{SU,STA}	Start Condition Setup Time		0.6		-	μs
t _{HD,STA}	Start Condition Hold Time		0.6		-	μs
t _{SU,STO}	Stop Condition Setup Time		0.6		-	μs
t _{HD,DAT}	Data Hold Time		0			μs
t _{SU,DAT}	Data Setup Time		100		-	ns
t _R	Rising Time of SCL and SDA (Input)				300	ns
t _F	Falling Time of SCL and SDA (Input)				300	ns
t _{SP}	Suppressing Pulse Width		0		50	ns

Hs-mode Operating Conditions (unless otherwise specified): V_{OUTD} = 1.8V, Ta = 25°C, C_B⁽¹⁾ = 100pF max

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
f _{SCL}	SCL Clock Frequency	—			3.4	MHz
t _{LOW}	SCL Clock "L" Time		160		-	ns
t _{HIGH}	SCL Clock "H" Time		60		-	ns
t _{SU,STA}	Start Condition Setup Time		160		-	ns
t _{HD,STA}	Start Condition Hold Time		160		-	ns
t _{SU,STO}	Stop Condition Setup Time		160		-	ns
t _{HD,DAT}	Data Hold Time		0		70	ns
t _{SU,DAT}	Data Setup Time		10		-	ns
t _{RCL} , t _{FCL}	Rising and Falling Time of SCL		10		40	ns
t _{RDA} , t _{FDA}	Rising and Falling Time of SDA		20		80	ns
t _{SP}	Suppressing Pulse Width		0		10	ns

Table 10-1 I²C-Bus AC Characteristics

Note*: All the above-mentioned values are corresponding to V_{IH} min and V_{IL} max level.

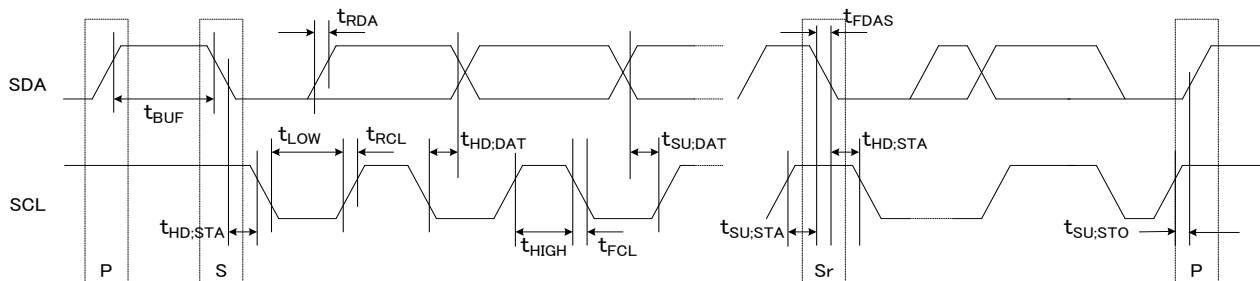

Fig. 10-3 I²C-Bus Interface Timing Chart

(1) Capacitive load for each bus line

10.3 I²C-Bus Data Transmission and Its Acknowledge

After start condition, data is transmitted by 1byte (8bits). The number of bytes that can be transmitted per transfer is unrestricted. Each byte must be followed by an acknowledge bit. Data transmission with acknowledge is obligatory. The acknowledge-related clock pulse is generated by the master. The transmitter releases SDA line during the acknowledge clock pulse.

The receiver must pull down SDA line during the acknowledge clock pulse so that SDA line remains stable “L” during the “H” period of the acknowledge clock pulse. If a master–receiver is involved in a transfer, it must signal the end of the data to the slave-transmitter by not generating acknowledge on the last byte that was clocked out of the slave. The slave-transmitter must release the data line to allow the master to generate a stop condition.

Fig. 10-4 I²C-Bus Data Transmission and Acknowledge

10.4 I²C-Bus Slave Address

After start condition, a slave address A[7:1] is sent. The address is 7-bit long followed by an 8th bit which is data direction bit (Read/Write). The slave address of This PMU is programmable by OTP.

	A7	A6	A5	A4	A3 ⁽¹⁾	A2 ⁽¹⁾	A1 ⁽¹⁾
Setting value	0	1	1	0	0	1	0

Table 10-2 Slave Address of This PMU

⁽¹⁾ A[3:1] of the slave address are programmable by OTP.

10.5 I²C-Bus Data Transmission Read Format (Fast-mode)

In order to read the internal register data:

- Specify an internal address pointer (8bit).
- Generate the repeated start condition to change the data transmission direction to read.

With a start of read mode, automatic increment in address pointers will be made. Read-mode is repeated until stop condition is initiated.

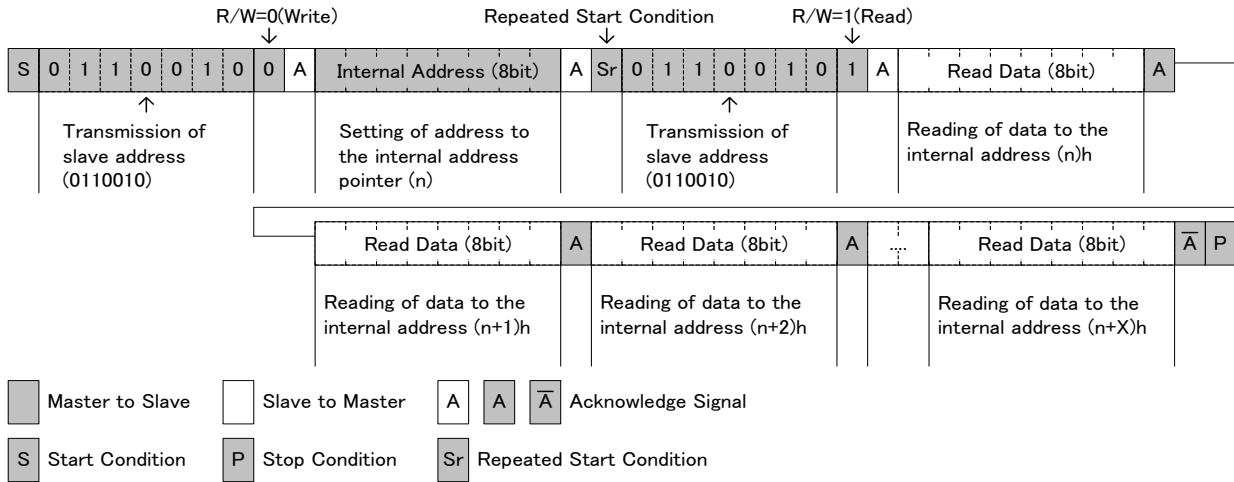

Fig. 10-5 I²C-Bus Data Transmission Read Format

10.6 I²C-Bus Data Transmission Write Format (Fast-mode)

The transmission format for the slave address allocated to each IC is defined by I²C-Bus standard. However, transmission method of address information of each IC is not defined. This PMU transmits command data. For the data transmission, please transmit MSB first from master and following data in sequence.

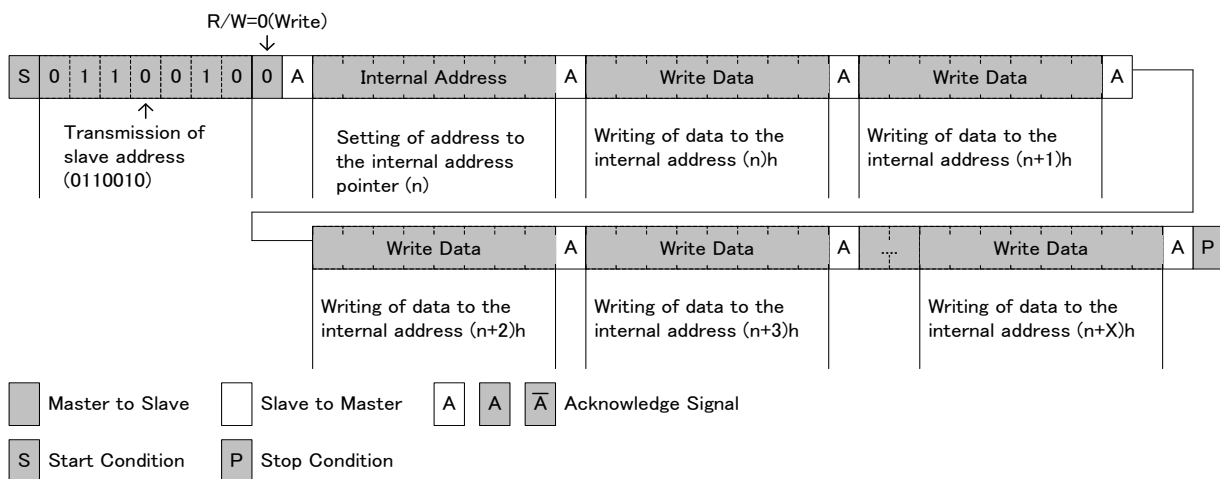

Fig. 10-1 I²C-Bus Data Transmission Write Format

The format which supports the power I²C is shown below.

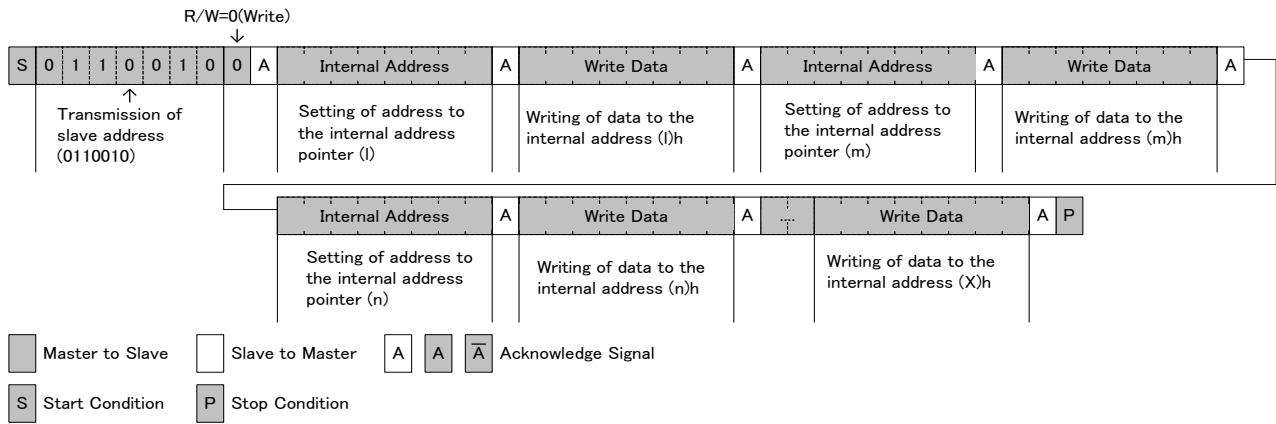

Fig. 10-2 I²C-Bus Data Transmission Write Format (Power I²C)

10.7 I²C-Bus Internal Register Write-in Timing (Fast-mode)

Fig. 10-3 I²C-Bus Internal Register Write-in Timing

10.8 I²C-Bus Data Transmission Read Format (Hs-mode)

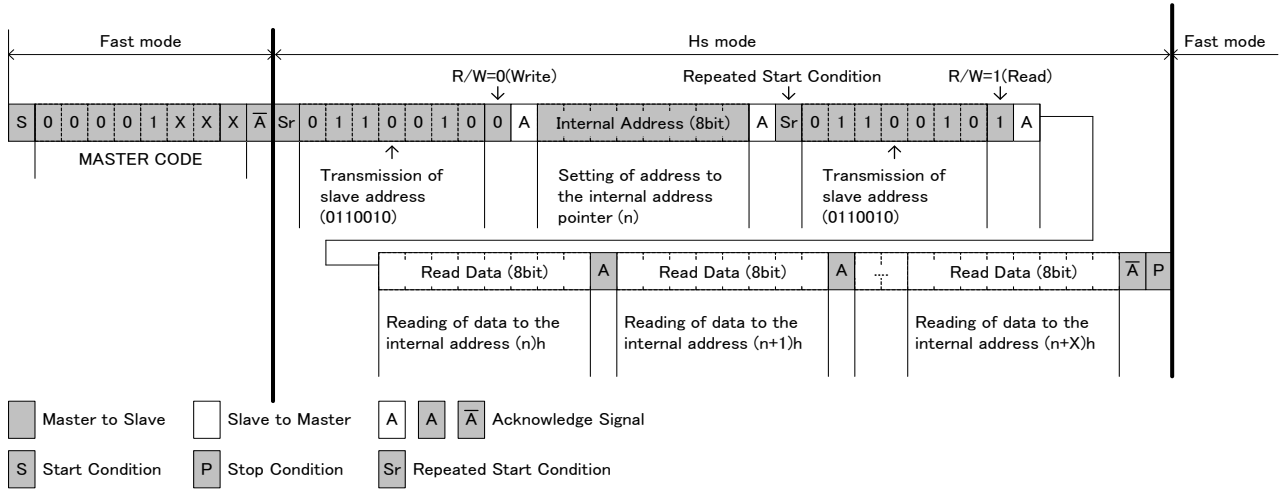

Fig. 10-4 I²C-Bus Data Transmission Read Format (Hs-mode)

10.9 I²C-Bus Data Transmission Write Format (Hs-mode)

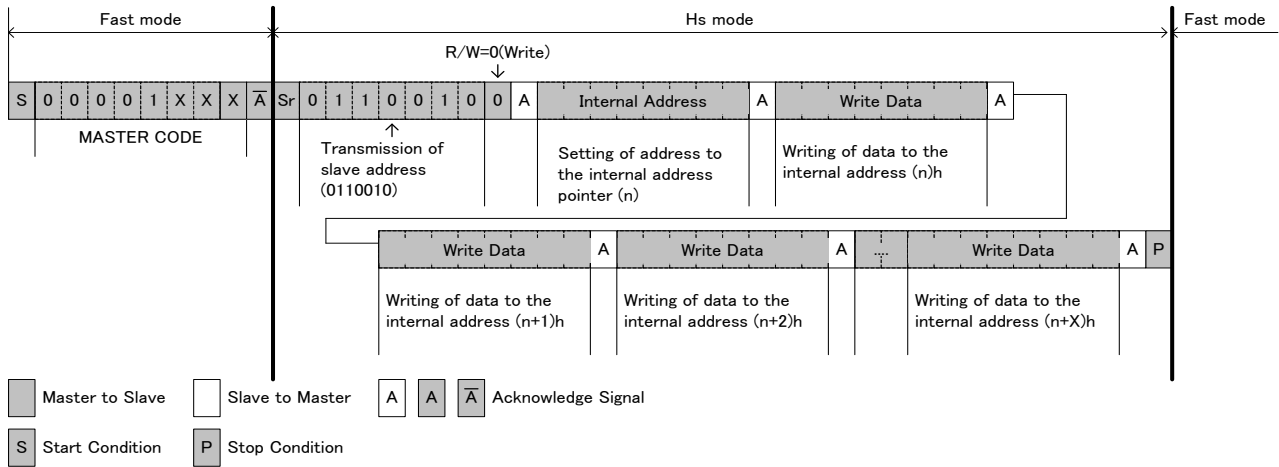

Fig. 10-5 I²C-Bus Data Transmission Write Format (Hs-mode)

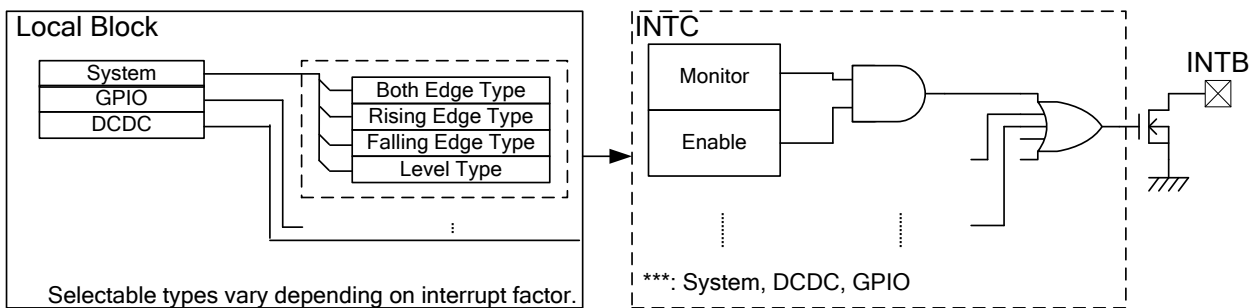

Note*: Should have the interval of 100us or more at writing and reading the same address.

11. Interrupt Controller (INTC)

This PMU has an interrupt controller. CPU can read all the permitted interrupt request flags coming from different functional blocks. When an interrupt occurs, CPU is informed by asserting INTB pin. CPU can identify block and factor which output interrupt by reading Monitor register of INTC and Local Block.

Monitor register is read-only. OR gate signal of each permitted interrupt request flag will be output from INTB pin. CPU can figure out the current state of this PMU by reading Monitor register at power-on. To enable interrupt output through INTB pin, it is necessary to write "1" in Enable register.

12. Registers

12.1 Registers Map

The additional information for the register map below is as follows:

RSTB : Transition to PWROFF state or Shutdown factor detection

ERSTB : UVLO detection

* : Do not set "1" to - bits. Do not write "1" or "0" to undefined registers.

 : The default value of green hatch registers is set by OTP.

 : The default value of yellow hatch registers is set by OTP and initial value of the other register.

12.2 SYSTEM

12.2.1 LSIVER: LSI Version Register (Address 00h)

Bit	7	6	5	4	3	2	1	0
Symbol	LSIVER							
R/W	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	1

Bit [7:0]: LSIVER

This register indicates the LSI version.

12.2.2 OTPVER: OTP Version Register (Address 01h)

Bit	7	6	5	4	3	2	1	0
Symbol	OTPVER							
R/W	R	R	R	R	R	R	R	R
Default	By OTP	By OTP	By OTP	By OTP	By OTP	By OTP	By OTP	By OTP

Bit [6:0]: OTPVER

This register indicates the OTP version.

12.2.3 IODAC: IODET Detection Voltage Setting Register (Address 02h)

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	IODAC[5:0]					
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	By OTP	By OTP	By OTP	By OTP	By OTP	By OTP

Bit [5:0]: IODAC

Sets a detection voltage for IODET.

The default voltage can be set to the following values by OTP: 1.4V, 1.6V, 1.85V, 2.1V, 2.35V, 2.6V, 2.85V, and 3.1V

IODET Detection Voltage Table (Step = 50mV)

IODAC[5:0]	Detection Voltage [V]
000000 (00h)	Prohibit
⋮	Prohibit
001100(0Ch)	1.40(↓)
⋮	⋮
010000(10h)	1.60(↓)
⋮	⋮
101000(28h)	2.80(↓)
⋮	⋮
110000(30h)	3.20(↓)
⋮	Prohibit
111111(3Fh)	Prohibit

12.2.4 VINDAC: VINDET Detection Voltage Setting Register (Address 03h)

Bit	7	6	5	4	3	2	1	0
Symbol	VINR RESET	-	-	VINHYS	-	VINDAC[2:0]		
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	By OTP	0	0	By OTP	0	By OTP	By OTP	By OTP

Bit [7]: VINRRESET

Selects the reset condition for the VINHYS and the VINDAC bits.

0: RSTB

1: ERSTB

Bit [4]: VINHYS

Sets the hysteresis voltage for VINDET.

1: 200mV

0: 500mV

Bit [2:0]: VINDAC

Sets the detection voltage for VINDET

VINDET Detection Voltage Table (Step = 100mV)

VINDAC[2:0]	Detection Voltage [V]
000 (0h)	2.6(↓)
001 (1h)	2.7(↓)
010 (2h)	2.8(↓)
011 (3h)	2.9(↓)
100 (4h)	3.0(↓)
101 (5h)	3.1(↓)
110 (6h)	3.2(↓)
111 (7h)	3.3(↓)

The default voltage can be set up all the above register values by OTP.

12.2.5 OUT32KEN: C32KOUT Control Register (Address 05h)

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	-	OUT32KEN3	OUT32KEN2	OUT32KEN1	OUT32KEN0	-
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	0	By OTP	By OTP	By OTP	By OTP	0

Bit [4]: OUT32KEN3

Selects the clock output control bit from GPIO3(C32KOUT3) pin. (OTP Option)

0: Disabled

1: Enabled

Bit [3]: OUT32KEN2

Selects the clock output control bit from GPIO2(C32KOUT2) pin. (OTP Option)

0: Disabled

1: Enabled

Bit [2]: OUT32KEN1

Selects the clock output control bit from GPIO1(C32KOUT1) pin. (OTP Option)

0: Disabled

1: Enabled

Bit [1]: OUT32KEN0

Selects the clock output control bit from GPIO0(C32KOUT0) pin. (OTP Option)

0: Disabled

1: Enabled

12.3 I2C**12.3.1 CPUCNT: CPUIF Control Register (Address 06h)**

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	-	-	-	-	INCB	POWER I2C
R/W	R	R	R	R	R	R	R/W	R/W
Default	0	0	0	0	0	0	0	0

Bit [1]: INCB

Sets the I2C R/W format (Automatic increment in address pointers).

0: Enabled (Automatic increment)

1: Disabled

Bit [0]: POWERI2C

Sets the power I2C format.

0: Disabled

1: Enabled

12.4 Power Control**12.4.1 PSWR: Power Supply Watch Register (Address 07h)**

Bit	7	6	5	4	3	2	1	0
Symbol	RRESET	PSWR						
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	0	0	0	0	0	0

This register is reset to "00h" by UVLO.

Bit [7]: RRESET

Selects a reset condition of registers which is reset by RSTB during the POWEROFF state. By setting this bit to "1", all registers are not reset. Writing to this bit is prohibited in Parts Mode.

0: Reset

1: Not reset (The reset condition is same as ERSTB).

Bit [6:0]: PSWR

After this device powers on, the CPU writes some unique value except for "00h" and recognizes whether the register data of the power supply is maintained.

12.4.2 PONHIS: Power-on History Register (Address 09h)

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	-	-	ON_EXTIN PON	-	REPWR PON	PWRON PON
R/W	R	R	R	R	R	R	R	R
Default	0	0	0	0	Undefined	0	Undefined	Undefined

The CPU can read this register to recognize a power-on factor. The power-on factor is set when the power-on sequence starts.

Bit [3]: ON_EXTINPON

Indicates the occurrence of the power-on when detecting assertion of ON_EXTIN.

Bit [1]: REPWRPON

Indicates that the repower-on has occurred by the power-off with setting REPWRON bit to 1.
Same as repower-on by HRESET.

Bit [0]: PWRONPON

Indicates the occurrence of the power-on when detecting assertion of PWRON.

12.4.3 POFFHIS: Power-off History Register (Address 0Ah)

Bit	7	6	5	4	3	2	1	0
Symbol	N_OE POFF	DCLIM POFF	WDG POFF	CPU POFF	IODET POFF	VINDET POFF	TSHUT POFF	PWRON POFF
R/W	R	R	R	R	R	R	R	R
Default	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

The CPU can read this register to recognize a power-off factor. The power-off factor is set when the power-off sequence starts or the forced power-off.

Bit [7]: N_OEPOFF

Indicates the occurrence of the power-off when detecting assertion of N_OE or HRESET.

Bit [6]: DCLIMPOFF

Indicates the occurrence of the power-off when detecting an overcurrent on DCDCn (n: 1 to 4).

Bit [5]: WDGPOFF

Indicates the occurrence of the power-off by the watchdog timer.

Bit [4]: CPUPOFF

Indicates the occurrence of the power-off by the followings:

- SWPWROFF bit setting.
- PSHOLD(GPIO*) is low.
- PSHOLD(GPIO*) is timeout.

Bit [3]: IODETPOFF

Indicates the occurrence of the power-off when detecting the IODET assertion.

Bit [2]: VINDETPOFF

Indicates the occurrence of the forced power-off when detecting the low power condition in the VINDET circuit

Bit [1]: TSHUTPOFF

Indicates the occurrence of the forced power-off when detecting an abnormal temperature in the thermal shutdown circuit

Bit [0]: PWRONPOFF

Indicates the occurrence of the power-off when detecting assertion of PWRON.

12.4.4 WATCHDOG: Watchdog Timer Setting Register (Address 0Bh)

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	-	-	WDOG SLPEN	WDOG EN	WDOGTIM	
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	0	0	0	0	1	1

The count value of watchdog timer is cleared by accessing (R/W) to this register.

Bit [3]: WDOGSLPEN

Valid / Invalid the watchdog timer during SLEEP state.

0: Invalid (Stop the countdown)

1: Valid (Kept the countdown and generated the interrupt after expiring the timer)

Bit [2]: WDOGEN

Enabled / Disabled the power-off function by the watchdog timer.

Writing to this bit is prohibited in Parts Mode.

0: Disabled

1: Enabled

This bit can restrict the writing by OTP as to whether rewritable or not.

Bit [1:0]: WDOGTIM

Sets the CPU access time for monitoring by watchdog timer.

WDOGTIM[1:0]	Timeout [sec]
00	1
01	8
10	32
11	128 (default)

12.4.5 WATCHDOGCNT: Watchdog Timer Count Register (Address 0Ch)

Bit	7	6	5	4	3	2	1	0
Symbol	WATCHDOGCNT							
R/W	R	R	R	R	R	R	R	R
Default	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit [7:0]: WATCHDOGCNT

Indicates the count value of watchdog timer.

The readout value of this register is determined by the setting of WDOGTIM bits as indicated below.

WDOGTIM[1:0]	WATCHDOGCNT Readout Value
00	25 msec / 1bit
01	50 msec / 1bit
10	200 msec / 1bit
11	800 msec / 1bit

Example: If the value = 10h (16d) and WDOGTIM = 11b,
the power-off sequence starts by watchdog after the (16 * 800 msec + 1 sec).

Note*: In order to prevent malfunction of reading operation, read this register twice or more continuously, and if both count value data match, they are determined as the value is read accurately.

12.4.6 PWRFUNC: Power Control Function Register (Address 0Dh)

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	SLP_TO_OFFSEQ	-	-	-	OFFSEQ_SEL	-
R/W	R	R	R/W	R	R	R	R/W	R
Default	0	0	0	0	0	0	0	0

Bit [5]: SLP_TO_OFFSEQ

Allows a change to the POWEROFF SEQUENCE state by detecting PWRON long press during SLEEP state. Writing to this bit is prohibited in Parts Mode.

- 0: Invalid
- 1: Valid

Bit [1]: OFFSEQ_SEL

Power-off sequence timing select bit. Writing to this bit is prohibited in Parts Mode.

- 0: By ONSLOT registers.
- 1: At Slot_15.

12.4.7 SLPCNT: Sleep Control Register (Address 0Eh)

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	SLPEXIT	SLPENT	-	-	-	SWPWROFF
R/W	W	W	W	W	W	W	W	W
Default	0	0	0	0	0	0	0	0

Bit [5]: SLPEXIT

During SLEEP state, this PMU changes to SLEEP EXIT SEQUENCE state by writing "1" in this bit. Writing to this bit is prohibited in Parts Mode.

Bit [4]: SLPENT

During POWERON state, this PMU changes to SLEEP ENTRY SEQUENCE state by writing "1" in this bit. Writing to this bit is prohibited in Parts Mode.

Bit [0]: SWPWROFF

During POWERON state, this PMU changes to POWEROFF SEQUENCE state by writing "1" in this bit.

12.4.8 REPCNT: Repower-on Control Register (Address 0Fh)

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	OFF_RESETO	-	-	REPWRTIM	-	REPWRON
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	0	0	0	0	0	0

Bit [5:4]: OFF_RESETO

Setting time asserted RESETO pin. Writing to this bit is prohibited in Parts Mode.

OFF_RESETO[1:0]	Time [ms]
00	0 (default)
01	2
10	8
11	16

Bit [2:1]: REPWRTIM

Setting time between the power-off sequence finishes and the power-on sequence starts.

REPWRTIM[1:0]	Time [ms]
00	10 (default)
01	100
10	500
11	1000

Bit [0]: REPWRON

By setting this bit to "1", this PMU powers on after the power-off without the power-on factors. Writing to this bit is prohibited in Parts Mode.

0: Disabled

1: Enabled

12.4.9 PWRONTIMSET: PWRON Timer Setting Register (Address 10h)

Bit	7	6	5	4	3	2	1	0
Symbol	DIS_OFF_PWRON_TIM	OFF_PRESS_PWRON			OFF_JUDGE_PWRON	ON_PRESS_PWRON		
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	1	1	1	by OTP	by OTP	by OTP

Bit [7]: DIS_OFF_PWRON_TIM

Clear and initializing the PWRON off_press timer value and over-flow flag.

0: Enabled

1: Disabled

Bit [6:4]: OFF_PRESS_PWRON

Setting of PWRON off_press timer.

Writing to this bit is prohibited in Parts Mode.

OFF_PRESS_PWRON[2:0]	Timeout [sec]
000	0
001	1
010	2
011	4 (default)
100	6
101	8
110	10
111	12

Bit [3]: OFF_JUDGE_PWRON

Setting of PWRON judge timer.

Writing to this bit is prohibited in Parts Mode.

OFF_JUDGE_PWRON	Timeout [sec]
0	0
1	1 (default)

Bit [2:0]: ON_PRESS_PWRON

Setting of PWRON on_press timer.

Writing to this bit is prohibited in Parts Mode.

ON_PRESS_PWRON[2:0]	Timeout
000	0 ms
001	20 ms
010	128 ms
011	1 sec
100	2 sec
101	3 sec
110	Prohibit
111	Prohibit

The default time can be set up the following values by OTP: 0ms, 20ms, 1s, 3s

12.4.10 NOETIMSET: N_OE Timer Setting Register (Address 11h)

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	-	-	DIS_OFF_NOE_TIM	OFF_JUDGE_NOE	OFF_PRESS_NOE	
R/W	R	R	R	R	R/W	R/W	R/W	R/W
Default	0	0	0	0	0	1	0	1

Bit [3]: DIS_OFF_NOE_TIM

Clear and initializing the N_OE off_press timer value and over-flow flag.

0: Enabled

1: Disabled

Bit [2]: OFF_JUDGE_NOE

Setting of N_OE judge timer

Writing to this bit is prohibited in Parts Mode.

Note*: It is possible to write this bit by writing "1" in DIS_OFF_NOE_TIM.

OFF_JUDGE_NOE	Timeout [sec]
0	0
1	1 (default)

Bit [1:0]: OFF_PRESS_NOE

Setting of N_OE off_press timer.

Writing to this bit is prohibited in Parts Mode.

Note*: It is possible to write this bit by writing "1" in DIS_OFF_NOE_TIM.

OFF_PRESS_NOE[1:0]	Timeout
00	128 ms
01	1 sec (default)
10	2 sec
11	3 sec

12.4.11 PWRIREN: Power Control Interrupt Factor Output Enable Register (Address 12h)

Bit	7	6	5	4	3	2	1	0
Symbol	-	EN_WDOG	EN_NOE_OFF	EN_PWRON_OFF	EN_OVTEMP	EN_PRVINDT	EN_EXTIN	EN_PWRON
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	0	0	0	0	0	0

Bit [6]: EN_WDOG

Enable outputs of the interrupt request in the watchdog timer. Writing to this bit is prohibited in Parts Mode.

0: Disabled

1: Enabled

Bit [5]: EN_NOE_OFF

Enable outputs of the interrupt request in the NOE timer. Power-off by long-press doesn't depend on EN_NOE_OFF bit setting.

0: Disabled

1: Enabled

Bit [4]: EN_PWRON_OFF

Enable outputs of the interrupt request in the PWRON timer. Power-off by long-press doesn't depend on EN_PWRON_OFF bit setting.

0: Disabled

1: Enabled

Bit [3]: EN_OVTEMP

Enable outputs of the interrupt request when detecting overheat temperature.

0: Disabled

1: Enabled

Bit [2]: EN_PRVINDT

Enable output of the interrupt request when the power supply to VSYS below the VINDET detection voltage.

0: Disabled

1: Enabled

Bit [1]: EN_EXTIN

Enable outputs of the interrupt request when ON_EXTIN pin input signal changes.

0: Disabled

1: Enabled

Bit [0]: EN_PWRON

Enable outputs of the interrupt request when PWRON pin input signal changes.

0: Disabled

1: Enabled

12.4.12 PWRIRQ: Power Control Interrupt Factor Register (Address 13h)

Bit	7	6	5	4	3	2	1	0
Symbol	-	IR_WDOG	IR_NOE_OFF	IR_PWRO_N_OFF	IR_OVTEMP	IR_PRVINDT	IR_EXTIN	IR_PWRON
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Each bit can be cleared by writing “0” but cannot be set by writing “1”.

Bit [6]: IR_WDOG

Store the interrupt request factor in the watchdog timer.

0: None

1: Requested

Bit [5]: IR_NOE_OFF

Store the interrupt request factor in the NOE timer.

0: None

1: Requested

Bit [4]: IR_PWRON_OFF

Store the interrupt request factor in the PWRON timer.

0: None

1: Requested

Bit [3]: IR_OVTEMP

Store the interrupt request factor in the detecting overheat temperature.

0: None

1: Requested

Bit [2]: IR_PRVINDT

Store the interrupt request factor in the power supply to VSYS below the VINDET detection voltage.

0: None

1: Requested

Bit [1]: IR_EXTIN

Store the interrupt request factor when ON_EXTIN pin input signal changes.

0: None

1: Requested

Bit [0]: IR_PWRON

Store the interrupt request factor when PWRON pin input signal changes.

0: None

1: Requested

12.4.13 PWRMON: Power Control Interrupt Factor Monitoring Register (Address 14h)

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	-	-	MON_ OVTEMP	MON_ PRVINDT	MON_ EXTIN	MON_ PWRON
R/W	R	R	R	R	R	R	R	R
Default	0	0	0	0	Undefined	Undefined	Undefined	Undefined

Bit [3]: MON_ OVTEMP

Monitor the detection state of overheat circuit.

0: Normal temperature

1: Abnormal temperature

Bit [2]: MON_ PRVINDT

Monitor PREVINDT detection signal.

0: Over PREVINDT release voltage

1: Under PREVINDT detection voltage

Bit [1]: MON_ EXTIN

Monitor ON_EXTIN signal.

0: ON_EXTIN deassert

1: ON_EXTIN assert

Bit [0]: MON_ PWRON

Monitor PWRON signal.

0: PWRON is released

1: PWRON is held down

12.4.14 PWRIRSEL: Power Control Interrupt Type Setting Register (Address 15h)

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	-	-	SEL_ OVTEMP	SEL_ PRVINDT	SEL_ EXTIN	SEL_ PWRON
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	0	0	1	1	1	1

For the details of interrupt, refer to the chapter of the interrupt controller (INTC).

Bit [3]: SEL_ OVTEMP

Select the type of the interrupt by the overheat temperature detection.

Bit [2]: SEL_ PRVINDT

Select the type of the interrupt by Pre-VINDET detection signal.

Bit [1]: SEL_ EXTIN

Select the type of the interrupt by ON_EXTIN input signal changes.

Bit [0]: SEL_ PWRON

Select the type of the interrupt by PWRON input signal changes.

SEL_ ***	Type
0	Level
1	Both-edge

12.4.15 *_SLOT:Power-On/Off And Sleep Entry/Exit Sequence Setting Register (Address 16h - 2Ah)**

(***) = DC1-4, LDO1-5, LDORTC1, PSO0-3)

DC1 SLOT (16h)

Bit	7	6	5	4	3	2	1	0
Symbol	DC1ONSLOT				DC1SLPSLOT			
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

1100		Slot _12
1101		Slot _13
1110		Slot _14
1111	Default Off	The state in POWERON state is maintained

12.5 DCDC

12.5.1 DC1CTL: DCDC1 Control Register (Address 2Ch)

Bit	7	6	5	4	3	2	1	0
Symbol	DC1MODE_SLP[1:0]		DC1MODE[1:0]		-	-	DC1DIS	DC1EN
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	0	0	0	0	1	By OTP

Bit [7:6]: DC1MODE_SLP[1 :0]

DCDC1 mode setting bit at the SLEEP state

Bit [5:4]: DC1MODE[1 :0]

DCDC1 mode setting bit at the POWERON state

- 00: Auto mode
- 01: PWM mode
- 10: PSM mode
- 11: Auto mode

Bit [1]: DC1DIS

DCDC1 discharge control bit

- 0: Off
- 1: On (This bit is invalid when DCDC1 state is on.)

Bit [0]: DC1EN

DCDC1 enable bit

- 0: Disabled
- 1: Enabled

The initial value of this register depends on the initial value of DC1ONSL0T register and Mode setting.

The initial value of DC1ONSL0T register and Mode setting are set by OTP.

·Normal Mode

- DC1ONSL0T = Fh: DC1EN = 0b
- DC1ONSL0T = 0h-Eh: DC1EN = 1b

·Parts Mode

- DC1EN = 1b

12.5.2 DC1CTL2: DCDC1 Control2 Register (Address 2Dh)

Bit	7	6	5	4	3	2	1	0
Symbol	(reserved)		DC1SR[1:0]		-	DC1LIM[1:0]		DC1LIMSDEN
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	By OTP	By OTP	0	0	0	By OTP	By OTP	By OTP

Bit [7:6]: reserved

These bits are reserved. Writing these bits are prohibited.

Bit [5:4]: DC1SR

DCDC1 ramp rate of output voltage setting bit. Writing this register is prohibited during the ramp control.

DC1SR[1:0]	Voltage Slope
00	14 mV / us (default)
01	7 mV / us
10	3.5 mV / us
11	Prohibited

Bit [2:1]: DC1LIM

DCDC1 minimum current limit setting bit

DC1LIM[1:0]	Current Limit
00	No Limit
01	3.2A
10	3.7A
11	4.0A

The default current can be set up all the above register values by OTP.

Bit [0]: DC1LIMSDEN

Enable shutdown function from the current limit detection of DCDC1.

The current limit detection is to continue exceeding limit current during 2ms.

0: Disabled

1: Enabled

The initial value of this register depends on Mode setting. Mode setting is set by OTP.

·Normal Mode

DC1LIMSDEN = 1b

·Parts Mode

DC1LIMSDEN = 0b

12.5.3 DC2CTL: DCDC2 Control Register (Address 2Eh)

Bit	7	6	5	4	3	2	1	0
Symbol	DC2MODE_SLP[1:0]		DC2MODE[1:0]		-	-	DC2DIS	DC2EN
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	0	0	0	0	1	By OTP

Bit [7:6]: DC2MODE_SLP[1 :0]

DCDC2 mode setting bit at the SLEEP state

Bit [5:4]: DC2MODE[1 :0]

DCDC2 mode setting bit at the POWERON state

- 00: Auto mode
- 01: PWM mode
- 10: PSM mode
- 11: Auto mode

Bit [1]: DC2DIS

DCDC2 discharge control bit

- 0: Off
- 1: On (This bit is invalid when DCDC2 state is on.)

Bit [0]: DC2EN

DCDC2 enable bit

- 0: Disabled
- 1: Enabled

The initial value of this register depends on the initial value of DC2ONSLOT register and Mode setting. The initial value of DC2ONSLOT register and Mode setting are set by OTP.

·Normal Mode

- DC2ONSLOT = Fh: DC2EN = 0b
- DC2ONSLOT = 0h-Eh: DC2EN = 1b

·Parts Mode

- DC2EN = 1b

12.5.4 DC2CTL2: DCDC2 Control2 Register (Address 2Fh)

Bit	7	6	5	4	3	2	1	0
Symbol	(reserved)		DC2SR[1:0]		-	DC2LIM[1:0]		DC2LIMSDEN
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	By OTP	By OTP	0	0	0	By OTP	By OTP	By OTP

Bit [7:6]: reserved

These bits are reserved. Writing these bits are prohibited.

Bit [5:4]: DC2SR

DCDC2 ramp rate of output voltage setting bit. Writing this register is prohibited during the ramp control.

DC2SR[1:0]	Voltage Slope
00	14 mV / us (default)
01	7 mV / us
10	3.5 mV / us
11	Prohibited

Bit [2:1]: DC2LIM

DCDC2 minimum current limit setting bit

DC2LIM[1:0]	Current Limit
00	No Limit
01	3.2A
10	3.7A
11	4.0A

The default current can be set up all the above register values by OTP.

Bit [0]: DC2LIMSDEN

Enable shutdown function from the current limit detection of DCDC2.

The current limit detection is to continue exceeding limit current during 2ms.

0: Disabled

1: Enabled

The initial value of this register depends on Mode setting. Mode setting is set by OTP.

·Normal Mode

DC2LIMSDEN = 1b

·Parts Mode

DC2LIMSDEN = 0b

12.5.5 DC3CTL: DCDC3 Control Register (Address 30h)

Bit	7	6	5	4	3	2	1	0
Symbol	DC3MODE_SLP[1:0]		DC3MODE[1:0]		-	-	DC3DIS	DC3EN
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	0	0	0	0	1	By OTP

Bit [7:6]: DC3MODE_SLP[1 :0]

DCDC3 mode setting bit at the SLEEP state

Bit [5:4]: DC3MODE[1 :0]

DCDC3 mode setting bit at the POWERON state

- 00: Auto mode
- 01: PWM mode
- 10: PSM mode
- 11: Auto mode

Bit [1]: DC3DIS

DCDC3 discharge control bit

- 0: Off
- 1: On (This bit is invalid when DCDC3 state is on.)

**Bit [0]: DC3EN**

DCDC3 enable bit

- 0: Disabled
- 1: Enabled

The initial value of this register depends on the initial value of DC3ONSLOT register and Mode setting.

The initial value of DC3ONSLOT register and Mode setting are set by OTP.

·Normal Mode

DC3ONSLOT = Fh: DC3EN = 0b

DC3ONSLOT = 0h-Eh: DC3EN = 1b

·Parts Mode

DC3EN = 1b

12.5.6 DC3CTL2: DCDC3 Control2 Register (Address 31h)

Bit	7	6	5	4	3	2	1	0
Symbol	(reserved)		DC3SR[1:0]		-	DC3LIM[1:0]		DC3LIMSDEN
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	By OTP	By OTP	0	0	0	By OTP	By OTP	By OTP

Bit [7:6]: reserved

These bits are reserved. Writing these bits are prohibited.

Bit [5:4]: DC3SR

DCDC3 ramp rate of output voltage setting bit. Writing this register is prohibited during the ramp control.

DC3SR[1:0]	Voltage Slope
00	14 mV / us (default)
01	7 mV / us
10	3.5 mV / us
11	Prohibited

Bit [2:1]: DC3LIM

DCDC3 minimum current limit setting bit

DC3LIM[1:0]	Current Limit
00	No Limit
01	2.3A
10	2.8A
11	3.2A

The default current can be set up all the above register values by OTP.

Bit [0]: DC3LIMSDEN

Enable shutdown function from the current limit detection of DCDC3.

The current limit detection is to continue exceeding limit current during 2ms.

0: Disabled

1: Enabled

The initial value of this register depends on Mode setting. Mode setting is set by OTP.

·Normal Mode

DC3LIMSDEN = 1b

·Parts Mode

DC3LIMSDEN = 0b

12.5.7 DC4CTL: DCDC4 Control Register (Address 32h)

Bit	7	6	5	4	3	2	1	0
Symbol	DC4MODE_SLP[1:0]		DC4MODE[1:0]		-	-	DC4DIS	DC4EN
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	0	0	0	0	1	By OTP

Bit [7:6]: DC4MODE_SLP[1:0]

DCDC4 mode setting bit at the SLEEP state

Bit [5:4]: DC4MODE[1:0]

DCDC4 mode setting bit at the POWERON state

- 00: Auto mode
- 01: PWM mode
- 10: PSM mode
- 11: Auto mode

Bit [1]: DC4DIS

DCDC4 discharge control bit

- 0: Off
- 1: On (This bit is invalid when DCDC4 state is on.)

Bit [0]: DC4EN

DCDC4 enable bit

- 0: Disabled
- 1: Enabled

The initial value of this register depends on the initial value of DC4ONSLOT register and Mode setting. The initial value of DC4ONSLOT register and Mode setting are set by OTP.

·Norma Mode

- DC4ONSLOT = Fh: DC4EN = 0b
- DC4ONSLOT = 0h-Eh: DC4EN = 1b

·Parts Mode

- DC4EN = 1b

12.5.8 DC4CTL2: DCDC4 Control2 Register (Address 33h)

Bit	7	6	5	4	3	2	1	0
Symbol	(reserved)		DC4SR[1:0]		-	DC4LIM[1:0]		DC4 LIMSDEN
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	By OTP	By OTP	0	0	0	By OTP	By OTP	By OTP

Bit [7:6]: reserved

These bits are reserved. Writing these bits are prohibited.

Bit [5:4]: DC4SR

DCDC4 ramp rate of output voltage setting bit. Writing this register is prohibited during the ramp control.

DC4SR[1:0]	Voltage Slope
00	14 mV / us (default)
01	7 mV / us
10	3.5 mV / us
11	Prohibited

Bit [2:1]: DC4LIM

DCDC4 minimum current limit setting bit

DC4LIM[1:0]	Current Limit
00	No Limit
01	2.3A
10	2.8A
11	3.2A

The default current can be set up all the above register values by OTP.

Bit [0]: DC4LIMSDEN

Enable shutdown function from the current limit detection of DCDC4.

The current limit detection is to continue exceeding limit current during 2ms.

0: Disabled

1: Enabled

The initial value of this register depends on Mode setting. Mode setting is set by OTP.

·Normal Mode

DC4LIMSDEN = 1b

12.7 GPIO

12.7.1 IOSEL: GPIO Direction Setting Register (Address 90h)

IOSEL register can set the input/output of GPIO pin. Writing “0” in the register, the corresponding pin becomes input pin, and becomes output pin when writing “1”.

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	-	-	IO03	IO02	IO01	IO00
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	0	0	0	0	0	0

Bit	Symbol	R/W	Function	1	0	Initial Value
3	IO03	R/W	GPI03 Direction Setting bit	Output	Input	0
2	IO02	R/W	GPI02 Direction Setting bit	Output	Input	0
1	IO01	R/W	GPI01 Direction Setting bit	Output	Input	0
0	IO00	R/W	GPI00 Direction Setting bit	Output	Input	0

Note*1: IO03 – IO00 are invalid when PSO ⁽¹⁾ mode.

12.7.2 IOOUT: GPIO Output Signal Register (Address 91h)

IOOUT register can set “L” or “Hi-Z” of GPIO pin when GP pin is set as output.

By writing “0” in IOOUT register, the corresponding pin outputs “L” and becomes “Hi-Z” by writing “1”.

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	-	-	IOOUT03	IOOUT02	IOOUT01	IOOUT00
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	0	0	0	0	0	0

Bit	Symbol	R/W	Function	1	0	Initial Value
3	IOOUT03	R/W	GPI03 Output Setting bit	H	L	0
2	IOOUT02	R/W	GPI02 Output Setting bit	H	L	0
1	IOOUT01	R/W	GPI01 Output Setting bit	H	L	0
0	IOOUT00	R/W	GPI00 Output Setting bit	H	L	0

Note*1: Valid only in the output mode.

Note*2: When the output circuit is set as Nch open drain by OTP, the output of GP pin becomes not “H” but “Hi-Z”.

⁽¹⁾ PSO: Power-on Signal Output for the external devices.

12.7.3 GPEDGE1: GPIO Interrupt Detection Type Setting Register (Address 92h)

GPEDGE register can set GPIO interrupt detection type.

Bit	7	6	5	4	3	2	1	0
Symbol	EDGE03		EDGE02		EDGE01		EDGE00	
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	0	0	0	0	0	0

Bit	Symbol	R/W	Function	1	0	Initial Value
7-6	EDGE03	R/W	GPIO3 Interrupt Detection Type Setting bit	As below		00
5-4	EDGE02	R/W	GPIO2 Interrupt Detection Type Setting bit	As below		00
3-2	EDGE01	R/W	GPIO1 Interrupt Detection Type Setting bit	As below		00
1-0	EDGE00	R/W	GPIO0 Interrupt Detection Type Setting bit	As below		00

EDGE*[1:0]	Detection Function
00	Level (default)
01	Rising Edge
10	Falling Edge
11	Both Edge

12.7.4 EN_GPIR: Interrupt Enable Register (Address 94h)

Writing "1" enables the interrupt request.

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	-	-	EN_ GP03IR	EN_ GP02IR	EN_ GP01IR	EN_ GP00IR
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	0	0	0	0	0	0

Bit	Symbol	R/W	Function	1	0	Initial Value
3	EN_GP03IR	R/W	GPIO3 interrupt enable bit	Enable	Disable	0
2	EN_GP02IR	R/W	GPIO2 interrupt enable bit	Enable	Disable	0
1	EN_GP01IR	R/W	GPIO1 interrupt enable bit	Enable	Disable	0
0	EN_GP00IR	R/W	GPIO0 interrupt enable bit	Enable	Disable	0

12.7.5 IR_GPR: Rising Edge Interrupt Request Register (Address 95h)

In the rising edge or both edge mode, IR_GPR register can monitor the interrupt request of rising edge.

The register is cleared by writing "0" in the corresponding bit but cannot be set by writing "1".

The function above-mentioned is operated in level mode as well.

However, it cannot be cleared while the interrupt request signal is "H".

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	-	-	IR_ GP03R	IR_ GP02R	IR_ GP01R	IR_ GP00R
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	0	0	0	0	0	0

Bit	Symbol	R/W	Function	1	0	Initial Value
3	IR_GP03R	R/W	GPI03 Rising Edge Interrupt Request bit	Requested	None	0
2	IR_GP02R	R/W	GPI02 Rising Edge Interrupt Request bit	Requested	None	0
1	IR_GP01R	R/W	GPI01 Rising Edge Interrupt Request bit	Requested	None	0
0	IR_GP00R	R/W	GPI00 Rising Edge Interrupt Request bit	Requested	None	0

12.7.6 IR_GPF: Falling Edge Interrupt Request Register (Address 96h)

In the falling edge or both edge mode, IR_GPF can monitor the interrupt request of falling edge.

It is cleared by writing "0" corresponding bit but cannot be set by writing "1".

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	-	-	IR_ GP03F	IR_ GP02F	IR_ GP01F	IR_ GP00F
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	0	0	0	0	0	0

Bit	Symbol	R/W	Function	1	0	Initial Value
3	IR_GP03F	R/W	GPI03 Falling Edge Interrupt Request bit	Requested	None	0
2	IR_GP02F	R/W	GPI02 Falling Edge Interrupt Request bit	Requested	None	0
1	IR_GP01F	R/W	GPI01 Falling Edge Interrupt Request bit	Requested	None	0
0	IR_GP00F	R/W	GPI00 Falling Edge Interrupt Request bit	Requested	None	0

12.7.7 MON_IOIN: GPIO Input Signal Read Register (Address 97h)

MON_IOIN register can monitor the debounced signal from GP pin.

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	-	-	MON_ IOIN03	MON_ IOIN02	MON_ IOIN01	MON_ IOIN00
R/W	R	R	R	R	R	R	R	R
Default	0	0	0	0	Undefined	Undefined	Undefined	Undefined

Bit	Symbol	R/W	Function	1	0	Initial Value
3	MON_IOIN03	R	GPI03 input status bit	H	L	-
2	MON_IOIN02	R	GPI02 input status bit	H	L	-
1	MON_IOIN01	R	GPI01 input status bit	H	L	-
0	MON_IOIN00	R	GPI00 input status bit	H	L	-

12.7.8 GPLED_FUNC: LED Function Setting Register (Address 98h)

When set to LED function, GPIO0 and GPIO1 can be changed type of flicker for LED.

Bit	7	6	5	4	3	2	1	0
Symbol	-	GP1_ LEDMODE	GP1_LEDFUNC[1:0]		-	GP0_ LEDMODE	GP0_LEDFUNC[1:0]	
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	By OTP	0	0	0	By OTP	0	0

Bit	Symbol	R/W	Function	1	0	Initial Value
6	GP1_LEDMODE	R/W	GP1 LED_MODE Select bit	As below		OTP
5-4	GP1_LEDFUNC	R/W	GP1 Type of Flicker Select bit			0
2	GP0_LEDMODE	R/W	GP0 LED_MODE Select bit	As below		OTP
1-0	GP0_LEDFUNC	R/W	GP0 Type of Flicker Select bit			0

LED Mode (GP*_LEDMODE bit)	Power-On/Off status or Flicker Control (GP*_LEDFUNC bit)	GPIO	
		Mode	Flicker Type
0	Power-Off	POWERON/OFF function	Off
	Power-On		Always Turn-On
1	00b	LED function	Off
	01b		1Hz Flicker (25% Turn-on)
	10b		4Hz Flicker (25% Turn-on)
	11b		Always Turn-on

12.8 INTC**12.8.1 INTPOL: Interrupt Polarity Register (Address 9Ch)**

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	-	-	-	-	-	INTPOL
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	0	0	0	0	0	0

Bit 0: INTPOL

INTB pin polarity

0: Low-active

1: High-active

12.8.2 INTEN: Interrupt Output Control Register (Address 9Dh)

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	-	GPIO IREN	-	-	DCDC IREN	SYSTEM IREN
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	0	0	0	0	0	0

Bit [4]: GPIOIREN

GPIO interrupt enable

0: Disabled

1: Enabled

Bit [1]: DCDCIREN

DCDC interrupt enable

0: Disabled

1: Enabled

Bit [0]: SYSTEMIREN

SYSTEM interrupt enable

0: Disabled

1: Enabled

12.8.3 INTMON: Interrupt Monitor Register (Address 9Eh)

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	WDG IRM	GPIO IRM	-	-	DCDC IRM	SYSTEM IRM
R/W	R	R	R	R	R	R	R	R
Default	0	0	0	0	0	0	0	0

Bit [5]: WDGIRM

Watchdog interrupt flag monitor

0: None

1: Requested

Bit [4]: GPIOIRM

GPIO interrupt flag monitor

0: None

1: Requested

Bit [1]: DCDCIRM

DCDC interrupt flag monitor

0: None

1: Requested

Bit [0]: SYSTEMIRM

SYSTEM interrupt flag monitor

0: None

1: Requested

12.9 SYSTEM OPTION

12.9.1 PREVINDAC: PREVINDET Detection Voltage Setting Register (Address B0h)

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	-	-	-	PREVIN DACH	PREVIN DAC[1:0]	
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	0	0	0	By OTP	By OTP	By OTP

The default voltage can be set up by OTP.

Bit [2]: PREVINDACH

Setting the detection voltage to PREVINDET

Bit [1:0]: PREVINDAC

Setting the detection voltage to PREVINDET

PREVINDET Output Voltage

PREVINDACH	PREVINDAC[1:0]	Detection Voltage [V]
0	00 (0h)	2.75(↑) / 2.7(↓)
0	01 (1h)	2.85(↑) / 2.8(↓)
0	10 (2h)	2.95(↑) / 2.9(↓)
0	11 (3h)	3.05(↑) / 3.0(↓)
1	00 (0h)	3.30(↑) / 3.2(↓)
1	01 (1h)	3.40(↑) / 3.3(↓)
1	10 (2h)	3.50(↑) / 3.4(↓)
1	11 (3h)	3.60(↑) / 3.5(↓)

12.9.2 OVTEMP: Overheat Detection Temperature Setting Register (Address BCh)

This register sets the detected temperature for Overheat temperature.

Bit	7	6	5	4	3	2	1	0
Symbol	-	-	-	-	-	-	OVTEMP[1:0]	
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default	0	0	0	0	0	0	By OTP	

Bit [1:0]: OVTEMP[1:0]

Setting the detected temperature at overheat detection.

OVTEMP[1:0]	Temperature [°C] (Detection / Recovery)
00 (0h)	105 / 85
01 (1h)	115 / 95
10 (2h)	125 / 105
11 (3h)	135 / 115

The power dissipation of the package is dependent on PCB material, layout, and environmental conditions. The following measurement conditions are based on JEDEC STD. 51-7.

Measurement Conditions

Item	Measurement Conditions
Environment	Mounting on Board (Wind Velocity = 0 m/s)
Board Material	Glass Cloth Epoxy Plastic (Four-Layer Board)
Board Dimensions	76.2 mm × 114.3 mm × 0.8 mm
Copper Ratio	Outer Layer (First Layer): Less than 95% of 50 mm Square Inner Layers (Second and Third Layers): Approx. 100% of 50 mm Square Outer Layer (Fourth Layer): Approx. 100% of 50 mm Square
Through-holes	φ 0.3 mm × 25 pcs

Measurement Result

(Ta = 25°C, Tjmax = 125°C)

Item	Measurement Result
Power Dissipation	3800 mW
Thermal Resistance (θja)	θja = 26°C/W
Thermal Characterization Parameter (ψjt)	ψjt = 10°C/W

θja: Junction-to-ambient thermal resistance.

ψjt: Junction-to-top of package thermal characterization parameter

Power Dissipation vs. Ambient Temperature

Measurement Board Pattern

QFN0707-48-P25 Package Dimensions (Unit:mm)

*The tab on the bottom of the package shown by blue circle is a substrate potential (GND). This tab must be connected to the ground plane on the board.

RN5T568BY OTP Settings

Normal mode, DCDC1-4 F_{osc} = 1.50MHz

System OTP Setting	OTP Function	Setting	Explanation: The settings of I2C slave address (A3-A1). The setting of PWRON pin power-on long press timer. SLEEP pin polarity selection (Default High active) PWRON pin polarity selection (Default High active) System Voltage Detection for Power-ON permit. Hysteresis Voltage for VINDET (System Voltage Detection for Power-ON permit) VINDAC/VINHYS Reset selection VDDIO Voltage Detection (Power OFF factor) System Voltage Pre-Detection (Interrupt output) initial temperature of Overheat Detection(Interrupt output)
	I2CSLV	2: 32h	
	ON_PRESS	2: 1sec	
	SLEEPPOL	0: Non-Inversion	
	PWRONPOL	0: Non-Inversion	
	VINDAC	4: 3.0V	
	VINHYSSEL	1: 200mV	
	VINRRESET	1: ERSTB	
	IODAC	1: 1.60V	
	PREVINDAC	6 :3.5 (↑)/3.4 (↓)	
OVTEMP	0: 105/85°C		

GPIO OTP setting	OTP Function	Setting	Explanation: GPIO1's Power Supply's selection (Related to GPIO function) GPIO0's Power Supply's selection (Related to GPIO function) GPIO3 input's polarity (Default High Active) GPIO2 input's polarity (Default High Active) GPIO1 input's polarity (Default High Active) GPIO0 input's polarity (Default High Active) GPIO3 input type selection GPIO2 input type selection GPIO1 input type selection GPIO0 input type selection GPIO3 output type selection GPIO2 output type selection GPIO1 output type selection GPIO0 output type selection GPIO3 function Selection (Please refer to GPIO APP NOTE) GPIO2 function Selection (Please refer to GPIO APP NOTE) GPIO1 function Selection (Please refer to GPIO APP NOTE) GPIO0 function Selection (Please refer to GPIO APP NOTE) LED function Selection (Power-on indication or Register control) (GPIO function need) LED function Selection (Power-on indication or Register control) (GPIO function need) Select Initial of the clock output control bit from GPIO3 (C32KOUT3) pin Select Initial of the clock output control bit from GPIO2 (C32KOUT2) pin Select Initial of the clock output control bit from GPIO1 (C32KOUT1) pin Select Initial of the clock output control bit from GPIO0 (C32KOUT0) pin
	GP1PWR	1: VSYS	
	GP0PWR	1: VSYS	
	GPIO3POL	0: Non-Inversion	
	GPIO2POL	0: Non-Inversion	
	GPIO1POL	0: Non-Inversion	
	GPIO0POL	0: Non-Inversion	
	GP3TYPE	0: NMOS input	
	GP2TYPE	1: CMOS input	
	GP1TYPE	1: CMOS input	
	GP0TYPE	0: NMOS input	
	GPO3TYPE	1: CMOS output	
	GPO2TYPE	0: NOD output	
	GPO1TYPE	0: NOD output	
	GPO0TYPE	1: CMOS output	
	GP3FUNC	03: PSHOLD	
	GP2FUNC	01: PSO	
	GP1FUNC	0C: LED	
	GP0FUNC	08: ON_EXTIN	
	GP1LEDMODE	0: PWRON	
GP0LEDMODE	0: PWRON		
GP3CLKEN	0: Disable		
GP2CLKEN	0: Disable		
GP1CLKEN	0: Disable		
GP0CLKEN	0: Disable		

Sequence, DCDC, LDO OTP settings	OTP Function	Setting	Explanation: LDORTC2 Always-ON or I2C Control / Initial VOUT (GPIO2 function need) LDORTC1 Always-ON or I2C Control / Initial VOUT Sequence Slot Timing Setting The setting of RTCLDO1 Power-ON sequence slot time (Select "0:Slot_0" for AlwaysON) The setting of LDO5 Power-ON sequence slot time / Initial VOUT The setting of LDO4 Power-ON sequence slot time / Initial VOUT The setting of LDO3 Power-ON sequence slot time / Initial VOUT The setting of LDO2 Power-ON sequence slot time / Initial VOUT The setting of LDO1 Power-ON sequence slot time / Initial VOUT DD4LIM 1: 2.3A Pon Seq. slot /VOUT /Limit Current DD3LIM 1: 2.3A Pon Seq. slot /VOUT /Limit Current DD2LIM 1: 3.2A Pon Seq. slot /VOUT /Limit Current DD1LIM 1: 3.2A Pon Seq. slot /VOUT /Limit Current Reset output signal hold (Extend) time after Slot_15 (RESETO signal slot) Reset output signal sequence slot Power-ON output signal sequence slot (GPIO PSO function need) Power-ON output signal sequence slot (GPIO PSO function need) Power-ON output signal sequence slot (GPIO PSO function need) Power-ON output signal sequence slot (GPIO PSO function need)
	LDORTC2AWON	0: Register	
	LDORTC1AWON	0: Control	
	SLOTWID	1: 2.0ms	
	LDORTC1ONSL0T	F: Slot_OFF	
	LDO5ONSL0T	7: Slot_7	
	LDO4ONSL0T	7: Slot_7	
	LDO3ONSL0T	7: Slot_7	
	LDO2ONSL0T	F: Slot_OFF	
	LDO1ONSL0T	F: Slot_OFF	
	DC4ONSL0T	8: Slot_8	
	DC3ONSL0T	4: Slot_4	
	DC2ONSL0T	7: Slot_7	
	DC1ONSL0T	0: Slot_0	
	RESETHOLD	0: 0ms	
	RESETSLOT	F: Slot_15	
	PSO3ONSL0T	F: Slot_OFF	
	PSO2ONSL0T	1: Slot_1	
	PSO1ONSL0T	F: Slot_OFF	
	PSO0ONSL0T	F: Slot_OFF	
LRTC2DAC	0.90V		
LRTC1DAC	3.30V		
L5DAC	1.20V		
L4DAC	1.00V		
L3DAC	1.80V		
L2DAC	1.80V		
L1DAC	3.30V		
DD4DAC	3.30V		
DD3DAC	1.80V		
DD2DAC	2.50V		
DD1DAC	1.00V		

1. The products and the product specifications described in this document are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to Ricoh sales representatives for the latest information thereon.
2. The materials in this document may not be copied or otherwise reproduced in whole or in part without prior written consent of Ricoh.
3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.
4. The technical information described in this document shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under Ricoh's or any third party's intellectual property rights or any other rights.
5. The products listed in this document are intended and designed for use as general electronic components in standard applications (office equipment, telecommunication equipment, measuring instruments, consumer electronic products, amusement equipment etc.). Those customers intending to use a product in an application requiring extreme quality and reliability, for example, in a highly specific application where the failure or misoperation of the product could result in human injury or death (aircraft, spacevehicle, nuclear reactor control system, traffic control system, automotive and transportation equipment, combustion equipment, safety devices, life support system etc.) should first contact us.
6. We are making our continuous effort to improve the quality and reliability of our products, but semiconductor products are likely to fail with certain probability. In order to prevent any injury to persons or damages to property resulting from such failure, customers should be careful enough to incorporate safety measures in their design, such as redundancy feature, fire containment feature and fail-safe feature. We do not assume any liability or responsibility for any loss or damage arising from misuse or inappropriate use of the products.
7. Anti-radiation design is not implemented in the products described in this document.
8. The X-ray exposure can influence functions and characteristics of the products. Confirm the product functions and characteristics in the evaluation stage.
9. WLCSP products should be used in light shielded environments. The light exposure can influence functions and characteristics of the products under operation or storage.
10. There can be variation in the marking when different AOI (Automated Optical Inspection) equipment is used. In the case of recognizing the marking characteristic with AOI, please contact Ricoh sales or our distributor before attempting to use AOI.
11. Please contact Ricoh sales representatives should you have any questions or comments concerning the products or the technical information.

Ricoh is committed to reducing the environmental loading materials in electrical devices with a view to contributing to the protection of human health and the environment.

Ricoh has been providing RoHS compliant products since April 1, 2006 and Halogen-free products since April 1, 2012.
