

## Product Overview

NSi8210 is a high reliability single channel digital isolator. The NSi8210 device is safety certified by UL1577 support several insulation withstand voltages (3.75kVrms, 5kVrms), while providing high electromagnetic immunity and low emissions at low power consumption. The data rate of NSi8210 is up to 150Mbps, and the common-mode transient immunity (CMTI) is up to 200kV/us. NSi8210 provides default output level configuration when the input power is lost. Wide supply voltage of NSi8210 supports to connect with most digital interface directly, easy to do the level shift. High system level EMC performance enhance reliability and stability of use. AEC-Q100 (Grade 1) option is provided for all devices.

## Key Features

- Up to 5000V<sub>rms</sub> Insulation voltage
- Data rate: DC to 150Mbps
- Power supply voltage: 2.5V to 5.5V
- All devices are AEC-Q100 qualified
- High CMTI: 200kV/us
- Chip level ESD: HBM: ±8kV
- Interlock function
- High system level EMC performance:
  - Enhanced system level ESD, EFT, Surge immunity
- Default output high level or low level option
- Isolation surge voltage: >10kV
- Low power consumption: 1.5mA/ch (1 Mbps)
- Low propagation delay: <15ns
- Operation temperature: -40°C~125°C
- RoHS-compliant packages:
  - SOP8 narrow body
  - SOW8 wide body
  - SOW16 wide body

## Safety Regulatory Approvals

- UL recognition: up to 5000V<sub>rms</sub> for 1 minute per UL1577
- CQC certification per GB4943.1-2011
- CSA component notice 5A approval IEC60950-1 standard
- DIN VDE V 0884-11:2017-01

## Applications

- Industrial automation system
- Isolated SPI, RS232, RS485
- General-purpose multichannel isolation
- Motor Control

## 7. Function Description

### 7.1. Overview

The NSi8210 is a single-channel digital isolator based on a capacitive isolation barrier technique. The digital signal is modulated with RF carrier generated by the internal oscillator at the Transmitter side. Then it is transferred through the capacitive isolation barrier and demodulated at the Receiver side.

NSi8210 is a high reliability single channel digital isolator with AEC-Q100(Grade 1) qualified, it's certified by UL1577 and support 3.75kVrms insulation withstand voltage, while providing high electromagnetic immunity and low emissions at low power consumption. The data rate of NSi8210 is up to 150Mbps, and the common-mode transient immunity (CMTI) is up to 200kV/us. NSi8210 provides default output level configuration when the input power is lost. Wide supply voltage of NSi8210 supports to connect with most digital interface directly, easy to do the level shift.

NSi8210 has a default output status when VDDIN is unready and VDDOUT is ready as shown in Table 7.1, which helps for diagnosis when power is missing at the transmitter side. The other outputs follow the same status with the input A within 1us after powering up respectively.

Table 7.1 Output status vs. power status with interlock function

<i>Input</i>	<i>VDD1 status</i>	<i>VDD2 status</i>	<i>Output</i>	<i>Comment</i>
H <sup>1</sup>	Ready	Ready	H	Normal operation.
L <sup>2</sup>	Ready	Ready	L	
X <sup>3</sup>	Unready	Ready	L(NSi8210x0) H(NSi8210x1)	The output follows the same status with the input within 20us after input side VDD1 is powered on.
X	Ready	Unready	X	The output follows the same status with the input within 20us after output side VDD2 is powered on.
Note: <sup>1</sup> H=Logic high; <sup>2</sup> L=Logic low; <sup>3</sup> X=Logic low or logic high				

### 7.2. OOK Modulation

NSi8210 is based on a capacitive isolation barrier technique and the digital signal is modulated with RF carrier generated by the internal oscillator at the transmitter side, as shown in Figure 7.1 & Figure 7.2, then it is transferred through the capacitive isolation barrier and demodulated at the receiver side. The modulation uses OOK modulation technique with key benefits of high noise immunity and low radiation EMI.

## 8. Application Note

### 8.1. Typical Application Circuit

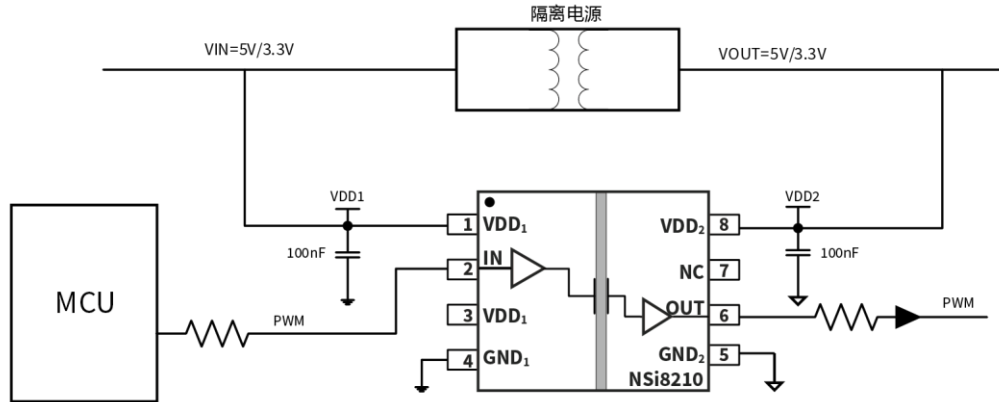

Figure 8.1 Typical PWM isolation circuit

### 8.2. PCB Layout

NSi8210 requires a 0.1  $\mu\text{F}$  bypass capacitor between VDD1 and GND1, VDD2 and GND2. The capacitor should be placed as close as possible to the package. Figure 8.2 to Figure 8.3 show the recommended PCB layout, make sure the space under the chip should keep free from planes, traces, pads and via. To enhance the robustness of a design, the user may also include resistors (50–300  $\Omega$ ) in series with the inputs and outputs if the system is excessively noisy. The series resistors also improve the system reliability such as latch-up immunity.

The typical output impedance of an isolator driver channel is approximately 50 $\Omega$ ,  $\pm 40\%$ . When driving loads where transmission line effects will be a factor, output pins should be appropriately terminated with controlled impedance PCB traces.

**8.4. Typical Supply Current Equations**

The typical supply current of NSi8210 can be calculated using below equations.  $I_{DD1}$  and  $I_{DD2}$  are typical supply currents measured in mA,  $f$  is data rate measured in Mbps,  $C_L$  is the capacitive load measured in pF

**NSi8210:**

$$I_{DD1} = 0.6 * a1 + 1.25 * b1 + 1.1 * c1.$$

$$I_{DD2} = 0.9 * a1 + 1.85 * b1 + VDD1 * f * C_L * c1 * 10^{-9}$$

Where  $a1$  is the channel number of low inputs at side 1,  $b1$  is the channel number of high inputs at side 1,  $c1$  is the channel number of switch signal inputs at side 1.
