NTE869 Integrated Circuit Dual, High Speed, Programmable Current Mode (Norton) Amp

Description:

The NTE869 consists of two current differencing (Norton) input amplifiers. Emphasis has been placed on obtaining high frequency performance and providing user programmable amplifier operating characteristics. Each amplifier is broadbanded to provide a high gain bandwidth product, fast slew rate and stable operation for an Inverting closed loop gain of 10 or greater. Pins for additional external frequency compensation are provided. The amplifiers are designed to operate from a single supply and can accommodate input common-mode voltages greater than the supply.

Applications:

- General Purpose Video Amplifiers
- High Frequency, High Q Active Filters
- Photo-Diode Amplifiers
- Wide Frequency Range Waveform Generation Circuits
- AC Applications Work to much Higher Frequencies

Features:

- User programmable gain bandwidth product, slew rate, input bias current, output stage biasing current and total device power dissipation.
- High gain bandwidth product ($I_{SET} = 0.5mA$)
 400MHz for $A_V = 10$ to 100
 30MHz for $A_V = 1$
- Current differencing inputs allow high common-mode input voltages
- Operates from a single 5V to 22V supply
- Large inverting amplifier output swing, 2mV to $V_{CC} - 2V$
- Low spot noise, $6nV/\sqrt{Hz}$, for $f > 1kHz$
