

# ADC1113D125

Dual 11-bit ADC; serial JESD204A interface

Rev. 3 — 10 February 2011

Product data sheet

## 1. General description

---

The ADC1113D125 is a dual-channel 11-bit Analog-to-Digital Converter (ADC) optimized for high dynamic performance and low power at a sample rate of 125 Msps. Pipelined architecture and output error correction ensure the ADC1113D125 is accurate enough to guarantee zero missing codes over the entire operating range. Supplied from a 3 V source for analog and a 1.8 V source for the output driver, it embeds two serial outputs. Each lane is differential and complies with the JESD204A format. An integrated Serial Peripheral Interface (SPI) allows the user to easily configure the ADC. A set of IC configurations is also available via the binary level control pins taken, which are used at power-up. The device also includes a programmable full-scale SPI to allow flexible input voltage range of 1 V to 2 V (peak-to-peak).

Excellent dynamic performance is maintained from the baseband to input frequencies of 170 MHz or more, making the ADC1113D125 ideal for use in communications, imaging, and medical applications.

## 2. Features and benefits

---

- SNR, 66.5 dBFS; SFDR, 86 dBc
- Sample rate: 125 Msps
- Clock input divided by 2 for less jitter contribution
- 3 V, 1.8 V single supplies
- Flexible input voltage range: 1 V (p-p) to 2 V (p-p)
- Two configurable serial outputs
- Two JESD204A serial outputs
- Pin compatible with ADC1613D series, ADC1413D series, and ADC1213D series
- Input bandwidth, 600 MHz
- Power dissipation, 1270 mW
- SPI register programming
- Duty Cycle Stabilizer (DCS)
- High IF capability
- Offset binary, two's complement, gray code
- Power-down mode and Sleep mode
- HVQFN56 package

## 3. Applications

---

- Wireless and wired broadband communications
- Spectral analysis
- Ultrasound equipment
- Portable instrumentation
- Imaging systems
- Software defined radio

## 11. Application information

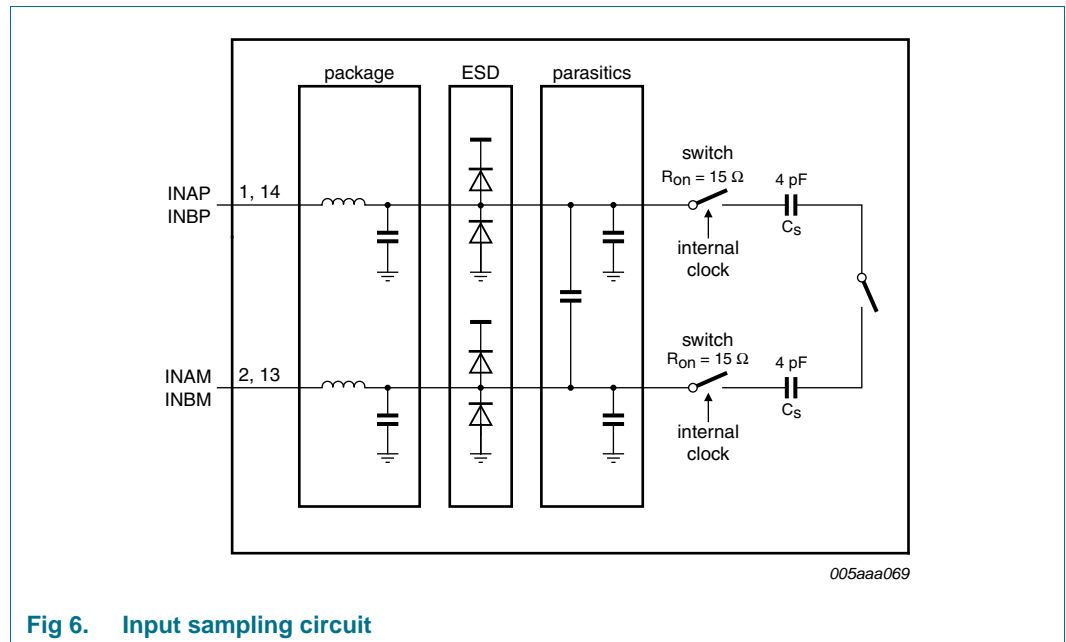

### 11.1 Analog inputs

#### 11.1.1 Input stage description

The analog input of the ADC1113D125 supports a differential or a single-ended input drive. Optimal performance is achieved using differential inputs with the common-mode input voltage ( $V_{I(cm)}$ ) on pins INP and INM set to 0.5VDDA.

The full-scale analog input voltage range is configurable between 1 V (p-p) and 2 V (p-p) via a programmable internal reference (see [Section 11.2](#) and [Table 21](#)).

[Figure 6](#) shows the equivalent circuit of the sample-and-hold input stage, including ElectroStatic Discharge (ESD) protection and circuit and package parasitics.

**Fig 6. Input sampling circuit**

The sample phase occurs when the internal clock (derived from the clock signal on pin CLKP/CLKM) is HIGH. The voltage is then held on the sampling capacitors. When the clock signal goes LOW, the stage enters the hold phase and the voltage information is transmitted to the ADC core.

#### 11.1.2 Anti-kickback circuitry

Anti-kickback circuitry (R-C filter in [Figure 7](#)) is needed to counteract the effects of a charge injection generated by the sampling capacitance.

The RC filter is also used to filter noise from the signal before it reaches the sampling stage. The value of the capacitor should be chosen to maximize noise attenuation without degrading the settling time excessively.

Fig 7. Anti-kickback circuit

The component values are determined by the input frequency and should be selected so as not to affect the input bandwidth.

Table 9. RC coupling versus input frequency - typical values

Input frequency (MHz)	Resistance ( $\Omega$ )	Capacitance (pF)
3	25	12
70	12	8
170	12	8

11.1.3 Transformer

The configuration of the transformer circuit is determined by the input frequency. The configuration shown in Figure 8 would be suitable for a baseband application.

Fig 8. Single transformer configuration

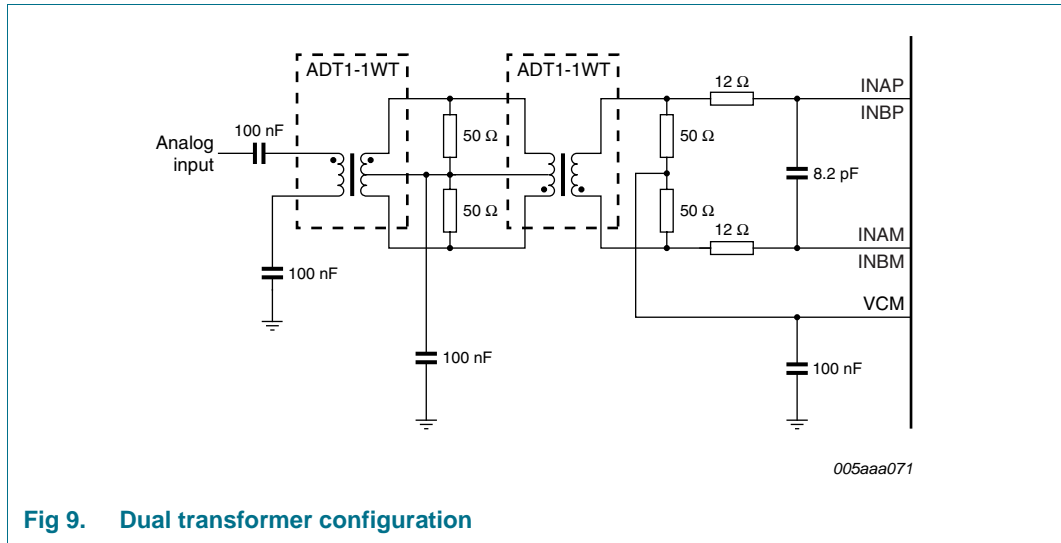

Fig 9. Dual transformer configuration

The configuration shown in [Figure 9](#) is recommended for high frequency applications. In both cases, the choice of transformer is a compromise between cost and performance.

## 11.2 System reference and power management

### 11.2.1 Internal/external reference

The ADC1113D125 has a stable and accurate built-in internal reference voltage to adjust the ADC full-scale. This reference voltage can be set internally via SPI or with pins VREF and SENSE (see [Figure 11](#) to [Figure 14](#)), in 1 dB steps between 0 dB and -6 dB, via SPI control bits INTREF[2:0] (when bit INTREF\_EN = logic 1; see [Table 21](#)). The equivalent reference circuit is shown in [Figure 10](#). An external reference is also possible by providing a voltage on pin VREF as described in [Figure 13](#).

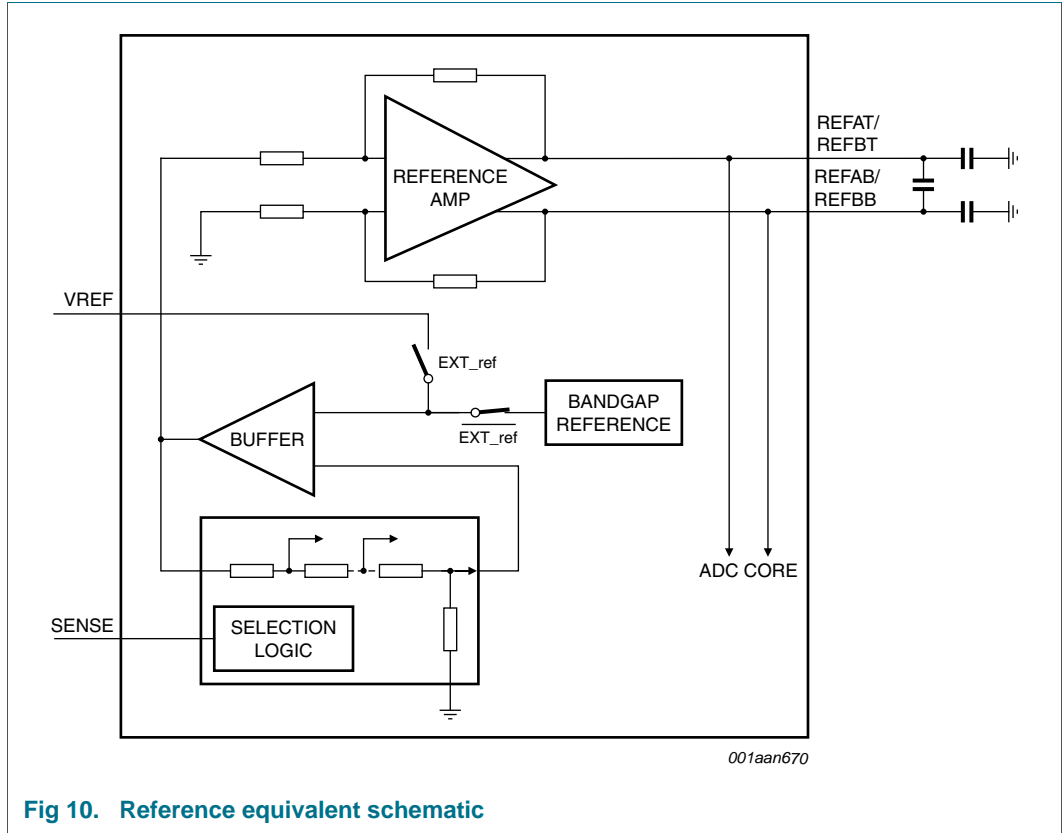

Fig 10. Reference equivalent schematic

If bit INTREF\_EN is set to logic 0, the reference voltage is determined either internally or externally as detailed in Table 10.

Table 10. Reference modes

Mode	SPI Bit, "Internal reference"	SENSE pin	VREF pin	Full-scale (V (p-p))
Internal (Figure 11)	0	GND	330 pF capacitor to GND	2
Internal (Figure 12)	0	VREF pin = SENSE pin and 330 pF capacitor to GND		1
External (Figure 13)	0	V <sub>DDA</sub>	external voltage from 0.5 V to 1 V	1 to 2
Internal, SPI mode (Figure 14)	1	VREF pin = SENSE pin and 330 pF capacitor to GND		1 to 2

Figure 11 to Figure 14 illustrate how to connect the SENSE and VREF pins to select the required reference voltage source.

### 11.2.2 Programmable full-scale

The full-scale is programmable between 1 V (p-p) to 2 V (p-p) (see Table 11).

Table 11. Programmable full-scale

INTREF[2:0]	Level (dB)	Full-scale (V (p-p))
000	0	2
001	-1	1.78
010	-2	1.59
011	-3	1.42
100	-4	1.26
101	-5	1.12
110	-6	1
111	not used	x

11.2.3 Common-mode output voltage ( $V_{O(cm)}$ )

An 0.1  $\mu\text{F}$  filter capacitor should be connected between the pins VCMA and VCMB and ground to ensure a low-noise common-mode output voltage. When AC-coupled, these pins can be used to set the common-mode reference for the analog inputs, for instance via a transformer middle point.

Fig 15. Reference equivalent schematic

11.2.4 Biasing

The common-mode input voltage,  $V_{I(cm)}$ , at the inputs to the sample-and-hold stage (pins INAM, INBM, INAP, and INBP) must be between 0.9 V and 2 V for optimal performance.

11.3 Clock input

11.3.1 Drive modes

The ADC1113D125 can be driven differentially (LVPECL). It can also be driven by a single-ended Low Voltage Complementary Metal Oxide Semiconductor (LVCMOS) signal connected to pin CLKP (pin CLKM should be connected to ground via a capacitor) or pin CLKM (pin CLKP should be connected to ground via a capacitor).

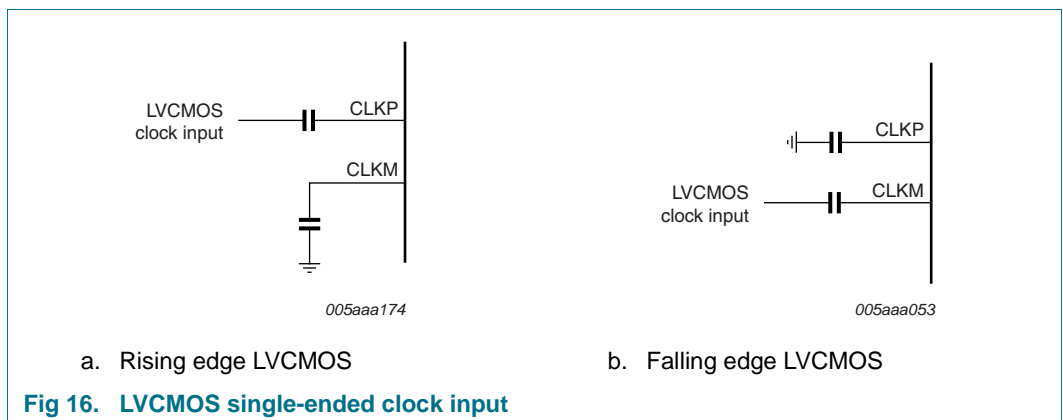

Fig 16. LVCMOS single-ended clock input

11.3.2 Equivalent input circuit

The equivalent circuit of the input clock buffer is shown in Figure 18. The common-mode voltage of the differential input stage is set via 5 kΩ internal resistors.

Single-ended or differential clock inputs can be selected via the SPI (see [Table 20](#)). If single-ended is selected, the input pin (CLKM or CLKP) is selected via control bit SE\_SEL.

If single-ended is implemented without setting bit SE\_SEL accordingly, the unused pin should be connected to ground via a capacitor.

**11.3.3 Clock input divider**

The ADC1113D125 contains an input clock divider that divides the incoming clock by a factor of 2 (when bit CLKDIV2\_SEL = logic 1; see [Table 20](#)). This feature allows the user to deliver a higher clock frequency with better jitter performance, leading to a better SNR result once acquisition has been performed.

**11.3.4 Duty cycle stabilizer**

The duty cycle stabilizer can improve the overall performances of the ADC by compensating the input clock signal duty cycle. When the duty cycle stabilizer is active (bit DCS\_EN = logic 1; see [Table 20](#)), the circuit can handle signals with duty cycles of between 30 % and 70 % (typical). When the duty cycle stabilizer is disabled (DCS\_EN = logic 0), the input clock signal should have a duty cycle of between 45 % and 55 %.

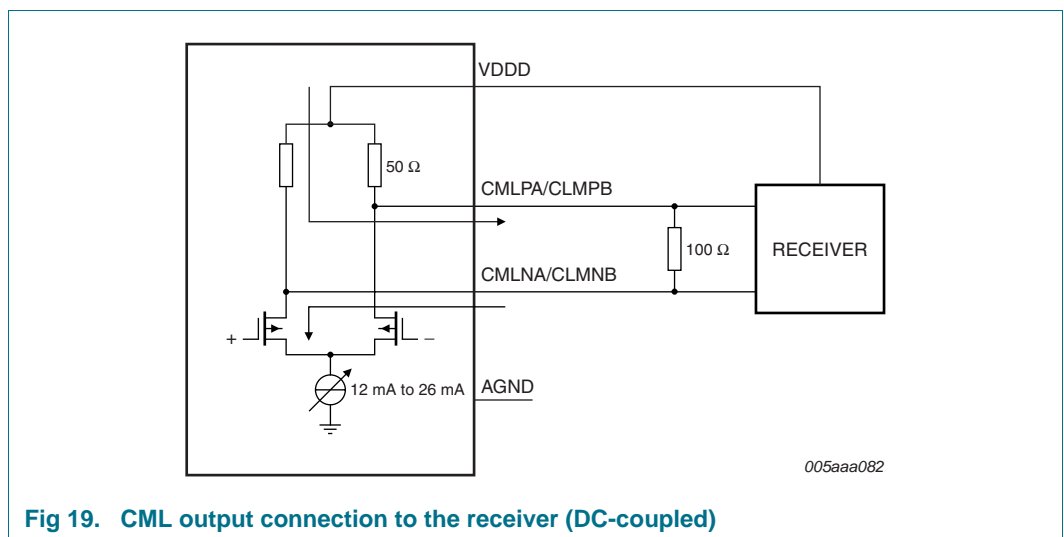

**Table 12. Duty cycle stabilizer**

Bit DCS_EN	Description
0	duty cycle stabilizer disable
1	duty cycle stabilizer enable

**11.4 Digital outputs**

**11.4.1 Serial output equivalent circuit**

The JESD204A standard specifies that if the receiver and the transmitter are DC-coupled, both must be fed from the same supply.

**Fig 19. CML output connection to the receiver (DC-coupled)**

The output should be terminated when 100 Ω (typical) is reached at the receiver side.

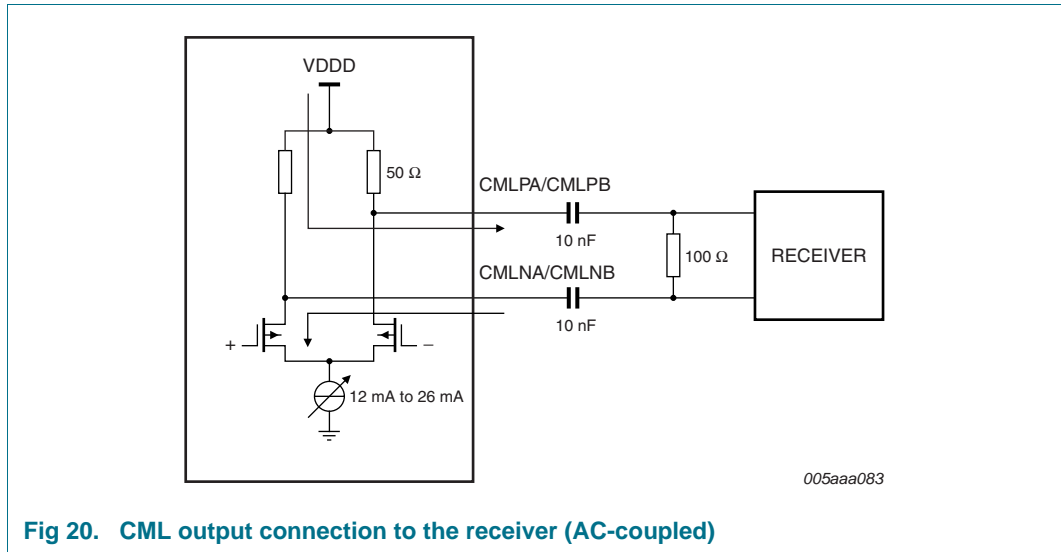

Fig 20. CML output connection to the receiver (AC-coupled)

### 11.5 JESD204A serializer

For more information about the JESD204A standard refer to the JEDEC web site.

#### 11.5.1 Digital JESD204A formatter

The block placed after the ADC cores is used to implement all functionalities of the JESD204A standard. This ensures signal integrity and guarantees the clock and the data recovery at the receiver side.

The block is highly parameterized and can be configured in various ways depending on the sampling frequency and the number of lanes used.

## 11.6 Serial Peripheral Interface (SPI)

### 11.6.1 Register description

The ADC1113D125 serial interface is a synchronous serial communications port allowing for easy interfacing with many industry microprocessors. It provides access to the registers that control the operation of the chip in both read and write modes.

This interface is configured as a 3-wire type (SDIO as bidirectional pin).

SCLK acts as the serial clock, and pin  $\overline{CS}$  acts as the serial chip select.

Each read/write operation is sequenced by the  $\overline{CS}$  signal and enabled by a LOW level to drive the chip with 2 bytes to 5 bytes, depending on the content of the instruction byte (see [Table 14](#)).

Table 14. SPI instruction bytes

Bit	MSB							LSB
	7	6	5	4	3	2	1	0
Description	R/W <sup>[1]</sup>	W1	W0	A12	A11	A10	A9	A8
	A7	A6	A5	A4	A3	A2	A1	A0

[1] R/W indicates whether a read (logic 1) or write (logic 0) transfer occurs after the instruction byte.

Table 15. Read or Write mode access description

R/W <sup>[1]</sup>	Description
0	Write mode operation
1	Read mode operation

[1] Bits W1 and W0 indicate the number of bytes transferred after the instruction byte.

Table 16. Number of bytes to be transferred

W1	W0	Number of bytes transferred
0	0	1 byte
0	1	2 bytes
1	0	3 bytes
1	1	4 or more bytes

Bits A12 to A0 indicate the address of the register being accessed. In the case of a multiple byte transfer, this address is the first register to be accessed. An address counter is incremented to access subsequent addresses.

The steps involved in a data transfer are as follows:

1. The falling edge on pin  $\overline{CS}$  in combination with a rising edge on pin SCLK determine the start of communications.
2. The first phase is the transfer of the 2-byte instruction.
3. The second phase is the transfer of the data which can vary in length but is always a multiple of 8 bits. The MSB is always sent first (for instruction and data bytes).
4. A rising edge on pin  $\overline{CS}$  indicates the end of data transmission.

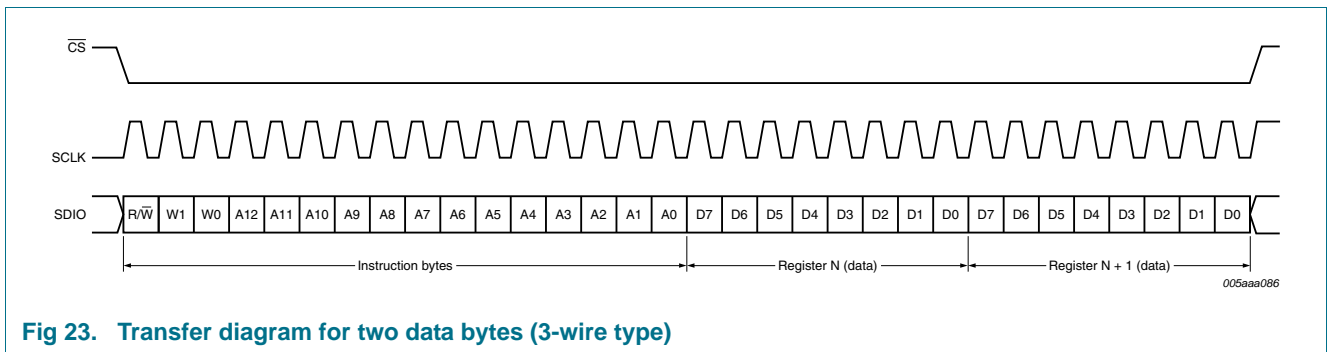

Fig 23. Transfer diagram for two data bytes (3-wire type)

### 11.6.2 Channel control

The two ADC channels can be configured at the same time or separately. By using the register “Channel index”, the user can choose which ADC channel receives the next SPI-instruction. By default the channel A and B receives the same instructions in write mode. In read mode only A is active.

Acronym	Description
ADC	Analog-to-Digital Converter
DCS	Duty Cycle Stabilizer
ESD	ElectroStatic Discharge
IF	Intermediate Frequency
IMD	InterModulation Distortion
LSB	Least Significant Bit
LVC MOS	Low Voltage Complementary Metal Oxide Semiconductor
LVPECL	Low-Voltage Positive Emitter-Coupled Logic
MSB	Most Significant Bit
OTR	Out-of-Range
PRBS	Pseudo-Random Binary Sequence
SFDR	Spurious-Free Dynamic Range
SNR	Signal-to-Noise Ratio
SPI	Serial Peripheral Interface
TX	Transmitter

## 15. Legal information

### 15.1 Data sheet status

Document status <sup>[1][2]</sup>	Product status <sup>[3]</sup>	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

### 15.2 Definitions

**Draft** — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

**Short data sheet** — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

**Product specification** — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

### 15.3 Disclaimers

**Limited warranty and liability** — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

**Right to make changes** — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

**Suitability for use** — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or

malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors accepts no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

**Limiting values** — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

**Terms and conditions of commercial sale** — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

**No offer to sell or license** — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

**Export control** — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from national authorities.

**Non-automotive qualified products** — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond

NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.
