LS2084A

QorIQ LS2084A/LS2044A Data Sheet

Features

- 64-bit Arm® Cortex®-A72 CPUs
  - LS2084A has eight A72 cores arranged as four clusters. Each cluster has two cores sharing a 1 MB L2 cache
  - LS2044A has four A72 cores arranged as two clusters. Each cluster has two cores sharing a 1 MB L2 cache
  - Up to 2.1 GHz
- 1 MB platform cache with ECC protection
- Hierarchical interconnect fabric
- Two 64-bit DDR4 SDRAM memory controllers with ECC and interleaving support
  - Up to 2.1 GT/s
- DPAA2 (Datapath acceleration architecture, second generation) incorporating acceleration for the following functions:
  - Wire-rate IO Processor(WRIOP) for packet parsing, classification, and distribution
  - Queue management for scheduling, packet sequencing, and congestion management; Hardware buffer management for buffer allocation and de-allocation (QBMan)
  - Cryptography acceleration (SEC 5.2) at up to 20 Gbps
  - RegEx pattern matching acceleration (PME 2.0) at up to 10 Gbps
  - Decompression/compression acceleration (DCE 1.0) at up to 20 Gbps
- qDMA engine
- 16 SerDes lanes at up to 10.3125 GHz
- Ethernet interfaces
  - Up to eight 10 Gbps Ethernet MACs
  - Up to sixteen 1 / 2.5 Gbps Ethernet MACs
- High-speed peripheral interfaces
  - Four PCIe 3.0 controllers. PCIe3 is capable of x8/x4/x2/x1 and SR-IOV and the other three (PCIe1, PCIe2 and PCIe4) are capable of x4/x2/x1 and do not support SR-IOV.
  - At platform speeds of 533 MHz or higher, there is no limitation to PCIe speed/width
  - At platform speed less than 533 MHz, all four PCIe controllers can run GEN1 and GEN2 speed at full width. For GEN3 speed, PCIe1/PCIe2/PCIe4 can only run x2 width, PCIe3 can only run x4 width.
- Additional peripheral interfaces
  - Two serial ATA (SATA 3.0) controllers
  - Two high-speed USB 3.0 controllers with integrated PHY
  - Enhanced secure digital host controller
  - Serial peripheral interface (SPI) controller
  - Quad Serial peripheral interface (QSPI) controller
  - Four I2C controllers
  - Two DUARTs
  - Integrated flash controller (IFC 2.0) supporting NAND and NOR flash
- Support for hardware virtualization and partitioning enforcement
- Implements trust architecture combined with TrustZone®
  - Service processor (SP) provides pre-boot initialization and secure-boot capabilities
- Automotive AEC-Q100 Grade 3 qualified (105°C Tj)
  - Maximum CPU speed 1.8 GHz, maximum DDR data rate 1.8 GT/s

1 Overview

The LS2084A and LS2044A have eight and four, respectively, Arm® Cortex®-A72 cores built on Armv8-A architecture with high-performance data path acceleration and network and peripheral bus interfaces required for networking, telecom/datacom, wireless infrastructure, and military/aerospace applications.

This chip can be used for combined control, data path, and application layer processing in routers, switches, gateways, and general-purpose embedded computing systems, including vehicle management servers, gateways, and Advanced Driver Assist Systems (ADAS). Its high level of integration offers significant performance benefits compared to multiple discrete devices, while also simplifying the board design.

This figure shows the block diagram of the chip.

1. Functionally, this pin is an output or an input, but structurally it is an I/O because it either sample configuration input during reset, is a muxed pin, or has other manufacturing test functions. This pin will therefore be described as an I/O for boundary scan.

2. This output is actively driven during reset rather than being tri-stated during reset.

3. MDIC[0] is grounded through an 162 Ω precision 1% resistor and MDIC[1] is connected to GV_{DD} through an 162 Ω precision 1% resistor. For either full or half driver strength calibration of DDR I/Os, use the same MDIC resistor value of 162 Ω. Memory controller register setting can be used to determine automatic calibration is done to full or half drive strength. These pins are used for automatic calibration of the DDR4 I/Os. The MDIC[0:1] pins must be connected to 162 Ω precision 1% resistors.

4. This pin is a reset configuration pin. It has a weak (~20 kΩ) internal pull-up P-FET that is enabled only when the processor is in its reset state. This pull-up is designed such that it can be overpowered by an external 4.7 kΩ resistor. However, if the signal is intended to be high after reset, and if there is any device on the net that might pull down the value of the net at reset, a pull-up or active driver is needed.

5. Pin must **NOT** be pulled down during power-on reset. This pin may be pulled up, driven high, or if there are any externally connected devices, left in tristate. If this pin is connected to a device that pulls down during reset, an external pull-up is required to drive this pin to a safe state during reset.

6. Recommend that a weak pull-up resistor (2-10 kΩ) be placed on this pin to the respective power supply.

7. This pin is an open-drain signal.

8. Recommend that a weak pull-up resistor (1 kΩ) be placed on this pin to the respective power supply.

9. This pin has a weak (~20 kΩ) internal pull-up P-FET that is always enabled.

10. These are test signals for factory use only and must be pulled up (1 kΩ) to the respective power supply for normal operation.

11. This pin requires a 200 Ω pull-up to respective power-supply.

12. Do not connect. These pins should be left floating.

13. TBSCAN_EN_B is an IEEE 1149.1 JTAG Compliance Enable pin. 0: To be compliant to the 1149.1 specification for boundary scan functions. The JTAG compliant state is documented in the BSDL. 1: JTAG connects to DAP controller for the ARM core debug. In normal operation, this pin must be pulled high to OVDD with 4.7 Kohm.

14. For LS2084A, this pin must be pulled high through 1 to 10 kΩ resistor to OVDD. For LS2044A, this pin must be pulled low through 1 to 10 kΩ resistor to GND.

15. These pins must be tied to ground (GND).

16. This pin requires a 698 Ω pull-up to respective power supply.

17. These pins should be tied to ground if the diode is not used for temperature monitoring. For details, see the Connection Recommendations section.

18. When the Dn_MDQS_B[9:17] pins are not used, terminate the pin with 50 Ω to VTT or 100 Ω to GND. When using a discrete x8 or x16 DRAM, place the termination close to the device pin. When the signals are connected to a DIMM connector that is used only by DIMMs with an x8 or x16 DRAM, terminate the pin close to the DIMM connector.

19. This pin must be powered up all the time, even when the secure boot is not used, or the secure boot is used without the low power feature.

20. This pin supplies power to both the USB1 and USB2 controllers. If any of USB1 or USB2 is used, this pin must be powered.

24. Recommend that a weak pull-up resistor (10-100 kΩ) be placed on this pin to the respective power supply.

25. This pin must be tied to GND through a 200 Ω 1% precision resistor.

27. The permissible voltage range is 0-5.5 V.

28. For proper clock selection, terminate cfg_eng_use0 with a pull up or pull down of 4.7 kΩ to ensure that the signal will have a valid state as soon as the IO voltage reach its operating condition.

29. When using discrete DRAM or RDIMM, the MALERT_B pin needs a 50 Ω to 100 Ω pull-up resistor to GVDD.

Warning

See **"Connection Recommendations"** for additional details on properly connecting these pins for specific applications.

3 Electrical characteristics

This section provides the AC and DC electrical specifications for the chip. The chip is currently targeted to these specifications, some of which are independent of the I/O cell but are included for a more complete reference. These are not purely I/O buffer design specifications.

3.1 Overall DC electrical characteristics

This section describes the ratings, conditions, and other characteristics.

3.1.1 Absolute maximum ratings

Notes:

1. Functional operating conditions are given in Table 3. Absolute maximum ratings are stress ratings only, and functional operation at the maximums is not guaranteed. Stresses beyond those listed may affect device reliability or cause permanent damage to the device.

2. Supply voltage specified at the voltage sense pin. Voltage input pins should be regulated to provide specified voltage at the sense pin.

Table 2. Absolute maximum ratings[1]

Characteristic	Symbol	Min Value	Max Value	Unit	Notes
3. **Caution:** MV_{IN} must not exceed GnV_{DD} by more than 0.3 V. This limit may be exceeded for a maximum of 20 ms during power-on reset and power-down sequences.					
4. SV_{IN}, USB_HV_{IN}, USB_SV_{IN} may overshoot/undershoot to a voltage and for a maximum duration as shown in Figure 7.					
5. **Caution:** OV_{IN} must not exceed OV_{DD} by more than 0.3 V. This limit may be exceeded for a maximum of 20 ms during power-on reset and power-down sequences.					

3.1.2 Recommended operating conditions

This table provides the recommended operating conditions for this chip.

NOTE

The values shown are the recommended operating conditions and proper device operation outside these conditions is not guaranteed.

	Secure boot fuse programming	T_A, T_J	T_A = 0 (min) to T_J = 70 (max)	°C	4

Notes:

1. See Voltage ID (VID) controllable supply in this document and "Core and platform supply voltage filtering" in the design checklist for additional information.

2. Supply voltage specified at the voltage sense pin. Voltage input pins should be regulated to provide specified voltage at the sense pin.

3. Operation at 1.1 V is allowable for up to 25 ms at initial power on.

4. TA_PROG_SFP must be supplied 1.80 V and the chip must operate in the specified fuse programming temperature range (0 - 70°C) only during secure boot fuse programming. For all other operating conditions, TA_PROG_SFP must be tied to GND, subject to the power sequencing constraints shown in Power sequencing.

5. Voltage ID (VID) operating range is between 0.90 to 1.05 V. Regulator selection should be based on Vout range of at least 0.875 to 1.1 V, with resolution of 12.5 mV or better.

6. For supported voltage requirement for a given part number, contact your NXP sales representative.

7. Only available on automotive grade parts

8. The Tj must not exceed 105°C. Proper thermal solution should be applied to meet this requirement.

This figure shows the undershoot and overshoot voltages at the interfaces of the chip.

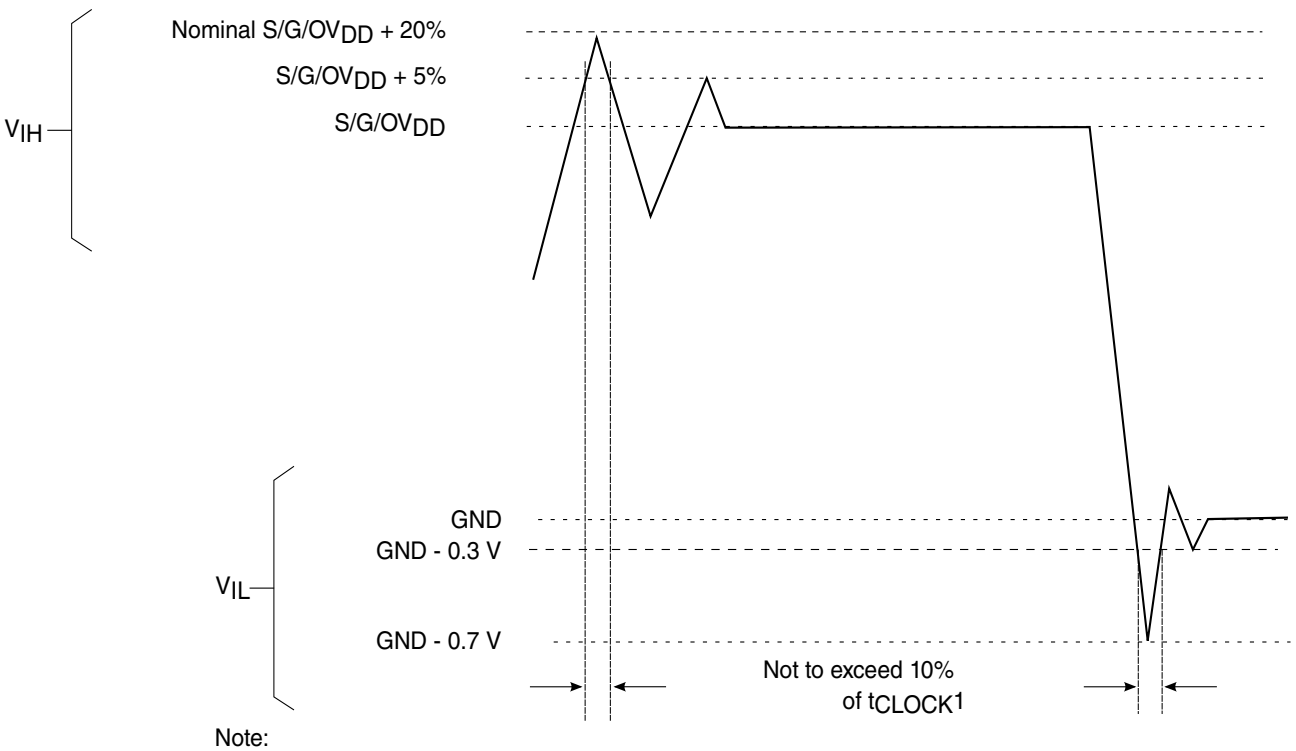

Figure 7. Overshoot/Undershoot voltage for $GV_{DD}/OV_{DD}/SV_{DD}$

The core and platform voltages must always be provided at nominal VID. See Table 3 for actual recommended core voltage. Voltage to the processor interface I/Os are provided through separate sets of supply pins and must be provided at the voltages shown in Table 3. The input voltage threshold scales with respect to the associated I/O supply voltage. OV_{DD} based receivers are simple CMOS I/O circuits and satisfy appropriate LVCMOS type specifications. The DDR SDRAM interface uses differential receivers referenced by the internally generated MV_{REF} signal. The DDR DQS receivers cannot be operated in single-ended fashion. The complement signal must be properly driven and cannot be grounded.

3.1.3 Output driver characteristics

This chip provides information on the characteristics of the output driver strengths.

NOTE

These values are preliminary estimates.

Table 4. Output drive capability

Driver type	Output impedance (Ω)	Supply voltage	Notes
DDR4 signal	18 (full-strength mode) 27 (half-strength mode)	GV_{DD} = 1.2 V	1
General I/O signals	45	OV_{DD} = 1.8 V	—
Notes: 1. The drive strength of the DDR4 interface in half-strength mode is at T_j = 105 °C and at GV_{DD} (min).			

3.2 Power sequencing

For power up, the following sequence should be followed:

1. VDD must reach 90% of its value before G*n*V_{DD} reaches 10% of its value. During V_{DD} ramping, PORESET_B must be held low and TA_PROG_SFP must be grounded. All other power supplies(OV_{DD}, USB_HV_{DD}, USB_SV_{DD}, USB_SDV_{DD}, SV_{DD}, XV_{DD}, TA_BB_V_{DD}, TH_V_{DD}, AV_{DD} (cores, platform, DDR), and AV_{DD}_SD*m*_PLL*n*) have no ordering requirement with respect to one another and with respect to V_{DD} and G*n*V_{DD}. All supplies must be at their stable values within 400 ms.
2. Negate PORESET_B input as long as the required assertion/hold time has been met per Table 19.
3. For secure boot fuse programming, use the following steps:
   a. After negation of PORESET_B, drive TA_PROG_SFP = 1.80 V after a required minimum delay per Table 5.
   b. After fuse programming is completed, it is required to return TA_PROG_SFP = GND before the system is power cycled (PORESET_B assertion) or powered down (V_{DD} ramp down) per the required timing specified in Table 5. See Security fuse processor, for additional details.

NOTE

If using Trust Architecture Security Monitor battery backed features, prior to V_{DD} ramping up to 0.5 V level, ensure that OV_{DD} is properly ramped and SYSCLK or DIFF_SYSCLK / DIFF_SYSCLK_B is running. The clock should have a minimum frequency of 800 MHz and a maximum frequency no greater than the supported system clock frequency for the device.

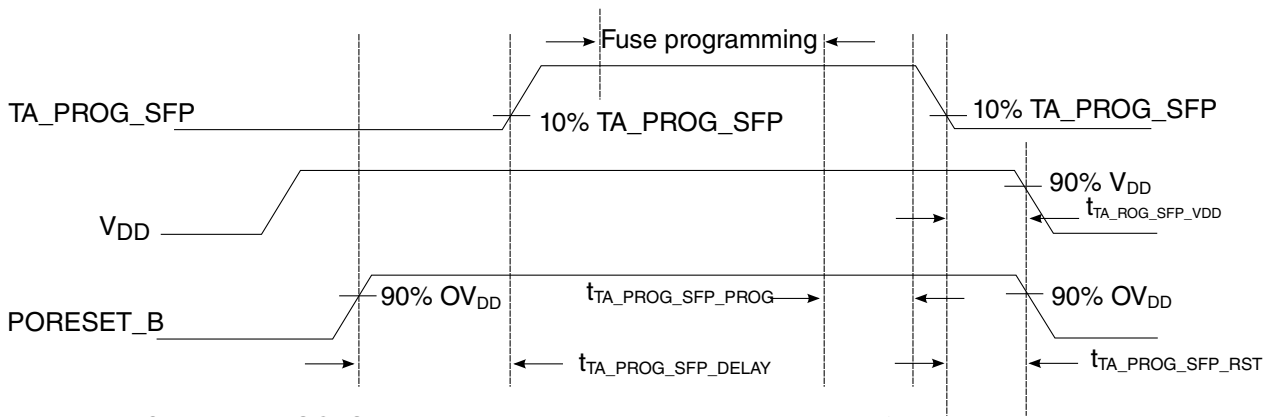
Warning

No activity other than that required for secure boot fuse programming is permitted while TA_PROG_SFP is driven to any voltage above GND, including the reading of the fuse block. The reading of the fuse block may only occur while TA_PROG_SFP = GND.

From a system standpoint, if any of the I/O power supplies ramp prior to the V_{DD} supplies, there will be a brief period as the V_{DD} powers up that the I/Os associated with that I/O supply may go from being tristated to an indeterminate state (either driven to a logic one or zero) and extra current may be drawn by the device.

Only 300,000 POR cycles are permitted per lifetime of a device. Note that this value is based on design estimates and is preliminary.

This figure provides the TA_PROG_SFP timing diagram.



NOTE: TA_PROG_SFP must be stable at 1.80 V prior to initiating fuse programming.

Figure 8. TA_PROG_SFP timing diagram

This table provides information on the power-down and power-up sequence parameters for TA_PROG_SFP.

Table 5. TA_PROG_SFP timing [5]

Driver type	Min	Max	Unit	Notes

$t_{TA\_PROG\_SFP\_PROG}$	0	—	µs	2
$t_{TA\_PROG\_SFP\_VDD}$	0	—	µs	3
$t_{TA\_PROG\_SFP\_RST}$	0	—	µs	4

Table continues on the next page...

Table 5. TA_PROG_SFP timing [5] (continued)

Driver type	Min	Max	Unit	Notes
1. Delay required from the de-assertion of PORESET_B to driving TA_PROG_SFP ramp up. Delay measured from PORESET_B deassertion at 90% OV_{DD} to 10% TA_PROG_SFP ramp up.				
2. Delay required from fuse programming finished to TA_PROG_SFP ramp down start. Fuse programming must complete while TA_PROG_SFP is stable at 1.80 V. No activity other than that required for secure boot fuse programming is permitted while TA_PROG_SFP driven to any voltage above GND, including the reading of the fuse block. The reading of the fuse block may only occur while TA_PROG_SFP = GND. After fuse programming is completed, it is required to return TA_PROG_SFP = GND.				
3. Delay required from TA_PROG_SFP ramp down complete to V_{DD} ramp down start. TA_PROG_SFP must be grounded to minimum 10% TA_PROG_SFP before V_{DD} is at 90% V_{DD}.				
4. Delay required from TA_PROG_SFP ramp down complete to PORESET_B assertion. TA_PROG_SFP must be grounded to minimum 10% TA_PROG_SFP before PORESET_B assertion reaches 90% OV_{DD}.				
5. Only two secure boot fuse programming events are permitted per lifetime of a device.				

Warning

TA_PROG_SFP ramp up slew rate must not exceed 18,000V/s. Ramp down does not have a slew rate constraint.

3.3 Power-down requirements

The power-down cycle must complete such that power supply values are below 0.4 V before a new power-up cycle can be started.

If performing secure boot fuse programming per Power sequencing, it is required that TA_PROG_SFP = GND before the system is power cycled (PORESET_B assertion) or powered down (V_{DD} ramp down) per the required timing specified in Table 5.

NOTE

All input signals, including I/Os that are configured as inputs, driven into the chip need to monotonically increase/decrease through entire rise/fall durations.

3.4 Power characteristics

These tables show the thermal power dissipation of the V_{DD} power supply for four A72 core/platform/DDR frequency combinations.

Table 6. LS2084A VDD power dissipation for the thermal design at 85C

A72 frequency (MHz)	Coherency domain frequency (MHz)	Platform frequency(MHz)	Main DDR data rate (MT/s)	V_{DD} (V)	Power (W)	Notes

Notes:

1. VDD must run at VID voltage level, which is defined in FUSESR register

2. Thermal power assumes Dhrystone running with activity factor of 60% (on all cores) and executing DMA on the platform at 100% activity factor.

3. Thermal power are based on worst-case processed device. The above powers are measured at the junction temperature of 85C.

4. Refer to AN4977 "QorIQ LS2088A Family Design Checklist":

Section 4.2 "Maximum VDD Power and IO Power" shows the maximum power dissipation across junction temperature range. This should be used as guide for power supply design and regulator sizing.

Section 7.23.1 "Thermal Power" shows the thermal power across junction temperature range. This data should be used thermal solution design.

5. Valid for part numbers with "7" in option code

The following table shows the estimated power saving for the low power modes.

Table 8. LS2084A/LS2044A low power mode power saving, 65ºC[1,2,3]

Low Power Mode		Core/Platform/DDR				Units	Comments	Notes
NXP	Arm®	2100/800/2133 MHz, VDD=1.0 V	2000/800/2133 MHz, VDD=1.0V	1800/700/1867 MHz, VDD=1.0 V	1600/600/1600 MHz, VDD=0.9 V			
PW15	STANDBYWFI/WFE	1.26	1.19	1.06	0.74	Watts	Saving realized moving from run to PW15 per core	4
PW20	STANDBYWFI/ WFE-retain	1.31	1.25	1.12	0.77	Watts	Saving realized moving from run to PW20 per core	4
PCL10	STANDBYWFIL2	0.20	0.19	0.19	0.14	Watts	Saving realized moving from PW15 or PW20 to PCL10 per cluster	
LPM20	—	0.75	0.74	0.71	0.47	Watts	Saving realized moving from PCL10 to LPM20 per device	

Notes:

1. Power for V_{DD} only.
2. Typical power assumes Dhrystone running with activity factor of 70%.
3. Typical power based on nominal process device.
4. PW15, PW20 power savings with one core. Maximum savings would be N times, where N is the number of used cores.

The following table shows the estimated power dissipation on the TA_BB_V_{DD} supply for the LS2084A/LS2044A at allowable voltage levels.

Table 9. TA_BB_V_{DD} power dissipation

Supply	Maximum	Unit	Notes
TA_BB_V_{DD} (LS2084A/LS2044A off, 70°C)	55	uW	1
TA_BB_V_{DD} (LS2084A/LS2044A off, 40°C)	40	uW	1

Notes:

1. When LS2084A/LS2044A is off, TA_BB_V_{DD} may be supplied by battery power to retain the Zeroizable Master Key and other trust architecture state. Board should implement a PMIC, which switches TA_BB_V_{DD} to battery when SoC powered down. See the LS2084A reference manual trust architecture chapter for more information.

3.5 Power-on ramp rate

This section describes the AC electrical specifications for the power-on ramp rate requirements. Controlling the maximum power-on ramp rate is required to avoid excess in-rush current.

This table provides the power supply ramp rate specifications.

Table 10. Power supply ramp rate

Parameter	Min	Max	Unit	Notes
Required ramp rate for all voltage supplies (including OV_{DD}/GnV_{DD}/SV_{DD}/XV_{DD}/ V_{DD}, all AV_{DD} supplies.)	—	25	V/ms	1, 2
Required ramp rate for TA_PROG_SFP	—	18	V/ms	1, 2

Notes:

1. Ramp rate is specified as a linear ramp from 10 to 90%. If non-linear (for example, exponential), the maximum rate of change from 200 to 500 mV is the most critical as this range might falsely trigger the ESD circuitry.
2. Over full recommended operating temperature range (see Table 3).

3.6 Input clocks

3.6.1 System clock (SYSCLK) timing specifications

This section provides the system clock DC and AC timing specifications.

3.6.1.1 System clock DC timing specifications

This table provides the system clock (SYSCLK) DC characteristics.

Table 11. SYSCLK DC electrical characteristics[3]

Characteristic	Symbol	Min	Typical	Max	Unit	Notes
Input high voltage	V_{IH}	1.2	—	—	V	1
Input low voltage	V_{IL}	—	—	0.6	V	1
Input capacitance	C_{IN}	—	7	12	pF	—
Input current (OV_{IN}= 0 V or OV_{IN} = OV_{DD})	I_{IN}	—	—	± 50	μA	2, 3

Note:

1. The min $V_{IL}$and max V_{IH} values are based on the respective min and max OV_{IN} values found in Table 3.
2. The symbol OV_{IN}, in this case, represents the OV_{IN} symbol referenced in Table 3.
3. At recommended operating conditions with OV_{DD} = 1.8 V, see Table 3.

3.6.1.2 System clock AC timing specifications

This table provides the system clock (SYSCLK) AC timing specifications.

Table 12. SYSCLK AC timing specifications[5]

Parameter/condition	Symbol	Min	Typ	Max	Unit	Notes
SYSCLK frequency	f_{SYSCLK}	83.3	—	133.3	MHz	1, 2
SYSCLK cycle time	t_{SYSCLK}	7.5	—	12	ns	1, 2
SYSCLK duty cycle	t_{KHK} / t_{SYSCLK}	40	—	60	%	2
SYSCLK slew rate	—	1	—	4	V/ns	3
SYSCLK peak period jitter	—	—	—	± 150	ps	—
SYSCLK jitter phase noise at -56 dBc	—	—	—	500	KHz	4
AC input swing limits	ΔV_{AC}	0.60 x OV_{DD}	—	OV_{DD}	V	—

Notes:

1. **Caution:** The relevant clock ratio settings must be chosen such that the resulting SYSCLK frequency do not exceed their respective maximum or minimum operating frequencies.
2. Measured at the rising edge and/or the falling edge at OV_{DD}/2.
3. Slew rate as measured from 0.35 x OV_{DD} to 0.65 x OV_{DD}.
4. Phase noise is calculated as FFT of TIE jitter.
5. At recommended operating conditions with OV_{DD} = 1.8V, see Table 3.

3.6.2 Spread-spectrum sources

Spread-spectrum clock sources are an increasingly popular way to control electromagnetic interference emissions (EMI) by spreading the emitted noise to a wider spectrum and reducing the peak noise magnitude in order to meet industry and government requirements. These clock sources intentionally add long-term jitter to diffuse the EMI spectral content.

The jitter specification given in this table considers short-term (cycle-to-cycle) jitter only. The clock generator's cycle-to-cycle output jitter should meet the chip's input cycle-to-cycle jitter requirement. Frequency modulation and spread are separate concerns; the chip is compatible with spread-spectrum sources if the recommendations listed in this table are observed.

Table 13. Spread-spectrum clock source recommendations[1]

Parameter	Min	Max	Unit	Notes
Frequency modulation	—	60	kHz	—

Table continues on the next page...

Table 13. Spread-spectrum clock source recommendations[1] (continued)

Parameter	Min	Max	Unit	Notes
Frequency spread	—	1.0	%	2, 3

Notes:

1. At recommended operating conditions with OV_{DD} = 1.8 V, see Table 3.
2. SYSCLK frequencies that result from frequency spreading and the resulting core frequency must meet the minimum and maximum specifications given in Table 12.
3. Maximum spread-spectrum frequency may not result in exceeding any maximum operating frequency of the device.

CAUTION

The processor's minimum and maximum SYSCLK and core/platform/DDR frequencies must not be exceeded regardless of the type of clock source. Therefore, systems in which the processor is operated at its maximum rated core/platform/DDR frequency should avoid violating the stated limits by using down-spreading only.

3.6.3 Differential System clock (DIFF_SYSCLK/DIFF_SYSCLK_B) timing specifications

Differential system clocking mode requires an onboard oscillator to provide reference clock input to Differential System clock pair (DIFF_SYSCLK/DIFF_SYSCLK_B).

This Differential clock pair can be configured to provide clock to Core, Platform and USB PLLs.

This figure shows a receiver reference diagram of the Differential System clock.

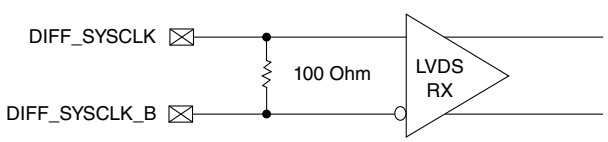

Figure 9. LVDS receiver

This section provides the differential system clock DC and AC timing specifications.

3.6.3.1 Differential System clock DC timing specifications

The differential system clock receiver voltage requirements are as specified in the Recommended operating conditions table.

The differential system clock can also be single-ended. For this, DIFF_SYSCLK_B should be connected to $OV_{DD}/2$.

This table provides the differential system clock (DIFF_SYSCLK/DIFF_SYSCLK_B) DC specifications.

Table 14. Differential system clock DC electrical characteristics[1]

Parameter	Symbol	Min	Typical	Max	Unit	Notes
Input differential voltage swing	V_{id}	100	-	600	mV	2
Input common mode voltage	V_{icm}	50	-	1570	mV	-
Power supply current	I_{cc}	-	-	5	mA	-
Input capacitance	C_{in}	1.45	1.5	1.55	pF	-

Note:

1. At recommended operating conditions with OV_{DD} = 1.8 V, see Table 3 for details.
2. Input differential voltage swing (Vid) specified is equal to |VDIFF_SYSCLK_P - VDIFF_SYSCLK_N|

3.6.3.2 Differential System clock AC timing specifications

Differential System clock(DIFF_SYSCLK/DIFF_SYSCLK_B) input pair supports input clock frequency of 83.3-133.3MHz

Spread spectrum clocking is not supported on differential system clock pair input.

This table provides the differential system clock (DIFF_SYSCLK/DIFF_SYSCLK_B) AC specifications.

Table 15. Differential system clock AC electrical characteristics[1]

Parameter	Symbol	Min	Typical	Max	Unit	Notes
DIFF_SYSCLK/DIFF_SYSCLK_B frequency range	t_{DIFF_SYSCLK}	83.3		133.3	MHz	-
DIFF_SYSCLK/DIFF_SYSCLK_B frequency tolerance	t_{DIFF_TOL}	-300	-	+300	ppm	-
Duty cycle	t_{DIFF_DUTY}	40	50	60	%	-
Clock period jitter (peak to peak)	t_{DIFF_TJ}	-	-	100	ps	1

Note:

1. This is evaluated with supply noise profile at +/- 5% sine wave
2. At recommended operating conditions with OV_{DD} = 1.8 V, see Table 3

3.6.4 USB reference clock specification

USB PHY needs a reference clock. There are two options for the reference clock: SYSCLK or DIFF_SYSCLK/DIFF_SYSCLK_B.

This table provides the additional requirements when SYSCLK or DIFF_SYSCLK/ DIFF_SYSCLK_B is used as USB REFCLK.

Table 16. REFCLK requirements for USB PHY

Parameter/condition	Symbol	Min	Typ	Max	Unit	Notes
REFCLK duty cycle	t_{KHK} / t_{SYSCLK}	45	—	55	—	—
REFCLK frequency	f_{SYSCLK}	—	100	—	MHz	—
REFCLK frequency offset	FREF_OFFSET	-300	—	300	ppm	—
REFCLK random jitter	RMSJREF_CLK	—	—	3	ps	1, 2
REFCLK cycle-to-cycle jitter	DJREF_CLK	-150		150	ps	3
Notes: 1. 1.5 MHz to Nyquist frequency. For example, for 100 MHz reference clock, the Nyquist frequency is 50 MHz. 2. The peak-to-peak Rj specification is calculated as 14.069 times the RMS Rj for 10-12 BER. 3. DJ across all frequencies.						

3.6.5 Real-time clock timing

The real-time clock timing (RTC) input is sampled by the platform clock. The output of the sampling latch is then used as an input to the time base unit of the core; there is no need for jitter specification. The minimum period of the RTC signal should be greater than or equal to 16x the period of the platform clock with a 50% duty cycle. There is no minimum RTC frequency; RTC may be grounded if not needed.

3.6.6 DDR clock timing

This section provides the DDR clock DC and AC timing specifications.

3.6.6.1 DDR clock DC electrical characteristics

This table provides the DDR clock (DDRCLK) DC electrical characteristics.

Table 17. DDRCLK DC electrical characteristics[3]

Characteristic	Symbol	Min	Typical	Max	Unit	Notes
Input high voltage	V_{IH}	1.25	—	—	V	1

Table continues on the next page...

Table 17. DDRCLK DC electrical characteristics[3] (continued)

Characteristic	Symbol	Min	Typical	Max	Unit	Notes
Input low voltage	V_{IL}	—	—	0.6	V	1
Input capacitance	C_{IN}	—	7	12	pF	—
Input current (OV_{IN}= 0 V or OV_{IN} = OV_{DD})	I_{IN}	—	—	± 50	μA	2

Note:

1. The min $V_{IL}$and max V_{IH} values are based on the respective min and max OV_{IN} values found in Table 3.
2. The symbol OV_{IN}, in this case, represents the OV_{IN} symbol referenced in Table 3.
3. At recommended operating conditions with OV_{DD} = 1.8 V, see Table 3.

3.6.6.2 DDR clock AC timing specifications

This table provides the DDR clock (DDRCLK) AC timing specifications.

Table 18. DDRCLK AC timing specifications[5]

Parameter/Condition	Symbol	Min	Typ	Max	Unit	Notes
DDRCLK frequency	f_{DDRCLK}	100	—	133.3	MHz	1, 2
DDRCLK cycle time	t_{DDRCLK}	7.5	—	10	ns	1, 2
DDRCLK duty cycle	t_{KHK} / t_{DDRCLK}	40	—	60	%	2
DDRCLK slew rate	—	1	—	4	V/ns	3
DDRCLK peak period jitter	—	—	—	± 150	ps	—
DDRCLK jitter phase noise at -56 dBc	—	—	—	500	kHz	4
AC Input Swing Limits	ΔV_{AC}	0.60 x OV_{DD}	—	OV_{DD}	V	—

Notes:

1. **Caution:** The relevant clock ratio settings must be chosen such that the resulting DDRCLK frequency do not exceed their respective maximum or minimum operating frequencies.
2. Measured at the rising edge and/or the falling edge at OV_{DD}/2.
3. Slew rate as measured from 0.35 x OV_{DD} to 0.65 x OV_{DD}.
4. Phase noise is calculated as FFT of TIE jitter.
5. At recommended operating conditions with OV_{DD} = 1.8 V, see Table 3.

3.6.7 Other input clocks

A description of the overall clocking of this device is available in the chip reference manual in the form of a clock subsystem block diagram. For information about the input clock requirements of functional modules sourced external of the chip, such as SerDes, see the specific interface section.

3.7 RESET initialization

This section describes the AC electrical specifications for the RESET initialization timing requirements. This table describes the AC electrical specifications for the RESET initialization timing.

Table 19. RESET initialization timing specifications

Parameter/Condition	Min	Max	Unit	Notes
Required assertion time of PORESET_B	1	—	ms	1
Required input assertion time of HRESET_B	32	—	SYSCLKs	2, 3
Maximum rise/fall time of HRESET_B	—	10	SYSCLK	4
Maximum rise/fall time of PORESET_B	—	1	SYSCLK	4
Input setup time for POR configs (other than cfg_eng_use0) with respect to negation of PORESET_B	4	—	SYSCLKs	2,5
Input hold time for all POR configs with respect to negation of PORESET_B	2	—	SYSCLKs	2
Maximum valid-to-high impedance time for actively driven POR configs with respect to negation of PORESET_B	—	5	SYSCLKs	2

Notes:

1. PORESET_B must be driven asserted before the core and platform power supplies are powered up.
2. SYSCLK is the primary clock input for the chip.
3. The device asserts HRESET_B as an output when PORESET_B is asserted to initiate the power-on reset process. The device releases HRESET_B sometime after PORESET_B is deasserted. The exact sequencing of HRESET_B deassertion is documented in section "Power-On Reset Sequence" in the chip reference manual.
4. System/board must be designed to ensure the input requirement to the device is achieved. Proper device operation is guaranteed for inputs meeting this requirement by design, simulation, characterization, or functional testing.
5. For proper clock selection, terminate cfg_eng_use0 with a pull up or pull down of 4.7 kΩ to ensure that the signal will have a valid state as soon as the IO voltage reach its operating condition.

3.8 DDR4 SDRAM controller

This section describes the DC and AC electrical specifications for the DDR4 SDRAM controller interface. Note that the required GV_{DD}(typ) voltage is 1.2 V when interfacing to DDR4 SDRAM.

NOTE

When operating at a DDR data rate of 1866 MT/s or higher, only one dual-ranked module per memory controller is supported.

3.8.1 DDR4 SDRAM interface DC electrical characteristics

This table provides the recommended operating conditions for the DDR SDRAM controller when interfacing to DDR4 SDRAM.

Table 20. DDR4 SDRAM interface DC electrical characteristics (GV_{DD} = 1.2 V)[7]

Parameter	Symbol	Min	Max	Unit	Notes
Input low	V_{IL}	—	0.7 x GV_{DD} - 0.175	V	3, 5
Input high	V_{IH}	0.7 x GV_{DD} + 0.175	—	V	3, 5
I/O leakage current	I_{OZ}	-165	165	µA	4

Notes:

1. GV_{DD} is expected to be within 60 mV of the DRAM's voltage supply at all times. The DRAM's and memory controller's voltage supply may or may not be from the same source.
2. V_{TT} and VREFCA are applied directly to the DRAM device. Both V_{TT} and VREFCA voltages must track $GV_{DD}/2$.
3. Input capacitance load for DQ, DQS, and DQS_B are available in the IBIS models.
4. Output leakage is measured with all outputs disabled, 0V ≤ VOUT ≤ GV_{DD}.
5. Internal Vref for data bus must be set to 0.7 x GV_{DD}.
6. See the IBIS model for the complete output IV curve characteristics.
7. For recommended operating conditions, see Table 3.

3.8.2 DDR4 SDRAM interface AC timing specifications

This section provides the AC timing specifications for the DDR SDRAM controller interface. The DDR controller supports DDR4 memories. Note that the required GV_{DD}(typ) voltage is 1.2 V when interfacing to DDR4 SDRAM.

3.8.2.1 DDR4 SDRAM interface input AC timing specifications

This table provides the input AC timing specifications for the DDR controller when interfacing to DDR4 SDRAM.

Table 21. DDR4 SDRAM interface input AC timing specifications (GV_{DD} = 1.2 V ± 5%)$_1$

Parameter	Symbol	Min	Max	Unit	Notes
AC input low voltage ≤ 2133 MT/s data rate	V_{ILAC}	—	0.7 x GV_{DD} - 0.175	V	—
AC input high voltage ≤ 2133 MT/s data rate	V_{IHAC}	0.7 x GV_{DD} + 0.175	—	V	—

Note:

1. For recommended operating conditions, see Table 3.

This table provides the input AC timing specifications for the DDR controller when interfacing to DDR4 SDRAM.

Table 22. DDR4 SDRAM interface input AC timing specifications (GV_{DD} = 1.2 V ± 5% for DDR4)[3]

Parameter	Symbol	Min	Max	Unit	Notes
Controller skew for MDQS-MDQ/MECC	t_{CISKEW}	—	—	ps	1
2133 MT/s data rate		-80	80		
1866 MT/s data rate		-93	93		
1600 MT/s data rate		-112	112		
1333 MT/s data rate		-125	125		
Tolerated Skew for MDQS-MDQ/MECC	t_{DISKEW}	—	—	ps	2
2133 MT/s data rate		-154	154		
1866 MT/s data rate		-175	175		
1600 MT/s data rate		-200	200		
1333 MT/s data rate		-250	250		

Notes:

1. t_{CISKEW} represents the total amount of skew consumed by the controller between MDQS[n] and any corresponding bit that is captured with MDQS[n]. This must be subtracted from the total timing budget.

2. The amount of skew that can be tolerated from MDQS to a corresponding MDQ signal is called t_{DISKEW}. This can be determined by the following equation: $t_{DISKEW} = \pm(T \div 4 - abs(t_{CISKEW}))$ where T is the clock period and $abs(t_{CISKEW})$ is the absolute value of t_{CISKEW}.

3. For recommended operating conditions, see Table 3.

This figure shows the DDR4 SDRAM interface input timing diagram.

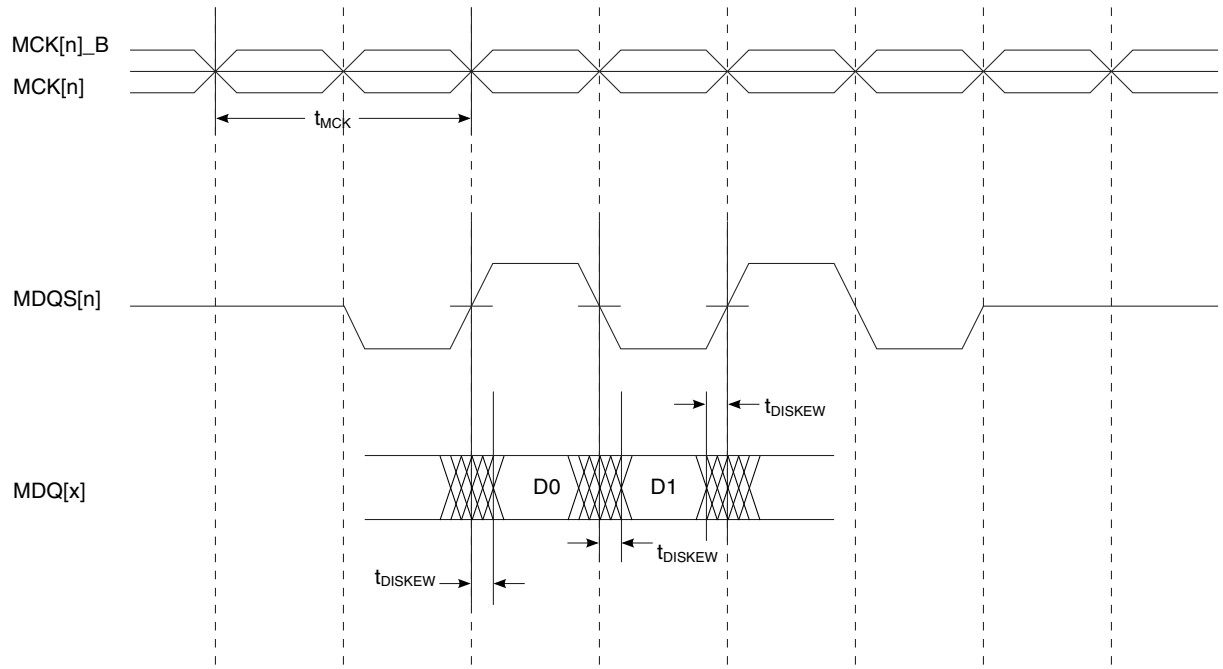

Figure 10. DDR4 SDRAM interface input timing diagram

3.8.2.2 DDR4 SDRAM interface output AC timing specifications

This table contains the output AC timing targets for the DDR4 SDRAM interface.

Table 23. DDR4 SDRAM interface output AC timing specifications (GV_{DD} = 1.2 V)[7]

Table continues on the next page...

Table 23. DDR4 SDRAM interface output AC timing specifications (GV_{DD} = 1.2 V)[7] (continued)

Parameter	Symbol[1]	Min	Max	Unit	Notes
1600 MT/s data rate		400	—		
1333 MT/s data rate		500	—		
MDQS preamble	t_{DDKHMP}	0.9 x t_{MCK}	—	ps	—
MDQS postamble	t_{DDKHME}	0.4 x t_{MCK}	0.6 x t_{MCK}	ps	—

1. The symbols used for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state) (reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. Output hold time can be read as DDR timing (DD) from the rising or falling edge of the reference clock (KH or KL) until the output went invalid (AX or DX). For example, t_{DDKHAS} symbolizes DDR timing (DD) for the time t_{MCK} memory clock reference (K) goes from the high (H) state until outputs (A) are setup (S) or output valid time. Also, t_{DDKLDX} symbolizes DDR timing (DD) for the time t_{MCK} memory clock reference (K) goes low (L) until data outputs (D) are invalid (X) or data output hold time.

2. All MCK/MCK_B and MDQS/MDQS_B referenced measurements are made from the crossing of the two signals.

3. ADDR/CMD/CNTL includes all DDR SDRAM output signals except MCK/MCK_B, MCS_B, and MDQ/MECC/MDM/MDQS.

4. Note that t_{DDKHMH} follows the symbol conventions described in note 1. For example, t_{DDKHMH} describes the DDR timing (DD) from the rising edge of the MCK[n] clock (KH) until the MDQS signal is valid (MH). t_{DDKHMH} can be modified through control of the MDQS override bits (called WR_DATA_DELAY) in the TIMING_CFG_2 register. This is typically set to the same delay as in DDR_SDRAM_CLK_CNTL[CLK_ADJUST]. The timing parameters listed in the table assume that these two parameters have been set to the same adjustment value. See the chip reference manual for a description and explanation of the timing modifications enabled by the use of these bits.

5. Available eye for data (MDQ), ECC (MECC), and data mask (MDM) outputs at the pin of the processor. Memory controller will center the strobe (MDQS) in the available data eye at the DRAM (end point) during the initialization.

6. Note that this is required to program the start value of the DQS adjust for write leveling.

7. For recommended operating conditions, see Table 3.

NOTE

For the ADDR/CMD/CNTL setup and hold specifications in Table 23, it is assumed that the clock control register is set to adjust the memory clocks by ½ applied cycle.

This figure shows the DDR4 SDRAM interface output timing for the MCK to MDQS skew measurement (t_{DDKHMH}).

3.10 QuadSPI interface

This section describes the DC and AC electrical characteristics for the QuadSPI interface.

3.10.1 QuadSPI DC electrical characteristics

This table provides the DC electrical characteristics for the QuadSPI interface operating at OV_{DD} = 1.8 V.

Table 26. QuadSPI DC electrical characteristics (1.8 V)[3]

Parameter	Symbol	Min	Max	Unit	Notes
Input high voltage	V_{IH}	0.7*OV_{DD}	—	V	1
Input low voltage	V_{IL}	—	0.2*OV_{DD}	V	1
Input current (0 V ≤ V_{IN} ≤)	I_{IN}	—	±50	μA	2
Output high voltage (I_{OH} = -100 μA)	V_{OH}	OV_{DD} - 0.2	—	V	—

Table continues on the next page...

Table 26. QuadSPI DC electrical characteristics (1.8 V)[3] (continued)

Parameter	Symbol	Min	Max	Unit	Notes
Output low voltage (I_{OL} = 100 µA)	V_{OL}	—	0.2	V	—

Notes:

1. The min V_{IL} and max V_{IH} values are based on the respective min and max OV_{IN} values found in Table 3.
2. The symbol V_{IN}, in this case, represents the OV_{IN} symbol referenced in Table 3.
3. At recommended operating conditions with OV_{DD} = 1.8 V.

3.10.2 QuadSPI AC timing specifications

This section describes the QuadSPI timing specifications in both SDR and DDR modes. All data is based on a negative edge data launch from the device and a positive edge data capture, as shown in the timing figures in this section.

3.10.2.1 QuadSPI timing SDR mode

This table provides the QuadSPI input and output timing in SDR mode (MCR[DQS_EN] = 0, regarding to the 1st sample point. See qSPI_SMPR[xSDLY, xSPHS] in the corresponding reference manual for different sampling points).

Table 27. SDR mode QuadSPI input and output timing

Parameter	Symbol	Min	Max	Unit

3.11 DUART interface

This section describes the DC and AC electrical specifications for the DUART interface.

3.11.1 DUART DC electrical characteristics

This table provides the DC electrical characteristics for the DUART interface at OV_{DD} = 1.8 V.

Table 30. DUART DC electrical characteristics(1.8 V)[3]

Parameter	Symbol	Min	Max	Unit	Notes
Input high voltage	V_{IH}	1.25	—	V	1
Input low voltage	V_{IL}	—	0.6	V	1
Input current (OV_{IN} = 0 V or OV_{IN} = OV_{DD})	I_{IN}	—	±50	μA	2
Output high voltage (OV_{DD} = min, I_{OH} = -0.5 mA)	V_{OH}	1.35	—	V	—
Output low voltage (OV_{DD} = min, I_{OL} = 0.5 mA)	V_{OL}	—	0.4	V	—
Notes:					

Table 30. DUART DC electrical characteristics(1.8 V)[3]

Parameter	Symbol	Min	Max	Unit	Notes
1. The min V_{IL} and max V_{IH} values are based on the min and max OV_{IN} respective values found in Table 3.					
2. The symbol OV_{IN} represents the input voltage of the supply. It is referenced in Table 3.					
3. For recommended operating conditions, see Table 3.					

3.11.2 DUART AC electrical specifications

This table provides the AC timing parameters for the DUART interface.

Table 31. DUART AC timing specifications

Parameter	Value	Unit	Notes
Minimum baud rate	f_{PLAT}/(2 x 1,048,576)	baud	1, 3
Maximum baud rate	f_{PLAT}/(2 x 16)	baud	1, 2
Notes:			
1. f_{PLAT} refers to the internal platform clock.			
2. The actual attainable baud rate is limited by the latency of interrupt processing.			
3. The middle of a start bit is detected as the eighth sampled 0 after the 1-to-0 transition of the start bit. Subsequent bit values are sampled each 16th sample.			

3.12 Ethernet management interface 1 and 2, IEEE Std 1588™

This section provides the AC and DC electrical characteristics for the Ethernet controller and the Ethernet management interfaces.

3.12.1 Ethernet management interface (EMI)

This section discusses the electrical characteristics for the EMI1 and EMI2 interfaces.

Both EMI1 and EMI2 interfaces support IEEE Std 802.3™ Clause 22 and Clause 45.

Note that both EMI1 and EMI2 are powered by 1.8V OV_{DD}, so external voltage level translators are needed to connect to PHY devices.

3.12.1.1 Ethernet management interface DC electrical characteristics

The DC electrical characteristics for EMI1_MDIO, EMI1_MDC, EMI2_MDIO and EMI2_MDC are provided in this section.

Table 32. Ethernet management interface DC electrical characteristics (OV_{DD} = 1.8 V)[3]

Parameters	Symbol	Min	Max	Unit	Notes
Input high voltage	V_{IH}	1.25	—	V	1
Input low voltage	V_{IL}	—	0.6	V	1
Input high current (V_{IN} = OV_{DD})	I_{IH}	—	50	μA	2
Input low current (V_{IN} = GND)	I_{IL}	-50	—	μA	—
Output high voltage (OV_{DD} = min, I_{OH} = -1.0 mA)	V_{OH}	1.35	OV_{DD} + 0.3	V	—
Output low voltage (OV_{DD} = min, I_{OL} = 1.0 mA)	V_{OL}	GND - 0.3	0.40	V	—

Notes:

1. The min $V_{IL}$and max V_{IH} values are based on the respective min and max OV_{IN} values found in Table 3.
2. The symbol V_{IN}, in this case, represents the OV_{IN} symbol referenced in Table 3.
3. For recommended operating conditions, see Table 3.

3.12.1.2 Ethernet management interface AC electrical specifications

This table provides the Ethernet management interface AC timing specifications.

Table 33. Ethernet management interface AC timing specifications[4]

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit	Notes
MDC frequency	f_{MDC}	—	—	5	MHz	2
MDC clock pulse width high	t_{MDCH}	80	—	—	ns	—
MDC to MDIO delay	t_{MDKHDX}	V - 3ns	—	V + 3ns	ns	3
MDIO to MDC setup time	t_{MDDVKH}	8	—	—	ns	—
MDIO to MDC hold time	t_{MDDXKH}	0	—	—	ns	—

Notes:

1. The symbols used for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{MDKHDX} symbolizes management data timing (MD) for the time t_{MDC} from clock reference (K) high (H) until data outputs (D) are invalid (X) or data hold time. Also, t_{MDDVKH} symbolizes management data timing (MD) with respect to the time data input signals (D) reach the valid state (V) relative to the t_{MDC} clock reference (K) going to the high (H) state or setup time.
2. This parameter is dependent on the Ethernet clock frequency (MDIO_CFG [MDIO_CLK_DIV] field determines the clock frequency of the MgmtClk Clock EC_MDC).
3. MDIO timing is configurable by programming MDIO_CFG. V value is determined by MDIO_CFG[NEG], MDIO_CFG[MDIO_HOLD] and MDIO[EHOL]. The easiest way is to program NEG=1, then MDIO is driven at negative edge of MDC, satisfying both setup and hold time reqirement of Ethernet PHY. If using MDIO_HOLD/EHOL to control the timing, enet_clk in the manual is equal to platform clock speed. See *Data Path Acceleration Architecture, Second Generation (DPAA2) Hardware Reference Manual*.
4. For recommended operating conditions, see Table 3.

3.12.2 IEEE 1588 electrical specifications

3.12.2.1 IEEE 1588 DC Electrical Characteristics

This table shows IEEE 1588 DC electrical characteristics when operating at OV_{DD} = 1.8 V supply.

Table 34. IEEE 1588 DC electrical characteristics (OV_{DD} = 1.8 V)[3]

Parameters	Symbol	Min	Max	Unit	Notes
Input high voltage	V_{IH}	1.25	—	V	1
Input low voltage	V_{IL}	—	0.6	V	1
Input current (OV_{IN}= 0 V or OV_{IN}= OV_{DD})	I_{IH}	—	±50	μA	2
Output high voltage (OV_{DD} = min, I_{OH} = -0.5 mA)	V_{OH}	1.35	OV_{DD} + 0.3	V	—
Output low voltage (OV_{DD} = min, I_{OL} = 0.5 mA)	V_{OL}	GND - 0.3	0.40	V	—

1. The min $V_{IL}$and max V_{IH} values are based on the respective min and max OV_{IN} values found in Table 3.

2. The symbol OV_{IN}, in this case, represents the OV_{IN} symbol referenced in Table 3.

3. For recommended operating conditions, see Table 3.

3.12.2.2 IEEE 1588 AC specifications

This table provides the IEEE 1588 AC timing specifications.

Table 35. IEEE 1588 AC timing specifications[2]

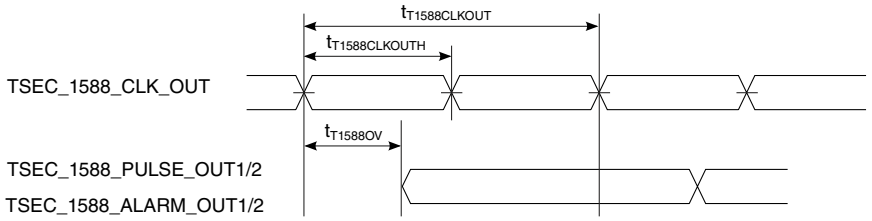
TSEC_1588_CLK_OUT duty cycle	$t_{T1588CLKOTH}$/ $t_{T1588CLKOUT}$	30	50	70	%	—
TSEC_1588_PULSE_OUT1/2, TSEC_1588_ALARM_OUT1/2	$t_{T1588OV}$	0.5	—	4.0	ns	—
TSEC_1588_TRIG_IN1/2 pulse width	$t_{T1588TRIGH}$	2 x $t_{T1588CLK}$	—	—	ns	1

Notes:

1. It needs to be at least two times the clock period of the clock selected by TMR_CTRL[CKSEL]. See the chip reference manual for a description of TMR_CTRL registers.

2. For recommended operating conditions, see Table 3.

This figure shows the data and command output AC timing diagram.



Note: The output delay is counted starting at the rising edge if $t_{T1588CLKOUT}$ is non-inverting. Otherwise, it is counted starting at the falling edge.

3.13 USB 2.0 interface

This section provides the AC and DC electrical specifications for the USB 2.0 interface.

3.13.1 USB 2.0 DC electrical characteristics

This table provides the DC electrical characteristics for the USB 2.0 interface at USB_HV_{DD} = 3.3 V.

Table 36. USB 2.0 DC electrical characteristics (USB_HV_{DD} = 3.3 V) [3]

Parameter	Symbol	Min	Max	Unit	Notes
Input high voltage	V_{IH}	2.0	-	V	1
Input low voltage	V_{IL}	-	0.8	V	1
Input current (USB_HV_{IN} = 0 V or USB_HV_{IN}= USB_HV_{DD})	I_{IN}	-	±50	μA	2
Output high voltage (USB_HV_{DD} = min, I_{OH} = -2 mA)	V_{OH}	2.8	-	V	-
Output low voltage (USB_HV_{DD} = min, I_{OL} = 2 mA)	V_{OL}	-	0.3	V	-

1. The min V_{IL} and max V_{IH} values are based on the respective min and max USB_HV_{IN} values found in Table 3.					
2. The symbol USB_HV_{IN}, in this case, represents the USB_HV_{IN} symbol referenced in Table 3					
3. For recommended operating conditions, see Table 3					

3.13.2 USB 2.0 AC timing specifications

This section describes the AC timing specifications for the on-chip USB PHY. See Chapter 7 in the *Universal Serial Bus Revision 2.0 Specification* for more information.

3.14 USB 3.0 interface

This section describes the DC and AC electrical specifications for the USB 3.0 interface.

3.14.1 USB 3.0 DC electrical characteristics

This table provides the USB 3.0 transmitter (Tx) DC electrical characteristics at package pins.

Table 37. USB 3.0 transmitter DC electrical characteristics[1]

Characteristic	Symbol	Min	Typ	Max	Unit
Differential output voltage	$V_{tx\text{-}diff\text{-}pp}$	800	1000	1200	$mV_{p\text{-}p}$
Low power differential output voltage	$V_{tx\text{-}diff\text{-}pp\text{-}low}$	400	—	1200	$mV_{p\text{-}p}$
Transmitter de-emphasis	$V_{tx\text{-}de\text{-}ratio}$	3	—	4	dB
Differential impedance	Z_{diffTX}	72	100	120	Ω
Transmitter common mode impedance	$R_{TX\text{-}DC}$	18	—	30	Ω
Absolute DC common mode voltage between U1 and U0	$T_{TX\text{-}CM\text{-}DC\text{-}ACTIVEIDLE\text{-}DELTA}$	—	—	200	mV
DC electrical idle differential output voltage	$V_{TX\text{-}IDLE\text{-}DIFF\text{-}DC}$	0	—	10	mV
Note:					
1. For recommended operating conditions, see Table 3.					

This table provides the USB 3.0 receiver DC electrical characteristics at the recieve package pins.

Table 38. USB 3.0 receiver DC electrical characteristics

Characteristic	Symbol	Min	Typ	Max	Unit	Notes
Differential receiver input impedance	$R_{RX-DIFF-DC}$	72	100	120	Ω	—
Receiver DC common mode impedance	R_{RX-DC}	18	—	30	Ω	—
DC input CM input impedance for V > 0 during reset or power down	$Z_{RX-HIGH-IMP-DC}$	25 K	—	—	Ω	—
LFPS detect threshold	$V_{RX-IDLE-DET-DC-DIFFpp}$	100	—	300	mV	1
Note: 1. Below the minimum is noise. Must wake up above the maximum.						

3.14.2 USB 3.0 AC timing specifications

3.15 Integrated flash controller

This section describes the DC and AC electrical specifications for the integrated flash controller.

3.15.1 Integrated flash controller DC electrical characteristics

This table provides the DC electrical characteristics for the integrated flash controller when operating at OV_{DD} = 1.8 V.

Table 42. Integrated flash controller DC electrical characteristics (OV_{DD} = 1.8 V)[3]

Parameter	Symbol	Min	Max	Unit	Note
Input high voltage	V_{IH}	1.2	-	V	1
Input low voltage	V_{IL}	-	0.6	V	1

Table continues on the next page...

Table 42. Integrated flash controller DC electrical characteristics (OV_{DD} = 1.8 V)[3] (continued)

Parameter	Symbol	Min	Max	Unit	Note
Input current (V_{IN} = 0 V or V_{IN} = OV_{DD})	I_{IN}	-	±50	μA	2
Output high voltage (OV_{DD} = min, I_{OH} = -0.5 mA)	V_{OH}	1.6	-	V	-
Output low voltage (OV_{DD} = min, I_{OL} = 0.5 mA)	V_{OL}	-	0.32	V	-

NOTE:

1. The min $V_{IL}$and max V_{IH} values are based on the respective min and max OV_{IN} values found in Table 3.
2. The symbol V_{IN}, in this case, represents the OV_{IN} symbol referenced in Table 3.
3. For recommended operating conditions, see Table 3.

3.15.2 Integrated flash controller AC timing specifications

This section describes the AC timing specifications for the integrated flash controller.

3.15.2.1 Test Condition

This figure provides the AC test load for the integrated flash controller.

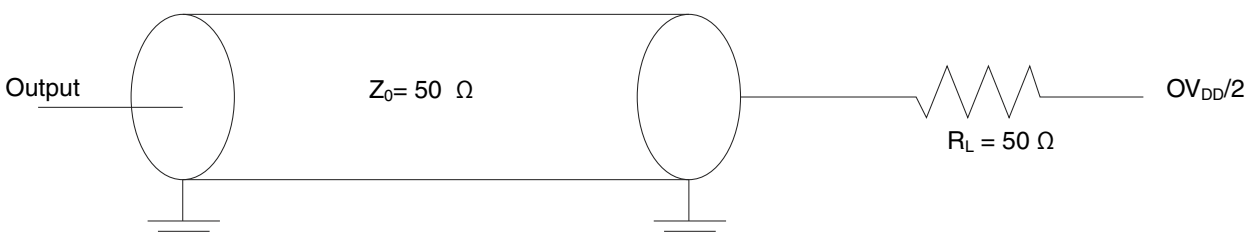

Figure 25. Integrated Flash Controller AC Test Load

3.15.2.2 IFC AC timing specifications (GPCM/GASIC)

This table describes the input AC timing specifications of the IFC-GPCM and IFC-GASIC interface.

Table 43. Integrated flash controller input timing specifications for GPCM and GASIC mode (OV_{DD} = 1.8 V)[1]

Parameter	Symbol	Min	Max	Unit	Notes

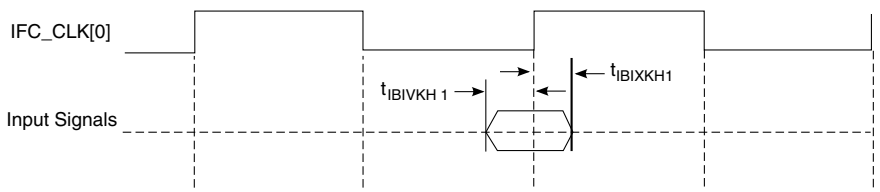

Figure 26. IFC-GPCM, IFC-GASIC input AC timings

This table describes the output AC timing specifications of IFC-GPCM and IFC-GASIC interface.

Table 44. Integrated flash controller IFC-GPCM and IFC-GASIC interface output timing specifications (OV_{DD} = 1.8 V)[2]

Parameter	Symbol	Min	Max	Unit	Notes
IFC_CLK cycle time	t_{IBK}	10	-	ns	-
IFC_CLK duty cycle	t_{IBKH}/t_{IBK}	45	55	%	-
Output delay	$t_{IBKLOV1}$	-	1.59	ns	-
Output hold	t_{IBKLOX}	-	-2	ns	1
IFC_CLK[0] to IFC_CLK[m] skew	$t_{IBKSKEW}$	0	±75	ps	-

NOTE:

1. Output hold is negative. This means that output transition happens earlier than the falling edge of IFC_CLK.
2. For recommended operating conditions, see Table 3.

This figure shows the output AC timing diagram for IFC-GPCM, IFC-GASIC interface.

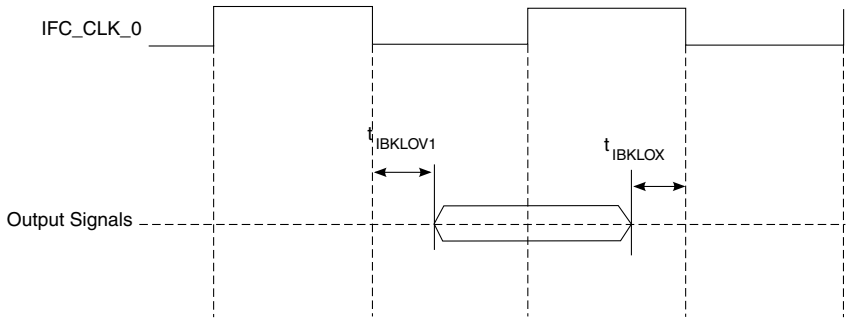

Figure 27. IFC-GPCM, IFC-GASIC signals

3.15.2.3 IFC AC timing specifications (NOR)

This table describes the input timing specifications of the IFC-NOR interface.

Table 45. Integrated Flash Controller input timing specifications for NOR mode (OV_{DD} = 1.8 V)[2]

Parameter	Symbol	Min	Max	Unit	Notes
Input setup	$t_{IBIVKH2}$	(2 x t_{IP_CLK}) + 2	—	ns	1
Input hold	$t_{IBIXKH2}$	(1 x t_{IP_CLK}) + 1	—	ns	1

Notes:

1. t_{IP_CLK} is the period of ip clock (not the IFC_CLK) on which IFC is running.
2. For recommended operating conditions, see Table 3.
3. The NOR flash state machine will de-assert OE_B once the flash controller samples data. Hold time given in the datasheet tIBIXKH2 is not a requirement for customer but rather an information used internally for test purpose.

This figure shows the AC input timing diagram for input signals of IFC-NOR interface. Here TRAD is a programmable delay parameter. See the IFC section of the reference manual for more information.

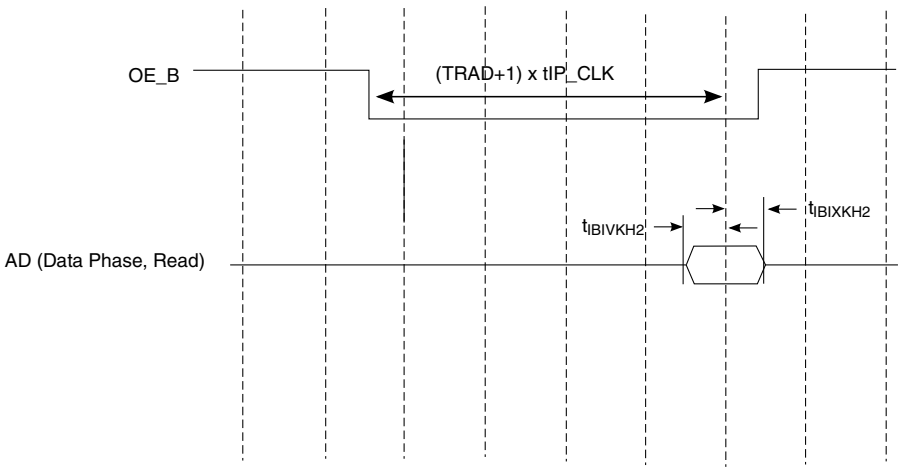

Figure 28. IFC-NOR Interface input AC timings

This table describes the output AC timing specifications of IFC-NOR interface.

Table 46. Integrated Flash Controller IFC-NOR interface output timing specifications (OV_{DD} = 1.8 V)[2]

Parameter	Symbol	Min	Max	Unit	Notes
Output delay	$t_{IBKLOV2}$	—	±1.5	ns	1

Notes:

1. This effectively means that a signal change may appear anywhere within $\pm t_{IBKLOV2}$ (max) duration, from the point where it's expected to change.
2. For recommended operating conditions, see Table 3.

This figure shows the AC timing diagram for output signals of IFC-NOR interface. The timing specs have been illustrated here by taking timings between two signals, CS_B and OE_B as an example. In a read operation, OE_B is supposed to change TACO (a programmable delay, see the IFC section of the reference manual for more information) time after CS_B. Because of skew between the signals, OE_B may change anywhere within the time window defined by $t_{IBKLOV2}$. This concept applies to other output signals of IFC-NOR interface, as well. The figure is an example to show the skew between any two chronological toggling signals as per the protocol. Here is the list of IFC-NOR output signals: NRALE, NRAVD_B, NRWE_B, NROE_B, CS_B, AD(Address phase).

3.15.2.4 IFC AC timing specifications (NAND)

This table describes the input timing specifications of the IFC-NAND interface.

Table 47. Integrated flash controller input timing specifications for NAND mode (OV_{DD} = 1.8 V)[2]

Parameter	Symbol	Min	Max	Unit	Notes
Input setup	$t_{IBIVKH3}$	(2 x t_{IP_CLK}) + 2	-	ns	1
Input hold	$t_{IBIXKH3}$	1	-	ns	1
IFC_RB_B pulse width	t_{IBCH}	2	-	t_{IP_CLK}	1
NOTE: 1. t_{IP_CLK} is the period of IP clock on which the IFC is running. 2. For recommended operating conditions, see Table 3.					

This figure shows the AC input timing diagram for IFC-NAND interface input signals. Note that TRAD is a programmable delay parameter. See the IFC section of the chip reference manual for more information.

Output delay	$t_{IBKLOV3}$	-	±1.55	ns	1
NOTE:					

Table 48. Integrated flash controller IFC-NAND interface output timing specifications (V_{DD} = 1.8 V)[2]

Parameter	Symbol	Min	Max	Unit	Notes
1. This effectively means that a signal change may appear anywhere within $t_{IBKLOV3}$ (min) to $t_{IBKLOV3}$ (max) duration, from the point where it is expected to change. 2. For recommended operating conditions, see Table 3.					

This figure shows the AC timing diagram for output signals of the IFC-NAND interface. The timing specifications illustrated here are derived by taking timings between two signals, for example, CS_B and CLE. CLE is expected to change TCCST (a programmable delay) time after CS_B. For more information, see the IFC section of the chip reference manual. Because of skew between the signals, CLE may change anywhere within the time window defined by $t_{IBKLOV3}$. This concept applies to other output signals of the IFC-NAND interface as well. The diagram is an example that shows the skew between any two chronological toggling signals, as per the protocol. The list of output signals is as follows: NDWE_B, NDRE_B, NDALE, WP_B, NDCLE, CS_B, and AD.

3.16 Enhanced secure digital host controller (eSDHC)

This section describes the DC and AC electrical specifications for the eSDHC interface.

3.16.1 eSDHC DC electrical characteristics

This table provides the DC electrical characteristics for the eSDHC interface.

Table 51. eSDHC interface DC electrical characteristics (dual-voltage cards)[3]

Characteristic	Symbol	Condition	Min	Max	Unit	Notes
Input high voltage	V_{IH}	—	0.7 x OV_{DD}	—	V	1
Input low voltage	V_{IL}	—	—	0.3 x OV_{DD}	V	1

Notes:					

Table 52. eSDHC AC timing specifications[6]

Parameter	Symbol[1]	Min	Max	Unit	Notes
1. The symbols used for timing specifications herein follow the pattern of $t_{\text{(first three letters of functional block)(signal)(state) (reference)(state)}}$ for inputs and $_{\text{(first three letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, $t_{FHSKHOV}$ symbolizes eSDHC high-speed mode device timing (SHS) clock reference (K) going to the high (H) state, with respect to the output (O) reaching the invalid state (X) or output hold time. Note that in general, the clock reference symbol is based on five letters representing the clock of a particular functional. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall). 2. In full-speed mode, the clock frequency value can be 0-25 MHz for an SD/SDIO card and 0-20 MHz for an MMC card. In high-speed mode, the clock frequency value can be 0-50 MHz for an SD/SDIO card and 0-52 MHz for an MMC card. 3. To satisfy setup timing, one-way board-routing delay between Host and Card, on SD_CLK, SD_CMD, and SD_DATx should not exceed 1 ns for any high speed MMC card. For any high speed or default speed mode SD card, the one way board routing delay between Host and Card, on SD_CLK, SD_CMD, and SD_DATx should not exceed 1.5ns. 4. $C_{CARD} \leq 10$ pF, (1 card), and $C_L = C_{BUS} + C_{HOST} + C_{CARD} \leq 40$ pF. 5. The parameter values apply to both full-speed and high-speed modes. 6. For recommended operating conditions, see Table 3.

3.17 Generic interrupt controller (GIC)

This section describes the DC and AC electrical specifications for the generic interrupt controller.

3.17.1 GIC DC characteristics

This figure provides the DC electrical characteristics for IRQ[0:11] and EVT[0:9]_B.

Table 54. GIC DC electrical characteristics (OV_{DD} = 1.8 V)[3]

Characteristic	Symbol	Min	Max	Unit	Notes
Input high voltage	V_{IH}	1.2	—	V	1
Input low voltage	V_{IL}	—	0.6	V	1
Input current (OV_{IN} = 0 V or OV_{IN} = OV_{DD})	I_{IN}	—	±50	μA	2
Output high voltage (OV_{DD} = min, I_{OH} = -0.5 mA)	V_{OH}	1.35	—	V	—

Table continues on the next page...

Table 54. GIC DC electrical characteristics (OV_{DD} = 1.8 V)[3] (continued)

Characteristic	Symbol	Min	Max	Unit	Notes
Output low voltage (OV_{DD} = min, I_{OL} = 0.5 mA)	V_{OL}	—	0.4	V	—

Note:

1. The min $V_{IL}$and max V_{IH} values are based on the min and max OV_{IN} respective values found in Table 3.
2. The symbol OV_{IN}, in this case, represents the OV_{IN} symbol referenced in Table 3.
3. For recommended operating conditions, see Table 3.

3.17.2 GIC AC timing specifications

This table provides the GIC input and output AC timing specifications for IRQ[0:11] and EVT[0:9]_B.

Table 55. GIC Input AC timing specifications[2]

Characteristic	Symbol	Min	Max	Unit	Notes
GIC inputs-minimum pulse width	t_{PIWID}	3	—	SYSCLKs	1

1. GIC inputs and outputs are asynchronous to any visible clock. GIC outputs must be synchronized before use by any external synchronous logic. GIC inputs are required to be valid for at least t_{PIWID} ns to ensure proper operation when working in edge triggered mode.
2. For recommended operating conditions, see Table 3.

3.18 JTAG controller

This section describes the DC and AC electrical specifications for the IEEE 1149.1 (JTAG) interface.

3.18.1 JTAG DC electrical characteristics

This table provides the JTAG DC electrical characteristics.

Table 56. JTAG DC electrical characteristics (OV_{DD} = 1.8V)[3]

Parameter	Symbol	Min	Max	Unit	Notes
Input high voltage	V_{IH}	1.2	—	V	1
Input low voltage	V_{IL}	—	0.6	V	1
Input current (OV_{IN} = 0 V or OV_{IN} = OV_{DD})	I_{IN}	—	-100/+50	µA	2,4

Parameter	Symbol	Min	Max	Unit	Notes
Output low voltage (OV_{DD} = min, I_{OL} = 0.5 mA)	V_{OL}	—	0.4	V	—

Notes:

1. The min $V_{IL}$and max V_{IH} values are based on the respective min and max OV_{IN} values found in Table 3.
2. The symbol V_{IN}, in this case, represents the OV_{IN} symbol found in Table 3.
3. For recommended operating conditions, see Table 3.
4. TDI, TMS, TRST_B have internal pull-ups per IEEE Std 1149.1 specification.

3.18.2 JTAG AC timing specifications

This table provides the JTAG AC timing specifications as defined in Figure 60 through Figure 63.

Table 57. JTAG AC timing specifications[4]

Parameter	Symbol[1]	Min	Max	Unit	Notes
JTAG external clock frequency of operation	f_{JTG}	0	33.3	MHz	—
JTAG external clock cycle time	t_{JTG}	30	—	ns	—
JTAG external clock pulse width measured at 1.4 V	t_{JTKHKL}	15	—	ns	—
JTAG external clock rise and fall times	t_{JTGR}/t_{JTGF}	0	2	ns	—
TRST_B assert time	t_{TRST}	25	—	ns	2
Input setup times	t_{JTDVKH}	4	—	ns	
Input hold times	t_{JTDXKH}	10	—	ns	—
Output valid times	t_{JTKLDV}			ns	3
Boundary-scan data		—	15		
TDO		—	10		
Output hold times	t_{JTKLDX}	0	—	ns	3

Notes:

1. The symbols used for timing specifications follow the pattern $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{JTDVKH} symbolizes JTAG device timing (JT) with respect to the time data input signals (D) reaching the valid state (V) relative to the t_{JTG} clock reference (K) going to the high (H) state or setup time. Also, t_{JTDXKH} symbolizes JTAG timing (JT) with respect to the time data input signals (D) reaching the invalid state (X) relative to the t_{JTG} clock reference (K) going to the high (H) state. Note that in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. TRST_B is an asynchronous level sensitive signal. The setup time is for test purposes only.
3. All outputs are measured from the midpoint voltage of the falling edge of t_{TCLK} to the midpoint of the signal in question. The output timings are measured at the pins. All output timings assume a purely resistive 50-Ω load. Time-of-flight delays must be added for trace lengths, vias, and connectors in the system.
4. For recommended operating conditions, see Table 3.

3.19 I²C interface

This section describes the DC and AC electrical characteristics for the I²C interface.

3.19.1 I²C DC electrical characteristics

This table provides the DC electrical characteristics for the I²C interfaces operating at 1.8 V.

Table 58. I²C DC electrical characteristics (OV_{DD} = 1.8 V)[4]

Parameter	Symbol	Min	Max	Unit	Notes
Input high voltage	V_{IH}	1.25	—	V	1
Input low voltage	V_{IL}	—	0.6	V	1
Output low voltage (OV_{DD} = min, I_{OL} = 2 mA)	V_{OL}	0	0.36	V	
Pulse width of spikes which must be suppressed by the input filter	t_{I2KHKL}	0	50	ns	2

Capacitance for each I/O pin	C_I	—	10	pF	—

Notes:

1. The min $V_{IL}$and max V_{IH} values are based on the respective min and max OV_{IN} values found in Table 3.
2. See the chip reference manual for information about the digital filter used.
3. I/O pins obstruct the SDA and SCL lines if OV_{DD} is switched off.
4. For recommended operating conditions, see Table 3.

3.19.2 I²C AC timing specifications

This table provides the AC timing parameters for the I²C interfaces.

Notes:

1. The symbols used for timing specifications herein follow the pattern $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{I2DVKH} symbolizes I²C timing (I2) with respect to the time data input signals (D) reaching the valid state (V) relative to the t_{I2C} clock reference (K) going to the high (H) state or setup time. Also, t_{I2SXKL} symbolizes I²C timing (I2) for the time that the data with respect to the START condition (S) went invalid (X) relative to the t_{I2C} clock reference (K) going to the low (L) state or hold time. Also, t_{I2PVKH} symbolizes I²C timing (I2) for the time that the data with respect to the STOP condition (P) reaches the valid state (V) relative to the t_{I2C} clock reference (K) going to the high (H) state or setup time.

2. The requirements for I²C frequency calculation must be followed. See *Determining the I²C Frequency Divider Ratio for SCL* (AN2919).

3. As a transmitter, the chip provides a delay time of at least 300 ns for the SDA signal (referred to the V_{IHmin} of the SCL signal) to bridge the undefined region of the falling edge of SCL to avoid unintended generation of a START or STOP condition. When the chip acts as the I²C bus master while transmitting, it drives both SCL and SDA. As long as the load on SCL and SDA are balanced, the chip does not generate an unintended START or STOP condition. Therefore, the 300 ns SDA output delay time is not a concern. If, under some rare condition, the 300 ns SDA output delay time is required for the chip as transmitter, see *Determining the I²C Frequency Divider Ratio for SCL* (AN2919).

4. The maximum t_{I2OVKL} has to be met only if the device does not stretch the LOW period (t_{I2CL}) of the SCL signal.

5. For recommended operating conditions, see Table 3.

3.22 High-speed serial interfaces (HSSI)

The chip features a serializer/deserializer (SerDes) interface to be used for high-speed serial interconnect applications. The SerDes interface can be used for PCI Express, SATA, XAUI, XFI, SGMII, and QSGMII data transfers.

This section describes the common portion of SerDes DC electrical specifications: the DC requirement for SerDes reference clocks. The SerDes data lane's transmitter (Tx) and receiver (Rx) reference circuits are also shown.

3.22.1 Signal terms definition

The SerDes uses differential signaling to transfer data across the serial link. This section defines the terms that are used in the description and specification of differential signals.

This figure shows how the signals are defined. For illustration purposes only, one SerDes lane is used in the description. This figure shows the waveform for either a transmitter output (SD_TX*n*_P and SD_TX*n*_N) or a receiver input (SD_RX*n*_P and SD_RX*n*_N). Each signal swings between A volts and B volts where A > B.

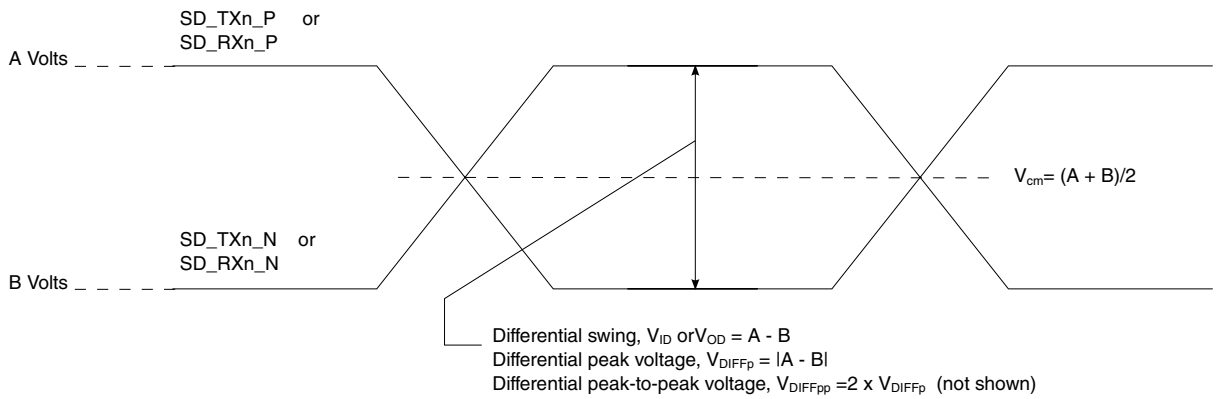

Figure 67. Differential voltage definitions for transmitter or receiver

Using this waveform, the definitions are as shown in the following list. To simplify the illustration, the definitions assume that the SerDes transmitter and receiver operate in a fully symmetrical differential signaling environment:

Single-Ended Swing

The transmitter output signals and the receiver input signals SD_TX*n*_P, SD_TX*n*_N, SD_RX*n*_P and SD_RX*n*_N each have a peak-to-peak swing of A - B volts. This is also referred as each signal wire's single-ended swing.

Differential Output Voltage, V_{OD} (or Differential Output Swing)

The differential output voltage (or swing) of the transmitter, V_{OD}, is defined as the difference of the two complementary output voltages: $V_{SD\_TXn\_P}$- $V_{SD\_TXn\_N.}$ The V_{OD} value can be either positive or negative.

Differential Input Voltage, V_{ID} (or Differential Input Swing)

The differential input voltage (or swing) of the receiver, V_{ID}, is defined as the difference of the two complementary input voltages: $V_{SD\_RXn\_P}$- $V_{SD\_RXn\_N.}$ The V_{ID} value can be either positive or negative.

Differential Peak Voltage, V_{DIFFp}

The peak value of the differential transmitter output signal or the differential receiver input signal is defined as the differential peak voltage, $V_{DIFFp} = |A - B|$ volts.

Differential Peak-to-Peak, $V_{DIFFp-p}$

Since the differential output signal of the transmitter and the differential input signal of the receiver each range from A - B to -(A - B) volts, the peak-to-peak value of the differential transmitter output signal or the differential receiver input signal is defined as differential peak-to-peak voltage, $V_{DIFFp-p} = 2 \times V_{DIFFp} = 2 \times |(A - B)|$ volts, which is twice the differential swing in amplitude, or twice of the differential peak. For example, the output differential peak-to-peak voltage can also be calculated as $V_{TX-DIFFp-p} = 2 \times |V_{OD}|$.

Differential Waveform

The differential waveform is constructed by subtracting the inverting signal (SD_TX*n*_N, for example) from the non-inverting signal (SD_TX*n*_P, for example) within a differential pair. There is only one signal trace curve in a differential waveform. The voltage represented in the differential waveform is not referenced to ground. See Figure 72 as an example for differential waveform.

Common Mode Voltage, V_{cm}

The common mode voltage is equal to half of the sum of the voltages between each conductor of a balanced interchange circuit and ground. In this example, for SerDes output, $V_{cm\_out} = (V_{SD\_TXn\_P} + V_{SD\_TXn\_N}) \div 2 = (A + B) \div 2$, which is the arithmetic mean of the two complementary output voltages within a differential pair. In a system, the common mode voltage may often differ from one component's output to the other's input. It may be different between the receiver input and driver output circuits within the same component. It is also referred to as the DC offset on some occasions.

To illustrate these definitions using real values, consider the example of a current mode logic (CML) transmitter that has a common mode voltage of 2.25 V and outputs, TD and TD_B. If these outputs have a swing from 2.0 V to 2.5 V, the peak-to-peak voltage swing of each signal (TD or TD_B) is 500 mV p-p, which is referred to as the single-ended swing for each signal. Because the differential signaling environment is fully symmetrical in this example, the transmitter output's differential swing (V_{OD}) has the same amplitude as each signal's single-ended swing. The differential output signal ranges between 500 mV and -500 mV. In other words, V_{OD} is 500 mV in one phase and -500 mV in the other phase. The peak differential voltage (V_{DIFFp}) is 500 mV. The peak-to-peak differential voltage ($V_{DIFFp-p}$) is 1000 mV p-p.

3.22.2 SerDes reference clocks

The SerDes reference clock inputs are applied to an internal PLL whose output creates the clock used by the corresponding SerDes lanes. The SerDes reference clocks inputs are SD1_REF_CLK[1:2]_P and SD1_REF_CLK[1:2]_N for SerDes 1, SD2_REF_CLK[1:2]_P and SD2_REF_CLK[1:2]_N for SerDes 2.

SerDes 1-2 may be used for various combinations of the following IP blocks based on the RCW Configuration field SRDS_PRTCLn:

- SerDes 1: XFI, XAUI, SGMII, QSGMII, PCIe
- SerDes 2: PCIe, SGMII, SATA

The following sections describe the SerDes reference clock requirements and provide application information.

3.22.2.1 SerDes spread-spectrum clock source recommendations

SDn_REF_CLKn_P/SDn_REF_CLKn_N are designed to work with spread-spectrum clock for PCI Express protocol only with the spreading specification defined in Table 64. When using spread-spectrum clocking for PCI Express, both ends of the link partners should use the same reference clock. For best results, a source without significant unintended modulation must be used.

For SATA protocol, the SerDes transmitter does not support spread-spectrum clocking. The SerDes receiver does support spread-spectrum clocking on receive, which means the SerDes receiver can receive data correctly from a SATA serial link partner using spread-spectrum clocking

The spread-spectrum clocking cannot be used if the same SerDes reference clock is shared with other non-spread-spectrum supported protocols. For example, if the spread-spectrum clocking is desired on a SerDes reference clock for PCI Express and the same reference clock is used for any other protocol such as SATA/SGMII/QSGMII/XAUI/XFI due to the SerDes lane usage mapping option, spread-spectrum clocking cannot be used at all.

Parameter	Min	Max	Unit	Notes
Frequency modulation	30	33	kHz	—
Frequency spread	+0	-0.5	%	2

Notes:

1. At recommended operating conditions. See Table 3.
2. Only down-spreading is allowed.

3.22.2.2 SerDes reference clock receiver characteristics

This figure shows a receiver reference diagram of the SerDes reference clocks.

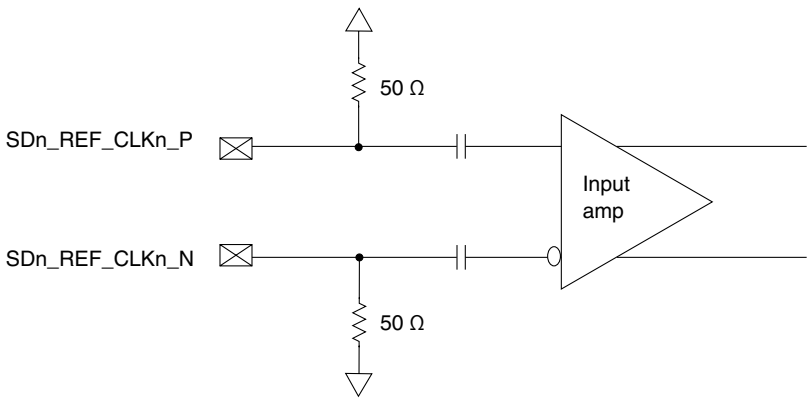

Figure 68. Receiver of SerDes reference clocks

The characteristics of the clock signals are as follows:

- The SerDes transceivers core power supply voltage requirements ($SV_{DD}n$) are as specified in Table 3.
- The SerDes reference clock receiver reference circuit structure is as follows:
  - The are internally AC-coupled differential inputs as shown in Figure 68. Each differential clock input (SD*n*_REF_CLK*n*_P or SD*n*_REF_CLK*n*_N) has on-chip 50-Ω termination to SD_GND followed by on-chip AC-coupling.
  - The external reference clock driver must be able to drive this termination.
  - The SerDes reference clock input can be either differential or single-ended. See the differential mode and single-ended mode descriptions below for detailed requirements.
- The maximum average current requirement also determines the common mode voltage range.
  - When the SerDes reference clock differential inputs are DC coupled externally with the clock driver chip, the maximum average current allowed for each input pin is 8 mA. In this case, the exact common mode input voltage is not critical as long as it is within the range allowed by the maximum average current of 8 mA because the input is AC-coupled on-chip.
  - This current limitation sets the maximum common mode input voltage to be less than 0.4 V (0.4 V ÷ 50 = 8 mA) while the minimum common mode input level is 0.1 V above SD_GND. For example, a clock with a 50/50 duty cycle can be produced by a clock driver with output driven by its current source from 0 mA to

16 mA (0-0.8 V), such that each phase of the differential input has a single-ended swing from 0 V to 800 mV with the common mode voltage at 400 mV.
  - If the device driving the SD*n*_REF_CLK*n*_P and SD*n*_REF_CLK*n*_N inputs cannot drive 50 Ω to SD_GND DC or the drive strength of the clock driver chip exceeds the maximum input current limitations, it must be AC-coupled off-chip.
- The input amplitude requirement is described in detail in the following sections.

3.22.2.3 DC-level requirement for SerDes reference clocks

The DC level requirement for the SerDes reference clock inputs is different depending on the signaling mode used to connect the clock driver chip and SerDes reference clock inputs, as described below.

Differential mode:

- The input amplitude of the differential clock must be between 400 mV and 1600 mV differential peak-to-peak (or between 200 mV and 800 mV differential peak). In other words, each signal wire of the differential pair must have a single-ended swing of less than 800 mV and greater than 200 mV. This requirement is the same for both external DC-coupled or AC-coupled connection.
- For an external DC-coupled connection, as described in SerDes reference clock receiver characteristics, the maximum average current requirements sets the requirement for average voltage (common mode voltage) as between 100 mV and 400 mV. Figure 69 shows the SerDes reference clock input requirement for DC-coupled connection scheme.

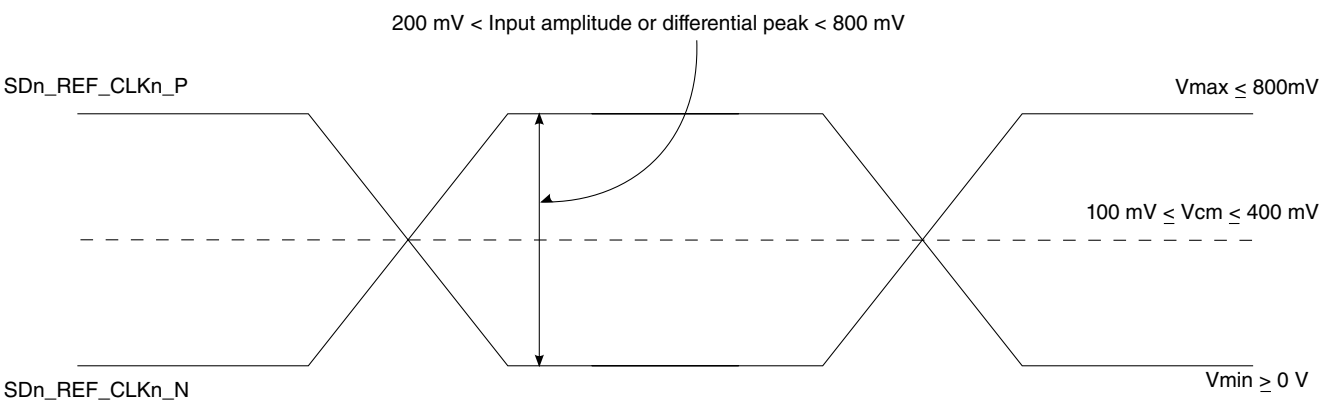

Figure 69. Differential reference clock input DC requirements (external DC-coupled)

- For an external AC-coupled connection, there is no common mode voltage requirement for the clock driver. Because the external AC-coupling capacitor blocks the DC level, the clock driver and the SerDes reference clock receiver operate in different common mode voltages. The SerDes reference clock receiver in this connection scheme has its common mode voltage set to SD_GND. Each signal wire

of the differential inputs is allowed to swing below and above the common mode voltage (SD_GND). Figure 70 shows the SerDes reference clock input requirement for AC-coupled connection scheme.

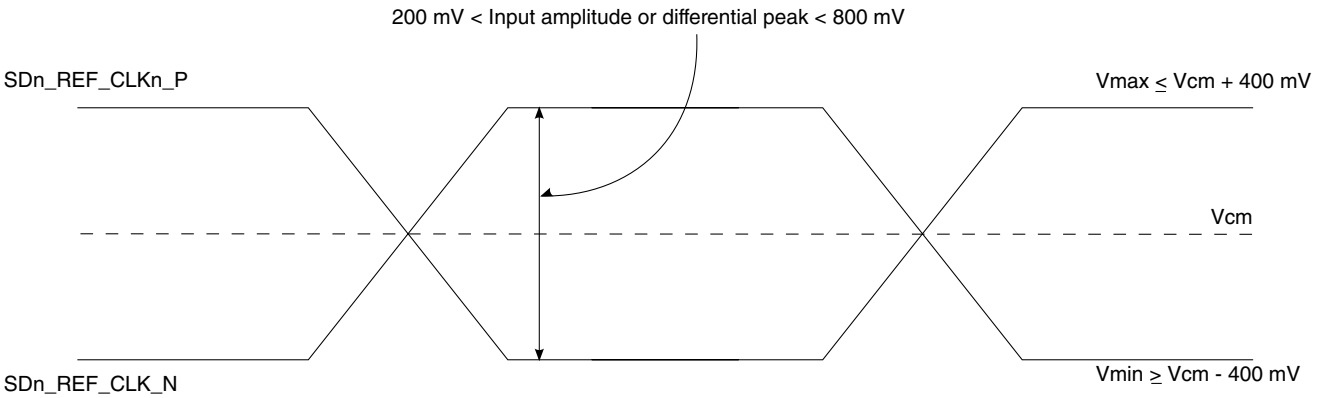

Figure 70. Differential reference clock input DC requirements (external AC-coupled)

Single-ended mode:

- The reference clock can also be single-ended. The SDn_REF_CLKn_P input amplitude (single-ended swing) must be between 400 mV and 800 mV peak-to-peak (from V_{MIN} to V_{MAX}) with SDn_REF_CLKn_N either left unconnected or tied to ground.
- The SDn_REF_CLKn_P input average voltage must be between 200 and 400 mV. Figure 71 shows the SerDes reference clock input requirement for single-ended signaling mode.
- To meet the input amplitude requirement, the reference clock inputs may need to be DC- or AC-coupled externally. For the best noise performance, the reference of the clock could be DC- or AC-coupled into the unused phase (SDn_REF_CLKn_N) through the same source impedance as the clock input (SDn_REF_CLKn_P) in use.

10. Measurement taken from single-ended waveform
11. Matching applies to rising edge for and falling edge rate for . It is measured using a 200 mV window centered on the median cross point where SDn_REF_CLKn_P rising meets SDn_REF_CLKn_N falling. The median cross point is used to calculate the voltage thresholds that the oscilloscope uses for the edge rate calculations. The rise edge rate of SDn_REF_CLKn_P must be compared to the fall edge rate of SDn_REF_CLKn_N, the maximum allowed difference should not exceed 20% of the slowest edge rate. See Figure 73.

This table lists the AC requirements for SerDes reference clocks for protocols running at data rates greater than 8 Gb/s.

This includes XFI (10.3125 Gbps) SerDes reference clocks to be guaranteed by the customer's application design.

3.22.3 SerDes transmitter and receiver reference circuits

This figure shows the reference circuits for SerDes data lane's transmitter and receiver.

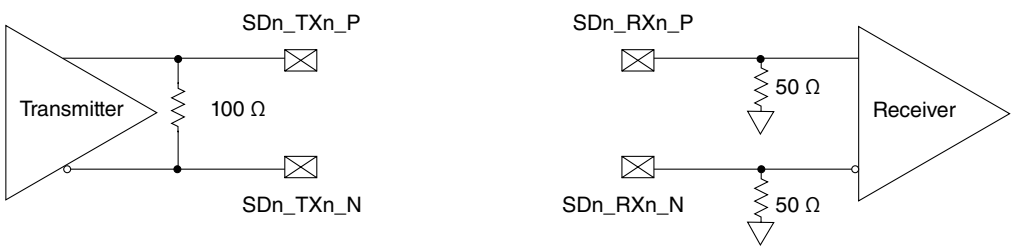

Figure 74. SerDes transmitter and receiver reference circuits

The DC and AC specification of SerDes data lanes are defined in each interface protocol section below based on the application usage:

- PCI Express
- XAUI interface
- Serial ATA (SATA) interface
- SGMII interface
- QSGMII interface
- XFI interface

Note that external AC-coupling capacitor is required for the above serial transmission protocols with the capacitor value defined in the specification of each protocol section.

3.22.4 PCI Express

This section describes the clocking dependencies, DC and AC electrical specifications for the PCI Express bus.

If the platform speed runs at 533 MHz, there is no limitation to PCIe speed/width. If the platform speed runs at 500 MHz, all four PCIe controllers can run GEN1 and GEN2 speed at full width. For GEN3 speed, PEX1/PEX2/PEX4 can only run x2 width, PEX3 can only run x4 width.

3.22.4.1 Clocking dependencies

The ports on the two ends of a link must transmit data at a rate that is within 600 parts per million (ppm) of each other at all times. This is specified to allow bit rate clock sources with a ±300 ppm tolerance.

3.22.4.2 PCI Express clocking requirements for SDn_REF_CLKn_P and SDn_REF_CLKn_N

SerDes 1-2 (SD[1:2]_REF_CLK[1:2]_P and SD[1:2]_REF_CLK[1:2]_N) may be used for various SerDes PCI Express configurations based on the RCW Configuration field SRDS_PRTCL. PCI Express is supported on SerDes 1 and 2.

For more information on these specifications, see SerDes reference clocks.

3.22.4.3 PCI Express DC physical layer characteristics

This section contains the DC characteristics for the physical layer of PCI Express on this chip.

3.22.4.3.1 PCI Express DC physical layer transmitter characteristics

This section discusses the PCI Express DC physical layer transmitter specifications for 2.5 GT/s, 5 GT/s and 8 GT/s.

This table defines the PCI Express 2.0 (2.5 GT/s) DC characteristics for the differential output at all transmitters. The parameters are specified at the component pins.

Table 69. PCI Express 8 GT/s differential transmitter output DC characteristics (XV_{DD} = 1.35 V)[3] (continued)

Parameter	Symbol	Min	Typical	Max	Units	Notes
De-emphasized differential output voltage (ratio)	$V_{TX-DE-RATIO-3.5dB}$	3.0	3.5	4.0	dB	—
De-emphasized differential output voltage (ratio)	$V_{TX-DE-RATIO-6.0dB}$	5.5	6.0	6.5	dB	—
Minimum swing during EIEOS for full swing	$V_{TX-EIEOS-FS}$	250	—	—	mVp-p	See Note 2
Minimum swing during EIEOS for reduced swing	$V_{TX-EIEOS-RS}$	232	—	—	mVp-p	See Note 2
DC differential transmitter impedance	$Z_{TX-DIFF-DC}$	80	100	120	Ω	Transmitter DC differential mode low impedance
Transmitter DC Impedance	Z_{TX-DC}	40	50	60	Ω	Required transmitter D+ as well as D- DC impedance during all states

Notes:

1. Voltage measurements for $V_{TX-FS-NO-EQ}$ and $V_{TX-RS-NO-EQ}$ are made using the 64-zeroes/64-ones pattern in the compliance pattern.

2. Voltage limits comprehend both full swing and reduced swing modes. The transmitter must reject any changes that would violate this specification. The maximum level is covered in the $V_{TX-FS-NO-EQ}$ measurement which represents the maximum peak voltage the transmitter can drive. The $V_{TX-EIEOS-FS}$ and $V_{TX-EIEOS-RS}$ voltage limits are imposed to guarantee the EIEOS threshold of 175 mV_{P-P} at the receiver pin. This parameter is measured using the actual EIEOS pattern that is part of the compliance pattern and then removing the ISI contribution of the breakout channel.

3. For recommended operating conditions, see Table 3.

3.22.4.4 PCI Express DC physical layer receiver specifications

This section discusses the PCI Express DC physical layer receiver specifications for 2.5 GT/s, 5 GT/s and 8 GT/s.

This table defines the DC characteristics for the PCI Express 1.0 (2.5 GT/s) differential input at all receivers. The parameters are specified at the component pins.

Table 70. PCI Express 2.5 GT/s differential receiver input DC characteristics (SV_{DD} = 1.0 V)[4]

Characteristic	Symbol	Min	Typ	Max	Units	Notes
Differential input peak-to-peak voltage	$V_{RX-DIFFp-p}$	120	1000	1200	mV	$V_{RX-DIFFp-p} = 2 \times \lvert V_{RX-D+} - V_{RX-D-} \rvert$ See Note 1.
DC differential input impedance	$Z_{RX-DIFF-DC}$	80	100	120	Ω	Receiver DC differential mode impedance. See Note 2
DC input impedance	Z_{RX-DC}	40	50	60	Ω	Required receiver D+ as well as D- DC Impedance (50 ± 20% tolerance). See Notes 1 and 2.

Characteristic	Symbol	Min	Typ	Max	Units	Notes
Powered down DC input impedance	$Z_{RX-HIGH-IMP-DC}$	50	—	—	kΩ	Required receiver D+ as well as D- DC Impedance when the receiver terminations do not have power. See Note 3.
Electrical idle detect threshold	$V_{RX-IDLE-DET-DIFFp-p}$	65	—	175	mV	$V_{RX-IDLE-DET-DIFFp-p}$ = 2 x $\|V_{RX-D+} - V_{RX-D-}\|$ Measured at the package pins of the receiver

Notes:

1. Measured at the package pins with a test load of 50 Ω to GND on each pin.
2. Impedance during all LTSSM states. When transitioning from a fundamental reset to detect (the initial state of the LTSSM) there is a 5 ms transition time before receiver termination values must be met on all unconfigured lanes of a port.
3. The receiver DC common mode impedance that exists when no power is present or fundamental reset is asserted. This helps ensure that the receiver detect circuit does not falsely assume a receiver is powered on when it is not. This term must be measured at 300 mV above the receiver ground.
4. For recommended operating conditions, see Table 3.

This table defines the DC characteristics for the PCI Express 2.0 (5 GT/s) differential input at all receivers. The parameters are specified at the component pins.

3.22.4.5 PCI Express AC physical layer specifications

This section contains the AC specifications for the physical layer of PCI Express on this device.

3.22.4.5.1 PCI Express AC physical layer transmitter specifications

This section discusses the PCI Express AC physical layer transmitter specifications for 2.5 GT/s, 5 GT/s and 8 GT/s.

This table defines the PCI Express 1.0 (2.5 GT/s) AC specifications for the differential output at all transmitters. The parameters are specified at the component pins. The AC timing specifications do not include RefClk jitter.

Table 73. PCI Express 2.5 GT/s differential transmitter output AC specifications[4]

Parameter	Symbol	Min	Typ	Max	Units	Notes
Unit interval	UI	399.88	400	400.12	ps	Each UI is 400 ps ± 300 ppm. UI does not account for spread-spectrum clock dictated variations.
Minimum transmitter eye width	T_{TX-EYE}	0.75	—	—	UI	The maximum transmitter jitter can be derived as $T_{TX-MAX-JITTER}$ = 1 - T_{TX-EYE} = 0.25 UI. Does not include spread-spectrum or RefCLK jitter. Includes device random jitter at 10^{-12}. See Notes 1 and 2.
Maximum time between the jitter median and maximum deviation from the median	$T_{TX-EYE-MEDIAN-to-MAX-JITTER}$	—	—	0.125	UI	Jitter is defined as the measurement variation of the crossing points ($V_{TX-DIFFp-p}$ = 0 V) in relation to a recovered transmitter UI. A recovered transmitter UI is calculated over 3500 consecutive unit intervals of sample data. Jitter is measured using all edges of the 250 consecutive UI in the center of the 3500 UI used for calculating the transmitter UI. See Notes 1 and 2.
AC coupling capacitor	C_{TX}	75	—	200	nF	All transmitters must be AC coupled. The AC coupling is required either within the media or within the transmitting component itself. See Note 3.

Notes:

1. Specified at the measurement point into a timing and voltage test load as shown in Figure 76 and measured over any 250 consecutive transmitter UIs.

2. A T_{TX-EYE} = 0.75 UI provides for a total sum of deterministic and random jitter budget of $T_{TX-JITTER-MAX}$ = 0.25 UI for the transmitter collected over any 250 consecutive transmitter UIs. The $T_{TX-EYE-MEDIAN-to-MAX-JITTER}$ median is less than half of the total transmitter jitter budget collected over any 250 consecutive transmitter UIs. It must be noted that the median is not the same as the mean. The jitter median describes the point in time where the number of jitter points on either side is approximately equal as opposed to the averaged time value.

3. The chip's SerDes transmitter does not have C_{TX} built-in. An external AC coupling capacitor is required.

4. For recommended operating conditions, see Table 3.

This table defines the PCI Express 2.0 (5 GT/s) AC specifications for the differential output at all transmitters. The parameters are specified at the component pins. The AC timing specifications do not include RefClk jitter.

Table 74. PCI Express 5 GT/s differential transmitter output AC specifications[3]

Parameter	Symbol	Min	Typ	Max	Units	Notes
Unit Interval	UI	199.94	200.00	200.06	ps	Each UI is 200 ps ± 300 ppm. UI does not account for spread-spectrum clock dictated variations.
Minimum transmitter eye width	T_{TX-EYE}	0.75	—	—	UI	The maximum transmitter jitter can be derived as: $T_{TX-MAX-JITTER}$ = 1 - T_{TX-EYE} = 0.25 UI. See Note 1.
Transmitter RMS deterministic jitter > 1.5 MHz	$T_{TX-HF-DJ-DD}$	—	—	0.15	ps	—
Transmitter RMS deterministic jitter < 1.5 MHz	$T_{TX-LF-RMS}$	—	3.0	—	ps	Reference input clock RMS jitter (< 1.5 MHz) at pin < 1 ps
AC coupling capacitor	C_{TX}	75	—	200	nF	All transmitters must be AC coupled. The AC coupling is required either within the media or within the transmitting component itself. See Note 2.

Notes:

1. Specified at the measurement point into a timing and voltage test load as shown in Figure 76 and measured over any 250 consecutive transmitter UIs.
2. The chip's SerDes transmitter does not have C_{TX} built-in. An external AC coupling capacitor is required.
3. For recommended operating conditions, see Table 3.

This table defines the PCI Express 3.0 (8 GT/s) AC specifications for the differential output at all transmitters. The parameters are specified at the component pins. The AC timing specifications do not include RefClk jitter.

Parameter	Symbol	Min	Typ	Max	Units	Notes
Unit Interval	UI	124.9625	125.00	125.0375	ps	Each UI is 125 ps ± 300 ppm. UI does not account for spread-spectrum clock dictated variations.
Transmitter uncorrelated total jitter	T_{TX-UTJ}	—	—	31.25	ps p-p	—
Transmitter uncorrelated deterministic jitter	$T_{TX-UDJ-DD}$	—	—	12	ps p-p	—
Total uncorrelated pulse width jitter (PWJ)	$T_{TX-UPW-TJ}$	—	—	24	ps p-p	See Note 1, 2
Deterministic data dependent jitter (DjDD) uncorrelated pulse width jitter (PWJ)	$T_{TX-UPW-DJDD}$	—	—	10	ps p-p	See Note 1, 2

Parameter	Symbol	Min	Typ	Max	Units	Notes
Data dependent jitter	T_{TX-DDJ}	—	—	18	ps p-p	See Note 2
AC coupling capacitor	C_{TX}	176	—	265	nF	All transmitters must be AC coupled. The AC coupling is required either within the media or within the transmitting component itself. See Note 3.

Notes:

1. PWJ parameters shall be measured after data dependent jitter (DDJ) separation.
2. Measured with optimized preset value after de-embedding to transmitter pin.
3. The chip's SerDes transmitter does not have C_{TX} built-in. An external AC coupling capacitor is required.
4. For recommended operating conditions, see Table 3.

3.22.4.5.2 PCI Express AC physical layer receiver specifications

This section discusses the PCI Express AC physical layer receiver specifications for 2.5 GT/s, 5 GT/s and 8 GT/s.

This table defines the AC specifications for the PCI Express 2.0 (2.5 GT/s) differential input at all receivers. The parameters are specified at the component pins. The AC timing specifications do not include RefClk jitter.

Table 76. PCI Express 2.5 GT/s differential receiver input AC specifications[4]

Parameter	Symbol	Min	Typ	Max	Units	Notes
Unit Interval	UI	399.88	400.00	400.12	ps	Each UI is 400 ps ± 300 ppm. UI does not account for spread-spectrum clock dictated variations.
Minimum receiver eye width	T_{RX-EYE}	0.4	—	—	UI	The maximum interconnect media and transmitter jitter that can be tolerated by the receiver can be derived as $T_{RX-MAX-JITTER}$ = 1 - T_{RX-EYE}= 0.6 UI. See Notes 1 and 2.
Maximum time between the jitter median and maximum deviation from the median.	$T_{RX-EYE-MEDIAN-to-MAX-JITTER}$	—	—	0.3	UI	Jitter is defined as the measurement variation of the crossing points ($V_{RX-DIFFp-p}$ = 0 V) in relation to a recovered transmitter UI. A recovered transmitter UI is calculated over 3500 consecutive unit intervals of sample data. Jitter is measured using all edges of the 250 consecutive UI in the center of the 3500 UI used for calculating the transmitter UI. See Notes 1, 2 and 3.

Notes:

Table 76. PCI Express 2.5 GT/s differential receiver input AC specifications[4]

Parameter	Symbol	Min	Typ	Max	Units	Notes
1. Specified at the measurement point and measured over any 250 consecutive UIs. The test load in Figure 76 must be used as the receiver device when taking measurements. If the clocks to the receiver and transmitter are not derived from the same reference clock, the transmitter UI recovered from 3500 consecutive UI must be used as a reference for the eye diagram. 2. A T_{RX-EYE} = 0.40 UI provides for a total sum of 0.60 UI deterministic and random jitter budget for the transmitter and interconnect collected any 250 consecutive UIs. The TRX-EYE-MEDIAN-to-MAX-JITTER specification ensures a jitter distribution in which the median and the maximum deviation from the median is less than half of the total. UI jitter budget collected over any 250 consecutive transmitter UIs. It must be noted that the median is not the same as the mean. The jitter median describes the point in time where the number of jitter points on either side is approximately equal as opposed to the averaged time value. If the clocks to the receiver and transmitter are not derived from the same reference clock, the transmitter UI recovered from 3500 consecutive UI must be used as the reference for the eye diagram. 3. It is recommended that the recovered transmitter UI is calculated using all edges in the 3500 consecutive UI interval with a fit algorithm using a minimization merit function. Least squares and median deviation fits have worked well with experimental and simulated data. 4. For recommended operating conditions, see Table 3.						

This table defines the AC specifications for the PCI Express 2.0 (5 GT/s) differential input at all receivers. The parameters are specified at the component pins. The AC timing specifications do not include RefClk jitter.

Sinusoidal Jitter at 100 MHz	$T_{RX-SV-SJ-8G}$	—	—	0.1	UI p-p	Fixed at 100 MHz. See Note 3.
Random Jitter	$T_{RX-SV-RJ-8G}$	—	—	2.0	ps RMS	Random jitter spectrally flat before filtering. See Note 4.

Note:

1. $T_{RX-SV-8G}$ is referenced to TP2P and obtained after post processing data captured at TP2. $T_{RX-SV-8G}$ includes the effects of applying the behavioral receiver model and receiver behavioral equalization.
2. $V_{RX-SV-DIFF-8G}$ voltage may need to be adjusted over a wide range for the different loss calibration channels.
3. The sinusoidal jitter in the total jitter tolerance may have any amplitude and frequency as shown in Figure 75.
4. Random jitter (Rj) is applied over the following range: The low frequency limit may be between 1.5 and 10 MHz, and the upper limit is 1.0 GHz. See Figure 75 for details. Rj may be adjusted to meet the 0.3 UI value for $T_{RX-SV-8G}$.
5. For recommended operating conditions, see Table 3.

3.22.4.6 Test and measurement load

The AC timing and voltage parameters must be verified at the measurement point. The package pins of the device must be connected to the test/measurement load within 0.2 inches of that load, as shown in the following figure.

NOTE

The allowance of the measurement point to be within 0.2 inches of the package pins is meant to acknowledge that package/

board routing may benefit from D+ and D- not being exactly matched in length at the package pin boundary. If the vendor does not explicitly state where the measurement point is located, the measurement point is assumed to be the D+ and D- package pins.

3.22.5.2 SATA AC timing specifications

This section discusses the SATA AC timing specifications.

3.22.5.2.1 AC requirements for SATA REF_CLK

The AC requirements for the SATA reference clock are listed in the Table 85 to be guaranteed by the customer's application design.

Table 85. SATA reference clock input requirements

Parameter	Symbol	Min	Typ	Max	Unit	Notes
SD_REF_CLK/SD_REF_CLK frequency range	t_{CLK_REF}	-	100/125	-	MHz	1
SD_REF_CLK/SD_REF_CLK clock frequency tolerance	t_{CLK_TOL}	-350	-	+350	ppm	-

SD_REF_CLK/SD_REF_CLK total reference clock jitter, phase jitter (peak-peak)	t_{CLK_PJ}	-50	-	+50	ps	2, 3, 4

Notes:

1. **Caution:** Only 100, 125MHz have been tested. In-between values do not work correctly with the rest of the system.
2. At RefClk input
3. In a frequency band from 150 kHz to 15 MHz at BER of 10^{-12}
4. Total peak-to-peak deterministic jitter should be less than or equal to 50 ps.

The figure below shows the reference clock timing waveform.

3.22.6 SGMII interface

Each SGMII port features a 4-wire AC-coupled serial link from the SerDes interface of the chip, as shown in Figure 78, where C_{TX} is the external (on board) AC-coupled capacitor. Each SerDes transmitter differential pair features 100-Ω output impedance. Each input of the SerDes receiver differential pair features 50-Ω on-die termination to SD_GND. The reference circuit of the SerDes transmitter and receiver is shown in Figure 74.

3.22.6.1 SGMII clocking requirements for

When operating in SGMII mode, a SerDes reference clock is required on SDn_REF_CLK[1:2]_P and SDn_REF_CLK[1:2]_Npins. Both SerDes 1 and SerDes 2 may be used for SGMII configurations based on the RCW Configuration field SRDS_PRTCL.

For more information on these specifications, see SerDes reference clocks.

3.22.6.2 SGMII DC electrical characteristics

This section discusses the electrical characteristics for the SGMII interface.

3.22.6.2.1 SGMII and SGMII 2.5x transmit DC characteristics

This table describes the SGMII SerDes transmitter AC-coupled DC electrical characteristics. Transmitter DC characteristics are measured at the transmitter outputs (SD*n*_TX*n*_P and SD*n*_TX*n*_N) as shown in Figure 79.

Table 92. SGMII DC transmitter electrical characteristics (XV_{DD} = 1.35 V)[4]

Parameter	Symbol	Min	Typ	Max	Unit	Notes
Output high voltage	V_{OH}	—	—	1.5 x $\lvert V_{OD} \rvert_{-max}$	mV	1
Output low voltage	V_{OL}	$\lvert V_{OD} \rvert_{-min}/2$	—	—	mV	1

		186.9	292.0	423.4		—
		160.0	250.0	362.5		—
Output impedance (differential)	R_O	80	100	120	Ω	—

Notes:

1. This does not align to DC-coupled SGMII.
2. $\lvert V_{OD} \rvert = \lvert V_{SD\_TXn\_P} - V_{SD\_TXn\_N} \rvert$. $\lvert V_{OD} \rvert$ is also referred to as output differential peak voltage. $V_{TX-DIFFp-p} = 2 \times \lvert V_{OD} \rvert$.
3. The $\lvert V_{OD} \rvert$ value shown in the Typ column is based on the condition of XVDD_SRDSn-Typ = 1.35 V, no common mode offset variation. SerDes transmitter is terminated with 100-Ω differential load between SD*n*_TXn_P and SD*n*_TXn_N.
4. For recommended operating conditions, see Table 3.

This figure shows an example of a 4-wire AC-coupled SGMII serial link connection.

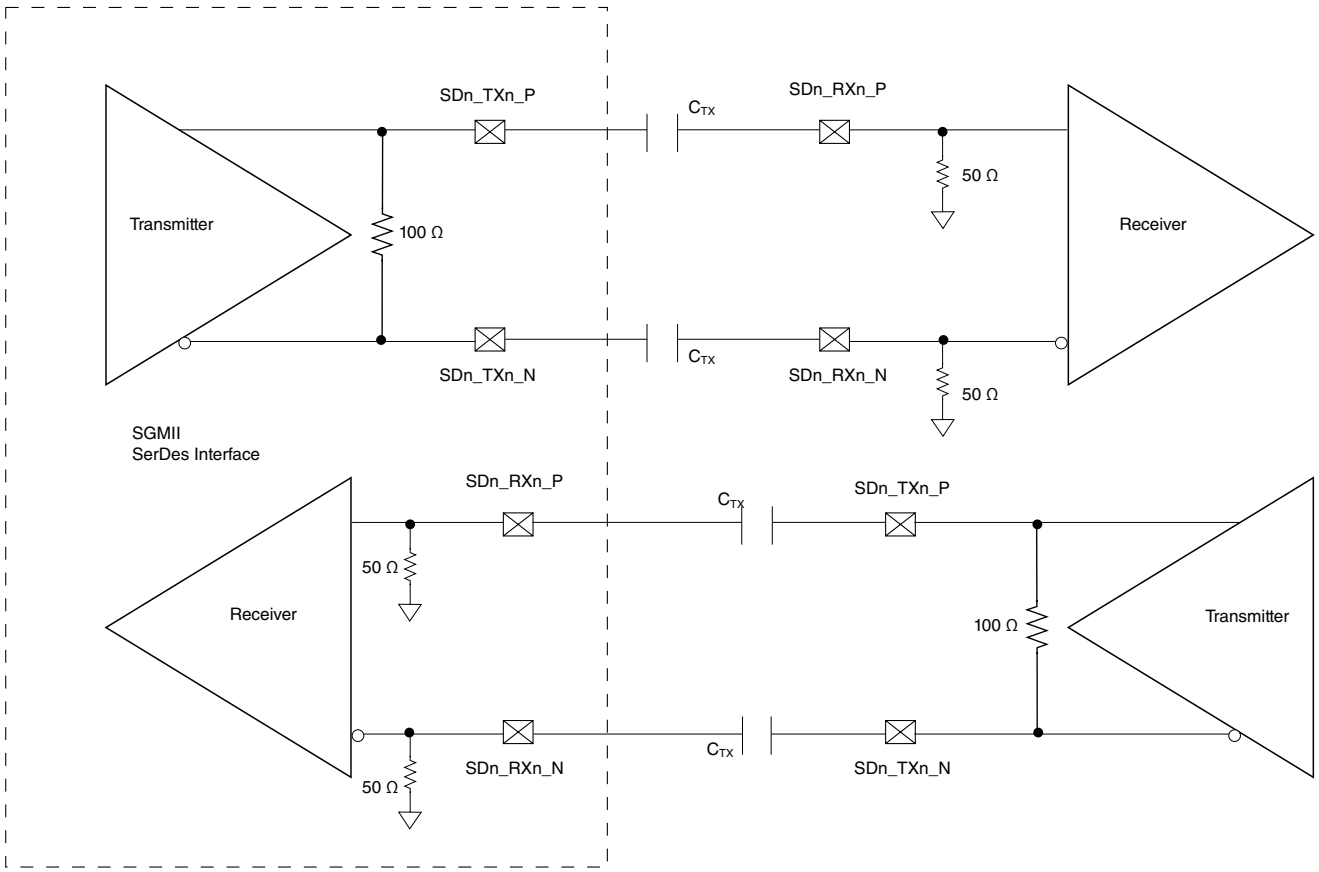

Figure 78. 4-wire AC-coupled SGMII serial link connection example

This figure shows the SGMII transmitter DC measurement circuit.

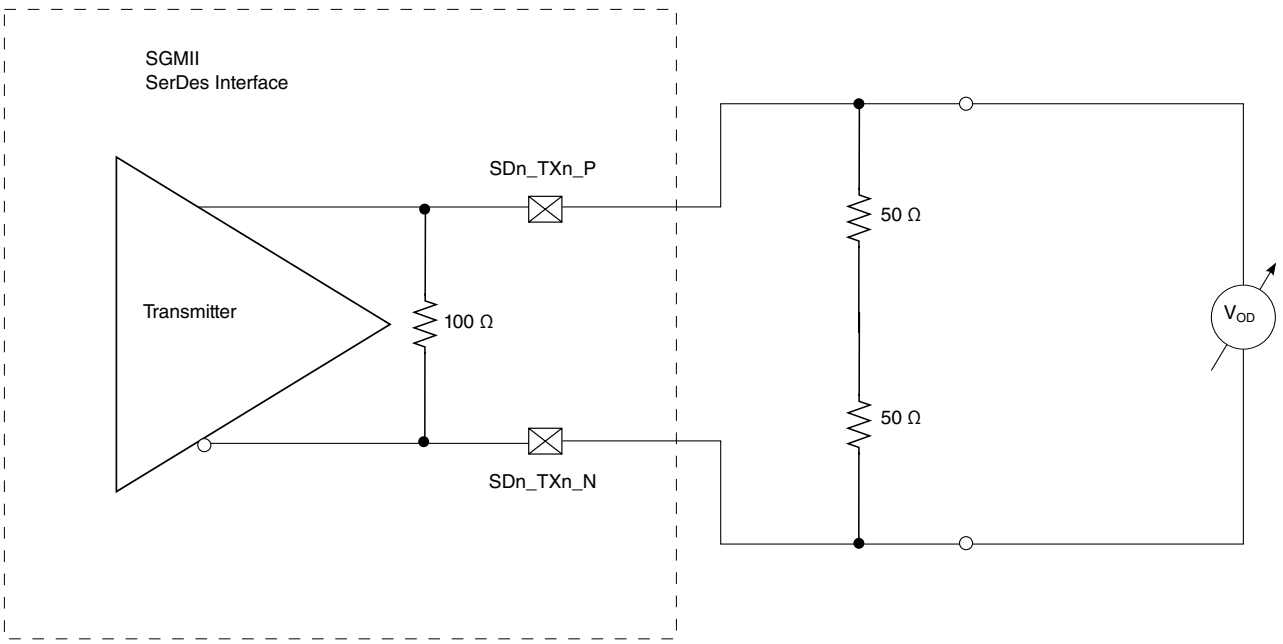

Figure 79. SGMII transmitter DC measurement circuit

This table defines the SGMII 2.5x transmitter DC electrical characteristics for 3.125 GBaud.

Notes:

1. Input must be externally AC coupled.
2. $V_{RX\_DIFFp\text{-}p}$ is also referred to as peak-to-peak input differential voltage.
3. The concept of this parameter is equivalent to the electrical idle detect threshold parameter in PCI Express. See PCI Express DC physical layer receiver specifications, and PCI Express AC physical layer receiver specifications, for further explanation.
4. For recommended operating conditions, see Table 3.

This table defines the SGMII 2.5x receiver DC electrical characteristics for 3.125 GBaud.

1. Measured at receiver 2. Total jitter is composed of three components: deterministic jitter, random jitter, and single frequency sinusoidal jitter. The sinusoidal jitter component is included to ensure margin for low frequency jitter, wander, noise, crosstalk and other variable system effects. 3. For recommended operating conditions, see Table 3.						

3.22.7 QSGMII interface

This section describes the QSGMII clocking and its DC and AC electrical characteristics.

3.22.7.1 QSGMII clocking requirements for SD*n*_REF_CLK*n*_P and SD*n*_REF_CLK*n*_N

For more information on these specifications, see SerDes reference clocks.

3.22.7.2 QSGMII DC electrical characteristics

This section discusses the electrical characteristics for the SGMII interface.

3.22.7.2.1 QSGMII transmitter DC characteristics

This table describes the QSGMII SerDes transmitter AC-coupled DC electrical characteristics. Transmitter DC characteristics are measured at the transmitter outputs (SD*n*_TX*n*_P and SD*n*_TX*n*_N).

Table 98. QSGMII DC transmitter electrical characteristics (XV_{DD} = 1.35 V)[1]

Notes:

1. The jitter (R_{CBHPJ}) and amplitude have to be correlated, for example, by a PCB trace.
2. For recommended operating conditions, see Table 3.

The sinusoidal jitter may have any amplitude and frequency in the unshaded region of this figure.

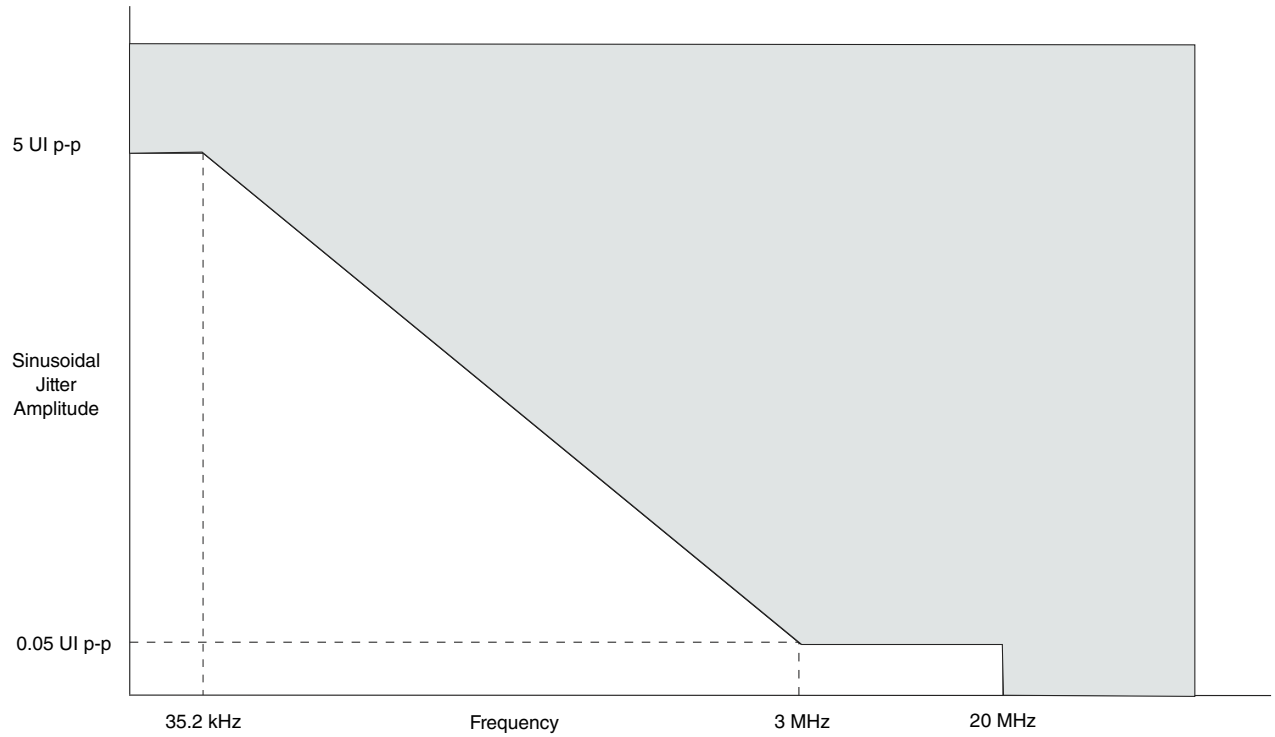

Figure 81. QSGMII single-frequency sinusoidal jitter limits

3.22.8 XFI interface

This section describes the XFI clocking requirements and its DC and AC electrical characteristics.

3.22.8.1 XFI clocking requirements for SD1_REF_CLK*n*_P and SD1_REF_CLK*n*_N

Only SerDes 1 (SD1_REF_CLK[1:2]_P and SD1_REF_CLK[1:2]_N) may be used for SerDes XFI configurations based on the RCW Configuration field SRDS_PRTCL.

For more information on these specifications, see SerDes reference clocks.

3.22.8.2 XFI DC electrical characteristics

This section describes the DC electrical characteristics for XFI.

3.22.8.2.1 XFI transmitter DC electrical characteristics

This table defines the XFI transmitter DC electrical characteristics.

3.22.8.3 XFI AC timing specifications

This section describes the AC timing specifications for XFI.

3.22.8.3.1 XFI transmitter AC timing specifications

This table defines the XFI transmitter AC timing specifications. RefClk jitter is not included.

Table 104. XFI transmitter AC timing specifications[1]

Parameter	Symbol	Min	Typical	Max	Unit
Transmitter baud rate	T_{BAUD}	10.3125 - 100ppm	10.3125	10.3125 + 100ppm	Gb/s
Unit Interval	UI	—	96.96	—	ps
Deterministic jitter	D_J	—	—	0.15	UI p-p
Total jitter	T_J	—	—	0.30	UI p-p

Notes:

1. For recommended operating conditions, see Table 3.

3.22.8.3.2 XFI receiver AC timing specifications

This table defines the XFI receiver AC timing specifications. RefClk jitter is not included.

Table 105. XFI receiver AC timing specifications[3]

Parameter	Symbol	Min	Typical	Max	Unit	Notes
Receiver baud rate	R_{BAUD}	10.3125 - 100ppm	10.3125	10.3125 + 100ppm	Gb/s	—
Unit Interval	UI	—	96.96	—	ps	—
Total non-EQJ jitter	$T_{NON-EQJ}$	—	—	0.45	UI p-p	1
Total jitter tolerance	T_J	—	—	0.65	UI p-p	1, 2

1. The total jitter (T_J) consists of Random Jitter (R_J), Duty Cycle Distortion (DCD), Periodic Jitter (P_J), and Inter symbol Interference (ISI). Non-EQJ jitter can include duty cycle distortion (DCD), random jitter (R_J), and periodic jitter (P_J). Non-EQJ jitter is uncorrelated to the primary data stream with exception of the DCD and so cannot be equalized by the receiver under test. It can exhibit a wide spectrum. Non - EQJ = T_J - ISI = R_J + DCD + P_J

2. The XFI channel has a loss budget of 9.6 dB @5.5GHz. The channel loss including connector @ 5.5GHz is 6dB. The channel crosstalk and reflection margin is 3.6dB. Manual tuning of transmitter equalization and amplitude is required for performance optimization.

3. For recommended operating conditions, see Table 3.

This figure shows the sinusoidal jitter tolerance of XFI receiver.

3.22.9 XAUI interface

This section describes the DC and AC electrical specifications for the XAUI bus.

3.22.9.1 XAUI DC electrical characteristics

This section discusses the XAUI DC electrical characteristics for the clocking signals, transmitter, and receiver.

3.22.9.1.1 DC requirements for XAUI SD*n*_REF_CLK*n*_P and SD*n*_REF_CLK*n*_N

Only SerDes 1 (SD1_REF_CLK[1:2]_P and SD1_REF_CLK[1:2]_N) may be used for various SerDes XAUI configurations based on the RCW Configuration field SRDS_PRTCL.

For more information on these specifications, see SerDes reference clocks.

3.22.9.1.2 XAUI transmitter DC electrical characteristics

This table defines the XAUI transmitter DC electrical characteristics.

Notes:

1. For recommended operating conditions, see Table 3.
2. Measured at receiver
3. Total jitter is composed of three components: deterministic jitter, random jitter, and single frequency sinusoidal jitter. The sinusoidal jitter component is included to ensure margin for low frequency jitter, wander, noise, crosstalk, and other variable system effects.

3.22.10 10GBase-KR interface

This section describes the 10GBase-KR clocking requirements and its DC and AC electrical characteristics.

3.22.10.1 10GBase-KR clocking requirements for SD1_REF_CLK*n* and SD1_REF_CLK*n*_B

Only SerDes 1 (SD1_REF_CLK[1:2] and SD1_REF_CLK[1:2]_B) may be used for SerDes 10GBase-KR configurations based on the RCW Configuration field SRDS_PRTCL.

For more information on these specifications, see SerDes reference clocks .

3.22.10.2 10GBase-KR DC electrical characteristics

This section describes the DC electrical characteristics for 10GBase-KR.

3.22.10.2.1 10GBase-KR transmitter DC electrical characteristics

This table defines the 10GBase-KR transmitter DC electrical characteristics.

3.22.11.2.2 1000Base-KX receiver AC specifications

Table below provides the 1000Base-KX receiver AC specification with parameters guided by IEEE Std 802.3ap-2007.

Table 117. 1000Base-KX receiver AC specifications

Parameter	Symbols	Min	Typical	Max	Units	Notes
Receiver baud rate	R_{BAUD}	1.25 - 100ppm	1.25	1.25 + 100ppm	Gb/s	—
Random jitter	R_{RJ}	—	—	0.15	UI p-p	1
Sinusoidal jitter, maximum	R_{SJ-max}	—	—	0.10	UI p-p	2
Total jitter	R_{TJ}	—	—	See Note 3	UI p-p	2
Notes: 1. Random jitter is specified at a BER of 10^{-12}. 2. The receiver interference tolerance level of this parameter shall be measured as described in Annex 69A of the IEEE Std 802.3ap-2007. 3. Per IEEE 802.3ap-clause 70. 4. The AC specifications do not include Refclk jitter. 5. For recommended operating conditions, see Table 3.						

4 Hardware design considerations

4.1 Clock ranges

This table provides the clocking specifications for the processor core, platform, memory, and integrated flash controller.

Table 118. Processor, platform, and memory clocking specifications

Characteristic	Maximum processor core frequency										Unit	Notes
	1600 MHz		1800 MHz		2000 MHz/800 MHz		2000 MHz/700 MHz		2100 MHz			
	Min	Max	Min	Max	Min	Max	Min	Max	Min	Max		
Core frequency	800	1600	800	1800	800	2100	800	2000	800	2100	MHz	1
Coherency Domain frequency	1000	1200	1000	1400	1000	1600	1000	1400	1000	1600	MHz	
Platform clock frequency	500	600	500	700	500	800	500	700	500	800	MHz	1
Memory bus clock frequency (DDRC1, DDRC2)	625	800	625	933	625	1066	625	1066	625	1066	MHz	1, 2
IFC clock frequency	-	100	-	100	-	100	-	100	-	100	MHz	3
WRIOP	500	600	500	700	500	800	500	700	500	800	MHz	

Notes:

1. **Caution:** The coherency domain clock to SYSCLK ratio and core to SYSCLK ratio settings must be chosen such that the resulting SYSCLK frequency, core frequency, coherency domain and platform clock frequency do not exceed their respective maximum or minimum operating frequencies.

2. The memory bus clock speed is half the DDR4 data rate.

3. The integrated flash controller (IFC) clock speed on IFC_CLK[0:1] is determined by half of the platform clock frequency divided by the IFC ratio programmed in CCR[CLKDIV]. See the chip reference manual for more information.

4.2 Power supply design

For additional details on the power supply design, see AN4977, *QorIQ LS2088A Family Design Checklist*.

4.2.1 Voltage ID (VID) controllable supply

To guarantee performance and power specifications, a specific method of selecting the optimum voltage-level must be implemented when the chip is used. As part of the chip's boot process, software must read the VID efuse values stored in the Fuse Status register (FUSESR) and then configure the external voltage regulator based on this information. This method requires a point of load voltage regulator for each chip. V_{DD} supply should be separated from the SerDes 1.0 V supply SV_{DD}. It is required in order to control the V_{DD} supply only.

NOTE

During the power-on reset process, the fuse values are read and stored in the FUSESR. It is expected that the chip's boot code reads the FUSESR value very early in the boot sequence and updates the regulator accordingly.

The default voltage regulator setting that is safe for the system to boot is the recommended operating V_{DD} at initial start-up of 1.05 V. It is highly recommended to select a regulator with a Vout range of at least 0.875 V to 1.1 V, with a resolution of 12.5 mV or better, when implementing a VID solution.

The table below lists the valid VID efuse values that will be programmed at the factory for this chip.

Table 119. Fuse Status Register (DCFG_CCSR_FUSESR)

Binary value of DA_V / DA_ALT_V	V_{DD} voltage
00000	default (1.05 V)
00010	0.9750 V
01000	0.9000 V
10000	1.0000 V
10010	1.0250 V
All other values	Reserved

For additional information on VID, see the chip reference manual.

5 Thermal

This table shows the thermal characteristics for the chip. Note that these numbers are based on design estimates and are preliminary.

Table 120. Package thermal characteristics[1]

Rating	Board	Symbol	Value	Unit	Notes
Junction to ambient, natural convection	Single-layer board (1s)	$R_{\Theta JA}$	13	°C/W	
Junction to ambient, natural convection	Four-layer board (2s2p)	$R_{\Theta JA}$	10	°C/W	
Junction to ambient (at 200 ft./min.)	Single-layer board (1s)	$R_{\Theta JMA}$	8	°C/W	
Junction to ambient (at 200 ft./min.)	Four-layer board (2s2p)	$R_{\Theta JMA}$	6	°C/W	
Junction to board	—	$R_{\Theta JB}$	3	°C/W	
Junction to case top	—	$R_{\Theta JCtop}$	0.3	°C/W	
Junction to Lid top	—	$R_{\Theta JLtop}$	0.1	°C/W	

Notes:

1. See "Thermal management information" in the design checklist for additional details.

2. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.

3. Junction-to-Ambient Thermal Resistance determined per JEDEC JESD51-3 and JESD51-6. Thermal test board meets JEDEC specification for this package.

Table 120. Package thermal characteristics[1]

Rating	Board	Symbol	Value	Unit	Notes
4. Junction-to-Board thermal resistance determined per JEDEC JESD51-8. Thermal test board meets JEDEC specification for the specified package.					
5. Junction-to-Case at the top of the package determined using MIL-STD 883 Method 1012.1. The cold plate temperature is used for the case temperature. Reported value includes the thermal resistance of the interface layer.					
6. Junction-to-Lid-Top thermal resistance determined using the using MIL-STD 883 Method 1012.1. However, instead of the cold plate, the lid top temperature is used here for the reference case temperature. Reported value does not include the thermal resistance of the interface layer between the package and cold plate.					

5.1 Temperature diode

The chip has a temperature diode that can be used to monitor its temperature by using some external temperature monitoring devices (such as Analog Devices, ADT7481A). For more information, see AN4787.

The followings are the specifications of the chip temperature diode:

- Operating range: 10 - 230 μA
- Ideality factor over temperature range 85°C - 105°C, n = 1.006 ± 0.003, with approximate error ± 1 °C and error under ± 3 °C for temperature range 0 °C to 85 °C.

6 Package information

6.1 Package parameters for the FC-PBGA

The package parameters are as provided in the following list. The package type is 37.5 mm x 37.5 mm, 1292 flip-chip plastic lidded ball grid array (FC-PBGA).

- Package outline—37.5 mm x 37.5 mm
- Interconnects—1292
- Ball Pitch—1 mm
- Ball Diameter (typical)—0.6 mm
- Solder Balls—96.5% Sn, 3% Ag, 0.5% Cu
- Module height—3.02 mm (minimum), 3.17 mm (typical), 3.32 mm (maximum)

6.2 Mechanical dimensions of the FC-PBGA

NOTES:

1. All dimensions are in millimeters.
2. Dimensions and tolerances per ASME Y14.5M-1994.
3. Maximum solder ball diameter measured parallel to datum A.
4. Datum A, the seating plane, is determined by the spherical crowns of the solder balls.
5. Parallelism measurement shall exclude any effect of mark on top surface of package.
6. All dimensions are symmetric across the package center lines, unless dimensioned otherwise.
7. Pin 1 thru hole shall be centered within foot area.
8. 37.7 mm maximum package assembly (lid + laminate) X and Y.

7 Security fuse processor

This chip implements the QorIQ platform's trust architecture, supporting capabilities such as secure boot. Use of the trust architecture features is dependent on programming fuses in the Security Fuse Processor (SFP). The details of the trust architecture and SFP can be found in the chip reference manual.

To program SFP fuses, the user is required to supply 1.80 V to the TA_PROG_SFP pin per Power sequencing. TA_PROG_SFP should only be powered for the duration of the fuse programming cycle, with a per device limit of two fuse programming cycles. All other times TA_PROG_SFP should be connected to GND. The sequencing requirements for raising and lowering TA_PROG_SFP are shown in Figure 8. To ensure device reliability, fuse programming must be performed within the recommended fuse programming temperature range per Table 3.

NOTE

Users not implementing the QorIQ platform's trust architecture features should connect TA_PROG_SFP to GND.
