## K52P144M100SF2

## K52 Sub-Family Data Sheet

## Supports the following: <br> MK52DN512ZCLQ10, MK52DN512ZCMD10

Features

- Operating Characteristics
- Voltage range: 1.71 to 3.6 V
- Flash write voltage range: 1.71 to 3.6 V
- Temperature range (ambient): -40 to $85^{\circ} \mathrm{C}$
- Performance
- Up to 100 MHz ARM Cortex-M4 core with DSP instructions delivering 1.25 Dhrystone MIPS per MHz
- Memories and memory interfaces
- Up to 512 KB program flash memory on nonFlexMemory devices
- Up to 256 KB program flash memory on FlexMemory devices
- Up to 256 KB FlexNVM on FlexMemory devices
- 4 KB FlexRAM on FlexMemory devices
- Up to 128 KB RAM
- Serial programming interface (EzPort)
- FlexBus external bus interface
- Clocks
- 3 to 32 MHz crystal oscillator
- 32 kHz crystal oscillator
- Multi-purpose clock generator
- System peripherals
- Multiple low-power modes to provide power optimization based on application requirements
- Memory protection unit with multi-master protection
- 16-channel DMA controller, supporting up to 63 request sources
- External watchdog monitor
- Software watchdog
- Low-leakage wakeup unit
- Security and integrity modules
- Hardware CRC module to support fast cyclic redundancy checks
- Hardware random-number generator
- Hardware encryption supporting DES, 3DES, AES, MD5, SHA-1, and SHA-256 algorithms
- 128-bit unique identification (ID) number per chip
- Human-machine interface
- Low-power hardware touch sensor interface (TSI)
- General-purpose input/output
- Analog modules
- Two 16-bit SAR ADCs
- Programmable gain amplifier (PGA) (up to x64) integrated into each ADC
- Two 12-bit DACs
- Two operational amplifiers
- Two transimpedance amplifiers
- Three analog comparators (CMP) containing a 6-bit DAC and programmable reference input
- Voltage reference
- Timers
- Programmable delay block
- Eight-channel motor control/general purpose/PWM timer
- Two 2-channel quadrature decoder/general purpose timers
- IEEE 1588 timers
- Periodic interrupt timers
- 16-bit low-power timer
- Carrier modulator transmitter
- Real-time clock

Freescale reserves the right to change the detail specifications as may be required to permit improvements in the design of its products.

- Communication interfaces
- Ethernet controller with MII and RMII interface to external PHY and hardware IEEE 1588 capability
- USB full-/low-speed On-the-Go controller with on-chip transceiver
- Three SPI modules
- Two I2C modules
- Six UART modules
- Secure Digital host controller (SDHC)
- I2S module

## 1 Ordering parts

### 1.1 Determining valid orderable parts

Valid orderable part numbers are provided on the web. To determine the orderable part numbers for this device, go to freescale.com and perform a part number search for the following device numbers: PK52 and MK52.

## 2 Part identification

### 2.1 Description

Part numbers for the chip have fields that identify the specific part. You can use the values of these fields to determine the specific part you have received.

### 2.2 Format

Part numbers for this device have the following format:
Q K\#\# A M FFF R T PP CC N

### 2.3 Fields

This table lists the possible values for each field in the part number (not all combinations are valid):

| Field | Description | Values |
| :--- | :--- | :--- |
| Q | Qualification status | $\bullet \mathrm{M}=$ Fully qualified, general market flow <br>  |
| K\#\# $=$ Prequalification |  |  |

### 2.4 Example

This is an example part number:
MK52DN512ZVMD10

## 3 Terminology and guidelines

### 3.1 Definition: Operating requirement

An operating requirement is a specified value or range of values for a technical characteristic that you must guarantee during operation to avoid incorrect operation and possibly decreasing the useful life of the chip.

### 3.1.1 Example

This is an example of an operating requirement:

| Symbol | Description | Min. | Max. | Unit |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{V}_{\mathrm{DD}}$ | 1.0 V core supply <br> voltage | 0.9 | 1.1 | V |

### 3.2 Definition: Operating behavior

An operating behavior is a specified value or range of values for a technical characteristic that are guaranteed during operation if you meet the operating requirements and any other specified conditions.

### 3.2.1 Example

This is an example of an operating behavior:

| Symbol | Description | Min. | Max. | Unit |
| :--- | :--- | :--- | :--- | :--- |
| IWP | Digital I/O weak pullup/ <br> pulldown current | 10 | 130 | $\mu \mathrm{~A}$ |

### 3.3 Definition: Attribute

An attribute is a specified value or range of values for a technical characteristic that are guaranteed, regardless of whether you meet the operating requirements.

### 3.3.1 Example

This is an example of an attribute:

| Symbol | Description | Min. | Max. | Unit |
| :--- | :--- | :--- | :--- | :--- |
| CIN_D | Input capacitance: <br> digital pins | - | 7 | pF |

### 3.4 Definition: Rating

A rating is a minimum or maximum value of a technical characteristic that, if exceeded, may cause permanent chip failure:

- Operating ratings apply during operation of the chip.
- Handling ratings apply when the chip is not powered.

### 3.4.1 Example

This is an example of an operating rating:

| Symbol | Description | Min. | Max. | Unit |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{V}_{\mathrm{DD}}$ | 1.0 V core supply <br> voltage | -0.3 | 1.2 | V |

### 3.5 Result of exceeding a rating

### 3.6 Relationship between ratings and operating requirements

Operating (power on)

$-\infty$
Handling (power off)

### 3.7 Guidelines for ratings and operating requirements

Follow these guidelines for ratings and operating requirements:

- Never exceed any of the chip's ratings.
- During normal operation, don't exceed any of the chip's operating requirements.
- If you must exceed an operating requirement at times other than during normal operation (for example, during power sequencing), limit the duration as much as possible.

### 3.8 Definition: Typical value

A typical value is a specified value for a technical characteristic that:

- Lies within the range of values specified by the operating behavior
- Given the typical manufacturing process, is representative of that characteristic during operation when you meet the typical-value conditions or other specified conditions

Typical values are provided as design guidelines and are neither tested nor guaranteed.

### 3.8.1 Example 1

This is an example of an operating behavior that includes a typical value:

| Symbol | Description | Min. | Typ. | Max. | Unit |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $I_{\mathrm{WP}}$ | Digital I/O weak <br> pullup/pulldown <br> current | 10 | 70 | 130 | $\mu \mathrm{~A}$ |

### 3.8.2 Example 2

This is an example of a chart that shows typical values for various voltage and temperature conditions:

### 3.9 Typical value conditions

Typical values assume you meet the following conditions (or other conditions as specified):

| Symbol | Description | Value | Unit |
| :--- | :--- | :--- | :--- |
| $\mathrm{T}_{\mathrm{A}}$ | Ambient temperature | 25 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{V}_{\mathrm{DD}}$ | 3.3 V supply voltage | 3.3 | V |

## 4 Ratings

### 4.1 Thermal handling ratings

| Symbol | Description | Min. | Max. | Unit | Notes |
| :---: | :--- | :---: | :---: | :---: | :---: |
| $\mathrm{T}_{\text {STG }}$ | Storage temperature | -55 | 150 | ${ }^{\circ} \mathrm{C}$ | 1 |
| $\mathrm{~T}_{\text {SDR }}$ | Solder temperature, lead-free | - | 260 | ${ }^{\circ} \mathrm{C}$ | 2 |
|  | Solder temperature, leaded | - | 245 |  |  |

1. Determined according to JEDEC Standard JESD22-A103, High Temperature Storage Life.
2. Determined according to IPC/JEDEC Standard J-STD-020, Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices.

### 4.2 Moisture handling ratings

| Symbol | Description | Min. | Max. | Unit | Notes |
| :---: | :--- | :---: | :---: | :---: | :---: |
| MSL | Moisture sensitivity level | - | 3 | - | 1 |

1. Determined according to IPC/JEDEC Standard J-STD-020, Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices.

### 4.3 ESD handling ratings

| Symbol | Description | Min. | Max. | Unit | Notes |
| :---: | :--- | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {HBM }}$ | Electrostatic discharge voltage, human body model | -2000 | +2000 | V | 1 |
| $\mathrm{~V}_{\text {CDM }}$ | Electrostatic discharge voltage, charged-device model | -500 | +500 | V | 2 |
| $\mathrm{I}_{\text {LAT }}$ | Latch-up current at ambient temperature of $105^{\circ} \mathrm{C}$ | -100 | +100 | mA | 3 |

1. Determined according to JEDEC Standard JESD22-A114, Electrostatic Discharge (ESD) Sensitivity Testing Human Body Model (HBM).
2. Determined according to JEDEC Standard JESD22-C101, Field-Induced Charged-Device Model Test Method for Electrostatic-Discharge-Withstand Thresholds of Microelectronic Components.
3. Determined according to JEDEC Standard JESD78, IC Latch-Up Test.

### 4.4 Voltage and current operating ratings

| Symbol | Description | Min. | Max. | Unit |
| :---: | :--- | :---: | :---: | :---: |
| $\mathrm{V}_{\mathrm{DD}}$ | Digital supply voltage | -0.3 | 3.8 | V |
| $\mathrm{I}_{\mathrm{DD}}$ | Digital supply current | - | 185 | mA |
| $\mathrm{~V}_{\mathrm{DIO}}$ | Digital input voltage (except RESET, EXTAL, and XTAL) | -0.3 | 5.5 | V |
| $\mathrm{~V}_{\text {AIO }}$ | Analog ${ }^{1}, \overline{R E S E T}$, EXTAL, and XTAL input voltage | -0.3 | $\mathrm{~V}_{\mathrm{DD}}+0.3$ | V |
| $\mathrm{I}_{\mathrm{D}}$ | Maximum current single pin limit (applies to all digital pins) | -25 | 25 | mA |
| $\mathrm{~V}_{\text {DDA }}$ | Analog supply voltage | $\mathrm{V}_{\mathrm{DD}}-0.3$ | $\mathrm{~V}_{\mathrm{DD}}+0.3$ | V |
| $\mathrm{~V}_{\text {USB_DP }}$ | USB_DP input voltage | -0.3 | 3.63 | V |
| $\mathrm{~V}_{\text {USB_DM }}$ | USB_DM input voltage | -0.3 | 3.63 | V |
| VREGIN | USB regulator input | -0.3 | 6.0 | V |
| $\mathrm{~V}_{\text {BAT }}$ | RTC battery supply voltage | -0.3 | 3.8 | V |

1. Analog pins are defined as pins that do not have an associated general purpose I/O port function.

## 5 General

### 5.1 AC electrical characteristics

Unless otherwise specified, propagation delays are measured from the $50 \%$ to the $50 \%$ point, and rise and fall times are measured at the $20 \%$ and $80 \%$ points, as shown in the following figure.

The midpoint is $\mathrm{V}_{\mathrm{IL}}+\left(\mathrm{V}_{\mathrm{IH}}-\mathrm{V}_{\mathrm{IL}}\right) / 2$.
Figure 1. Input signal measurement reference
All digital I/O switching characteristics assume:

1. output pins

- have $\mathrm{C}_{\mathrm{L}}=30 \mathrm{pF}$ loads,
- are configured for fast slew rate (PORTx_PCRn[SRE]=0), and
- are configured for high drive strength (PORTx_PCRn[DSE]=1)

2. input pins

- have their passive filter disabled (PORTx_PCRn[PFE]=0)

1. All 5 V tolerant digital $\mathrm{I} / \mathrm{O}$ pins are internally clamped to $\mathrm{V}_{S S}$ through an ESD protection diode. There is no diode connection to $\mathrm{V}_{\mathrm{DD}}$. If $\mathrm{V}_{I N}$ is less than $\mathrm{V}_{\text {DIO_MIN }}$, a current limiting resistor is required. The negative DC injection current limiting resistor is calculated as $R=\left(V_{\text {DIO_MIN }}-V_{\text {IN }}\right) / I_{\text {ICDIO }} \mid$.
2. Analog pins are defined as pins that do not have an associated general purpose I/O port function. Additionally, EXTAL and XTAL are analog pins.
3. All analog pins are internally clamped to $\mathrm{V}_{S S}$ and $\mathrm{V}_{\mathrm{DD}}$ through ESD protection diodes. If $\mathrm{V}_{\mathrm{IN}}$ is less than $\mathrm{V}_{\text {AIO_MIN }}$ or greater than $\mathrm{V}_{\text {AIO_MAX }}$, a current limiting resistor is required. The negative DC injection current limiting resistor is calculated as $R=\left(V_{A I O} M_{I N}-V_{I N}\right) / I_{I C A I O}$. The positive injection current limiting resistor is calculated as $R=\left(V_{I N}-V_{A I O}{ }_{M A X}\right) / I_{I C A I O}$. Select the larger of these two calculated resistances if the pin is exposed to positive and negative injection currents.
4. Open drain outputs must be pulled to VDD.

1. Typical values characterized at $25^{\circ} \mathrm{C}$ and $\mathrm{VDD}=3.6 \mathrm{~V}$ unless otherwise noted.
2. Open drain outputs must be pulled to $\mathrm{V}_{\mathrm{DD}}$.
3. Analog pins are defined as pins that do not have an associated general purpose I/O port function.
4. Digital pins have an associated GPIO port function and have 5V tolerant inputs, except EXTAL and XTAL.
5. Internal pull-up/pull-down resistors disabled.
6. Characterized, not tested in production.
7. Examples calculated using $V_{I L}$ relation, $V_{D D}$, and $\max I_{I N D}: Z_{I N D}=V_{I L} / I_{I N D}$. This is the impedance needed to pull a high signal to a level below $\mathrm{V}_{\mathrm{IL}}$ due to leakage when $\mathrm{V}_{\mathrm{IL}}<\mathrm{V}_{\text {IN }}<\mathrm{V}_{\mathrm{DD}}$. These examples assume signal source low $=0 \mathrm{~V}$.
8. Measured at $V_{D D}$ supply voltage $=V_{D D}$ min and Vinput $=V_{S S}$
9. Measured at $\mathrm{V}_{\mathrm{DD}}$ supply voltage $=\mathrm{V}_{\mathrm{DD}}$ min and Vinput $=\mathrm{V}_{\mathrm{DD}}$

### 5.2.5.1 Diagram: Typical IDD_RUN operating behavior

The following data was measured under these conditions:

- MCG in FBE mode for 50 MHz and lower frequencies. MCG in FEE mode at greater than 50 MHz frequencies.
- USB regulator disabled
- No GPIOs toggled
- Code execution from flash with cache enabled
- For the ALLOFF curve, all peripheral clocks are disabled except FTFL

1. This is the minimum pulse width that is guaranteed to pass through the pin synchronization circuitry. Shorter pulses may or may not be recognized. In Stop, VLPS, LLS, and VLLSx modes, the synchronizer is bypassed so shorter pulses can be recognized in that case.
2. The greater synchronous and asynchronous timing must be met.
3. This is the minimum pulse width that is guaranteed to be recognized as a pin interrupt request in Stop, VLPS, LLS, and VLLSx modes.

## rerrpheral operating requirements and behaviors

1. This parameter is measured with the internal reference (slow clock) being used as a reference to the FLL (FEl clock mode).
2. These typical values listed are with the slow internal reference clock (FEI) using factory trim and DMX32=0.
3. The resulting system clock frequencies should not exceed their maximum specified values. The DCO frequency deviation ( $\Delta f_{\text {dco_t }}$ ) over voltage and temperature should be considered.
4. These typical values listed are with the slow internal reference clock (FEl) using factory trim and DMX32=1.
5. The resulting clock frequency must not exceed the maximum specified clock frequency of the device.
6. This specification applies to any time the FLL reference source or reference divider is changed, trim value is changed, DMX32 bit is changed, DRS bits are changed, or changing from FLL disabled (BLPE, BLPI) to FLL enabled (FEI, FEE, $\mathrm{FBE}, \mathrm{FBI})$. If a crystal/resonator is being used as the reference, this specification assumes it is already running.
7. Excludes any oscillator currents that are also consuming power while PLL is in operation.
8. This specification was obtained using a Freescale developed PCB. PLL jitter is dependent on the noise characteristics of each PCB and results will vary.
9. This specification applies to any time the PLL VCO divider or reference divider is changed, or changing from PLL disabled (BLPE, BLPI) to PLL enabled (PBE, PEE). If a crystal/resonator is being used as the reference, this specification assumes it is already running.

1. $\mathrm{V}_{\mathrm{DD}}=3.3 \mathrm{~V}$, Temperature $=25^{\circ} \mathrm{C}$
2. See crystal or resonator manufacturer's recommendation
3. $\mathrm{C}_{\mathrm{x}}, \mathrm{C}_{\mathrm{y}}$ can be provided by using either the integrated capacitors or by using external components.
4. When low power mode is selected, $R_{F}$ is integrated and must not be attached externally.
5. The EXTAL and XTAL pins should only be connected to required oscillator components and must not be connected to any other devices.

|  | Crystal startup time - 8 MHz high-frequency <br> (MCG_C2[RANGE]=01), low-power mode <br> (HGO=0) | - | 0.6 | - | ms |  |

1. Other frequency limits may apply when external clock is being used as a reference for the FLL or PLL.
2. When transitioning from FBE to FEI mode, restrict the frequency of the input clock so that, when it is divided by FRDIV, it remains within the limits of the DCO input clock frequency.
3. Proper PC board layout procedures must be followed to achieve specifications.
4. Crystal startup time is defined as the time between the oscillator being enabled and the OSCINIT bit in the MCG_S register being set.

## NOTE

The 32 kHz oscillator works in low power mode by default and cannot be moved into high power/gain mode.

| $\mathrm{v}_{\text {ec_extal32 }}$ | Externally provided input clock amplitude | 700 | - | $\mathrm{V}_{\text {BAT }}$ | mV | 2,3 |

1. Proper PC board layout procedures must be followed to achieve specifications.
2. This specification is for an externally supplied clock driven to EXTAL32 and does not apply to any other clock input. The oscillator remains enabled and XTAL32 must be left unconnected.
3. The parameter specified is a peak-to-peak value and $\mathrm{V}_{\mathrm{IH}}$ and $\mathrm{V}_{\mathrm{IL}}$ specifications do not apply. The voltage of the applied clock must be within the range of $\mathrm{V}_{\mathrm{SS}}$ to $\mathrm{V}_{\mathrm{BAT}}$.

1. Typical data retention values are based on measured response accelerated at high temperature and derated to a constant $25^{\circ} \mathrm{C}$ use profile. Engineering Bulletin EB618 does not apply to this technology. Typical endurance defined in Engineering Bulletin EB619.
2. Cycling endurance represents number of program/erase cycles at $-40^{\circ} \mathrm{C} \leq T_{j} \leq 125^{\circ} \mathrm{C}$.
3. Write endurance represents the number of writes to each FlexRAM location at $-40^{\circ} \mathrm{C} \leq T j \leq 125^{\circ} \mathrm{C}$ influenced by the cycling endurance of the FlexNVM (same value as data flash) and the allocated EEPROM backup per subsystem. Minimum and typical values assume all byte-writes to FlexRAM.

### 6.4.1.5 Write endurance to FlexRAM for EEPROM

When the FlexNVM partition code is not set to full data flash, the EEPROM data set size can be set to any of several non-zero values.

The bytes not assigned to data flash via the FlexNVM partition code are used by the flash memory module to obtain an effective endurance increase for the EEPROM data. The built-in EEPROM record management system raises the number of program/erase cycles that can be attained prior to device wear-out by cycling the EEPROM data through a larger EEPROM NVM storage space.

While different partitions of the FlexNVM are available, the intention is that a single choice for the FlexNVM partition code and EEPROM data set size is used throughout the entire lifetime of a given application. The EEPROM endurance equation and graph shown below assume that only one configuration is ever used.
Writes_subsystem $=\frac{\text { EEPROM }-2 \times \text { EEESPLIT } \times \text { EEESIZE }}{\text { EEESPLIT } \times \text { EEESIZE }} \times$ Write_efficiency $\times n_{\text {nvmoycd }}$
where

- Writes_subsystem - minimum number of writes to each FlexRAM location for subsystem (each subsystem can have different endurance)

K52 Sub-Family Data Sheet Data Sheet, Rev. 7, 02/2013.

- EEPROM - allocated FlexNVM for each EEPROM subsystem based on DEPART; entered with the Program Partition command
- EEESPLIT - FlexRAM split factor for subsystem; entered with the Program Partition command
- EEESIZE - allocated FlexRAM based on DEPART; entered with the Program Partition command
- Write_efficiency -
- 0.25 for 8 -bit writes to FlexRAM
- 0.50 for 16 -bit or 32 -bit writes to FlexRAM
- $\mathrm{n}_{\text {nvmcycd }}$ - data flash cycling endurance (the following graph assumes 10,000 cycles)

### 6.4.3 Flexbus Switching Specifications

All processor bus timings are synchronous; input setup/hold and output delay are given in respect to the rising edge of a reference clock, FB_CLK. The FB_CLK frequency may be the same as the internal system bus frequency or an integer divider of that frequency.

The following timing numbers indicate when data is latched or driven onto the external bus, relative to the Flexbus output clock (FB_CLK). All other timing relationships can be derived from these values.

### 6.5 Security and integrity modules

There are no specifications necessary for the device's security and integrity modules.

### 6.6 Analog

### 6.6.1 ADC electrical specifications

The 16-bit accuracy specifications listed in Table 27 and Table 28 are achievable on the differential pins ADCx_DP0, ADCx_DM0, ADCx_DP1, ADCx_DM1, ADCx_DP3, and ADCx_DM3.

The ADCx_DP2 and ADCx_DM2 ADC inputs are connected to the PGA outputs and are not direct device pins. Accuracy specifications for these pins are defined in Table 29 and Table 30.

All other ADC channels meet the 13-bit differential/12-bit single-ended accuracy specifications.

|  |  | 16 bit modes <br> No ADC hardware averaging <br> Continuous conversions enabled <br> Peripheral clock $=50$ MHz | 37.037 | - | 250 | Ksps | 8 |

1. Typical values assume $\mathrm{V}_{\mathrm{DDA}}=3.0 \mathrm{~V}$, Temp $=25^{\circ} \mathrm{C}, \mathrm{f}_{\mathrm{ADCK}}=6 \mathrm{MHz}$ unless otherwise stated. Typical values are for reference only and are not tested in production.
2. ADC must be configured to use the internal voltage reference (VREF_OUT)
3. PGA reference is internally connected to the VREF_OUT pin. If the user wishes to drive VREF_OUT with a voltage other than the output of the VREF module, the VREF module must be disabled.
4. For single ended configurations the input impedance of the driven input is $R_{\text {PGAD }} / 2$
5. The analog source resistance ( $\mathrm{R}_{\mathrm{AS}}$ ), external to MCU , should be kept as minimum as possible. Increased $\mathrm{R}_{\mathrm{AS}}$ causes drop in PGA gain without affecting other performances. This is not dependent on ADC clock frequency.
6. The minimum sampling time is dependent on input signal frequency and ADC mode of operation. A minimum of $1.25 \mu \mathrm{~s}$ time should be allowed for $F_{\text {in }}=4 \mathrm{kHz}$ at 16-bit differential mode. Recommended ADC setting is: ADLSMP=1, ADLSTS=2 at 8 MHz ADC clock.
7. ADC clock $=18 \mathrm{MHz}, \mathrm{ADLSMP}=1, \mathrm{ADLST}=00, \mathrm{ADHSC}=1$
8. ADC clock $=12 \mathrm{MHz}, \mathrm{ADLSMP}=1, \mathrm{ADLST}=01, \mathrm{ADHSC}=1$

2. This current is a PGA module adder, in addition to ADC conversion currents.
3. Between $\operatorname{IN}+$ and $I N-$. The PGA draws a DC current from the input terminals. The magnitude of the DC current is a strong function of input common mode voltage $\left(\mathrm{V}_{\mathrm{CM}}\right)$ and the PGA gain.
4. Gain $=2^{\text {PGAG }}$
5. After changing the PGA gain setting, a minimum of 2 ADC+PGA conversions should be ignored.
6. Limit the input signal swing so that the PGA does not saturate during operation. Input signal swing is dependent on the PGA reference voltage and gain setting.

| Pulse width of spikes that must be suppressed by the input filter | $\mathrm{t}_{\text {SP }}$ | N/A | N/A | 0 | 50 | ns |

1. The master mode $I^{2} C$ deasserts $A C K$ of an address byte simultaneously with the falling edge of SCL. If no slaves acknowledge this address byte, then a negative hold time can result, depending on the edge rates of the SDA and SCL lines.
2. The maximum tHD; DAT must be met only if the device does not stretch the LOW period (tLOW) of the SCL signal.
3. Input signal Slew $=10 \mathrm{~ns}$ and Output Load $=50 \mathrm{pf}$
4. Set-up time in slave-transmitter mode is 1 IPBus clock period, if the TX FIFO is empty.
5. A Fast mode $I^{2} \mathrm{C}$ bus device can be used in a Standard mode I2C bus system, but the requirement $\mathrm{t}_{\mathrm{SU}}$; DAT $\geq 250$ ns must then be met. This is automatically the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, then it must output the next data bit to the SDA line $t_{\text {rmax }}+t_{\text {SU; DAT }}$ $=1000+250=1250 \mathrm{~ns}$ (according to the Standard mode $\mathrm{I}^{2} \mathrm{C}$ bus specification) before the SCL line is released.
6. $\mathrm{C}_{\mathrm{b}}=$ total capacitance of the one bus line in pF .

### 6.8.10 $\quad I^{2} S$ switching specifications

This section provides the AC timings for the $\mathrm{I}^{2} \mathrm{~S}$ in master (clocks driven) and slave modes (clocks input). All timings are given for non-inverted serial clock polarity
$(\operatorname{TCR}[T S C K P]=0, \operatorname{RCR}[\operatorname{RSCKP}]=0)$ and a non-inverted frame sync $(T C R[T F S I]=0$, RCR[RFSI] = 0). If the polarity of the clock and/or the frame sync have been inverted, all the timings remain valid by inverting the clock signal (I2S_BCLK) and/or the frame sync (I2S_FS) shown in the figures below.

1. The TSI module is functional with capacitance values outside this range. However, optimal performance is not guaranteed.
2. CAPTRM=7, DELVOL=7, and fixed external capacitance of 20 pF .
3. CAPTRM=0, $D E L V O L=2$, and fixed external capacitance of 20 pF .
4. CAPTRM=0, EXTCHRG=9, and fixed external capacitance of 20 pF .
5. The programmable current source value is generated by multiplying the SCANC[REFCHRG] value and the base current.
6. The programmable current source value is generated by multiplying the SCANC[EXTCHRG] value and the base current.
7. Measured with a 5 pF electrode, reference oscillator frequency of $10 \mathrm{MHz}, \mathrm{PS}=128, \mathrm{NSCN}=8$; lext $=16$.
8. Measured with a 20 pF electrode, reference oscillator frequency of $10 \mathrm{MHz}, \mathrm{PS}=128, \mathrm{NSCN}=2$; lext $=16$.
9. Measured with a 20 pF electrode, reference oscillator frequency of $10 \mathrm{MHz}, \mathrm{PS}=16, \mathrm{NSCN}=3$; lext $=16$.
10. Sensitivity defines the minimum capacitance change when a single count from the TSI module changes, it is equal to ( $\mathrm{C}_{\text {ref }}$
 configuration: lext $=5 \mu \mathrm{~A}, \mathrm{EXTCHRG}=4, \mathrm{PS}=128, \mathrm{NSCN}=2, \mathrm{I}_{\text {ref }}=16 \mu \mathrm{~A}, \operatorname{REFCHRG}=15, \mathrm{C}_{\mathrm{ref}}=1.0 \mathrm{pF}$. The minimum sensitivity describes the smallest possible capacitance that can be measured by a single count (this is the best sensitivity but is described as a minimum because it's the smallest number). The minimum sensitivity parameter is based on the following configuration: $I_{\text {ext }}=1 \mu \mathrm{~A}, \mathrm{EXTCHRG}=0, \mathrm{PS}=128, \mathrm{NSCN}=32, \mathrm{I}_{\text {ref }}=32 \mu \mathrm{~A}$, REFCHRG $=31, \mathrm{C}_{\mathrm{ref}}=0.5$ pF
11. Time to do one complete measurement of the electrode. Sensitivity resolution of $0.0133 \mathrm{pF}, \mathrm{PS}=0, \mathrm{NSCN}=0,1$ electrode, DELVOL = 2, EXTCHRG $=15$.
12. CAPTRM $=7$, $D E L V O L=2, R E F C H R G=0$, $E X T C H R G=4, P S=7$, $N S C N=0 F$, LPSCNITV=F, LPO is selected ( 1 kHz ), and fixed external capacitance of 20 pF . Data is captured with an average of 7 periods window.

## 7 Dimensions

### 7.1 Obtaining package dimensions

Package dimensions are provided in package drawings.
To find a package drawing, go to freescale.com and perform a keyword search for the drawing's document number:

| If you want the drawing for this package | Then use this document number |
| :--- | :--- |
| 144-pin LQFP | $98 A S S 23177 \mathrm{~W}$ |
| 144-pin MAPBGA | $98 \mathrm{ASA00222D}$ |

### 8.2 K52 Pinouts

The below figure shows the pinout diagram for the devices supported by this document. Many signals may be multiplexed onto a single pin. To determine what signals can be used on which pin, see the previous section.

## 9 Revision History

The following table provides a revision history for this document.
Table 58. Revision History

| Rev. No. | Date | Substantial Changes |
| :---: | :---: | :--- |
| 2 | $3 / 2011$ | Initial public revision |

Table 58. Revision History (continued)

| Rev. No. | Date | Substantial Changes |
| :---: | :---: | :---: |
| 3 | 3/2011 | Added sections that were inadvertently removed in previous revision |
| 4 | 3/2011 | Reworded $\mathrm{I}_{\mathrm{IC}}$ footnote in "Voltage and Current Operating Requirements" table. <br> Added paragraph to "Peripheral operating requirements and behaviors" section. <br> Added "JTAG full voltage range electricals" table to the "JTAG electricals" section. |
| 5 | 6/2011 | - Changed supported part numbers per new part number scheme <br> - Changed DC injection current specs in "Voltage and current operating requirements" table <br> - Changed Input leakage current and internal pullup/pulldown resistor specs in "Voltage and current operating behaviors" table <br> - Split Low power stop mode current specs by temperature range in "Power consumption operating behaviors" table <br> - Changed typical $I_{D D \_V B A T}$ spec in "Power consumption operating behaviors" table <br> - Added ENET and LPTMR clock specs to "Device clock specifications" table <br> - Changed Minimum external reset pulse width in "General switching specifications" table <br> - Changed PLL operating current in "MCG specifications" table <br> - Added footnote to PLL period jitter in "MCG specifications" table <br> - Changed Supply current in "Oscillator DC electrical specifications" table <br> - Changed Crystal startup time in "Oscillator frequency specifications" table <br> - Changed Operating voltage in "EzPort switching specifications" table <br> - Changed title of "FlexBus switching specifications" table and added Output valid and hold specs <br> - Added "FlexBus full range switching specifications" table <br> - Changed ADC asynchronous clock source specs in "16-bit ADC characteristics" table <br> - Changed Gain spec in "16-bit ADC with PGA characteristics" table <br> - Added typical Input DC current to "16-bit ADC with PGA characteristics" table <br> - Changed Input offset voltage and ENOB notes field in "16-bit ADC with PGA characteristics" table <br> - Changed Analog comparator initialization delay in "Comparator and 6-bit DAC electrical specifications" <br> - Changed Code-to-code settling time, DAC output voltage range low, and Temperature coefficient offset voltage in "12-bit DAC operating behaviors" table <br> - Moved Output resistance to "TRIAMP operating behaviors" tables <br> - Changed Supply current, Input offset current, AC input impedance in "TRIAMP operating behaviors" tables <br> - Changed Temperature drift and Load regulation in "VREF full-range operating behaviors" table <br> - Changed Regulator output voltage in "USB VREG electrical specifications" table <br> - Changed ILIM description and specs in "USB VREG electrical specifications" table <br> - Changed DSPI_SCK cycle time specs in "DSPI timing" tables <br> - Changed DSPI_SS specs in "Slave mode DSPI timing (low-speed mode)" table <br> - Changed DSPI_SCK to DSPI_SOUT valid spec in "Slave mode DSPI timing (highspeed mode)" table <br> - Changed Reference oscillator current source base current spec and added Low-power current adder footer in "TSI electrical specifications" table |

## Table 58. Revision History (continued)

| Rev. No. | Date | Substantial Changes |
| :---: | :---: | :---: |
| 6 | 01/2012 | - Added AC electrical specifications. <br> - Replaced TBDs with silicon data throughout. <br> - In "Power mode transition operating behaviors" table, removed entry times. <br> - Updated "EMC radiated emissions operating behaviors" to remove SAE level and also added data for 144LQFP. <br> - Clarified "EP7" in "EzPort switching specifications" table and "EzPort Timing Diagram". <br> - Added "ENOB vs. ADC_CLK for 16-bit differential and 16-bit single-ended modes" figures. <br> - Updated $\mathrm{I}_{\mathrm{DD} \_ \text {RUN }}$ numbers in 'Power consumption operating behaviors' section. <br> - Clarified 'Diagram: Typical IDD_RUN operating behavior' section and updated 'Run mode supply current vs. core frequency - all peripheral clocks disabled' figure. <br> - In 'Voltage reference electrical specifications' section, updated $\mathrm{C}_{\mathrm{L}}, \mathrm{V}_{\text {tdrift }}$, and $\mathrm{V}_{\text {vdrift }}$ values. <br> - In 'USB electrical specifications' section, updated $V_{D P / S R C}, I_{\text {DDstby }}$, and ${ }^{\prime} V_{\text {Reg33out }}$ values. |
| 7 | 02/2013 | - In "ESD handling ratings", added a note for ILAT. <br> - Updated "Voltage and current operating requirements". <br> - Updated "Voltage and current operating behaviors". <br> - Updated "Power mode transition operating behaviors". <br> - Updated "EMC radiated emissions operating behaviors" to add MAPBGA data. <br> - In "MCG specifications", updated the description of $f_{\text {ints_t. }}$ <br> - In "16-bit ADC operating conditions", updated the max spec of $\mathrm{V}_{\text {ADIN }}$. <br> - In "16-bit ADC electrical characteristics", updated the temp sensor slope and voltage specs. <br> - Updated "I2C switching specifications". <br> - In "SDHC specifications", removed the operating voltage limits and updated the SD1 and SD6 specs. <br> - In "I2S switching specifications", added separate specification tables for the full operating voltage range. |
