## 1. General description

The NX5P2553 is a precision adjustable current-limited power switch. The device includes undervoltage lockout, overtemperature, and reverse bias protection circuits designed to isolate the switch terminals when a fault condition occurs. It also has an overcurrent protection circuit to limit the output current. The device features two power switch terminals, one input (VIN), and one output (VOUT). It also consists of a current limit input (ILIM) for defining the overcurrent limit, an open-drain fault output (FAULT) to indicate when a fault condition has occurred, and an enable input (EN) to control the state of the switch.

The overcurrent limit threshold can be programmed between 85 mA and 1.8 A using an external resistor between the ILIM and GND pins. The device has built-in soft-start. This feature controls the output rise time by minimizing current surges when the switch is enabled.

Designed for operation from 2.5 V to 5.5 V , it is used in power domain isolation applications to protect from out of range operation. The enable input includes integrated logic level translation making the device compatible with lower voltage processors and controllers.

## 2. Features and benefits

■ Wide supply voltage range from 2.5 V to 5.5 V

- Isw maximum 1.5 A continuous current
- $\pm 6 \%$ current-limit accuracy at 1.8 A (typical)
- Meets USB current-limiting requirements
- Adjustable current limit from 85 mA to 1800 mA (typical)
- Constant current mode in overcurrent situation
- Overtemperature protection
- Very low ON resistance: $95 \mathrm{~m} \Omega$ (typical) for TSOP6 package
- Fast short-circuit switch-off response ( $2.0 \mu \mathrm{~s}$ typical)
- ILIM short detection
- Reverse input-output voltage protection

■ Built-in soft-start

- ESD protection:
- HBM ANSI/ESDA/JEDEC JS-001-2012 Class 2 exceeds 2000 V
- CDM JESD22-C101D exceeds 500 V
- IEC61000-4-2 contact discharge exceeds 8 kV for VOUT (with external capacitance)
- Specified from $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ ambient temperature

## 3. Applications

- USB port/hubs
- Digital TV and set-top boxes
- VoIP phones

## 4. Ordering information

Table 1. Ordering information

| Type number | Package |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | Temperature range | Name | Description | Version |
| NX5P2553GV | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | TSOP6 | plastic surface-mounted package (TSOP6); 6 leads | SOT457 |
| NX5P2553GU | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | HXSON6 | plastic, thermal enhanced extremely thin small outline <br> package; no leads; 6 terminals; body $1.6 \times 1.6 \times 0.5 \mathrm{~mm}$ | SOT1189-1 |
| NX5P2553GU6 | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | HXSON6 | plastic, thermal enhanced extremely thin small outline <br> package; no leads; 6 terminals; body $2.0 \times 2.0 \times 0.5 \mathrm{~mm}$ | SOT1348-1 |

## 5. Marking

Table 2. Marking codes

| Type number | Marking code ${ }^{\text {[1] }}$ |
| :--- | :--- |
| NX5P2553GV | x53 |
| NX5P2553GU | x53 |
| NX5P2553GU6 | x53 |

[1] The pin 1 indicator is on the lower left corner of the device, below the marking code.

## 6. Functional diagram

Fig 1. Logic diagram

## 7. Pinning information

### 7.1 Pinning

Fig 2. Pin configuration SOT457 (TSOP6)

### 7.2 Pin description

Table 3. Pin description

| Symbol | Pin |  | Description |
| :--- | :--- | :--- | :--- |
|  | TSOP6 | HXSON6 |  |
| VOUT | 6 | 1 | output voltage |
| ILIM | 5 | 2 | current limiter I/O |
| FAULT | 4 | 3 | fault condition indicator (open-drain; active LOW) |
| EN | 3 | 4 | enable input (active HIGH) |
| GND | 2 | 5 | ground (0 V) |
| VIN | 1 | 6 | input voltage[1] |

[1] Connect a decoupling capacitance with a minimum value of $0.1 \mu \mathrm{~F}$ as close as possible to the input VIN.

## 8. Functional description

Table 4. Function table[1]

| Input EN | Switch |
| :--- | :--- |
| L | switch OFF |
| H | switch ON |

[1] $H=$ HIGH voltage level; L = LOW voltage level.

### 8.1 EN input

When EN is set to LOW, the N-channel MOSFET is disabled and the device enters a low-power mode. In low-power mode, all protection circuits are disabled and the FAULT output is set to high-impedance state. When EN is set to HIGH, all protection circuits are enabled. If no fault conditions exist, the N -channel MOSFET is enabled.

### 8.2 UnderVoltage LockOut (UVLO)

The UVLO circuit is active until VIN $>2.35 \mathrm{~V}$. It disables the N -channel MOSFET and switches the device back to low-power mode. It occurs irrespective of the logic level on the EN pin. Once VIN > 2.35 V , the EN pin controls the N -channel MOSFET state. The UVLO circuit remains active in low-power mode.

### 8.3 ILIM

The OverCurrent Protection (OCP) circuit trigger value $\mathrm{I}_{\text {ocp }}$ is set using an external resistor connected to the ILIM pin as shown in Figure 8. If EN is set to HIGH and the ILIM pin is grounded, the N -channel MOSFET is disabled and the FAULT output is set to LOW.

### 8.4 OverCurrent Protection (OCP)

Three possible overcurrent conditions can occur. They are:

- Overcurrent at start-up, $\mathrm{I}_{\mathrm{SW}}>\mathrm{I}_{\text {ocp }}$ when enabling the N -channel MOSFET
- Overcurrent when enabled, $I_{\text {Sw }}>I_{\text {ocp }}$ when the $N$-channel MOSFET is enabled
- Short-circuit when enabled, $\mathrm{I}_{\mathrm{SW}}>4 \times \mathrm{I}_{\mathrm{ocp}}$ (typical)

### 8.4.1 Overcurrent at start-up

If the device senses a short or overcurrent while enabling the N -channel MOSFET, OCP is triggered. It limits the output current to $\mathrm{I}_{\text {ocp }}$ and after the deglitch time sets the $\overline{\mathrm{FAULT}}$ output to LOW, as shown in Figure 22. Increased power dissipation combined with the OTP may lead to temperature cycling.

### 8.4.2 Overcurrent when enabled

When enabled, if the device senses $I_{\text {Sw }}>I_{\text {ocp }}$, the OCP is triggered. It limits the output current to $\mathrm{I}_{\text {ocp }}$ and after the deglitch time sets the $\overline{\text { FAULT }}$ output to LOW. Limiting the output current reduces $\mathrm{V}_{\mathrm{O}(\mathrm{VOUT})}$, as shown in Figure 20 and Figure 21. Increased power dissipation combined with the OTP may lead to temperature cycling.

### 8.4.3 Short-circuit when enabled

When enabled, if the device senses $\mathrm{I}_{\text {sw }}>4 \times \mathrm{I}_{\text {ocp }}$, a short-circuit is detected. The device disables the N -channel MOSFET immediately. It then enables the N -channel MOSFET, output current is limited to $\mathrm{I}_{\text {ocp }}$ and after the deglitch time, the $\overline{\text { FAULT }}$ output is set to LOW as shown in Figure 16 to Figure 19. Increased power dissipation combined with the OTP may lead to temperature cycling.

### 8.5 Reverse-Voltage Protection (RVP)

If VOUT exceeds VIN by 140 mV for the deglitch time, RVP protects the device by disabling the N -channel MOSFET. When the reverse voltage condition is removed for the deglitch time, the N-channel MOSFET is enabled as shown in Figure 14 and Figure 15.

### 8.6 FAULT output

The $\overline{\text { FAULT }}$ pin is an open-drain output that requires an external pull-up resistor. If any of the protection circuits are activated, $\overline{\text { FAULT }}$ is set to LOW to indicate that a fault has occurred. It returns to the high-impedance state automatically once the fault condition is removed.

### 8.7 OverTemperature Protection (OTP)

If the device temperature exceeds $155^{\circ} \mathrm{C}$ when EN is set HIGH and the device is not in current limit, OTP triggers. It disables the N-channel MOSFET and sets the FAULT pin to LOW. Any transition on the EN pin has no effect. Once the device temperature decreases below $125^{\circ} \mathrm{C}$, the device returns to the defined state.

If the device temperature exceeds $130^{\circ} \mathrm{C}$ when EN is set HIGH and the device is in current limit, OTP triggers. It disables the N-channel MOSFET and sets the FAULT pin to LOW. Any transition on the EN pin has no effect. Once the device temperature decreases below $118{ }^{\circ} \mathrm{C}$, the device returns to the defined state.

## 9. Limiting values

Table 5. Limiting values
In accordance with the Absolute Maximum Rating System (IEC 60134). Voltages are referenced to GND (ground = 0 V).

| Symbol | Parameter | Conditions |  | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $V_{1}$ | input voltage | inputs EN and ILIM | [1] | -0.35 | +6.5 | V |
|  |  | input VIN | [2] | -0.35 | +6.5 | V |
| $\mathrm{V}_{\mathrm{O}}$ | output voltage | output $\overline{\text { FAULT }}$ | [1] | -0.35 | $\mathrm{V}_{\text {IVIN }}$ | V |
|  |  | output VOUT | [2] | -0.35 | +6.5 | V |
| $\mathrm{V}_{\text {SW }}$ | switch voltage |  | [2] | -6.5 | +6.5 | V |
| $\mathrm{I}_{\mathrm{K}}$ | input clamping current | input EN; $\mathrm{V}_{\text {I(EN) }}<-0.35 \mathrm{~V}$ |  | -50 | - | mA |
|  |  | input ILIM; $\mathrm{V}_{\text {I(IIIM })}<-0.35 \mathrm{~V}$ |  | -50 | - | mA |
| $I_{\text {source }}$ | source current | input ILIM |  | - | 1 | mA |
| lok | output clamping current | $\mathrm{V}_{\mathrm{O}}<0 \mathrm{~V}$ |  | -50 | - | mA |
| $\mathrm{I}_{\text {SK }}$ | switch clamping current | input VIN; $\mathrm{V}_{\text {I(VIN })}<-0.35 \mathrm{~V}$ |  | -50 | - | mA |
|  |  | output VOUT; $\mathrm{V}_{\mathrm{O} \text { (VOUT) }}<-0.35 \mathrm{~V}$ |  | -50 | - | mA |
| Isw | switch current | $\mathrm{V}_{\text {sw }}>-0.35 \mathrm{~V}$ | [3] | - | 1900 | mA |
| $\mathrm{T}_{\mathrm{j}(\text { max })}$ | maximum junction temperature |  |  | -40 | +150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\text {stg }}$ | storage temperature |  |  | -65 | +150 | ${ }^{\circ} \mathrm{C}$ |
| $P_{\text {tot }}$ | total power dissipation | NX5P2553GV | [4] | - | 300 | mW |
|  |  | NX5P2553GU | [4] | - | 315 | mW |
|  |  | NX5P2553GU6 | [4] | - | 340 | mW |

[1] If the input current rating is observed, the minimum input voltage rating may be exceeded.
[2] If the switch clamping current rating is observed, the minimum and maximum switch voltage ratings may be exceeded.
[3] Internally limited.
[4] The (absolute) maximum power dissipation depends on the junction temperature $\mathrm{T}_{\mathrm{j}}$. Higher power dissipation is allowed with lower ambient temperatures. The conditions to determine the specified values are $\mathrm{T}_{\mathrm{amb}}=85^{\circ} \mathrm{C}$ and the use of a two layer PCB.

## 10. Recommended operating conditions

Table 6. Operating conditions

| Symbol | Parameter | Conditions | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $V_{1}$ | input voltage | input VIN | 2.5 | 5.5 | V |
|  |  | input EN | 0 | 5.5 | V |
| $\mathrm{I}_{\text {SW }}$ | switch current | $\mathrm{T}_{\mathrm{j}}=-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ | 0 | 1.2 | A |
|  |  | $\mathrm{T}_{\mathrm{j}}=-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$ | 0 | 1.5 | A |
| $\mathrm{l}_{\mathrm{O} \text { (sink) }}$ | output sink current | output $\overline{\text { FAULT }}$ | -10 | - | mA |
| $\mathrm{R}_{\text {ILIM }}$ | current limit resistance | input ILIM | 15 | 232 | $k \Omega$ |
| $\mathrm{C}_{\text {dec }}$ | decoupling capacitance | VIN and VOUT to GND | 0.1 | - | $\mu \mathrm{F}$ |
| $\mathrm{T}_{\text {amb }}$ | ambient temperature |  | -40 | +85 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\mathrm{j}}$ | junction temperature | $\mathrm{I}_{\text {SW }}<1.2 \mathrm{~A}$ | -40 | +125 | ${ }^{\circ} \mathrm{C}$ |
|  |  | $\mathrm{I}_{\text {SW }}<1.5 \mathrm{~A}$ | -40 | +105 | ${ }^{\circ} \mathrm{C}$ |

[1] Current-limit threshold resistor range from ILIM to GND.

## 11. Thermal characteristics

Table 7. Thermal characteristics

| Symbol | Parameter | Conditions |  | Typ | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{R}_{\text {th( }}$-a) | thermal resistance from junction to ambient | NX5P2553GV | [1] | 133 | K/W |
|  |  | NX5P2553GU | [1] | 105 | K/W |
|  |  | NX5P2553GU6 | [1] | 93 | K/W |

[1] $R_{\mathrm{th}(j-a)}$ is dependent upon board layout. To minimize $\mathrm{R}_{\mathrm{th}(-\mathrm{a})}$, ensure that all pins have a solid connection to larger copper layer areas. In multi-layer PCBs, the second layer should be used to create a large heat spreader area below the device. Avoid using solder-stop varnish under the device.

## 12. Static characteristics

Table 8. Static characteristics
At recommended operating conditions; $V_{I(V I N)}=V_{I(E N)}$ and $R_{F A U L T}=10 \mathrm{k} \Omega$ unless otherwise specified; voltages are referenced to GND (ground = 0 V); see Figure 4, Figure 5, Figure 6, and Figure 11.

| Symbol | Parameter | Conditions | Min | Typ[1] | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  |  | FAULT; RVP; $\mathrm{V}_{\mathrm{I}(\mathrm{VIN})}=5 \mathrm{~V}$ | 2 | 4.4 | 6 | ms |

[1] Typical values are measured at $\mathrm{T}_{\mathrm{j}}=25^{\circ} \mathrm{C}$.
[2] $t_{e n}$ is the same as $t_{\text {pzh }}$.
[3] $t_{\text {dis }}$ is the same as $t_{\text {PHz }}$.

### 13.1 Waveform and test circuits

Measurement points are given in Table 13.
Logic level: $\mathrm{V}_{\mathrm{OH}}$ is the typical output voltage that occurs with the output load.
Fig 9. Switching times and rise and fall times

Table 13. Measurement points

| Supply voltage | EN input | Output |  |
| :--- | :--- | :--- | :--- |
| $\mathbf{V}_{\mathbf{I}(\mathrm{VIN})}$ | $\mathbf{V}_{\mathbf{M}}$ | $\mathbf{V}_{\mathbf{X}}$ | $\mathbf{V}_{\mathbf{Y}}$ |
| 2.5 V | $0.5 \times \mathrm{V}_{\text {I(EN) }}$ | $0.9 \times \mathrm{V}_{\mathrm{OH}}$ | $0.1 \times \mathrm{V}_{\mathrm{OH}}$ |
| 5.5 V | $0.5 \times \mathrm{V}_{\text {I(EN) }}$ | $0.9 \times \mathrm{V}_{\mathrm{OH}}$ | $0.1 \times \mathrm{V}_{\mathrm{OH}}$ |

Test data is given in Table 14.
Definitions test circuit:
$\mathrm{R}_{\mathrm{L}}=$ Load resistance.
$C_{L}=$ Load capacitance including jig and probe capacitance
$\mathrm{V}_{\mathrm{EXT}}=$ External voltage for measuring switching times.
Fig 10. Test circuit for measuring switching times

## 14. Application information

### 14.1 Application diagram

For the IEC61000-4-2 contact discharge test, the $10 \mu \mathrm{~F}$ input capacitance is not needed.
Fig 25. Application diagram

### 14.2 Best practices

In order to avoid product damage, the device should always operate within the boundaries given in Section 9. However, in applications with high switching currents, these limits might be violated during transients even when the static values are well within the limiting values. The device includes soft-start which limits in-rush current when enabling the N -channel MOSFET. This feature does not limit current transients due to load change when the N -channel MOSFET is already enabled.

The following aspects can be taken as guideline:

- Widen the circuit board traces between:
- Power supply and VIN input
- VOUT output and load connection (USB plug)
- Load GND (USB plug) and power supply GND as much as possible. Define a Kelvin point in the GND line, close to the product and have the device GND connected to it.
- Use combination of larger and smaller value capacitors with low ESR at the VIN input and the VOUT output. Ensure that wires to the VIN input, VOUT output and the Kelvin point are short. Wires behave like coils. Transient currents (e.g. as a result of a short) may lead to high positive or negative inductance voltages. The carefully routed high-current path and the short wired capacitors at the VIN input and the VOUT output keeps these voltages away from the product.
- Load transients affect the supply of the application. Load transients result from the switch enable and disable process as well as load jumps (application of or removal of load). The supply might react to load transients with voltage jumps that exceed the Limiting values. If such voltage jumps are larger, the capacitors at the VIN input and the VOUT output might not be able to filter them. A strong 6 V Zener diode between VIN and GND might be considered. Improving the design of the supply is a better solution.

## 18. Legal information

### 18.1 Data sheet status

| Document status $\underline{[1][2]}$ | Product status $[3]$ | Definition |
| :--- | :--- | :--- |
| Objective [short] data sheet | Development | This document contains data from the objective specification for product development. |
| Preliminary [short] data sheet | Qualification | This document contains data from the preliminary specification. |
| Product [short] data sheet | Production | This document contains the product specification. |

[1] Please consult the most recently issued document before initiating or completing a design.
[2] The term 'short data sheet' is explained in section "Definitions",
[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL http://www.nxp.com.

### 18.2 Definitions

Draft - The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet - A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.
Product specification - The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

### 18.3 Disclaimers

Limited warranty and liability - Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.
Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.
Right to make changes - NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use - NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications - Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.
NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.
Limiting values - Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.
Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at http://www.nxp.com/profile/terms, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.
No offer to sell or license - Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

Export control - This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Non-automotive qualified products - Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.
In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond

## Precision adjustable current-limited power switch

NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.
Translations - A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.
