LCD driver for low multiplex rates

OM4068

FEATURES

- Single-chip LCD controller/driver
- Static/duplex/triplex drive modes with up to 32/64/96 LCD segments drive capability per device
- Selectable backplane drive configuration: static or 2 or 3 backplane multiplexing
- Selectable display bias configuration drive: static, $\frac{1}{2}$ or $\frac{1}{3}$
- 32 segment drivers
- Serial data input (word length 32 to 96 bits)
- On-chip generation of intermediate LCD bias voltages
- 2 MHz fast serial bus interface
- CMOS compatible
- Compatible with any 4-bit, 8-bit or 16-bit microprocessors/microcontrollers
- May be cascaded for large LCD applications
- Logic supply voltage range ($V_{DD} - V_{SS}$) of 2.5 to 5.5 V
- Display supply voltage range ($V_{LCD} - V_{SS}$) of 3.5 to 6.5 V
- Low power consumption, suitable for battery operated systems
- No external components needed by the oscillator
- Manufactured in silicon gate CMOS process.

APPLICATIONS

- Telecom equipment
- Portable instruments
- Alarm systems
- Automotive equipment.

GENERAL DESCRIPTION

The OM4068 is a low-power CMOS LCD driver, designed to drive Liquid Crystal Displays (LCDs) with low multiplex rates. It generates the drive signals for any static or multiplexed LCD containing up to three backplanes and up to 32 segment lines and can be easily cascaded for larger LCD applications. All necessary functions for the display are provided in a single chip, including on-chip generation of LCD bias voltages, resulting in a minimum of external components and lower power consumption. A 3-line bus structure enables serial data transfer with most microprocessors/microcontrollers. All inputs are CMOS compatible.

SEG31	2	17	LCD segment driver output 31
SEG32	3	18	LCD segment driver output 32

Notes

1. SEG1 to SEG32 (LCD segment driver outputs) output the multi-level signals for the LCD segments.
2. BP0, BP1 and BP2 (LCD backplane driver outputs) output the multi-level signals for the LCD backplanes.
3. V_{LCD} (LCD power supply): power supply for the LCD.
4. SDIN (serial data line): input for the bus data line.
5. SCL (serial clock line): input for the bus clock line.
6. SDOUT (serial data output): output of the shift register to allow serial cascading of the OM4068 with other devices.
7. SCE (serial clock enable): input for enable/disable acquisition on the data input line. If disabled, data on the serial bus are not accepted by the device.
8. M0 and M1 (display mode select inputs): inputs to select the LCD drive configurations; static, duplex or triplex.

OM4068

FUNCTIONAL DESCRIPTION

The OM4068 is a low-power LCD driver designed to interface with any microprocessor/microcontroller and a wide variety of LCDs. It can drive any static or multiplexed LCD containing up to three backplanes and up to 96 segments.

The display configurations possible with the OM4068 depend on the number of active backplane outputs required; a selection of display configurations is given in Table 1.

A typical system (MUX 1 : 3) is shown in Fig.4.

Table 1 Selection of display configurations

NUMBER OF		7-SEGMENTS NUMERIC		DOT MATRIX
BACKPLANES	DISPLAY SEGMENTS	DIGITS	INDICATOR SYMBOLS	
3	96	12	12	96 dots (3 × 32)
2	64	8	8	64 dots (2 × 32)
1	32	4	4	32 dots (1 × 32)

The host microprocessor/microcontroller maintains the 3-line bus communication channel with OM4068. The internal oscillator requires no external components. The appropriate intermediate biasing voltage for the multiplexed LCD waveforms are generated on-chip.

The only other connections required to complete the system are to the power supplies (VSS, VDD and VLCD) and suitable capacitors to decouple the VLCD and VDD pins to VSS.

LCD driver for low multiplex rates

OM4068

Power-on reset

The on-chip power-on reset block initializes the chip after power-on or power failures. The OM4068 resets to a starting condition as follows:

- All backplane and segment outputs are set to V_{SS} (display off)
- All shift registers and latches are set in 3-state
- SDOUT (allowing serial cascading) is set to logic 0 (with SCE LOW)
- Power-down mode.

Data transfers on the serial bus should be avoided for 0.5 ms following power-on to allow completion of the reset action.

Power-down

After power-on the chip is in power-down mode as long as the serial clock is not active. During power-down all static currents are switched off (no internal oscillator, no timing and no bias level generation) and all LCD-outputs are 3-stated. The power-on reset functions remain enabled.

The power-down mode is disabled at the first rising edge of the serial clock SCLK.

LCD bias voltage generator

The intermediate bias voltages for the LCD display are generated on-chip. This removes the need for an external resistive bias chain and significantly reduces the system power consumption. The full-scale LCD voltage V_{OP} equals $V_{LCD} - V_{SS}$. The optimum value of V_{OP} depends on the LCD threshold voltage (V_{th}) and the number of bias levels.

Fractional LCD biasing voltages are obtained from an internal voltage divider of three series resistors ($\frac{1}{3}$ bias) connected between V_{LCD} and V_{SS} . The centre resistor can be switched out of the circuit to provide a $\frac{1}{2}$ bias voltage level for the 1 : 2 multiplex configuration.

The bias levels depend on the multiplex rate and are selected automatically when the display configuration is selected using M1 and M0.

LCD voltage selector

The LCD voltage selector (control logic) coordinates the multiplexing of the LCD in accordance with the selected drive or display configuration. The operation of the voltage selector is controlled by the input pins M0 and M1 (see Table 2).

Table 2 Drive mode selection

M1	M0	DRIVE MODE
0	0	test mode (not user accessible)
0	1	static drive (1 : 1)
1	0	duplex drive (1 : 2)
1	1	triplex drive (1 : 3)

For multiplex rates of 1 : 2 three bias levels are used including V_{LCD} and V_{SS} . Four bias level are used for the 1 : 3 multiplex rate. The various biasing configurations together with the biasing characteristics as functions of $V_{OP} = V_{LCD} - V_{SS}$ and the resulting discrimination ratios (D), are given in Table 3.

A practical value for V_{OP} is determined by equating $V_{off(rms)}$ with a defined LCD threshold voltage (V_{th}), typically when the LCD exhibits approximately 10% contrast. In static mode a suitable choice is $V_{OP} > 3V_{th}$.

LCD driver for low multiplex rates

OM4068

Table 3 LCD drive modes: summary of characteristics

LCD DRIVE MODE	NUMBER OF		LCD BIAS CONFIGURATION	$\frac{V_{off(rms)}}{V_{OP}}$	$\frac{V_{on(rms)}}{V_{OP}}$	$D = \frac{V_{on(rms)}}{V_{off(rms)}}$
	BACKPLANES	LEVELS				
Static	1	2	static	0	1	—
1 : 2	2	3	1/2	0.354	0.791	2.2236
1 : 3	3	4	1/3	0.333	0.638	1.915

LCD drive mode waveforms

The static LCD drive mode is used when a single backplane is provided in the LCD. Backplane and segment drive waveforms for this mode are shown in Fig.5.

LCD driver for low multiplex rates

OM4068

1 : 2 MULTIPLEX DRIVE MODE

When two backplanes are provided in the LCD, the 1 : 2 multiplex mode applies, as shown in Fig.6.

Fig.6 Waveforms for 1 : 2 multiplex drive mode ($V_{OP} = V_{LCD} - V_{SS}$).

1 : 3 MULTIPLEX DRIVE MODE

When three backplanes are provided in the LCD, the 1 : 3 multiplex mode applies, as shown in Fig.7.

LCD driver for low multiplex rates

OM4068

LCD driver for low multiplex rates

OM4068

Oscillator

The internal logic and the multi-level LCD drive signals of the OM4068 are generated by the built-in RC oscillator. No external components are required.

In order to minimize radio frequency interference, the oscillator operates with symmetrical and slew-rate limited capacitor charge/discharge.

The oscillator runs continuously once the power down state after power-on has been left.

Interface to microprocessor unit: serial interface

A three-line bus structure enables serial unidirectional data transfer with microprocessors/microcontrollers. The three lines are a serial data input line (SDIN), a serial clock line (SCLK) and a data line enable (SCE). All inputs are CMOS compatible. These lines must always be in a defined state V_{SS} or V_{DD} . Floating inputs could damage the chip.

On the bus, one data bit is transferred during each clock pulse. The data on the SDIN line remains stable during the whole clock period. Data changes arrive with the falling edge of the serial clock SCLK (see Fig.8).

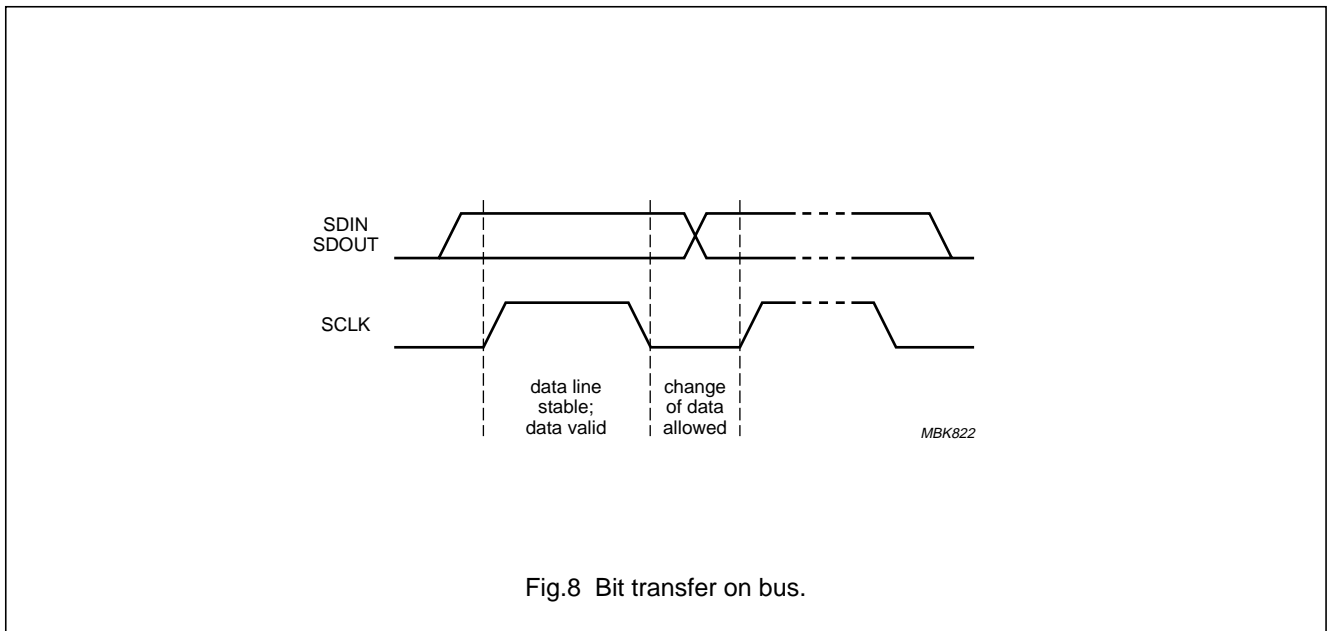

Fig.8 Bit transfer on bus.

Shift register

Data present on the SDIN pin is shifted into a shift register with the rising edge of the serial clock SCLK in a synchronous manner. The shift register serves to transfer display information from the serial bus to the (display) latch while previous data is displayed.

The shift register is organized as three 32-bit shift registers. Depending on the display driving mode selected (see Table 3), one, two or three registers are used and cascaded resulting in a shift register length of 32, 64 or 96 bits. Figure 9 shows the shift register organization with the display data bits after a shift operation is completed. The shift sequence begins with data bit D32 and finishes with data bit D1. The correspondence between the data bit

numbers and the LCD display segments is shown in Table 4.

Data from the last stage of the register is supplied to the SDOUT pin to allow serial cascading of the OM4068 with other peripheral devices. Depending on the display driving mode selected, SDOUT corresponds to bit 32, 64 or 96 of the register (see Fig.10). Data on the SDOUT pin is shifted out with the falling edge of the SCLK clock. SDOUT is therefore delayed by $\frac{1}{2}$ SCLK cycle before it is applied to the SDIN pin of the next IC in the serial chain (see Fig.8).

The clock enable SCE signal must be HIGH in order to enable the shift operation. SDOUT output is latched with the last data after SCE returned to HIGH (shift operation terminated).

SDOUT is in 3-state mode when SCE is LOW.

LCD driver for low multiplex rates

OM4068

Display latch

The 96-bit display latch holds the display data while the corresponding multiplex signals are generated. There is a one-to-one relationship between the data in the display latch and the LCD segment outputs. An LCD segment is activated when the corresponding data bit in the display latch is HIGH.

Display latches are in HOLD mode (SCE HIGH) during the shift operation to maintain the display data constant.

Data are latched into the display latch with the internal frame clock. Thus there is a delay of up to one half frame before new data are latched after signal SCE returns to zero.

Timing

The timing of the OM4068 organizes the internal data flow of the device. This includes the transfer of display data from the shift register to the display segments outputs. The timing also generates the LCD frame frequency which is derived from the clock frequency generated in the internal clock generator:

$$f_{fr(LCD)} = \frac{f_{osc}}{2400}$$

Segment outputs

The LCD drive section includes 32 segment outputs SEG1 to SEG32 which should be connected directly to the LCD. The segment output signals are generated in accordance with the multiplex backplane signals and with data in the display latch. When less than 32 segments are required the unused segment outputs should be left open-circuit.

LCD driver for low multiplex rates

OM4068

Backplane outputs

The LCD drive section includes three backplane outputs (BP1 to BP3) which should be connected directly to the LCD. The backplane output signals are generated in accordance with the selected LCD drive mode. If less than three backplane outputs are required the unused outputs should be left open-circuit. In 1 : 2 multiplex drive mode, BP3 is set to $\frac{1}{2}V_{LCD}$. In static drive mode BP3 and BP2 are set to V_{SS} .

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DD}	supply voltage		-0.5	+6.5	V
V_{LCD}	LCD supply voltage		-0.5	+7.5	V
V_I	input voltage (any input)		-0.5	$V_{DD} + 0.5$	V
V_O	output voltage (BP1, BP2, BP3, S1 to S32 and V_{LCD})		-0.5	$V_{LCD} + 0.5$	V
I_I	DC input current		-10	+10	mA
I_O	DC output current		-10	+10	mA
I_{DD}, I_{SS}, I_{LCD}	V_{DD}, V_{SS} or V_{LCD} current		-50	+50	mA
$P_{tot(pack)}$	total power dissipation per package		-	500	mW
P/out	power dissipation per output		-	10	mW
T_{amb}	operating ambient temperature		-40	+105	°C
T_{stg}	storage temperature		-65	+150	°C
T_j	junction temperature		-	150	°C
V_{es}	electrostatic handling	note 1	-2000	+2000	V
		note 2	-150	+150	V

Notes

- Equivalent to discharging a 100 pF capacitor via a 1.5 k Ω series resistor (human body model).
- Equivalent to discharging a 200 pF capacitor via a 0.75 μ H series inductor (machine model).

HANDLING

Inputs and outputs are protected against electrostatic discharge in normal handling. However, to be totally safe, it is desirable to take normal precautions appropriate to handling MOS devices (see "Handling MOS Devices").

LCD driver for low multiplex rates

OM4068

DC CHARACTERISTICS $V_{DD} = 2.5$ to 5.5 V; $V_{SS} = 0$ V; $V_{LCD} = 3.5$ to 6.5 V; $T_{amb} = -40$ to $+105$ °C; unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
Supplies						
V_{DD}	supply voltage		$V_{SS} + 2.5$	–	5.5	V

$V_{back(bias)(tol)}$	bias tolerance BP1, BP2 and BP3	note 7	–100	0	+100	mV

Notes

1. Power-down state. After power-on the chip is in power-down state as long as the serial clock is not activated. During power-down all static currents are switched off except the power-on reset block.
2. Output SDOUT is open-circuit; inputs at V_{DD} or V_{SS} ; bus inactive.
3. Drive mode: static, duplex and triplex.
4. LCD outputs are open-circuit, $C_L = 50$ pF typical, inputs at V_{DD} or V_{SS} ; bus inactive.
5. Resets all logic when $V_{DD} < V_{POR}$.
6. Resistance of output terminal (S1 to S32 and BP1, BP2 and BP3) with a load current of 20 μ A; outputs measured one at a time.
7. LCD outputs open-circuits.

LCD driver for low multiplex rates

OM4068

AC CHARACTERISTICS

$V_{DD} = 2.5$ to 5.5 V; $V_{SS} = 0$ V; $V_{LCD} = 5.0$ V; $T_{amb} = -40$ to $+105$ °C; unless otherwise specified.

SYMBOL	PARAMETER	MIN.	TYP.	MAX.	UNIT
$f_{fr(LCD)}$	LCD frame frequency (internal clock)	50	84	175	Hz
f_{osc}	oscillator frequency (not available at any pin)	116	224	405	kHz
Bus timing characteristics: serial bus interface; note 1					
f_{SCLK}	SCLK clock frequency	0	–	2.1	MHz
t_{SCLKL}	SCLK clock LOW period	190	–	–	ns
t_{SCLKH}	SCLK clock HIGH period	190	–	–	ns
$t_{su(D)}$	data set-up time	100	–	–	ns
$t_{h(D)}$	data hold time	100	–	–	ns
t_r	SCLK, SDIN rise time	–	10	–	ns
t_f	SCLK, SDIN fall time	–	10	–	ns
$t_{su(en)}(SDEH-SCLKH)$	enable set-up time (SDE HIGH to SCLK HIGH)	250	–	–	ns
$t_{su(dis)}(SCLKL-SDEL)$	disable set-up time (SCLK LOW to SDE LOW)	250	–	–	ns
$t_{PHL}(SDOUT)$	SDOUT HIGH-to-LOW propagation delay	100	–	–	ns

Note

1. All timing values are valid within the operating supply voltage and ambient temperature range and are referenced to V_{IL} and V_{IH} with an input voltage swing of V_{SS} to V_{DD} .

SOLDERING**Introduction**

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"Data Handbook IC26; Integrated Circuit Packages"* (order code 9398 652 90011).

DIP**SOLDERING BY DIPPING OR BY WAVE**

The maximum permissible temperature of the solder is 260 °C; solder at this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ($T_{stg\ max}$). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

REPAIRING SOLDERED JOINTS

Apply a low voltage soldering iron (less than 24 V) to the lead(s) of the package, below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300 °C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400 °C, contact may be up to 5 seconds.

QFP**REFLOW SOLDERING**

Reflow soldering techniques are suitable for all QFP packages.

The choice of heating method may be influenced by larger plastic QFP packages (44 leads, or more). If infrared or vapour phase heating is used and the large packages are not absolutely dry (less than 0.1% moisture content by weight), vaporization of the small amount of moisture in them can cause cracking of the plastic body. For details, refer to the Drypack information in the *"Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods"*.

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several methods exist for reflowing; for example, infrared/convection heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 50 and 300 seconds depending on heating method. Typical reflow peak temperatures range from 215 to 250 °C.

WAVE SOLDERING

Wave soldering is **not** recommended for QFP packages. This is because of the likelihood of solder bridging due to closely-spaced leads and the possibility of incomplete solder penetration in multi-lead devices.

CAUTION

Wave soldering is NOT applicable for all QFP packages with a pitch (e) equal or less than 0.5 mm.

If wave soldering cannot be avoided, for QFP packages with a pitch (e) larger than 0.5 mm, the following conditions must be observed:

- **A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.**
- **The footprint must be at an angle of 45° to the board direction and must incorporate solder thieves downstream and at the side corners.**

LCD driver for low multiplex rates

OM4068

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder is 10 seconds, if cooled to less than 150 °C within 6 seconds. Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

REPAIRING SOLDERED JOINTS

Fix the component by first soldering two diagonally-opposite end leads. Use only a low voltage soldering iron (less than 24 V) applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
