PCA9451A

Power management IC for i.MX 93x application processor

Rev. 2.0 — 17 April 2023 Product data sheet

1 General description

The PCA9451A is a single chip Power Management IC (PMIC) designed to support i.MX 93x family processor in both 1 cell Li-Ion and Li-polymer battery portable application and 5 V adapter non-portable applications.

The device provides six high efficiency step-down regulators, three LDOs, one 400 mA load switch, 2-channel level translator and 32.768 kHz crystal oscillator driver. Three buck regulators support Dynamic Voltage Scaling (DVS)[1] along with programmable ramping up and down time. The buck regulators support remote sense to compensate IR drop to load from buck regulator, allowing better performance to meet the demand for accuracy in critical supply rails. This device is characterized across -40 °C to 105 °C ambient temperature range, making it a good option for the industrial, extended-industrial, and consumer markets.

The six step-down regulators are designed to providing power for i.MX 93x application processor and the associated DRAM memory. The LDO1 features very low quiescent current to provide power for Secure Non-Volatile Storage (SNVS) since this LDO is always ON when input voltage is valid. Low quiesce (Low IQ) is important in low voltage systems since it enables longer battery life without sacrificing performance.

The PCA9451A also integrates a 2-bit logic translator, dual supply translating transceiver with auto direction sensing, enabling bidirectional voltage level translation. It can be used as I^2C level translator. PCA9451A also includes a 400 mA load switch supplying 3.3 V power supply to SD card, which has an internal discharge resistor, used to discharge the electric charge stored in the output when the equipment is turned off, for safety reasons.

The PCA9451A is offered in an industrial friendly 56-pin HVQFN package, 7 mm x 7 mm, 0.4 mm pitch.

2 Features and benefits

- Six high-efficiency step down regulators
  - One 4 A dual phase buck regulator with DVS feature and remote sense
  - One 2 A buck regulator with DVS feature and remote sense
  - One 3 A buck regulator
  - One 2 A buck regulator
  - One 1.5 A buck regulator
- Three linear regulators
  - One Low IQ 10 mA LDO
  - One 150 mA LDO
  - One 200 mA LDO
- 400 mA load switch with a built-in active discharge resistor
- 32.768 kHz crystal oscillator driver and buffer output
- Two channel logic level translator
- Power control IO
  - Power ON/OFF control

1 To reduce overall power consumption, processor core voltages can vary depending on the mode or activity level of the processor. DVS is used to support such voltage variation requirements by dynamically changing the output voltage of the regulator.

  - Standby/Run mode control
- Fm+ 1 MHz I^2C interface
- ESD protection
  - Human Body Model (HBM): +/- 2000 V
  - Charged Device Model (CDM): +/-500 V
- 7 mm x 7 mm, 56 pin HVQFN with 0.4 mm pitch

3 Applications

- IoT devices
- Tablet
- Electronic Point of Sale (ePOS)
- Industrial application
- Monitoring system
- Infotainment

4 Ordering information

Table 1. Ordering information

Type number	Topside marking	AP platform	Package		
			Name	Description	Version
PCA9451AHN	PCA9451A	i.MX 93x	HVQFN56	thermal enhanced very thin quad flat package; no leads; 56 terminals; 0.4 mm pitch, 7 mm x 7 mm x 0.85 mm body	SOT949-6

Table 3. Pin description

Pin description			
Symbol	**Pin**	**Type**	**Description**
LDO4	1	P	LDO4 output. Bypass with a 1 µF to Ground.
NC	2	-	Not connected; leave floating.
LDO1	3	P	LDO1 output. Bypass with a 1 µF to Ground.
VINT	4	P	Internal Power supply output pin. Bypass with 1 µF to Ground.
AGND	5	GND	Analog ground pin. It should be connected to ground plane through Via. Do not short to EP directly on top layer.
RTC_RESET_B	6	DO	Reset output pin. It is High-Z after LDO1 voltage is good. It is internally pulled up with LDO1 power rail.
CLK_32K_OUT	7	DO	32.768 kHz clock CMOS output with LDO1 power rail.

Table 3. Pin description...*continued*

Pin description			
Symbol	**Pin**	**Type**	**Description**
PMIC_RST_B	8	DI	PMIC reset input pin. It is internally pulled up with LDO1 power rail. Once it is asserted LOW, PMIC performs reset.
POR_B	9	DO	Power On reset output pin. Open drain output requiring external pull up resistor.
XTAL_IN	10	AI	32.768 kHz crystal oscillator input, tie to GND if Xtal is not used.
XTAL_OUT	11	AO	32.768 kHz crystal oscillator output, leave float if Xtal is not used.
SW_EN	12	DI	Load switch enable input pin. It has internal 1.5 MΩ pull down resistor.
IRQ_B	13	DO	Open drain output to indicate Interrupt issued.
BUCK5FB	14	AI	Buck5 output voltage sensing pin.
LX5	15	P	Buck5 switching node.
INB45	16,17,18	P	Buck4 / Buck5 Input pins. Bypass with 10 µF and 4.7 µF to Ground.
LX4	19,20	P	Buck4 switching node.
BUCK4FB	21	AI	Buck4 output voltage sensing pin.
SWIN	22	P	Load switch input pin, Bypass with a 1 µF to Ground.
SWOUT	23	P	Load switch output pin, Bypass with a 1 µF to Ground.
SDAH	24	DIO	Level translator high voltage IO pin, SDA referenced to SWIN, 3.3 V.
SCLH	25	DO	Level translator high voltage IO pin, SCL referenced to SWIN, 3.3 V.
SDAL	26	DIO	Level translator low voltage IO pin, SDA referenced to VINT, 1.8 V.
SCLL	27	DO	Level translator low voltage IO pin, SCL referenced to VINT, 1.8 V.
WDOG_B	28	DI	Active LOW watchdog reset input pin from application processor.
SD_VSEL	29	DI	LDO5 voltage selection input pin. LDO5 output is 3.3 V when it is driven LOW and 1.8 V when driven HIGH.
R_SNSP3_CFG	30	AI	Buck3 output voltage remote sense pin. This pin should be tied to ground to use Buck1 and Buck3 in dual phase configuration.
LX3	31,32	P	Buck3 switching node. For dual-phase configuration, Buck1 and Buck3 outputs should be connected together. Refer to Figure 15 for details
INB13	33,34,35	P	Buck1 / Buck3 Input. Bypass with two 10 µF to Ground
LX1	36,37	P	Buck1 switching node
R_SNSP1	38	AI	Buck1 output voltage remote sensing pin
PMIC_ON_REQ	39	DI	PMIC ON input from Application processor. When it is asserted HIGH, the device starts power on sequence.
PMIC_STBY_REQ	40	DI	Standby mode input from Application processor. When it is asserted HIGH, device enters STANDBY mode.
SCL	41	DI	I^2C serial clock pin
SDA	42	DIO	I^2C serial data pin
BUCK_AGND	43	GND	Buck reference GND for BUCK1,2,3. It should be connected to ground plane through Via. Do not short to EP directly on top layer

Table 3. Pin description*...continued*

Pin description			
Symbol	**Pin**	**Type**	**Description**
R_SNSP2	44	AI	Buck2 output voltage remote sensing pin
LX2	45,46	P	Buck2 switching node
INB26	47,48,49	P	Buck2 / Buck6 Input. Bypass with 10 µF and 4.7 µF to Ground
LX6	50,51	P	Buck6 switching node
BUCK6FB	52	AI	Buck6 output voltage sensing pin
VSYS	53	P	Internal power input. Bypass with a 1 µF to Ground
NC	54	-	Not connected; leave floating.
LDO5	55	P	LDO5 output. Bypass with a 1 µF to Ground.
INL1	56	P	Power input pin for LDO1, LDO4 and LDO5. Bypass with a 4.7 µF to Ground.
EP		GND	Exposed PAD. All bucks' PGND are internally connected. Do not short to EP directly on top layer.

7 Functional description

7.1 Features

The PCA9451A is a power management integrated circuit (PMIC) designed to be the primary power management for NXP application processors i.MX 93x.

- Buck regulators
  - BUCK1/BUCK3: Dual-phase, 0.65 V to 2.2375 V, 12.5 mV step, 4000 mA
  - BUCK2: 0.6 V to 2.1875 V, 12.5 mV step, 2000 mA
  - BUCK4: 0.6 V to 3.4 V, 25 mV step, 3000 mA
  - BUCK5: 0.6 V to 3.4 V, 25 mV step, 2000 mA
  - BUCK6: 0.6 V to 3.4 V, 25 mV step, 1500 mA
  - Dynamic Voltage scaling on BUCK1, BUCK2 and BUCK3
  - Support remote sensing on BUCK1, BUCK2 and BUCK3
  - Monitor fault condition
- LDO regulators
  - LDO1, 1.6 V to 1.9 V, 3.0 V to 3.3 V 100 mV step, 10 mA
  - LDO4, 0.8 V to 3.3 V with 100 mV step, 200 mA
  - LDO5, 1.8 V to 3.3 V with 100 mV step, 150 mA, voltage selection through SD_VSEL pin
  - Monitor fault condition
- 400 mA Load switch for SD card
  - Built-in OCP protection
  - GPIO/I^2C control
  - Built-in active discharge resistor
- I^2C level translator
- 32.768 kHz crystal oscillator driver
  - Mux output with internal 32 kHz output
- Protection and monitoring: Soft start, power rails fault detection, UVLO, thermal shutdown

- Configurable reset from WDOGB, PMIC_RST_B and SW_RST register
- Power control IO
  - PMIC_ON_REQ, PMIC_STBY_REQ
- Fm+ 1 MHz I^2C-bus interface
- Type 3 PCB applicable

7.2 Functional diagram

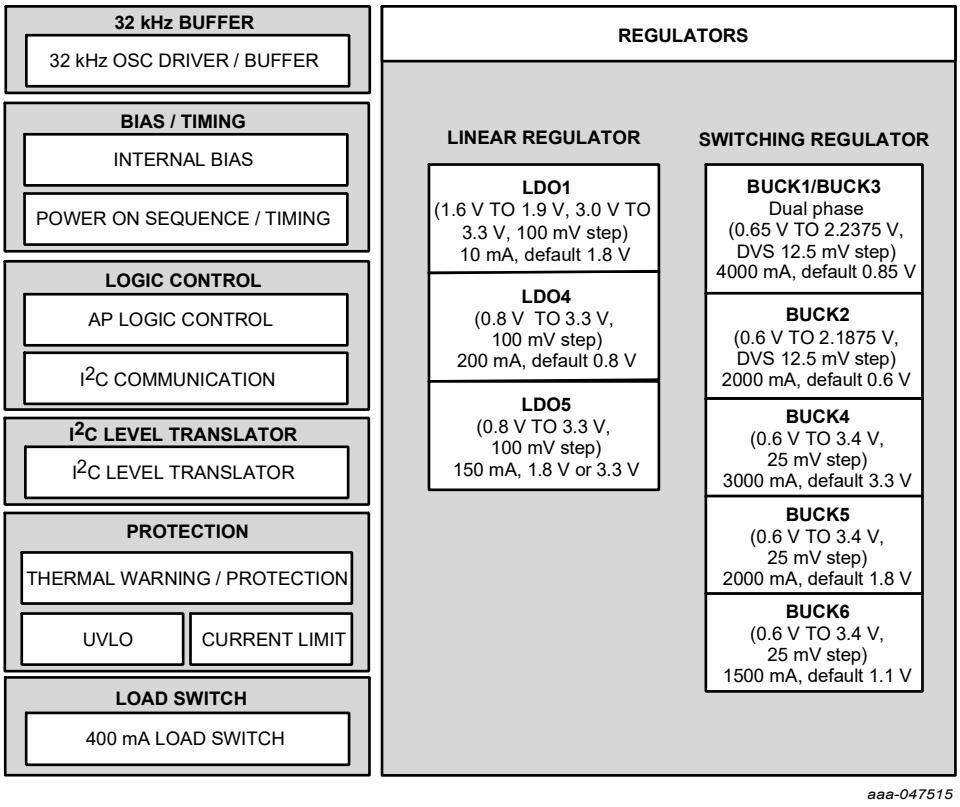

Figure 3. Functional internal block diagram

The PCA9451A is a single chip Power Management IC (PMIC) specifically designed to support i.MX 93x family processor in both 1 cell Li-Ion and Li-polymer battery portable application and 5 V adapter non-portable applications.

7.3 Power modes

PCA9451A has eight power modes: OFF, READY, SNVS, RUN, STANDBY, PWRDN, PWRUP and FAULT_SD. Figure 4 shows the state transition diagram showing the conditions to enter and exit each state.

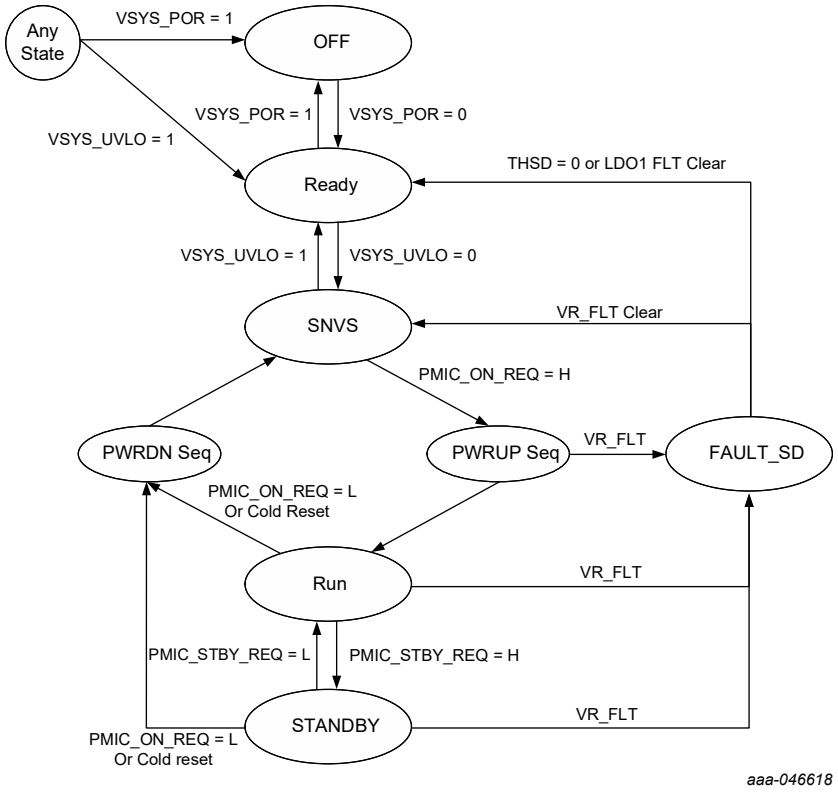

Figure 4. Power states diagram

7.3.1 Off mode

PCA9451A enters OFF mode from any state when VSYS falls below V_{SYS_POR} threshold. All regulators are off and all registers get reset in this mode.

7.3.2 READY mode

PCA9451A enters READY mode from OFF mode when VSYS is higher than V_{SYS_POR}. Internal LDO VINT is enabled and loads MTP data to registers. Once MPT loading is done, it is ready to transition to SNVS mode.

7.3.3 SNVS mode

PCA9451A enters Secure Non-Volatile Storage (SNVS) mode when VSYS exceeds V_{SYS_UVLO} threshold. LDO1 is powered up and 32.768 kHz buffer starts running. RTC_RESET_B is pulled HIGH in t_{RTC_RST} after LDO1 voltage comes up.

PMIC_ON_REQ input is masked until RTC_RESET_B is released. If PMIC_ON_REQ is asserted HIGH in this mode, PCA9451A starts power up sequence.

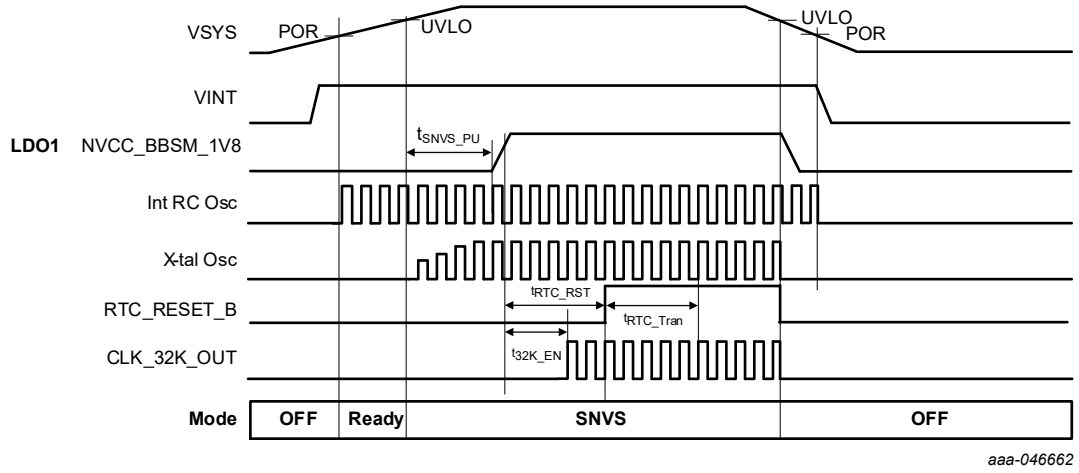

Figure 5. SNVS mode ON/OFF sequence

Table 4. SNVS mode

Time	Description	Value
t_{SNVS_PU}	Time to LDO1 turn on from VSYS UVLO detected	20 ms
t_{RTC_RST}	Time to RTC_RESET_B release from LDO1 POK	20 ms
t_{32K_EN}	Time to 32k buffer Enable from LDO1 POK	10 ms
t_{RTC_Tran}	Time to transition to Xtal output from RC osc after RTC_RESET_B release	1 sec

7.3.4 PWRUP mode

After RTC_RESET_B is released in SNVS mode, it starts power up with pre-defined sequence when PMIC_ON_REQ is asserted HIGH for longer than debounce time, t_{ON_DEB}, which is programmable in PWR_CTRL reg. Buck1 begins turning ON at first and then each power rail is followed with t_{step} after POK of predecessor power rail. During PWRUP mode, PMIC_STBY_REQ signal is masked until POR_B is released. The PWRUP mode ends up releasing POR_B and PCA9451A transitions to RUN mode.

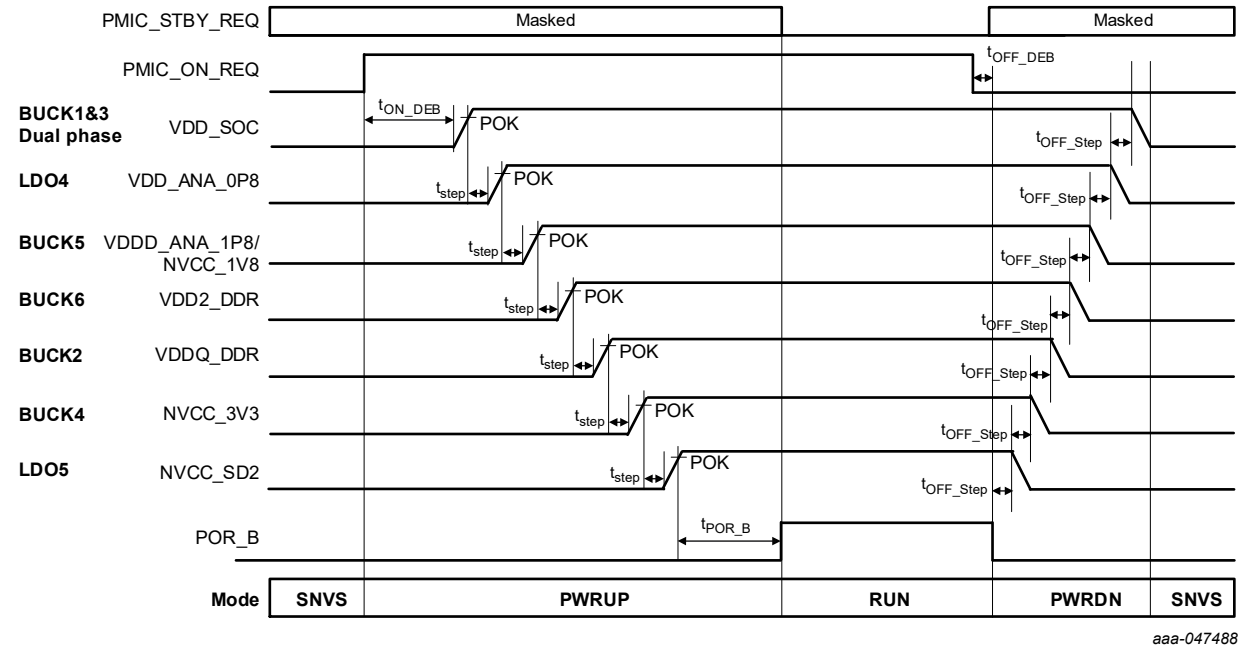

Figure 6. Power ON/OFF sequence

Table 5. Power up sequence

Regulator	PCA9451A
LDO1	Always ON, 1.8 V
BUCK1, BUCK3 (Dual Phase)	T1, 0.85 V
BUCK2	T5, 0.6 V
BUCK4	T6, 3.3 V
BUCK5	T3, 1.8 V
BUCK6	T4, 1.1 V
LDO4	T2, 0.8 V
LDO5	T7, 1.8 V/3.3 V

Table 6. PWRUP mode

Time	Description	Value
t_{ON_DEB}	Time to power-on start from PMIC_ON_REQ high	20 ms
t_{STEP}	Time to next power rail ON from prev rail POK	2 ms
t_{PORB}	Time to POR_B release from the last rail POK	20 ms
t_{OFF_STEP}	Time to next power rail off from prev rail off	8 ms
t_{OFF_DEB}	Time to POR_B low from PMIC_ON_REQ falling	2 ms

If any of regulators does not generate POK within $t_{FLT\_SH\_PU}$ after receiving digital enable during PWRUP mode, it transitions to Fault_SD mode.

7.3.5 PWRDN mode

When PMIC_ON_REQ is LOW for t_{OFF_DEB} in RUN or STANDBY mode, PCA9451A enters PWRDN mode. It starts with pulling down POR_B, turns off each power rail in t_{OFF_STEP} and transitions to SNVS mode.

7.3.6 RUN mode

PCA9451A operates in RUN mode when PMIC_ON_REQ is driven HIGH and PMIC_STBY_REQ is driven LOW. BUCK1, BUCK2, and BUCK3 output voltages are set to BUCK1OUT_DVS0, BUCK2OUT_DVS0 and BUCK3OUT_DVS0 register values, respectively. When PMIC_STBY_REQ is asserted HIGH in this mode, it transitions to STANDBY mode. After PMIC_ON_REQ is asserted LOW, it moves to PWRDN mode.

7.3.7 STANDBY mode

PCA9451A transitions to STANDBY mode from RUN mode when both PMIC_ON_REQ and PMIC_STBY_REQ are driven HIGH. BUCK1 output voltage is set to BUCK1OUT_DVS1.

If PMIC_ON_REQ is asserted LOW, then it transitions to PWRDN mode. If PMIC_STBY_REQ is driven LOW, then it transitions to RUN mode.

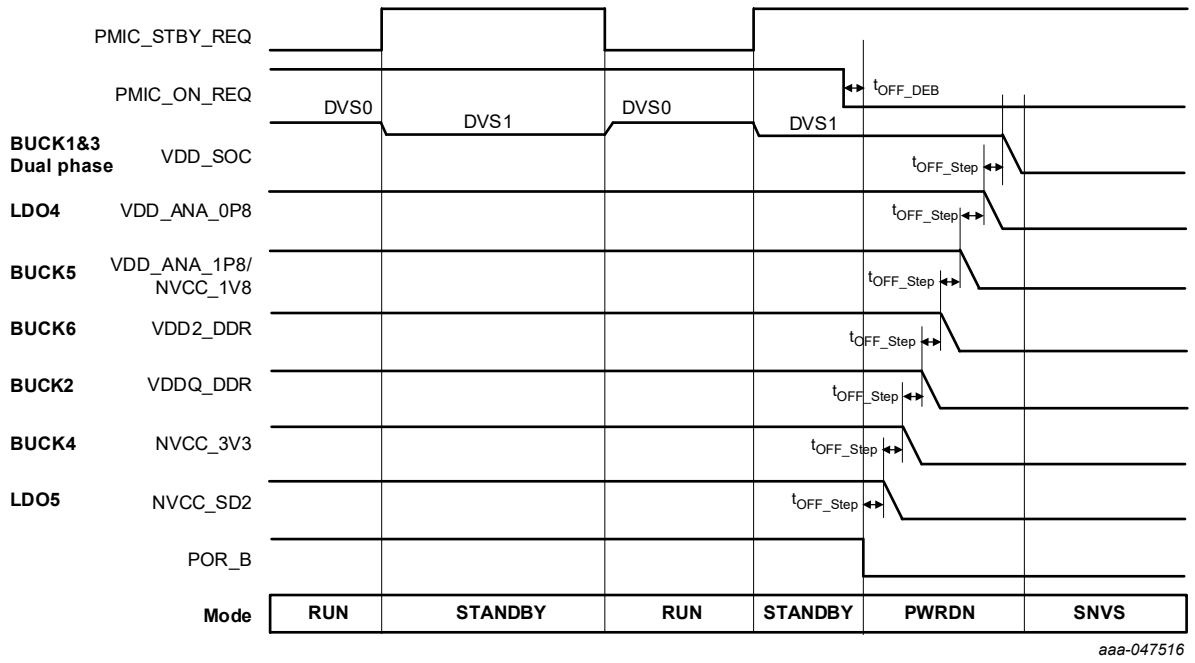

Figure 7. PCA9451A mode transition

Table 7. Power modes summary

X: Don't care

Power mode	VSYS	PMIC_ON_REQ	PMIC_STBY_REQ
OFF	VSYS < V_{SYS_POR}	X	X
READY	VSYS > V_{SYS_POR}	X	X
SNVS	VSYS > V_{SYS_UVLO}	Low	X
STANDBY	VSYS > V_{SYS_UVLO}	High	High

Table 7. Power modes summary*...continued*

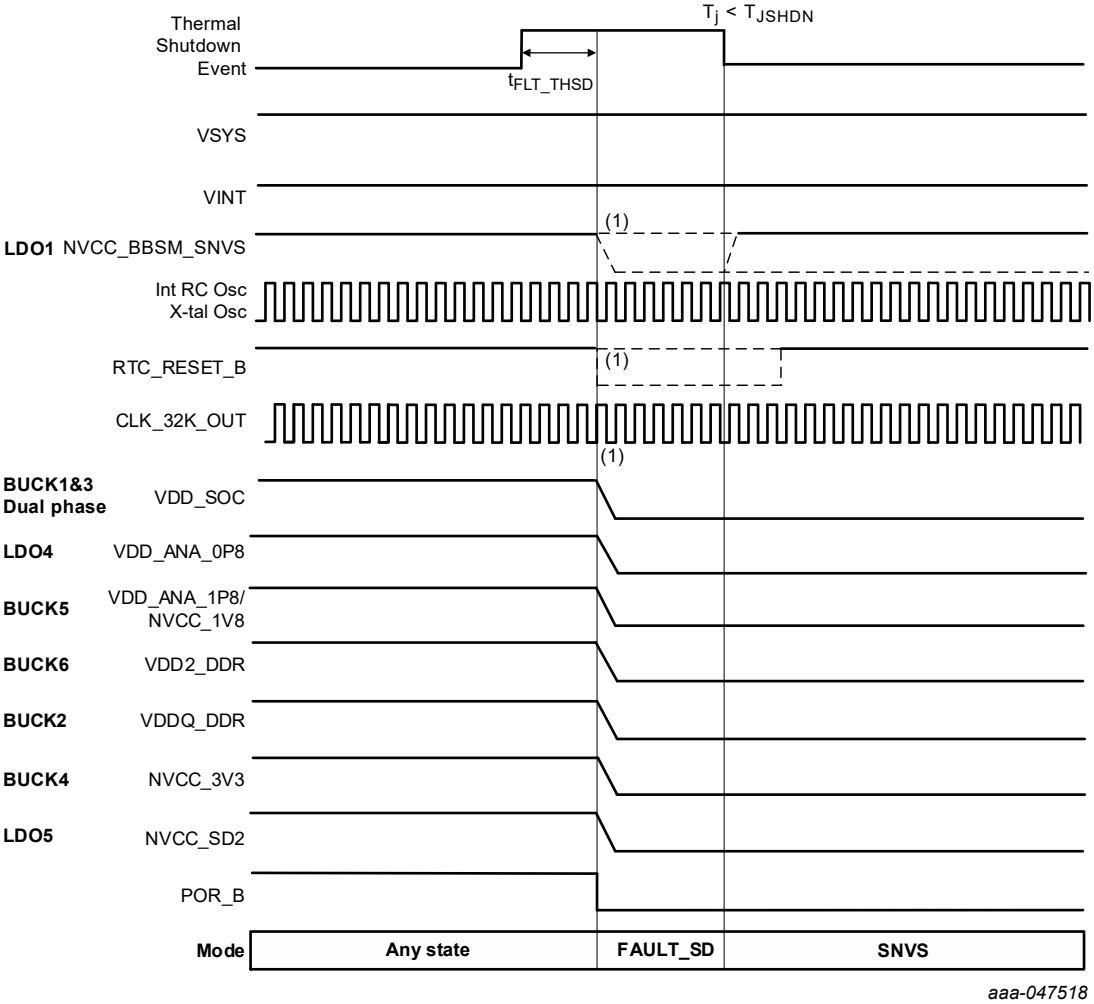
X: Don't care

Power mode	VSYS	PMIC_ON_REQ	PMIC_STBY_REQ
RUN	VSYS > V_{SYS_UVLO}	High	Low

7.3.8 FAULT_SD

PCA9451A has three types of fault sources:

1. **Thermal shutdown**: Transition to SNVS mode or READY mode after FAULT_SD mode. When junction temperature reaches T_{JSHDN}, it enters FAULT_SD mode after t_{FLT_THSD} where regulators are turned off simultaneously. It stays at FAULT_SD until junction temperature falls below T_{JSHDN}. If the temperature drops below T_{JSHDN}, then it moves to READY state if LDO1 fault is triggered when thermal shutdown happens; it moves to SNVS mode if LDO1 fault is not triggered when thermal shutdown happens.



(1) If LDO1 fault occurs when junction temperature reaches thermal shutdown threshold, LDO1/RTC_RESETB/CLK_32K_OUT is turned off. Otherwise, they are kept on.

Figure 8. PCA9451A FAULT_SD from thermal shutdown

Table 8. t_{FLT_THSD}

Time	Description	Value
t_{FLT_THSD}	Time to reset released from Fault event	120 µs

2. **Voltage regulator fault during power-up**: Transition to READY mode or SNVS mode after FAULT_SD mode. Any POK of voltage regulators does not come up within $t_{FLT\_SD\_PU}$ after regulator is enabled during power-up sequence; it stops power-up sequence and then moves to FAULT_SD where all regulators are turned off. It stays at FAULT_SD for $t_{FLT\_SD\_STAY}$ and transitions to READY mode or SNVS mode.
3. **Voltage regulator fault in STANDBY and RUN MODE**: Move to FAULT_SD mode in $t_{FLT\_SD\_WAIT}$ after Fault is detected. Transition to SNVS mode or READY mode after FAULT_SD mode when fault is removed. During RUN and STANDBY mode, VR Fault status bit in VRFLT1_STS and VRFLT2_STS registers is latched to “1” when corresponding regulator voltage falls below POK threshold for t_{DEB_POKB}, or POK does not go HIGH within $t_{FLT\_POK\_MSK}$ after regulator is enabled.
If the fault status bit is masked in VRFLT1_MASK and VRFLT2_MASK registers, it does not enter FAULT_SD mode; instead, PCA9451A stays at current mode. If the fault register bit is unmasked, it starts $t_{FLT\_SD\_WAIT}$ timer. Application processor can determine to enter FAULT_SD mode or not, by masking the VR Fault status bit in VRFLTx_MASK registers before the timer expires. PCA9451A enters FAULT_SD mode when the timer expires. PCA9451A stays at FAULT_SD mode for $t_{FLT\_SD\_STAY}$.

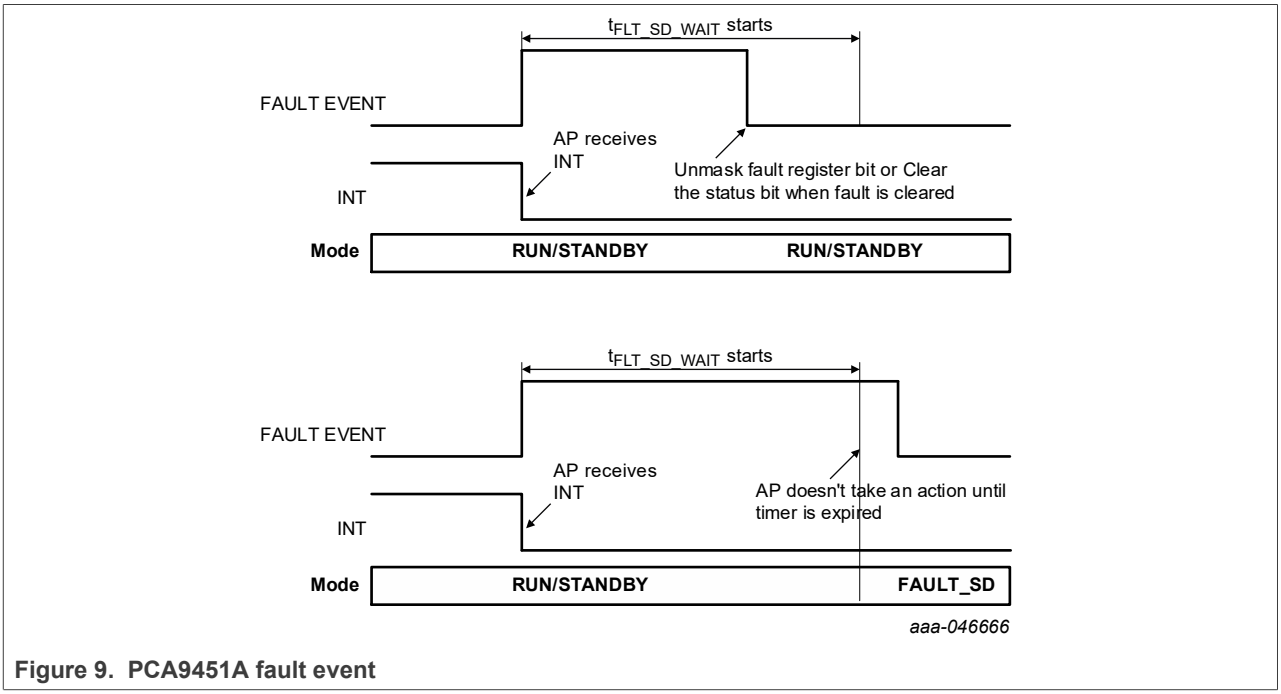


Figure 9. PCA9451A fault event

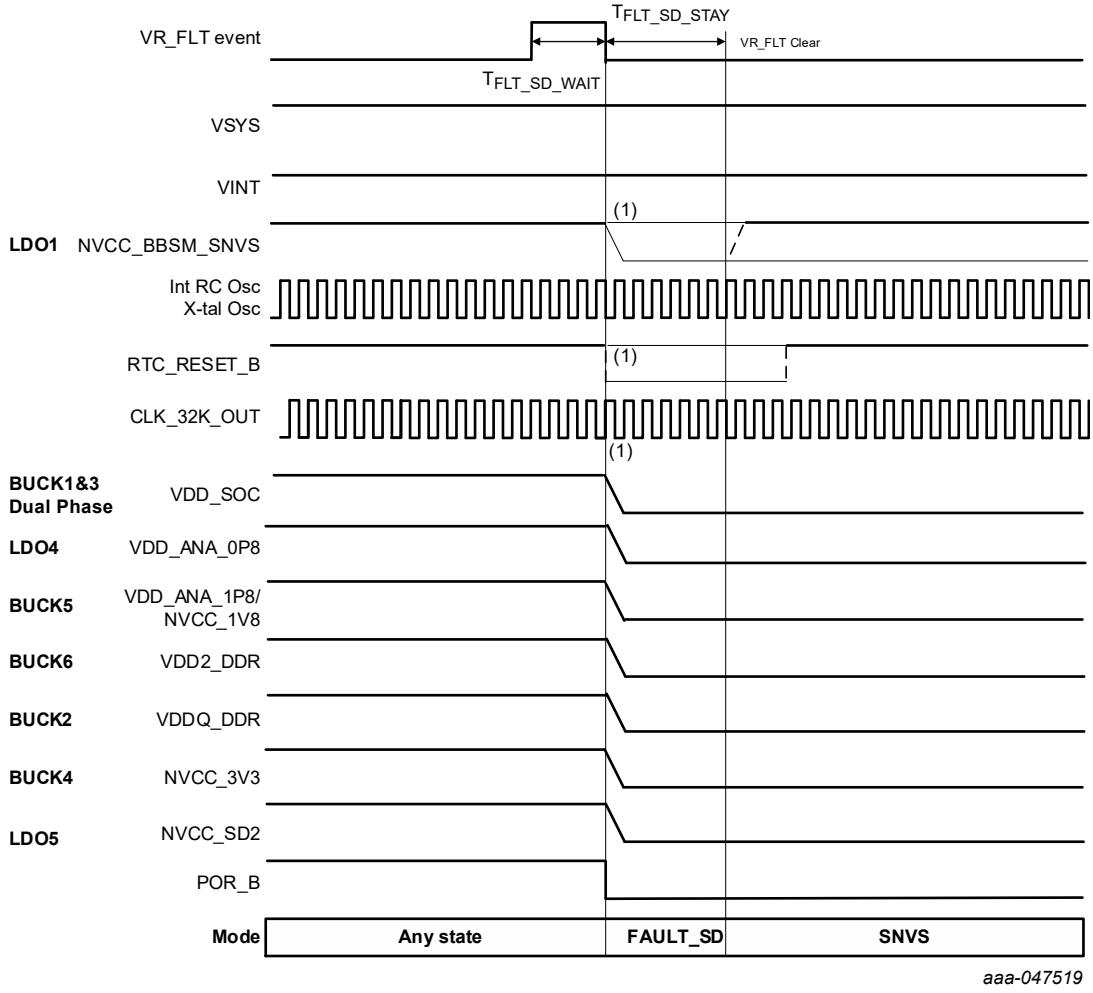
PCA9451A moves to READY mode after FAULT_SD mode if the regulator fault is caused by LDO1. Otherwise, it moves to SNVS mode after FAULT_SD.

If LDO1 has a fault in SNVS mode, then it enters FAULT_SD mode regardless of VRFLT1 Mask bit.

PCA9451A does not enter FAULT_SD mode from load switch overcurrent fault.



(1) If VR fault is caused by LDO1, then LDO1/RCT_REST_B/CLK_32K_OUT turns off; otherwise, they stay on.

Figure 10. PCA9451A FAULT_SD from VR Fault except LDO1 in RUN/STANDBY

Table 9. $t_{FLT\_SD\_WAIT}$

Time	Description	Value
$t_{FLT\_SD\_WAIT}$	Time to reset released from Fault event	100 ms

7.4 PMIC reset

The PCA9451A PMIC has three reset inputs: WDOG_B pin, PMIC_RST_B pin, and I^2C reset bit.

The reset behavior is configured in RESET_CTRL register for WDOG_B pin and PMIC_RST_B pin. I^2C reset behavior is configured in SW_RST register.

Table 10. 0x08 – RESET_CTRL

0x08 – RESET_CTRL				Reset Type	S
Bit	**Name**	**Type**	**Reset**	**Description**	
7:6	WDOG_B_CFG	R/W	00	When WDOG_B is asserted to L, PMIC behavior **00b = WDOG_B reset is disabled**

5:4	PMIC_RST_CFG	R/W	10	When PMIC_RST_B is asserted to L, PMIC behavior 00b = PMIC_RST_B reset is disabled 01b = Warm Reset, POR_B pin is asserted LOW for 20 ms **10b = Cold Reset, All voltage regulators are recycled except LDO1** 11b = Cold Reset, All voltage regulators are recycled	

Table 11. 0x06 – SW_RST

0x06 – SW_RST				Reset Type	O
Bit	**Name**	**Type**	**Reset**	**Description**	
7:0	SW_RST	R/W	0x00	Software reset register. This register read back to “0x00” right after writing the value. 0x00 = No action 0x05 = Reset all registers to default value 0x14 = Cold reset (Power recycle all regulators except LDO1) 0x35 = Warm Reset (Toggle POR_B for 20 ms) 0x64 = Cold reset (Power recycle all regulators) Others = No action	

WDOG_B is an active LOW watchdog reset input pin from application processor. The PCA9451A does not include a watchdog timer, but includes a dedicated input pin to be used as a source of reset connected from external watchdog timer circuit, so in case the watchdog timer expires, the PCA9451A PMIC receives a reset request signal. When WDOG_B is asserted LOW, it resets depending on WDOG_B_CFG bit configuration. When the bits are set to 2b00, the reset by WDOG_B pin is disabled. If the bits are set to 2b01, warm reset is performed, where POR_B is pulled LOW for 20 ms and reset I^2C O type registers to default value keeping power rails remaining ON. If the bits are set to 2b11, it performs Cold reset, where all voltage regulators except LDO1 are power recycled and I^2C O type registers get reset to default value.

When PMIC_RST_B is asserted LOW, it also gets reset depending on PMIC_RST_CFG bits configuration. When the bits are set to 2b00, any reset by PMIC_RST_B pin is disabled. If the bits are set to 2b01, warm reset is performed, which pulls POR_B low for 20 ms and resets I^2C O type registers to default value keeping power rails remaining ON.

Cold reset event is generated by either of I^2C reset, WDOG_B falling edge or PMIC_RST_B falling edge after debounce time. Once it is detected, POR_B is pulled LOW and takes power down sequence. For cold reset from WDOG_B and I^2C reset, PCA9451A stays at RESET for $t_{RESTART}$ and then starts power on sequence even though WDOG_B pin is still LOW. For cold reset from PMIC_RST_B, $t_{RESTART}$ timer starts after PMIC_RST_B is asserted HIGH, in other words, PCA9451A starts power on sequence in $t_{RESTART}$ after PMIC_RST_B pin is released HIGH.

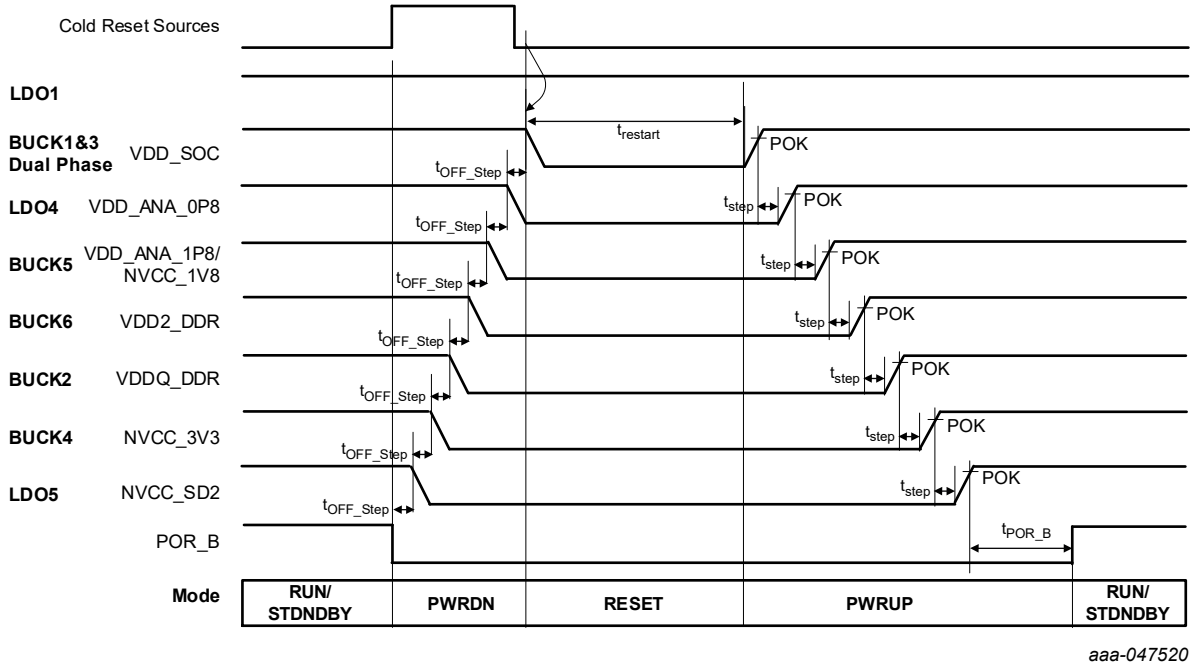

Figure 11. PCA9451A Cold reset

7.5 Regulator control in each power mode

Table 14 shows PCA9451A regulator ON/OFF control in each power mode by default. It can be reconfigured through I^2C registers.

Table 14. PCA9451A Regulator control summary

Power Rail		Default Voltage	OFF	SNVS	STANDBY	RUN
LDO1	NVCC_BBSM_SNVS	1.8 V	OFF	ON	ON	ON
BUCK1&3 Dual Phase	VDD_SOC	0.85 V	OFF	OFF	ON	ON
LDO4	VDD_ANA_0P8	0.8 V	OFF	OFF	ON	ON
BUCK5	VDD_ANA_1P8/ NVCC_1V8	1.8 V	OFF	OFF	ON	ON
BUCK6	VDD2_DDR	1.1 V	OFF	OFF	ON	ON
BUCK2	VDDQ_DDR	0.6 V	OFF	OFF	ON	ON
BUCK4	NVCC_3V3	3.3 V	OFF	OFF	ON	ON
LDO5	NVCC_SD2	3.3 V / 1.8 V	OFF	OFF	ON	ON

7.6 Regulator summary

The PCA9451A features six buck regulators, three linear regulators, and one load switch to supply voltage rails powering for the application processor and peripheral devices. The buck regulators are supplied directly from the main input supply, the input to all of the buck regulators must be tied to VSYS, whether they are powered on or off.

7.6.1 Buck regulator

The PCA9451A has six high-efficiency low Iq buck regulators. Each buck regulator features soft start and overcurrent protection. Buck regulator operates in two modes, PFM, and PWM mode. It automatically transitions from PFM to PWM mode when FPWM bit is set to “0”. Internal active discharge resistor is installed in each buck regulator output to discharge voltage on output capacitors when regulator is off. It is configurable through I^2C register. Table 15 shows buck regulator summary.

BUCK1 and BUCK3 are configured as dual-phase buck and provide up to 4 A.

Table 15. PCA9451A buck summary

Buck#	INPUT PIN	Default VOUT [V]	Vout range [V]	Step size [mV]	Default ON/ OFF	Current rating [mA]
BUCK1/3	INB13	0.85	0.65 - 2.2375	12.5	ON	4000
BUCK2	INB26	0.6	0.6 - 2.1875	12.5	ON	2000
BUCK4	INB45	3.3	0.6 - 3.4	25	ON	3000
BUCK5	INB45	1.8	0.6 - 3.4	25	ON	2000
BUCK6	INB26	1.1	0.6 - 3.4	25	ON	1500

7.6.1.1 Dynamic voltage scaling

BUCK1, BUCK2, and BUCK3 support Dynamic Voltage Scaling (DVS). If PRESET_EN bit in BUCK123_DVS register is set to 1, BUCK1/BUCK2/BUCK3 outputs are controlled by Bx_DVS_PRESET bits in BUCK123_DVS. It enables those buck outputs to be controlled by writing one register at a time.

If PRESET_EN bit is set to 0, those buck regulator outputs are determined by BUCKxOUT_DVS0 and BUCKxOUT_DVS1 depending on PMIC_STBY_REQ pin. When PMIC_STBY_REQ is asserted LOW, BUCKxOUT_DVS0 register determines each buck output voltage; if the PMIC_STBY_REQ is asserted HIGH, BUCKxOUT_DVS1 register is selected as each buck output voltage. Figure 13 shows the DVS voltage section diagram.

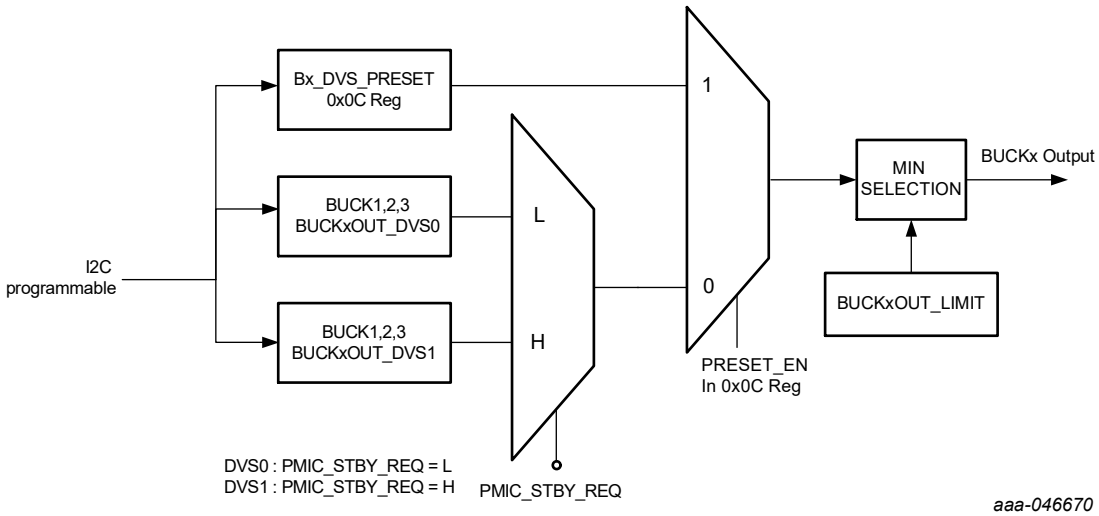

Figure 13. DVS functional diagram

The programmable voltage rampup and ramp-down are applied during the DVS voltage transition. The RAMP[7:6] bits configure the ramp rate in each BUCKxCTRL register.

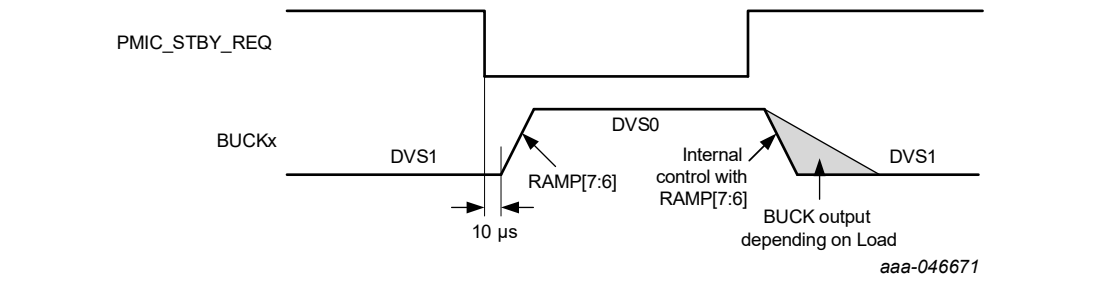

Figure 14. DVS timing

7.6.1.2 Buck output limiting

Application processor may accidentally write higher voltage than absolute maximum voltage rating of its power input, it may cause significant damage on application processor. PCA9451A has registers to limit the maximum voltage to prevent such an incident.

The maximum output of BUCK1, BUCK2, and BUCK3 is limited by BUCKxOUT_LIMIT, respectively. Even if Buck output is configured to be higher than the limit voltage configured in BUCKxOUT_LIMIT register, the actual buck output is clamped to the limiting voltage set by BUCKxOUT_LIMIT register.

7.6.1.3 BUCK1 and BUCK3 dual-phase configuration

BUCK1 and BUCK3 are configured as dual-phase buck. R_SNSP3_CFG pin must be connected to GND. This dual phase buck regulator is controlled through BUCK1 registers. All BUCK3 registers are not responsive under dual-phase configuration.

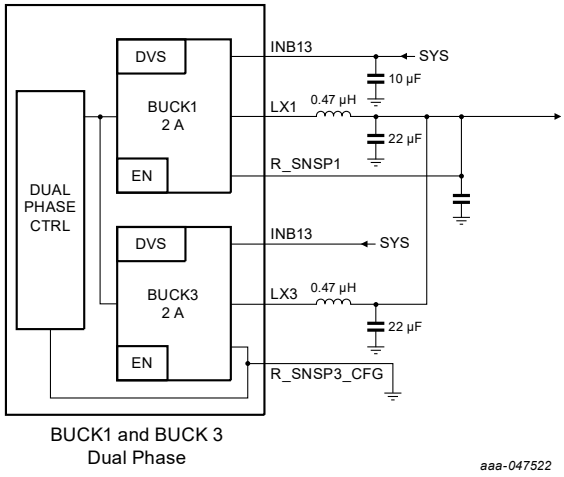

Figure 15. BUCK1 and BUCK3 configuration

7.6.2 LDO and load switch

The PCA9451A has three LDOs and one load switch. LDO1 supplies SNVS core in application processor. This LDO features ultra-low quiescent current, 2 µA typical, since it is always ON when VSYS is valid.

For all LDOs and the load switch, each has designated active discharge resistor configurable through I^2C.

Table 16. LDO summary

LDO#	INPUT PIN	Default VOUT [V]	VOUT range [V]	Step size [mV]	Default ON/ OFF	Current rating [mA]
LDO1	INL1	1.8	1.6-1.9, 3.0-3.3	100	ON	10
LDO4	INL1	0.8	0.8 - 3.3	100	ON	200
LDO5	INL1	3.3/1.8	1.8 - 3.3	100	ON	150
SW	SWIN	-	-	-	OFF	400

7.7 32 kHz crystal oscillator driver

The PCA9451A consists of a crystal oscillator driver with an external load capacitor buffer referenced to LDO1 voltage. When VSYS exceeds POR threshold and internal power VINT is good, internal 32 kHz oscillator and 32.768 kHz crystal oscillator start oscillating. Crystal oscillator typically takes few seconds to be stabilized.

PCA9451A outputs the internal 32 kHz RC oscillator initially, while internal counter counts crystal oscillator output in t_{RTC_Tran} after RTC_RESET_B is released. If the counter reaches 100, then CLK_32K_OUT buffer input is switched to the external crystal oscillator from internal 32 kHz oscillator.

Clock stretch is applied during this clock source transition to prevent unwanted glitch. If external 32.768 kHz crystal oscillator is not populated, CLK_32K_OUT pin outputs 32 kHz clock from internal 32 kHz oscillator.

For more detailed information on selecting crystal oscillator and load capacitance, refer to Section 9.2.2.

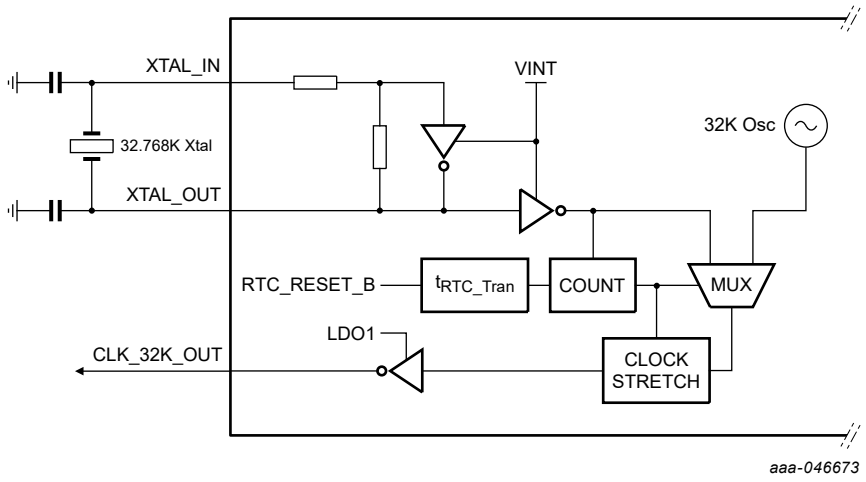

Figure 16. 32 kHz Crystal oscillator driver block diagram

7.8 Load switch

PCA9451A integrates 400 mA load switch which supplies SD card VDD. SWIN is connected to BUCK4 output, 3.3 V, in this application. It is enabled by SW_EN pin or SW_EN[1:0] bits in LOADSW_CTRL register. It has soft start feature to reduce inrush current during turn-on.

This load switch has over current protection and short circuit protection by monitoring voltage difference between SWIN and SWOUT. When the switch current exceeds overcurrent threshold (I_{OC}) for overcurrent debounce time (t_{OC_DEB}), SW_OCP bit in VRFLT1_STS register is set to 1, and SW_OC[1:0] configuration in LOADSW_CTRL register determines the fault behavior. When the switch current exceeds short-circuit current threshold (I_{SC}), SW_OCP bit in VRFLT1_STS register is set to 1, and switch is turned off right away.

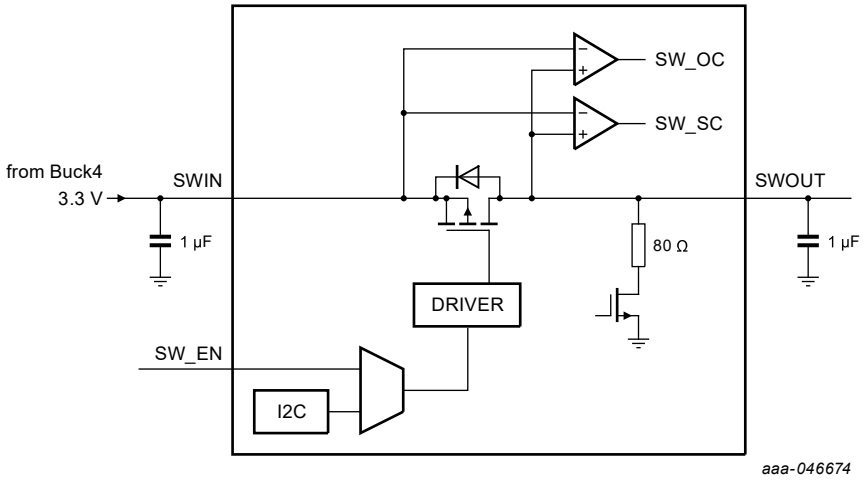

Figure 17. Load switch internal block diagram

7.9 I²C level translator

PCA9451A I²C level translator is a "switch" type voltage translator; it employs two key circuits to enable voltage translation:

1. A pass-gate transistor (N-channel) that ties the ports together.

2. An output edge-rate accelerator that detects and accelerates rising edges on the I/O pins.

The gate bias voltage of the pass gate transistor (T3) is set at approximately one threshold voltage above the VCC level of the low-voltage side. During a LOW-to-HIGH transition, the output one-shot accelerates the output transition by switching on the PMOS transistors (T1, T2), bypassing the 10 kΩ pullup resistors and increasing current drive capability. The one-shot is activated once the input transition reaches approximately VCCI/2; it is deactivated approximately 50 ns after the output reaches VCCO/2. During the acceleration time, the driver output resistance is between approximately 50 Ω and 70 Ω. To avoid signal contention and minimize dynamic ICC, the user should wait for the one-shot circuit to turn off before applying a signal in the opposite direction. Pullup resistors are included in the device for DC current sourcing capability.

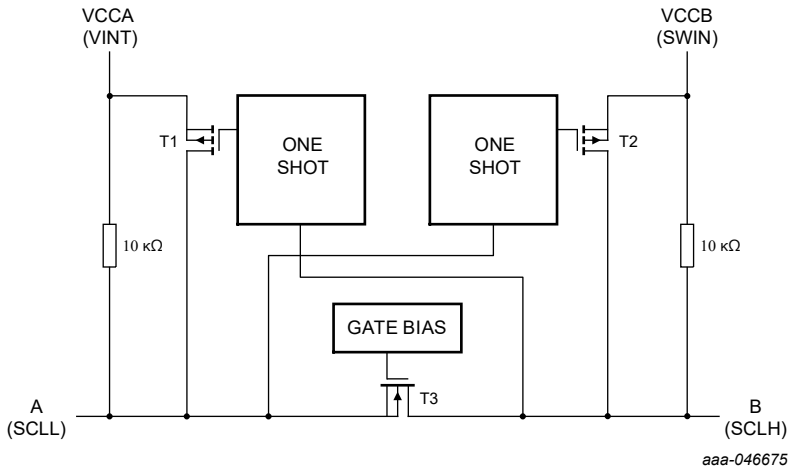

Figure 18. Architecture of I^2C level translator (one channel)

Each A port I/O has an internal 10 kΩ pullup resistor to VCCA, and each B port I/O has an internal 10 kΩ pullup resistor to VCCB. If a smaller value of pullup resistor is required, an external resistor must be added parallel to the internal 10 kΩ, which affects the VOL level. When Level translator is disabled through I^2C, the internal pullup resistors are disconnected.

PCA9451A I^2C level translator is controlled by I^2C register, CONFIG2 Reg. When disabled, all I/Os assume the high-impedance OFF-state. The enable time (t_{en}) indicates the amount of time the user must allow for one one-shot circuitry to become operational after it is enabled.

7.10 Interrupt management

The IRQ_B pin is an interface to the software-controlled system that indicates any interrupt bit status change of INT1 register. The IRQ_B pin is pulled LOW when any unmasked interrupt bit status is changed and it is released HIGH once application processor read INT1 register.

The INT1 bits are latched to 1 whenever corresponding STATUS1 bits change and the latch is cleared when the INT1 register is read. The INT1_MASK bits are used to enable or disable individual interrupt bits of INT1 register. The STATUS1 register indicates the status and is not latched.

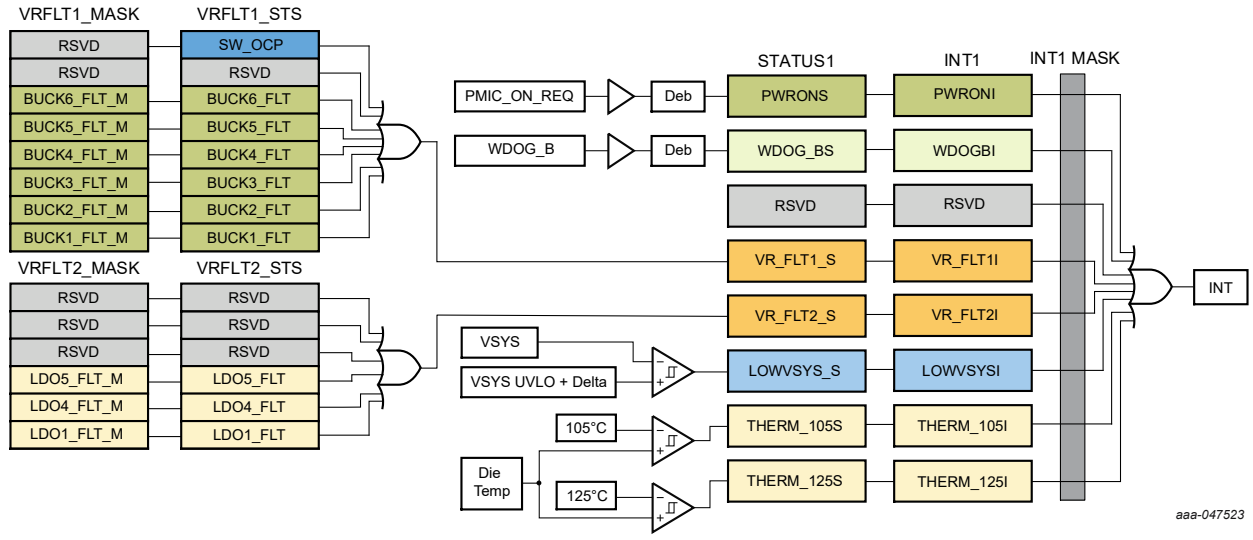

Figure 19. Interrupt diagram

8 Software interface

PCA9451A implements I^{2}C-bus target interface which interfaces with the host system. The host processor can issue commands, monitor status and receive response through this bus. A detailed description of the I^{2}C-bus specification, with applications, is given in UM10204, "I^{2}C-bus specification and user manual" [Ref. 4]. PCA9451A supports I^{2}C-bus data transfers in Standard-mode (100 kbit/s), Fast-mode (400 kbit/s) and Fast-mode plus (1 Mbit/s).

The I^{2}C address at Power-On Reset is shown in Table 17.

Table 17. I^{2}C target address

7-bit target Address	8-bit Write Address	8-bit Read Address
0x25, 0b 010 0101	0x4A, 0b 0100 1010	0x4B, 0b 0100 1011

There are three I^{2}C register reset types:

- **Type S1**: Reset condition = VSYS < V_{SYS_POR}
- **Type S**: Reset condition = VSYS < V_{SYS_UVLO}
- **Type O**: Reset condition = (VSYS < V_{SYS_UVLO}) || (Cold Reset) || (Warm Reset) || (Falling edge of PMIC_ON_REQ) || (SW_RST) || (FAULT_SD)

8.2 Register details

8.2.1 0x00 Device_ID

The device identification code stores a unique identifier for each version and/or revision of a PCA9451A, so that the connected processor recognizes it automatically.

Table 19. 0x00 Device ID

0x00 – Device_ID				Reset Type	S
Bit	**Name**	**Type**	**Reset**	**Description**	
7:4	CHIP_ID	R	1001	Chip ID 1001b = PCA9451A	
3:0	RSVD	R	0000	Reserved	

8.2.2 0x01 INT1

Interrupt source register. Either of unmasked register bits is set to 1, IRQB pin is pulled LOW. This register is Read and Clear.

Table 20. 0x01 INT1

0x01 – INT1				Reset Type	S
Bit	**Name**	**Type**	**Reset**	**Description**	
7	PWRONI	R/C	0	PWRON interrupt bit 0b = PWRONS bit has not been changed 1b = PWRONS bit has been changed	
6	WDOGBI	R/C	0	WDOGB interrupt bit 0b = WDOG_BS bit has not been changed 1b = WDOG_BS bit has been changed	
5	RSVD	R/C	0	Reserved	
4	VR_FLT1I	R/C	0	Voltage regulator Group1 Fault interrupt 0b = VR_FLT1S bit has not been changed 1b = VR_FLT1S bit has been changed

0	THERM_125I	R/C	0	Die temperature 125 °C interrupt 0b = THERM_125S bit has not been changed 1b = THERM_125S bit has been changed	

8.2.3 0x02 INT1_MSK

The INT1_MSK register enables the masking (disabling) of the different interrupt signals of register INT1. When unmasked, interrupt events trigger the IRQB pin to be pulled LOW when the matching flag bit in the register INT1 is set.

Table 21. 0x02 INT1_MSK

0x02 – INT1_MSK				Reset Type	S
Bit	**Name**	**Type**	**Reset**	**Description**	
7	PWRON_M	R/W	1	PWRONI interrupt mask bit 0b = Enable PWRONI interrupt **1b = Mask PWRONI interrupt**	
6	WDOGB_M	R/W	1	WDOGBI interrupt mask bit 0b = Enable WDOGBI interrupt **1b = Mask WDOGBI interrupt**	
5	RSVD	R/W	1	Reserved	
4	VR_FLT1_M	R/W	1	VR_FLT1I interrupt mask bit 0b = Enable VR_FLT1I interrupt **1b = Mask VR_FLT1I interrupt**	
3	VR_FLT2_M	R/W	1	VR_FLT2I interrupt mask bit 0b = Enable VR_FLT2I interrupt **1b = Mask VR_FLT2I interrupt**	
2	LOWVSYS_M	R/W	1	LOWVINI interrupt mask bit 0b = Enable LOWVINI interrupt **1b = Mask LOWVINI interrupt**	
1	THERM_105_M	R/W	1	THERM_105 interrupt mask bit 0b = Enable THERM_105 interrupt **1b = Mask THERM_105 interrupt**	
0	THERM_125_M	R/W	1	THERM_125 interrupt mask bit 0b = Enable THERM_125 interrupt **1b = Mask THERM_125 interrupt**	

8.2.4 0x03 STATUS1

STATUS1 register shows status. Any status bit change set corresponding interrupt bit to 1.

Table 22. 0x03 STATUS1

0x03 – STATUS1				Reset Type	S
Bit	**Name**	**Type**	**Reset**	**Description**	
7	PWRONS	R	0	PMIC_ON_REQ pin status after debounce time	

Table 22. 0x03 STATUS1*...continued*

0x03 – STATUS1				Reset Type	S
Bit	**Name**	**Type**	**Reset**	**Description**	
				0b = PMIC_ON_REQ pin is low 1b = PMIC_ON_REQ pin is high	
6	WDOG_BS	R	0	WDOG_B pin status **0b = WDOG_B pin is low** 1b = WDOG_B pin is high	
5	RSVD	R	0	Reserved	
4	VR_FLT1S	R	0	Voltage Regulator Fault status, See 0x2B Register. **0b = All voltage regulators are OK** 1b = Either of voltage regulators is in Fault state	
3	VR_FLT2S	R	0	Voltage Regulator POK status, See 0x2C Registers. **0b = All voltage regulators are OK** 1b = Either of voltage regulators is in Fault state	
2	LOWVSYSS	R	0	VSYS low voltage status **0b = VSYS > Low VSYS threshold** 1b = VSYS ≤ Low VSYS threshold	
1	THERM_105S	R	0	Die temperature 105 °C statue **0b = Die temperature is below 105 °C** 1b = Die temperature is above 105 °C	
0	THERM_125S	R	0	Die temperature 125 °C statue **0b = Die temperature is below 125 °C** 1b = Die temperature is above 125 °C	

8.2.5 0x04 STATUS2

STATUS1 register shows current PCA9451A power mode.

Table 23. 0x04 STATUS2

0x04 – STATUS2				Reset Type	S1
Bit	**Name**	**Type**	**Reset**	**Description**	
7:4	RSVD	R	0000	Reserved

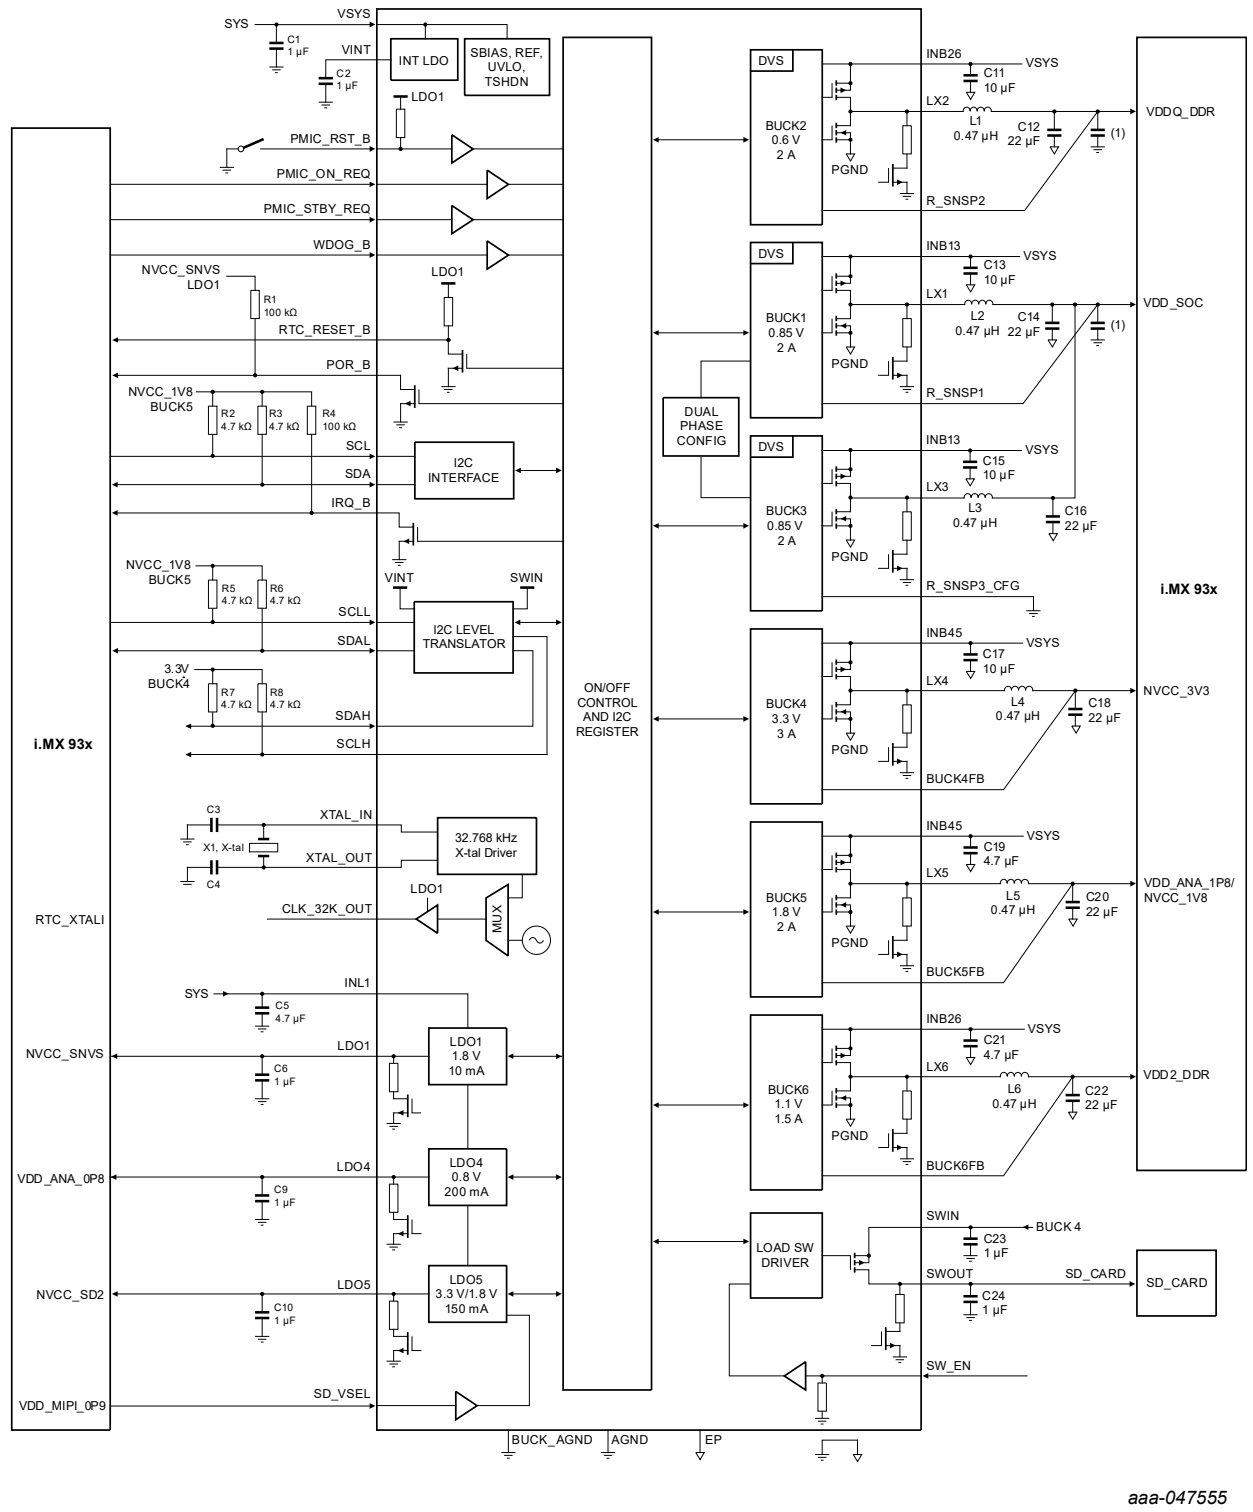
2:1	RSVD	R/W	1	Reserved	
0	LDO1_FLT_M	R/W	1	LDO1 FLT mask 0b = Unmask **1b = Masked**	

9 Application design-in information

9.1 Reference schematic

PCA9451A reference schematic with i.MX 93x is illustrated in Figure 20.



(1) Decoupling capacitor in MCU side.

Figure 20. Application schematic

9.2 Typical application

The PCA9451A devices have only a few design requirements. Use the following parameters for the design.

- 1 µF bypass capacitor on VINT and VSYS, located as close as possible to those pins to ground
- Input capacitors must be present on the INB and INL supplies if used
- Output inductors and capacitors must be used on the outputs of the BUCK converters if used
- Output capacitors must be used on the outputs of the LDOs

9.2.1 Detailed design procedure

9.2.2 Inductor selection for buck converters

Each of the converters in the PCA9451A typically use a 0.47 µH output inductor which has to be rated for its DC resistance and saturation current. The DC resistance of the inductance influences directly the efficiency of the converter. Therefore, an inductor with lowest DC resistance must be selected for highest efficiency.

Equation 1 calculates the maximum inductor current under static load conditions. The saturation current of the inductor must be rated higher than the maximum inductor current as calculated with Equation 2. This is needed because during heavy load transient the inductor current rises above the calculated value.

$\Delta I_L = Vout \times \frac{1-\frac{Vout}{Vinmax}}{L \times f}$	(1)
$I_{L.max} = I_{out.max} \times \frac{\Delta I_L}{2}$	(2)

Where

f = switching frequency (2 MHz)

L = Inductance

ΔI_L = Peak to peak inductor ripple current

$I_{L.max}$ = Maximum inductor current

A conservative approach is to select the inductor current rating just for the maximum switch current of the PCA9451A.

Table 65 shows possible inductors list.

Table 65. Tested inductor list

Buck	Vendor	Part number	Size	DCR [mΩ]	Isat [A]	Itemp [A]
BUCK1, BUCK2, BUCK3, BUCK4	Sunlord	WPN252012HR47MT	2520	29	5.6	4.0
	Murata	1239AS-H-R47M	2520	39	3.8	3.7
BUCK5, BUCK6	Sunlord	WPN201610UR47MT	2016	28	5.0	4.1
	Murata	1286AS-H-R47M	2016	52	3.4	3.2

9.2.3 Output capacitor selection for buck converters

The fast response adaptive constant ON time control scheme of the buck converters implemented in the PCA9451A allow the use of small ceramic capacitors with a typical value of 22 µF for each converter without

having large output voltage under and overshoots during heavy load transients. Ceramic capacitors having low ESR values have the lowest output voltage ripple and are recommended.

If ceramic output capacitors are used, the capacitor RMS ripple current rating always meets the application requirements. Just for completeness, the RMS ripple current is calculated in Equation 3.

$$I_{RMS.COUT} = \mathrm{Vout} \times \frac{1-\frac{\mathrm{Vout}}{\mathrm{Vin}}}{\mathrm{L} \times \mathrm{f}} \times \frac{1}{2\sqrt{3}} \quad (3)$$

At nominal load current, the inductive converters operate in PWM mode. The overall output voltage ripple is the sum of the voltage spike caused by the output capacitor ESR plus the voltage ripple caused by charging and discharging the output capacitor:

$$\Delta \mathrm{Vout} = \mathrm{Vout} \times \frac{1-\frac{Vout}{Vin}}{\mathrm{L} \times \mathrm{f}} \times \left(\frac{1}{8 \times Cout \times f} + ESR \right) \quad (4)$$

Where:

The highest output voltage ripple occurs at the highest input voltage Vin.

At light load currents, the converters operate in PFM mode and the output voltage ripple is dependent on the output capacitor value. The output voltage ripple is set by the internal comparator delay and the external capacitor. The typical output voltage ripple is less than 1 % of the nominal output voltage.

9.2.4 Input capacitor selection for buck converters

Low ESR input capacitor is highly recommended for best input voltage filtering and minimizing the interference with other circuits caused by high input voltage spikes because of the nature of buck converter. Each DC-DC converter requires a 10 µF ceramic input capacitor on its input pins. The input capacitor could be increased without any limit for better input voltage filtering.

9.3 Layout guide

Figure 21 shows layout guidance.

All components related to the power stage should be kept as close to the PMIC as possible, especially decoupling input and output capacitors. Place these components in order of priority:

- Input capacitor of the buck regulators
- LDO capacitors
- VSYS and VINT capacitors
- Buck regulator inductors
- Buck regulator output capacitors

Care must be taken with BUCKxFB pins traces. These signals are susceptible to noise and must be routed far away from power, clock, or high power signals, like the ones on the INBxx, and LXx pins. The exposed pad (EP) is the power ground of all bucks which is relatively noisy. AGND is the analog ground. Do not connect AGND to EP on the top layer. Connect AGND to main ground by via. Avoid separating the main ground under PCA9451A which may increase the return path. Make sure that there are enough vias to connect EP to system main ground.

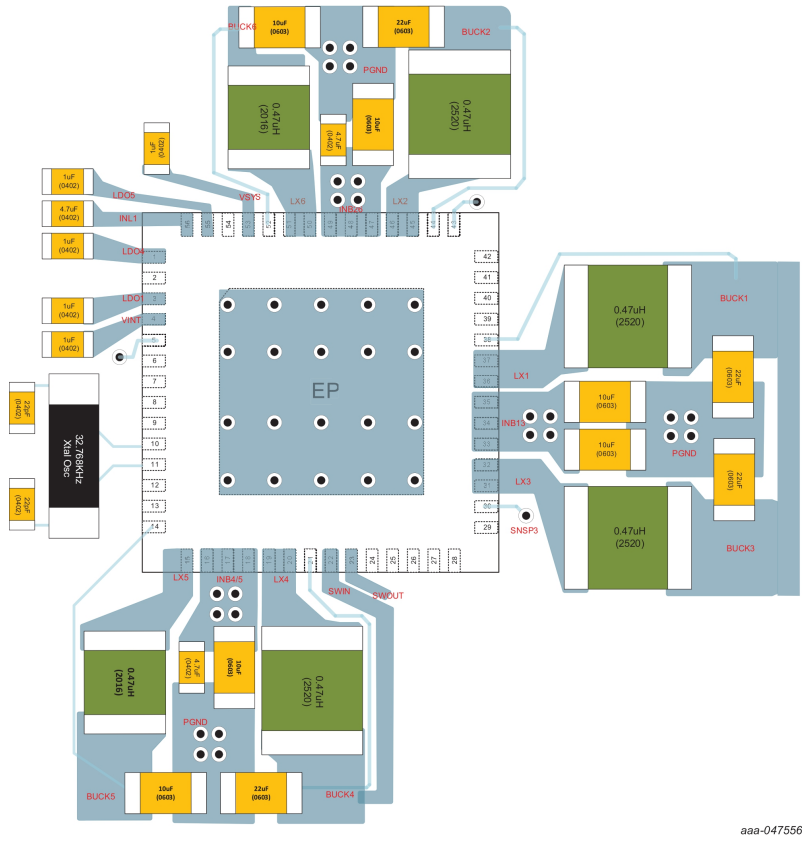


Figure 21. PCA9451A layout

10 Limiting values

Table 66. Limiting values (Absolute Maximum Ratings)

Explanation	Pin	Conditions	Min	Max	Unit

t_{en}	Enable time	EN rising to 90 % of output voltage		200		µs
POK	Output Power good	Percentage of V_{LDO5} configuration	75	85	92	%
R_{DIS}	Active Discharge Resistance			100	150	Ω
C_{OUT}	Output capacitance	Minimum nominal capacitance	1		2	µF

13.11 Load SW

Table 79. Load SW

Unless otherwise specified, VSYS = 3.8 V, V_{INBx} = 3.8 V, V_{INL1} = 3.8 V, V_{SWIN} = 3.8 V, C_{SWIN} = C_{SWOUT} = 1 µF, T_{amb}= -40 °C ~ +105 °C

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{SWIN}	Input voltage range	SWIN	2.8		5.5	V
I_Q	Quiescent current	Switch enabled, No load, V_{SWIN} = 3.3 V		5	8	µA
I_{SHDN}	Shut down current	SWEN = 0 V, V_{SWIN} = 3.3 V		1	2.5	µA
I_{OC}	OverCurrent Threshold		450	800		mA
I_{SC}	Short circuit current threshold			2		A
R_{DSON}	Switch ON resistance	V_{SWIN} = 3.3 V, I_{LOAD} = 200 mA, including bonding wire resistance		150	210	mΩ
t_{en}	Enable time	Time to SWOUT 10 % from EN pin high, V_{SWIN} = 3.3 V		90	120	us
t_{ON}	Output rise time	CL = 10uF, V_{SWIN} = 3.3 V, SWOUT 10 % to 90 %		200	500	us
R_{DIS}	Active Discharge Resistance	SWEN = 0 V		80	120	Ω

13.12 32 kHz internal oscillator

Table 80. 32 kHz internal oscillator

Unless otherwise specified, VSYS = 3.8 V, V_{INBx} = 3.8 V, V_{INL1} = 3.8, T_{amb}= -40 °C ~ +105 °C

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{OSC_32K}	Clock frequency	Internal Oscillator	29	32.77	36	kHz
f_{CLK}	Clock frequency	External 32.768 kHz crystal oscillator		32.768		kHz
t_{RTCSTB}	Oscillator stabilization time			1000		ms
Duty	Output Duty cycle		30	50	70	%
V_{OL}	Output Low level	I_{OL} = 1 mA			0.4	V
V_{OH}	Output High level	V_{LDO1} = 1.8 V, I_{OL} = 1 mA	1.6			V

13.13 I^2C interface and logic I/O

Table 81. I^2C interface and logic I/O

Unless otherwise specified, VSYS = 3.8 V, V_{INBx} = 3.8 V, V_{INL1} = 3.8, T_{amb}= -40 °C ~ +105 °C

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
SCL, SDA						
f_{I2C}	I^2C c lock frequency		-	-	1	MHz
V_{IH}	High-level Input voltage	SCL, SDA; VSYS= 3.0 V to 5.5 V	1.2	-	-	V

Table 81. I²C interface and logic I/O*...continued*

Unless otherwise specified, VSYS = 3.8 V, V_{INBx} = 3.8 V, V_{INL1} = 3.8, T_{amb}= -40 °C ~ +105 °C

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{IL}	Low-level Input voltage	SCL, SDA; VSYS= 3.0 V to 5.5 V	-	-	0.4	V
V_{hys}	Hysteresis of Schmitt trigger inputs		0.01	-	-	V
V_{OL}	Low-level output voltage	SDA, Iload = 20 mA, VSYS = 3.0 V to 5.5 V	0	-	0.4	V
$t_{HD,STA}$	Hold time (repeated) START condition	Fast mode plus; After this period, the first clock pulse is generated	0.26	-	-	µs
t_{LOW}	LOW period of I²C clock	Fast mode plus	0.5	-	-	µs
t_{HIGH}	HIGH period of I²C clock	Fast mode plus	0.26	-	-	µs
$t_{SU,STA}$	Setup time (repeated) START condition	Fast mode plus	0.26	-	-	µs
$t_{HD,DAT}$	Data Hold time	Fast mode plus	0	-	-	µs
$t_{SU,DAT}$	Data Setup time	Fast mode plus	50	-	-	ns
t_r	Rise time of I2C_SCL and I2C_SDA signals	Fast mode plus	-	-	120	ns
t_f	Fall time of I2C_SCL and I2C_SDA signals	Fast mode plus	-	-	120	ns
$t_{SU,STO}$	Setup time for STOP condition	Fast mode plus	0.26	-	-	µs
t_{BUF}	Bus free time between STOP and START condition	Fast mode plus	0.5	-	-	µs
$t_{VD,DAT}$	Data valid time	Fast mode plus		-	0.45	µs
$t_{VD,ACK}$	Data valid acknowledge time	Fast mode plus		-	0.45	µs
t_{SP}	Pulse width of spikes that must be suppressed by input filter		0	-	50	ns

16 Revision history

Table 82. Revision history

Document ID	Release date	Data sheet status	Change notice	Supersedes
PCA9451A v.2.0	20230417	Product data sheet	-	PCA9451A v.1.0
Modifications:	• Updated BUCK1/BUCK3 voltage by +0.05 throughout data sheet • Updated Figure 15 • Table 6: Updated t_{OFF_DEB} value from 120 µs to 2 ms • Table 18: Updated reset value for 0x07 from 0x4C to 0x6C • Table 26: Updated bit 5 reset from 0 to 1; updated highlighted field in description from 0b to 1b • Removed BUCK1/BUCK3 from Table 44; added Table 43 • Bx_ENMODE 11b updated from "always on" to "reserved" throughout data sheet • Table 68: Updated typical values for $R_{th(j-a)}$ and Ψ_{j-top} • Table 69: Added table note to t_{FLT_THSD}			
PCA9451A v.1.0	20221205	Product data sheet	-	-

17 Legal information

17.1 Data sheet status

Document status[1][2]	Product status[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.
[2] The term 'short data sheet' is explained in section "Definitions".
[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL http://www.nxp.com.

17.2 Definitions

Draft — A draft status on a document indicates that the content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included in a draft version of a document and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

17.3 Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at http://www.nxp.com/profile/terms, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

Quick reference data — The Quick reference data is an extract of the product data given in the Limiting values and Characteristics sections of this document, and as such is not complete, exhaustive or legally binding.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Suitability for use in non-automotive qualified products — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

Translations — A non-English (translated) version of a document, including the legal information in that document, is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

Security — Customer understands that all NXP products may be subject to unidentified vulnerabilities or may support established security standards or specifications with known limitations. Customer is responsible for the design and operation of its applications and products throughout their lifecycles to reduce the effect of these vulnerabilities on customer's applications and products. Customer's responsibility also extends to other open and/or proprietary technologies supported by NXP products for use in customer's applications. NXP accepts no liability for any vulnerability. Customer should regularly check security updates from NXP and follow up appropriately.

Customer shall select products with security features that best meet rules, regulations, and standards of the intended application and make the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP.

NXP has a Product Security Incident Response Team (PSIRT) (reachable at PSIRT@nxp.com) that manages the investigation, reporting, and solution release to security vulnerabilities of NXP products.

17.4 Trademarks
