

# AVR-ISP500

**Users Manual** 

Rev.C, May 2009 Copyright(c) 2008, OLIMEX Ltd, All rights reserved

# **INTRODUCTION:**

**AVR-ISP500** is USB low cost in-system programmer for AVR microcontrollers. It implements the STK500v2 protocol as defined by Atmel which makes it compatible with a range of tools, including <u>AvrStudio</u> and <u>avrdude</u>.

There are two ways you can use AVR-ISP500

#### **FEATURES:**

- Fully STK500v2 compatible;
- Works with AvrStudio, WinAVR, Avrdude and every other software compatible with STK500v2;
- USB port for connection to PC;
- One bi-color LED for current operation status;
- Supports both standard Atmel ICSP10 and ICSP6 layout connectors;
- Powered by USB;
- External clock output on ICSP10 pin 3 for rescuing AVRs with enabled external clock fuse;
- Supports target voltages ranging from 1.8V to 5.5V.
- ISP clock frequencies ranging from 5kHz to 2MHz.

### **ELECTROSTATIC WARNING:**

The AVR-ISP500 must not be subject to high electrostatic potentials. General practice for working with static sensitive devices should be applied when working with this board.

#### **REQUIREMENTS:**

**Cables:** 1.8 meter USB A-B cable (not supplied with the programmer)

#### Software:

- AvrStudio, available from Atmel.
- avrdude, included in the WinAVR distribution.
- Any other software with support for the STK500v2 protocol.

## **SUPPORTED MICROCONTROLLERS:**

The following AVR microcontrollers are supported for programming:

- Classic 8-bit AVRs
- megaAVR
- tinyAVR
- USB AVR

The following AVR microcontrollers are **<u>not supported</u>**:

- XMEGA
- AVR32

#### The following programming methods are **<u>not supported</u>**:

- JTAG
- debugWire
- Parallel High Voltage Programming
- Serial High Voltage Programming
- PDI

# **CONNECTORS:**

ICSP10				
pin	Abbrev.	description		
1	MOSI	Serial Output		
2	V_TAR	Target VCC		
3	CLKO	Clock output		
4	GND	Ground		
5	TRST	Target RESET		
6	GND	Ground		
7	SCK	Serial Clock		
8	GND	Ground		
9	MISO	Serial Input		
10	GND	Ground		

ICSP6					
pin	Abbrev.	description			
1	MISO	Serial Input			
2	V_TAR	Target VCC			
3	SCK	Serial Clock			
4	MOSI	Serial Output			
5	TRST	Target RESET			
6	GND	Ground			

#### **POWER SUPPLY:**

The programmer is supplied from USB.

#### PC DRIVER INSTALLATION:

Drivers for the Mass Storage mode are integrated in Windows XP/Vista.

The driver for STK500v2 mode is available from our website. Windows installation steps are the following:

- 1. Download and unzip the file "AVR-STK500-drivers.zip" in a temporary directory.
- 2. Plug the programmer in the USB port.
- 3. Point the Device Wizard to the temporary directory.
- 4. Windows will complain that drivers are not signed. Click "Continue".
- 5. Click finish.

Screen shots of the steps are shown below:

Found New Hardware Wizard

Found New Hardware Wizard
Please choose your search and installation options.
Search for the best driver in these locations. Use the check boxes below to limit or expand the default search, which includes local
paths and removable media. The best driver found will be installed.  Search removable media (floppy, CD-ROM)
Include this location in the search:  C:\MY_TEMPORARY_FOLDER  Browse  Browse
O Don't search. I will choose the driver to install.
Choose this option to select the device driver from a list. Windows does not guarantee that the driver you choose will be the best match for your hardware.

Hardware Installation
nardware installation

1	The software you are installing for this hardware: Olimex Virtual COM - AVR-ISP500	
	has not passed Windows Logo testing to verify its compatibility with Windows XP. ( <u>Tell me why this testing is important.</u> )	
	Continuing your installation of this software may impair or destabilize the correct operation of your system either immediately or in the future. Microsoft strongly recommends that you stop this installation now and contact the hardware vendor for software that has passed Windows Logo testing.	
	Continue Anyway STOP Installation	

**WARNING:** The COM port number assigned by Windows to AVR-ISP500 must be COM4 or below. Otherwise AvrStudio might not be able to detect the programmer. Here are the steps to change it:

- 1. Go to Device Manager.
- 2. Unfold "Ports (COM&LPT)" and right-click on "Olimex Virtual COM AVR-ISP500 (COMxx)" where COMxx can be anything between COM1 and COM255. Select properties.

3. Go to the "Port Settings" tab and click the "Advanced" button.

	Olim	ex Virtual C	OM - AVR-	ISP 500 (C	OM8) P	roperti	es	22	
	Ger	neral Port Sett	ings Driver	Details					1
			Bits p	per second:	9600			<b>~</b>	
				Data bits:	8			~	
				Parity:	None			~	
				Stop bits:	1			~	
			F	low control:	None			~	
				Adv	anced	Re	store Defa	ults	
						ОК	Ca	ncel	
nge	the	"COM	Port	Num	ber"	to	CON	13	<b>0</b> 1

5. Click OK.

- 6. If a warning message pops up and complains about COM port being used by another device, click "Yes".
- 7. Click OK to close the device properties.

### USING AVR-ISP500 WITH AVRSTUDIO:

**WARNING:** The COM port number assigned by Windows to AVR-ISP500 must be COM4 or below. Otherwise AvrStudio might not be able to detect the programmer. See the section for PC Drivers Installation for more information.

Usage under AvrStudio is straightforward. First open the Programmer Connect dialog:

Die Brijeet Quid View Dools Debug _eb         Imaac Diedweid	🌣 AVR Studio

		<u> </u>			
	TELBUIC Message reference in Files 1.4 Breakboirte and indepointe		100		C10 H 4

Then select "STK500 or AVRISP option" with automatic port detection:

Select AVR Programmer		X
Platform: STK500 or AVRISP JTAG ICE JTAGICE mkli AVRISP mkli AVR Dragon STK600	Port: Auto COM1 COM2 COM3 COM4 COM5 V	Connect Cancel Baud rate:
Tip: To auto-connect to the program button on the toolbar. Note that a tool cannot be used for a debugging session. In that case, s Disconnected Mode	nmer used last time, press the 'Programmer' programming as long as it is connected in select 'Stop Debugging' first.	Baud rate changes are active immediately.

After pressing "Connect" the programming dialog should appear:

STK500	
Main Program Fuses LockBits Advanced HW	Settings   HW Info   Auto
No device selected	Erase Device Read Signature
Programming Mode and Target Settings	Settings Settings ISP Frequency: 19.40 kHz
Detecting on 'Auto' STK500 with V2 timware found on CDM3: Setting continence IV/ 0x02 St/ Major Dx02 St/ Minor	0.0 DY
Getting isp parameter SD=0x0f OK	

Target AVR now can be erased, flashed with a provided HEX file, FUSES and LOCK bits can be written and/or verified. For more information please consult the AvrStudio documentation.

**CAVEAT:** Although the programmer will happily accept setting VTARGET and ARef in the "HW SETTINGS" tab, these actions will have no effect. The programmer hardware can only read target VCC and show it simultaneously in the VTARGET and ARef sliders.

#### USING AVR-ISP500 WITH AVRDUDE:

AVRDUDE requires the serial port name, assigned by the Operating System to AVR-ISP500. It must be given with the -P command line option.

For Windows systems please check the Device Manager. For Linux systems the following command will list all USB CDC serial ports: *ls /dev/ttyACM\** 

For MacOS X systems the following command will list all serial ports: ls /dev/cu.\*

An example command line for programming an Atmega88 under MacOS X: avrdude -p m88 -B 50 -c stk500v2 -P / dev/cu.usbmodem000010471 -e -U flash:w:blinkled.hex

#### **CLOCK OUTPUT:**

Pin 3 of the ICSP10 connector is normally left unconnected by other ISP programmers. Not ours. In normal programmer state this pin is tri-stated. During programming operation, however, this pin is made output and a square-wave clock is generated. Clock frequency is fixed to 62.5kHz.

After programming operation finishes, this pin is again tri-stated in order not to interfere with the target circuit.

This clock output can be really helpful when target AVR is accidentally programmed with External Clock FUSE option. To resurrect it just wire ICSP10 pin 3 to XTAL1 pin of the target AVR chip and initiate a programming session to fix the FUSE values.

#### **FIRMWARE UPGRADE:**

AVR-ISP500 contains a built-in boot loader for easy firmware upgrade. Device enters boot loader mode if the application FLASH section is corrupted. To force the device to enter boot loader mode for manual firmware update do the following:

- 1. Disconnect the programmer from any power source (external AC/DC, USB).
- 2. Disconnect the programmer from any target boards.
- 3. Put a jumper between pin 1 and pin 3 of the ICSP10 connector.
- 4. Power up the device by connecting it to USB.
- 5. Device now must be in boot loader mode, indicated by the LED light sequence:
  - a. RED off, GREEN on.
  - b. RED on, GREEN off.
  - c. RED off, GREEN off.

Jumper can now be removed. The device will stay in boot loader mode until it is power cycled.

Boot loader implements the standard protocol XMODEM with CRC16 for firmware update. User is free to use his favorite terminal client (HyperTerminal, minicom, etc) to upload the firmware images taken from our website. The AVR-ISP500 boot loader implements a USB virtual serial port that is baud rate agnostic.

As an alternative we provide a simple Windows GUI application for users who don't want to or cannot use terminal software.

After the firmware image is uploaded the target will blink the GREEN LED if update was successful, otherwise it will blink the RED LED if firmware image was invalid or update was unsuccessful. Device stays in this state until it is power cycled.

#### **TROUBLESHOOTING GUIDE:**

**Problem:** <u>AVR Studio cannot find my programmer.</u>

#### Probable causes and solutions:

- Look whether the programmer is listed in Device Manager under the *"Ports (COM & LPT)"* section. If it's not there then check your USB cables and hubs. Reinstall the driver.
- Check that the green LED is constantly on. If not then the programmer might be in firmware upgrade mode. Go to the firmware upgrade section for more details.
- Your serial port number might be too high. Check the manual section "Installing drivers" for more information on assigning serial port numbers. Also go to AVR Studio menu "*Tools->Options*" and set the "*Number of COM ports to try*" field to at least 20.
- Remove all applications that might be using or scanning your computer's serial ports, including any serial port monitors. They might mess up the STK500v2 communication between AVR Studio and the programmer.

# **Problem:** <u>Programming fails. Target AVR chip cannot enter programming mode.</u>

#### Probable causes and solutions:

- ISP frequency might be too high. Set the ISP frequency to well below <sup>1</sup>/<sub>4</sub> of target MCU clock. Please note that the AVR MCU clock depends on its fuses configuration.
- Target power might not be stable enough or supply voltage might be too low. Check your target board circuit. Ensure that the used AVR chip specifications match your supply voltage.
- Target power supply VCC might not be connected to pin 2 of ICSP6/10. Check your target board circuit.
- The target AVR MCU might have fuses programmed for disabling SPI ISP or selecting another programming method. In such case you'll need a High Voltage Parallel programmer to unlock the chip.
- The reset line cannot be pulled low by the programmer. Check your schematic and ensure that only a weak pull-up (and possibly a small capacitor) are connected to RESET. Otherwise, if the pull-up is too small or there is another output driving RESET, the programmer won't be able to pull it down.
- Another circuit is driving the ISP lines (MISO, MOSI, SCK or RESET) resulting in a contention with the programmer. The solution is to remove all such circuits (LEDs, RS232 drivers, resistors below 2k, etc) from the four ISP lines during programming. AVR-ISP500 is more susceptible to this kind of fault than other programmers on the market because it has 560 ohm resistors in series with all its outputs. This protects both the target MCU and the target board circuit.

Symb ol	Description	Condition	Min	Тур	Max	Uni ts
V <sub>TARG</sub>	Target Supply Voltage.		1.8		5.5	V
$\mathbf{F}_{\mathrm{ISP}}$	ISP Frequency on SCK SPI pin.		5		2000	kHz
