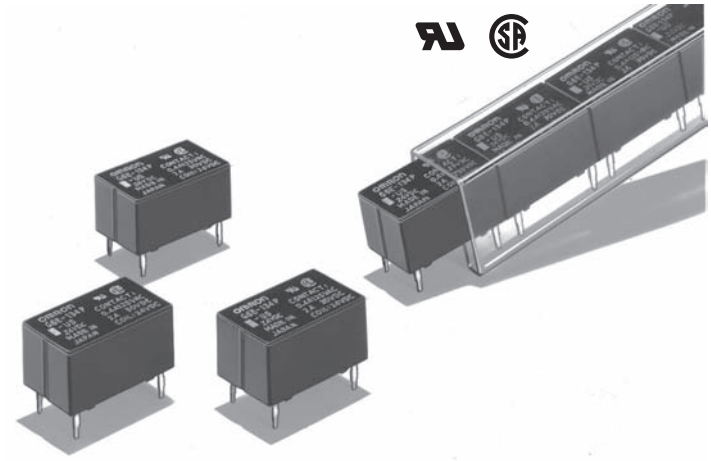
G6E
Low Signal Relay

Subminiature, Sensitive SPDT Signal Switching Relay



- High sensitivity: 98-mW (Rated power consumption: 200mW) pickup coil power.
- Impulse withstand voltage of 1,500V (10×160 μs) meets FCC requirements.
- Stick packing employed in consideration of supporting automatic implementation.
- Plastic-sealed model that allows automatic soldering.
- New series of ultrasonically cleanable models is available.
- Standard model conforms to UL/CSA standards.

RoHS Compliant

Failure rate (P level) (reference value) *3		10 μA at 10 mVDC		
Ambient operating temperature		-40°C to 70°C (with no icing or condenstion)		
Ambient operating humidity		5% to 85%		
Weight		Approx. 2.7 g		

Note: The values here are initial values.
*1. The contact resistance was measured with 1 A at 5 VDC using a voltage-drop method.
*2. The insulation resistance was measured with a 500 VDC Megger Tester applied to the same parts as those used for checking the dielectric strength.
*3. This value was measured at a switching frequency of 120 operations/min and the criterion of contact resistance is 50 Ω.
This value may vary depending on the switching frequency and operating environment. Always double-check relay suitability under actual operating conditions.

*1. The tests were conducted at an ambient temperature of 23°C.

*2. The contact resistance data are periodically measured reference values and are not values from each monitoring operation. Contact resistance values will vary according to the switching frequency and operating environment, so be sure to check operation under the actual operating conditions before use.

*3. High-frequency characteristics depend on the PCB to which the Relay is mounted. Always check these characteristics, including durability, in the actual machine before use.

■Precautions

●Please refer to “PCB Relays Common Precautions” for correct use.

Correct Use

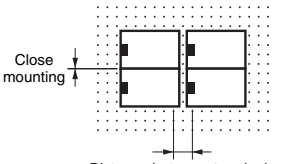
●Long-term Continuously ON Contacts

• Using the Relay in a circuit where the Relay will be ON continuously for long periods (without switching) can lead to unstable contacts because the heat generated by the coil itself will affect the insulation, causing a film to develop on the contact surfaces. We recommend using a latching relay (magnetic-holding relay) in this kind of circuit. If a single-side stable model must be used in this kind of circuit, we recommend using a fail-safe circuit design that provides protection against contact failure or coil burnout.

●Mounting

• Do not reverse the polarity of the coil (+, –).

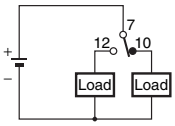
• Provide sufficient space between Relays when mounting two or more on the same PCB, as shown in the following diagram.



Distance between terminals:
2.54 × 2 (pitch) max.

●Wiring

• Refer to the following diagram when wiring to switch a DC load. The difference in polarity applied to the contacts will affect the endurance of the Relay due to the amount of contact movement. To extend the endurance characteristics beyond the performance ratings, wire the common (pin 7) terminal to the positive (+) side.



Wiring Diagram

●Ultrasonic Cleaning

• Do not use ultrasonic cleaning on standard relay models. Doing so may result in resonance, coil burnout, and contact adhesion within the Relay. Use a model designed for ultrasonic cleaning if ultrasonic cleaning is required.

●Relay Handling

• When washing the product after soldering the Relay to a PCB, use a water-based solvent or alcohol-based solvent, and keep the solvent temperature to less than 40°C. Do not put the Relay in a cold cleaning bath immediately after soldering.
