Note: The above values are initial values.
*1. The contact resistance was measured with 10 mA at 1 VDC with a voltage drop method.
*2. The insulation resistance was measured with a 500 VDC megohmmeter applied to the same parts as those used for checking the dielectric strength (except between the set and reset coil).
*3. This value was measured at a switching frequency of 120 operations/min. This value may vary, depending on switching frequency, operating conditions, expected reliability level of the relay, etc. It is always recommended to double-check relay suitability under actual load conditions.

- The thickness of cream solder to be applied should be within a range between 150 and $200 \mu \mathrm{~m}$ on OMRON's recommended PCB pattern.
- In order to perform correct soldering, it is recommended that the correct soldering conditions be maintained as shown below on the left side.
Correct Soldering Incorrect Soldering

Visually check that the Relay is properly soldered.

## Precautions

- Please refer to "PCB Relays Common Precautions" for correct use.

| Correct Use |
| :---: |
| Long-term Continuously ON Contacts |

- Long-term Continuously ON Contacts
- Using the Relay in a circuit where the Relay will be ON continuously for long periods (without switching) can lead to unstable contacts because the heat generated by the coil itself will affect the insulation, causing a film to develop on the contact surfaces. We recommend using a latching relay (magnetic-holding relay) in this kind of circuit. If a single-side stable model must be used in this kind of circuit, we recommend using a fail-safe circuit design that provides protection against contact failure or coil burnout.

## - Relay Handling

- Use the Relay as soon as possible after opening the moistureproof package. If the Relay is left for a long time after opening the moisture-proof package, the appearance may suffer and seal failure may occur after the solder mounting process. To store the Relay after opening the moisture-proof package, place it into the original package and sealed the package with adhesive tape.
- When washing the product after soldering the Relay to a PCB, use a water-based solvent or alcohol-based solvent, and keep the solvent temperature to less than $40^{\circ} \mathrm{C}$. Do not put the Relay in a cold cleaning bath immediately after soldering.
- Claw Securing Force During Automatic Mounting
- During automatic insertion of Relays, be sure to set the securing force of each claw to the following so that the Relay's characteristics will be maintained.

B Dimension A: 1.96 N max. Dimension B: 4.90 N max. Dimension C: 1.96 N max.

    Be sure since -TR" is not part of the relay model number, it is not marked on the relay case.
