## LED Control IC <br> W2RF002RF

## Most Suitable IC for Controlling LED Effects within Applications

- Free-running PWM gradation control, with up to 1,024 levels, enables the representation of beautiful fade-in and fade-out effects.
- CPU load can be reduced by controlling lighting gradation and speed.
- Up to 49 pieces of this IC can be connected on the same serial bus communication line. Device group setting is also possible.
- 24 Line Outputs are contained in the $7 \times 7 \mathrm{~mm}$ package.
- Use with Omron's W2RV005RM Constant Current IC to directly drive multiple LED's in series.

- RoHS Compliant

Note: 1. The $\overline{\mathrm{RST}}$ terminal is connected to an internal $100 \mathrm{k} \Omega$ pull-up resistor. When this terminal is not used, connect a $0.1 \mu \mathrm{~F}$ capacitor between the terminal and ground to prevent misoperation at power-on.
2. Connect the CAP terminal to a capacitor for smoothing power supply. Connect a $0.1 \mu \mathrm{~F}$ capacitor between the terminal and GND.
3. The VZ1 and VZ2 terminals are for driving output protection. Connect them to the power source of a driving system. When several driving system power supplies are used, connect the terminals to the highest potential among them. When these terminals are not used, leave them open.
4. Always leave the TST1 and TST2 terminals open.
5. Leave unused output terminals open.

## Operation

## Functional Overview

## Receiving Commands

The IC recieves commands with two-wire serial communication to control 24 LED lines. Commands are received in a 40-bits-per-command communication format.

## Gradation Control

The lighting of the 24 LED lines is controlled individually or by group with 16 -level lighting gradation and 32-level lighting speed. The exponential control of output duty cycle allows lighting gradation that matches the human visual characteristics. In addition, the specification of lighting speed allows fade-in and fade-out with up to 1,024 levels.

## Number of Control Lines

The IC has two device address lines, each of which can be configured in seven ways by terminal configuration. This provides up to 49 patterns of device address configuration, allowing up to 1,176 lines to be controlled on the same communication line. Two device address lines can be combined to configure a device group.

## Communication Specifications

Input signals to SDA-I and SCL-I are input via the filter circuit ( $0.1 \mu$ s delay) to the communication circuit. An SDA-I signal that is input to the communication circuit is taken in as serial data at the rising edge of an SCL-I signal. When serial data is received in a different format from the communication format, the data will be invalid.
When the START signal, "111111111" is detected, the communication circuit takes in data as new serial data, whether it is on stand-by or in the middle of intake of serial data.
Input signals to SDA-I and SCL-I will be output via the asynchronous buffer to SDA-O and SCL-O without going through the filter circuit.

## Communication Format

## Description of Communication Format

| Device Selection Data | Device ID | Device-specific ID (Fixed to "00" for this IC) |
| :---: | :---: | :--- |
|  | Device Address A | Specified with the ADRA0 to 2 terminals |
|  | Device Address B | Specified with the ADRB0 to 2 terminals |
| Control Data | Control | Specifies control <br> (data saving / immediate reflection) |
|  | Output Address | Specifies the terminal to output <br> (Individual specification and collective specification are possible) |
| Lighting Data | Lighting Speed | Specifies changing speed of free-running gradation control (32 levels) |
|  | Lighting Gradation | Specifies the brightness of lighting (16 levels) |

## Control Command

## Device Selection Data (8 bits)

| Device selection data dvc_dat (7:0) |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Device ID |  | Device Address A |  |  | Device Address B |  |  |  |
| 0 | 0 | ADRA2 | ADRA1 | ADRA0 | ADRB2 | ADRB1 | ADRB0 |  |

The device ID is fixed. The correspondence between the device addresses $A$ and $B$ and the setting terminals ADRA0 to 2 and ADRB0 to 2 is shown in the table. (Setting "L"...Data "0". Setting "H"...Data "1").
When ADRA0 to $2=$ " 111 ", the device address A line is specified collectively, and when ADRB0 to $2=$ " 111 ", the device address B line is specified collectively.
Because up to 7 addresses can be specified for each of device address $A$ and device address $B$, their combination allows the specification of up to 49 addresses.

Control Data (7 bits)

| Control data ctrI_dat (6:0) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| ctrl | 0_adr(5) | 0_adr(4) | o_adr(3) | o_adr(2) | o_adr(1) | o_adr(0) |  |

The control signal, 'ctrl', activates the operational control shown in the following table.

- When ctrl = " 0 ", latch operation is activated, in which data is only stored in latch registers and will not be reflected in the output.
- When ctrl = "1", load operation is activated, in which data is stored in the specified latch registers and the data of the latch registers in all addresses will be stored in the load registers.

| Control <br> (ctrl) | Operational <br> Control |

Lighting is controlled in each line with the values of the load registers. In lighting control, the gradation changes to the specified one at the specified lighting speed

The Lighting speed follows the table below.
The change time is specified with 5 bits;

| Lighting Speed$\operatorname{spd}(4: 0)$ |  |  |  |  | Change time per $1 / 15$ of brightness | Change time from 0/15 to 15/15 of brightness (and vice versa) |

| 1 | 1 | 1 | 1 | 1 | 1,638 ms | 24.58 s |

Note: The change time per $1 / 15$ of brightness represents the time required for a change from, for example, 10/15 to 11/15 of brightness.

The change time from $0 / 15$ to $15 / 15$ of brightness and vice versa represents the time required for a change from $0 / 15$ of brightness (light OFF) to $15 / 15$ of brightness (light completely ON). However, these times are median values and depend on the driving output PWM cycle.

The Lighting gradation follows the table below.
The brightness is specified with 4 bits;

| Lighting Gradation <br> brt(3:0) |  |  |  | Brightness | PWM duty ratio <br> (reference) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{( 3 )}$ | $\mathbf{( 2 )}$ | $\mathbf{( 1 )}$ | $\mathbf{( 0 )}$ |  | $0 \%$ |
| 0 | 0 | 0 | 0 | $0 / 15$ <br> (light OFF) | $0 \%$ |
| 0 | 0 | 0 | 1 | $1 / 15$ | $0.42 \%$ |
| 0 | 0 | 1 | 0 | $2 / 15$ | $0.84 \%$ |
| 0 | 0 | 1 | 1 | $3 / 15$ | $1.25 \%$ |
| 0 | 1 | 0 | 0 | $4 / 15$ | $1.78 \%$ |
| 0 | 1 | 0 | 1 | $5 / 15$ | $2.61 \%$ |
| 0 | 1 | 1 | 0 | $6 / 15$ | $3.76 \%$ |
| 0 | 1 | 1 | 1 | $7 / 15$ | $5.42 \%$ |
| 1 | 0 | 0 | 0 | $8 / 15$ | $7.96 \%$ |
| 1 | 0 | 0 | 1 | $9 / 15$ | $11.3 \%$ |
| 1 | 0 | 1 | 0 | $10 / 15$ | $16.7 \%$ |
| 1 | 0 | 1 | 1 | $11 / 15$ | $23.3 \%$ |
| 1 | 1 | 0 | 0 | $12 / 15$ | $35.2 \%$ |
| 1 | 1 | 0 | 1 | $13 / 15$ | $48.4 \%$ |
| 1 | 1 | 1 | 0 | $14 / 15$ | $73.4 \%$ |
| 1 | 1 | 1 | 1 | $15 / 15$ | $100 \%$ |

## Functional Terminals/Setting Terminals

| ADR terminals | The ADRA terminal and ADRB terminal set device address A and device address B, respectively. <br> For " H " setting, connect the terminal to $\mathrm{V}_{\mathrm{DD}}$ and for " L " setting, connect the terminal to GND |
| :--- | :--- |
| INV terminal | This terminal sets the polarity of OUT terminal. <br> - When the terminal is used with "L" as active (e.g., for directly driving an LED), connect the terminal to $\mathrm{V}_{\mathrm{DD}}$ <br> - When the terminal is used with the "H" as active (e.g., for driving an LED with a driving transistor), connect the terminal to GND. |
| $\overline{\text { RST }}$ terminal | When the voltage of the $\overline{\text { RST }}$ terminal becomes "L", the internal circuit will be reset and the output will be open. |

## Precautions for Use

## Correct Use

- The absolute maximum rating is the limit value which should not be exceeded even in a flash. Exceeding this value can cause deterioration of the characteristics or complete failure of the IC.
- Check the operation at the communication frequency to be used before using the device.
- Sufficiently take into consideration the static electricity, chattering and voltage of the input to be connected when determining each input circuit.
- Although the device contains an ESD protection circuit, static electricity that exceeds the function may damage the device. When handling the device, exercise due caution by, for example, grounding the human body.
- Due to potential damage, do not use product that has been dropped or that has come into contact with water.

## Recommended Reflow Conditions

## Allowable Temperature Profile Conditions

Product mounting method should be by Reflow and we recommend the following temperature profile. Reflow no more than two times, maximum.

## Storage Conditions before Mounting

Moisture absorption by the plastic package will increase the possibility of faults, such as cracks; therefore, take enough care for storage.

| Storage Conditions | Period |
| :---: | :---: |
| 5 to $30^{\circ} \mathrm{C}, 40$ to $70 \% \mathrm{RH}$ | One Year |

## ■ RoHS Directive Compliance

Models that are indicated as being RoHS compliant are free of the following six substances.

| Lead: | $1,000 \mathrm{ppm}$ max. |
| :--- | :--- |
| Mercury: | $1,000 \mathrm{ppm}$ max. |
| Cadmium: | 100 ppm max. |
| Hexavalent chromium: | $1,000 \mathrm{ppm}$ max. |
| PBB: | $1,000 \mathrm{ppm}$ max. |
| PBDE: | $1,000 \mathrm{ppm}$ max. |

■ Lot Code Indication

Control Code: Three-digit alphanumeric characters
$\rightarrow$ Production week: Serial number starting from week01 including January1
$\rightarrow$ Production year: The last one digit of the year

All sales are subject to Omron Electronic Components LLC standard terms and conditions of sale, which can be found at http://www.components.omron.com/components/web/webfiles.nsf/sales_terms.html

ALL DIMENSIONS SHOWN ARE IN MILLIMETERS.
To convert millimeters into inches, multiply by 0.03937 . To convert grams into ounces, multiply by 0.03527 .
