74F675A 16-Bit Serial-In, Serial/Parallel-Out Shift Register

General Description

FAIRCHILD

SEMICONDUCTOR

The 74F675A contains a 16-bit serial in/serial out shift register and a 16-bit parallel out storage register. Separate serial input and output pins are provided for expansion to longer words. By means of a separate clock, the contents of the shift register are transferred to the storage register. The contents of the storage register can also be loaded back into the shift register. A HIGH signal on the Chip Select input prevents both shifting and parallel loading.

Features

- Serial-to-parallel converter
- 16-Bit serial I/O shift register
- 16-Bit parallel out storage register
- Recirculating parallel transfer
- Expandable for longer words
- Slim 24 lead package
- 74F675A version prevents false clocking through CS or R/W inputs

Ordering Code:

Order Number	Package Number	Package Description
74F675ASC	M24B	24-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-013, 0.300 Wide
74F675APC	N24A	24-Lead Plastic Dual-In-Line Package (PDIP), JEDEC MS-011, 0.600 Wide
74F675ASPC	N24C	24-Lead Plastic Dual-In-Line Package (PDIP), JEDEC MS-001, 0.300 Wide

Devices also available in Tape and Reel. Specify by appending the suffix letter "X" to the ordering code.

Functional Description

The 16-Bit shift register operates in one of four modes, as determined by the signals applied to the Chip Select (CS), Read/Write (R/W) and Store Clock Pulse (STCP) input. State changes are indicated by the falling edge of the Shift Clock Pulse (SHCP). In the Shift Right mode, data enters D₀ from the Serial Input (SI) pin and exits from Q₁₅ via the Serial Data Output (SO) pin. In the Parallel Load mode, data from the storage register outputs enter the shift register and serial shifting is inhibited.

Shift Register Operations Table

	Contro	Operating		
CS	R/W	SHCP	STCP	Mode
Н	Х	Х	Х	Hold
L	L	~	Х	Shift Right
L	н	~	L	Shift Right
L	Н	\sim	Н	Parallel Load,
				No Shifting

The storage register is in the Hold mode when either \overline{CS} or R/W is HIGH. With \overline{CS} and R/W both LOW, the storage register is parallel loaded from the shift register on the rising edge of STCP.

To prevent false clocking of the shift register, SHCP should be in the LOW state during a LOW-to-HIGH transition of \overline{CS} . To prevent false clocking of the storage register, STCP should be LOW during a HIGH-to-LOW transition of \overline{CS} if R/\overline{W} is LOW, and should also be LOW during a HIGH-to-LOW transition of R/\overline{W} if \overline{CS} is LOW.

Note 1: Absolute maximum ratings are values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.

Note 2: Either voltage limit or current limit is sufficient to protect inputs.
