Low-Voltage CMOS Octal Transceiver

With 5 V−Tolerant Inputs and Outputs (3−State, Non−Inverting)

The 74LVC245A is a high performance, non−inverting octal transceiver operating from a 1.2 to 3.6 V supply. High impedance TTL compatible inputs significantly reduce current loading to input drivers while TTL compatible outputs offer improved switching noise performance. A V_I specification of 5.5 V allows 74LVC245A inputs to be safely driven from 5 V devices if V_{CC} is less than 5.0 V. The 74LVC245A is suitable for memory address driving and all TTL level bus oriented transceiver applications.

Current drive capability is 24 mA at both A and B ports. The Transmit/Receive (T/$\overline{R}$) input determines the direction of data flow through the bi−directional transceiver. Transmit (active−HIGH) enables data from A ports to B ports; Receive (active−LOW) enables data from B to A ports. The Output Enable input, when HIGH, disables both A and B ports by placing them in a HIGH Z condition.
